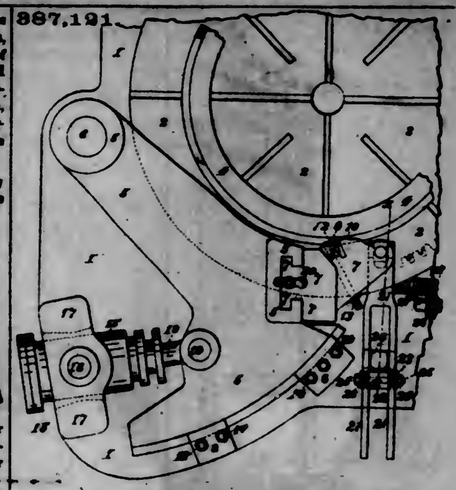
Claim.—A dandy-roll frame consisting of two heads, A A, a series of outer longitudinal rods extending between and secured to said heads, a series of rings, C, located within said rods, to the outer peripheries of which said rods are attached, a series of truss-rods each at one end headed and at its other screw-threaded extending in bifilial lines, substantially as described, from head to head, and passing therethrough, said truss-rods being in engagement with said rings, and nuts *f* engaging with the screw-threaded ends of said truss-rods against the one head, substantially as described.

387,119. BOOT OR SHOE. WILLIAM H. SEVERS, Leicester, County of Leicester, England. Filed Jan. 24, 1888. Serial No. 261,514. (No model.) Patented in England Sept. 30, 1885, No. 11,513.

Claim.—1. As an improved article of manufacture, the boot for foot-ball and other purposes, having ankle-protectors of a hard substance united or secured to the leg of the boot at a point to cover or protect the ankle-joint, as and for the purposes described.

2. The boot or shoe having a leg of flexible material, and two disk-shaped ankle-protectors fastened to said leg in a position to cover or shield the ankle, and having their cavities toward the inside of the boot or shoe, substantially as described.

3. The boot or shoe having the disk-shaped ankle-protector *c*, and a flexible or yielding padding upon the inner side thereof, as and for the purposes described.



387,120. BOOT OR SHOE. WILLIAM H. SEVERS, Leicester, County of Leicester, England. Filed Jan. 24, 1888. Serial No. 261,515. (No model.) Patented in England Oct. 30, 1885, No. 13,093.

Claim.—1. A sole constructed of rubber compound, with a sheet, *a*, of strong canvas or wire-gauze or such like material in the interior thereof, and another sheet, *a'*, of similar material on the surface next to the upper, substantially as herein shown and described, and for the purpose stated.

2. A lawn-tennis or other boot or shoe having a sole of rubber compound, with a sheet, *a*, of strong canvas or wire-gauze or such like material in the interior thereof, and another sheet, *a'*, of similar material on the surface next to the upper united to the insole and edge of the upper by stitches, as and for the purposes described.

387,121. METHOD OF FEEDING THE SUPPORT OF A METAL-CUTTING TOOL. FREDERICK W. TAYLOR, Philadelphia, Pa. Filed Aug. 28, 1887. Serial No. 247,922. (No model.)

Claim.—1. The improvement in the art of feeding a tool-support in a single direction, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, and in locating the centers of pressure of said advancing and resisting pressures at different points upon the tool-support, so as to cause the last motion in the joints of the tool-support to be taken up and the tool-support to deflect in the same direction as the pressure of the work upon the tool causes the last motion to be taken up and the tool-support to deflect, substantially as set forth.

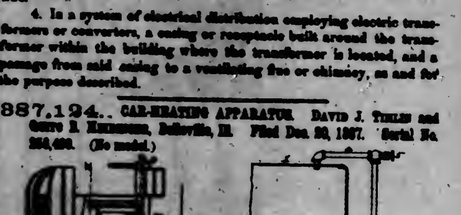
2. The improvement in the art of feeding a tool-support in a single direction, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, the advancing pressure tending in the same direction in which it is desired that the tool-support shall advance, while the resisting pressure varies inversely as the pressure of the work upon the tool—that is, becomes less as this pressure becomes greater, and greater as this pressure becomes less—and in locating the centers of pressure of the advancing pressure upon some portion of the tool-support, while the center of pressure of the resisting pressure is located upon one of the tool-supporting-members mounted thereon, substantially as set forth.

3. The improvement in the art of feeding in a single direction a tool-support having one or more tool-supporting members mounted thereon, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, and in locating the center of pressure of the advancing pressure upon some portion of the tool-support, while the center of pressure of the resisting pressure is located upon one of the tool-supporting members mounted thereon, substantially as set forth.

4. The improvement in the art of feeding in a single direction a tool-support having one or more tool-supporting members mounted thereon, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, the advancing pressure tending in the same direction in which it is desired that the tool-support shall advance, while the resisting pressure tends in the opposite direction to that in which it is desired that it shall advance, and in locating the center of pressure of the advancing pressure upon some portion of the tool-support, while the center of pressure of the resisting pressure is located upon one of the tool-supporting-members mounted thereon, substantially as set forth.

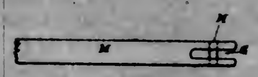
5. The improvement in the art of feeding a tool-support in a single direction, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, the advancing pressure being substantially uniform, while the resisting pressure varies inversely as the pressure of the work upon the tool—that is, becomes less as this pressure becomes greater, and greater as this pressure becomes less—and in locating the centers of pressure of said advancing and resisting pressures upon different parts of the tool-support, so as to cause the last motion in the joints of the tool-support to be taken up and the tool-support to deflect in the same direction as the pressure of the work upon the tool causes the last motion to be taken up and the tool-support to deflect, substantially as set forth.

6. The improvement in the art of feeding a tool-support in a single direction, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, the advancing pressure being substantially uniform and tending in the same direction in which it is desired that the tool-support shall advance, while the resisting pressure varies inversely as the pressure of the work upon the tool—that is, becomes less as this pressure becomes greater, and greater as this pressure becomes less—and tends in the opposite direction to that in which it is desired that it shall advance, and in locating the centers of pressure of said advancing and resisting pressures at different points upon the tool-support, so as to cause the last motion in the joints of the tool-support to be taken up and the tool-support to deflect in the same direction as the pressure of the work upon the tool causes the last motion to be taken up and the tool-support to deflect, substantially as set forth.



7. The improvement in the art of feeding in a single direction a tool-support having one or more tool-supporting members mounted thereon, which consists in advancing the tool-support by a pressure exerted upon it, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, the advancing pressure being practically uniform, while the resisting pressure varies inversely as the pressure of the work upon the tool—that is, becomes less as this pressure becomes greater, and greater as this pressure becomes less—and in locating the center of pressure of the advancing pressure upon some portion of the tool-support, while the center of pressure of the resisting pressure is located upon one of the tool-supporting-members mounted thereon, substantially as set forth.

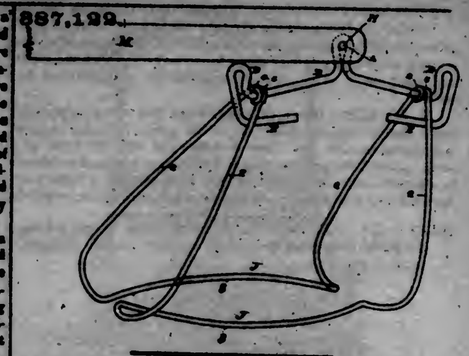
8. The improvement in the art of feeding in a single direction a tool-support having one or more tool-supporting members mounted thereon, which consists in advancing the tool-support by a pressure exerted upon it, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing thereto a resisting pressure, the advancing pressure being practically uniform and tending in the same direction in which it is desired that the tool-support shall advance, while the resisting pressure varies inversely as the pressure of the work upon the tool—that is, becomes less as this pressure becomes greater, and greater as this pressure becomes less—and tends in the opposite direction to that in which it is desired that the tool-support shall advance, and in locating the center of pressure of the advancing pressure upon some portion of the tool-support, while the center of pressure of the resisting pressure is located upon one of the tool-supporting members mounted thereon, substantially as set forth.



9. The improvement in the art of feeding in a single direction a tool-support having one or more tool-supporting members mounted thereon, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, and in locating the center of pressure of the advancing pressure upon some portion of the tool-support, while the center of pressure of the resisting pressure is located upon one of the tool-supporting members mounted thereon, and in exerting a pressure upon one of the tool-supporting members mounted upon the tool-support which is being fed, which tends in the direction in which this tool-supporting member is adapted to feed relatively to the tool-support upon which it is mounted, and at the same time in exerting pressure either upon this tool-supporting member or upon a tool-support mounted thereon, which prevents the tool-supporting member from feeding, so as to cause the last motion in the tool-support to be taken up and the tool-support to deflect in the same direction as the pressure of the work on the tool would cause this last motion to be taken up and the tool-support to deflect, substantially as set forth.

10. The improvement in the art of feeding in a single direction a tool-support having one or more supporting members mounted thereon, which consists in advancing the tool-support by a pressure exerted thereon, and simultaneously, during and as a part of the operation of regulating its rate of advance, in opposing a resisting pressure thereto, and in locating the center of pressure of the advancing pressure upon some portion of the tool-support, while the center of the resisting pressure is located upon one of the tool-supporting members mounted thereon, and in exerting a pressure upon one of the tool-supporting members upon which the tool-support which is being fed is mounted, which tends in the direction in which this tool-supporting member is adapted to feed relatively to the parts upon which it is mounted, and at the same time in exerting a pressure either upon the tool-support which is being fed or upon a tool-support mounted thereon, which prevents the tool-supporting member from feeding, so as to cause the last motion in the tool-support to be taken up and the tool-support to deflect in the same direction as the pressure of the work on the tool would cause this last motion to be taken up and the tool-support to deflect, substantially as set forth.

387,122. PLATE OR DISH LIFTER. JOHN W. TREMBLY, Lebanon, N. H., assignor, by direct and mesne assignments, to Henry A. Henderson, Boston, Mass. Filed June 23, 1888. Serial No. 278,023. (No model.)



Claim.—A plate or dish lifter composed of the handle, the yoke connected at its center to the handle by a pivot and adapted to oscillate on said pivot independently of the handle, and the jaws pivoted to the yoke, the said yoke and jaws being adapted to be turned end for end to partially rotate the plate by the inclination and partial rotation of the handle, as set forth.

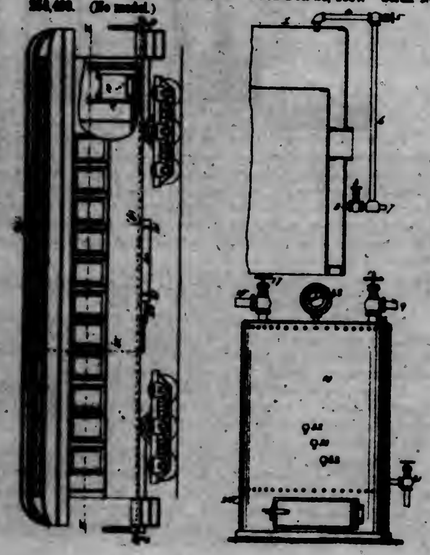
387,123. PLATE OR DISH LIFTER. JOHN W. TREMBLY, Lebanon, N. H., assignor, by direct and mesne assignments, to Henry A. Henderson, Boston, Mass. Filed June 23, 1888. Serial No. 278,024. (No model.)

Claim.—A plate or dish lifter composed of the handle, the yoke connected at its center to the handle by a pivot and adapted to oscillate on said pivot independently of the handle, and the jaws pivoted to the yoke, the said yoke and jaws being adapted to be turned end for end to partially rotate the plate by the inclination and partial rotation of the handle, as set forth.

387,122.

387,123.

387,128. PLUG FOR ELECTRIC TRANSFORMERS. ELIHU THOMSON, Lynn, Mass. Filed June 9, 1888. Serial No. 276,649. (No model.)

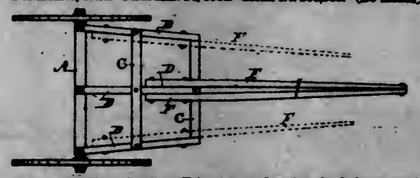


Claim.—1. The combination, with a transformer placed in a building, of a ventilating flue or pipe leading to the external atmosphere, and a casing surrounding the transformer and connected with said flue.

2. In a system of electrical distribution by alternating currents, an alternating-current transformer having a casing connected with a flue or passage through which any heated products of combustion may escape to the external atmosphere.

3. In a system of electrical distribution, a transformer provided with a casing connected with a flue, and openings at or near the bottom of said casing for inducing a ventilating and cooling current of air through the casing around the induction-coil and to the escape-flue.

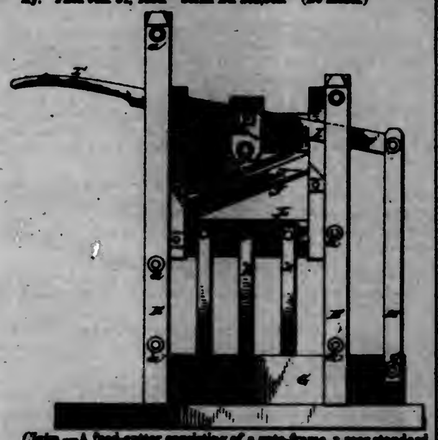
4. In a system of electrical distribution employing electric transformers or converters, a casing or receptacle built around the transformer within the building where the transformer is located, and a passage from said casing to a ventilating flue or chimney, as and for the purpose described.



387,124. CAR-HEATING APPARATUS. DAVID J. THELEN and GEORGE B. HENDERSON, Belleville, Ill. Filed Dec. 30, 1887. Serial No. 259,493. (No model.)

Claim.—1. In a heating system, the combination, with a steam-generator and a vessel or boiler forming part of said system, of a pipe or pipes communicating with said vessel or boiler and with the water and steam spaces of the generator respectively, substantially as described.

2. In a heating system, the combination, with a steam-generator and a vessel or boiler forming part of said system, of a pipe or pipes communicating with said vessel or boiler and with the water and steam spaces of the generator respectively, and an independent heater in connection with said system, whereby the said vessel or boiler may act either as a steam-heater or a generator, substantially as described.



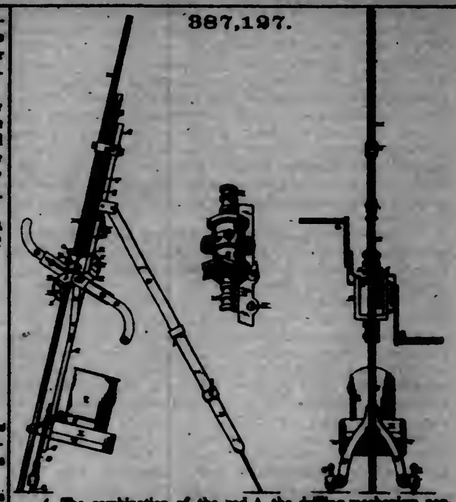
387,125. POLE AND SHAFTS FOR VEHICLES. HARVEY H. TIBBS, Des Moines, Iowa. Filed Mar. 24, 1888. Serial No. 268,268. (No model.)

Claim.—1. The pole-pieces F, having perforations in their rear ends adapting them for vertical and longitudinal adjustment, in combination with the central bar, D, in the manner set forth, for the purposes stated.

2. The pieces F, having perforations in their rear ends, and blocks or washers *g*, in combination with the side pieces, B, of the body-frame of a vehicle, for the purposes stated.

387,126. FEED-CUTTER. ERASTUS F. VERMILYEA, Elizabethtown, Ky. Filed Jan. 31, 1888. Serial No. 262,562. (No model.)

Claim.—A feed-cutter consisting of a gate-frame, a rear standard, a box secured to said frame and mounted on said standard, a vertical and horizontal guide at the mouth of the box, a gate carrying an inclined knife, a lever for operating said gate, guide-strips, bolts to secure said strips in place, coiled springs between the strips and gate-frame, a press-plate, and springs attached to the press plate and the feed cross-piece of the gate-frame, the parts being combined substantially as set forth.



387,127. ROCK-DRILL. WILLIAM WEAVER, Fleetwood, Pa. Filed June 14, 1887. Serial No. 241,256. (No model.)

Claim.—1. The combination of the drill-rod with the ratchet-nut having the opening for the drill-rod made eccentrically through it, so that the teeth of the nut can be longer upon one side than the other and thus rotate the drill-bar irregularly, substantially as set forth.

2. The combination of the rod A, the plate or frame W, the weight X, and a reservoir of water, with the triangular-shaped plate B, provided with perforated projections A', and the guide C, provided with a lip, E', substantially as shown.

3. The combination of the rod A, the operating-shaft journaled in suitable bearings, the cam-arms, the ratchet-nut, the mandrel-plate, the mandrel, the spring which is placed around the mandrel, the guiding-clamp U, and the spring-catch Y, which catches under the mandrel-plate and holds the spring in a compressed position, so as to allow the drill to be removed, substantially as described.

387,197.

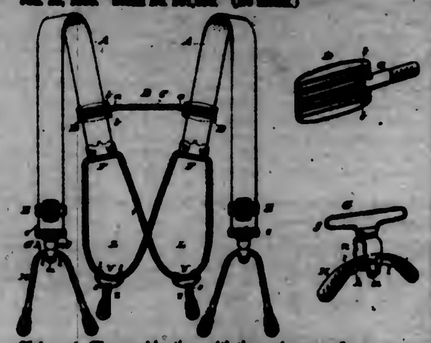
4. The combination of the rod A, the drilling mechanism connected thereto, the leg D, pivoted to the rod A, the triangular-shaped plate connected to the leg, an operating-shaft journaled in suitable bearings and provided with handles, a sprocket-wheel upon the shaft, a sprocket-chain, and a sprocket-wheel connected to the operating-shaft of the drilling mechanism, substantially as shown.

387,128. CHRONOMETER. GEORGE F. WILLIS, San Francisco, Cal. Filed Mar. 16, 1888. Serial No. 267,267. (No model.)

Claim.—1. The weight R, the cord C, the sheaves D D, the winding-drum E, the wheel F, ratchet-wheel F' and pawl G, the pinion H, the wheel I, the pinion J, the wheel K, with tappet-pins L, and the wheel M, in combination with the wheels N, N', and O, for the purpose of operating the music-rolls O' and P and carrying the music over the range T', constructed, arranged, and operated substantially as and for the purposes set forth.

2. The wheel K, with tappet-pins L, in combination with the lever R, pivoted at R' and operated in connection with the weight-ball T and friction brake-lever S, for the purpose of regulating and governing or controlling the time of the music, constructed and operated substantially as and for the purposes set forth.

3. The dial-plate K', with the words "Largo," "Andante," "Allegro," and "Presto," with indicating-pointer N' and lever-arm N'', in combination with the levers R and S, and the wheel K, connected by means of the cords O' and P', for the purpose of regulating the time of the music and stopping the instrument, constructed and operated substantially as and for the purposes set forth.



4. The keys A', B', C', D', E', F', and G', in combination with the front swell, A', connected by means of the levers D' and E', pivoted at E', and the pin E'', for the purpose of regulating the volume of sound from the higher notes, constructed and operated substantially as and for the purposes set forth.

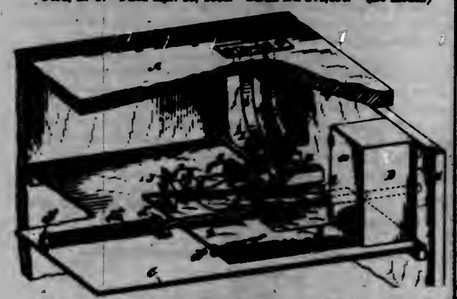
5. The key J', lever B', and valve G', for the purpose of closing the air-opening E' and softening the tone, constructed and operated substantially as and for the purposes set forth.

6. The key F' and lever F', jointed at I', the lever B', and valve or door G', for the purpose of suppressing the volume of the low notes, constructed and operated substantially as and for the purposes set forth.

7. The cam H' upon the shaft J', in combination with the connecting-rod K', with spring V', the rock-shaft N', pivoted at N'', and the connecting-rods L' and M', levers O' and P', and the connecting-rods T' and T'', for the purpose of operating the bellows Q', constructed and operated substantially as and for the purposes set forth.

387,129. SUSPENDER. WARD E. WHITMAN, Burlington, assignor to the Willard Manufacturing Company, St. Albans, Vt. Filed Jan. 28, 1888. Serial No. 261,993. (No model.)

Claim.—1. The combination, with the main suspender-straps and the slide D, of the connecting-cord C, attached to clamps *a*, notched to engage the end bar of the slide, and having the lugs *b* to secure the clamps to the bars of the slide, substantially as specified.



2. In a pair of suspenders, the center rocking clamp A, carrying the button-cord and pivoted to the branches of the dependent hanger *a*, and having the extended end portions, substantially as specified.

3. In a pair of suspenders, the combination, with the main straps and their rear clamps, of the cross-loops L L, respectively attached to both of the rear clamps of the main straps and carrying the rear button attachments of the suspenders, substantially as specified.

4. In a pair of suspenders, an arc-shaped bearing, V, secured to the rear suspender-loop and carrying the button-loop clamp *a*, having an eye, *a*, substantially as specified.

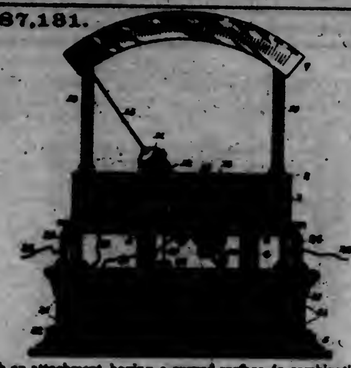
5. The combination, with the main suspender-straps A, of the adjustable back strap, C, the rear double loops, L L, the rocking clamps A, and the arc bearings V, substantially as specified.

387,130. COIN-OPERATED MACHINE. CHARLES F. WILLS, New York, N. Y. Filed Apr. 12, 1888. Serial No. 271,121. (No model.)

Claim.—In a coin-operated machine, the combination, with a box or case, of a receptacle for articles to be ejected from the box or case, a plate, a pull-piece for operating said plate, a lever, a chute, and a stop on said plate for preventing a movement of the plate in one direction until a coin of proper size has been deposited upon the lever, said stop being provided with an inclined surface, whereby when the lever has been rocked sufficiently far by the coin the said plate may be withdrawn and the stop will pass under the lever and rock it to cause the coin to fall off from the lever, substantially as specified.

387,131. ELECTRIC INDICATOR. WILLIAM A. ANTHONY, Manchester, Conn., assignor to the Hartford Electric Company, same place. Filed Mar. 26, 1888. Serial No. 268,602. (No model.)

Claim.—1. In an instrument for indicating or measuring current or potential, an electric conductor which is pivoted in a magnetic field, and a curved plate or lever which is attached to said pivoted conductor, in combination with a weight and a flexible connection whereby said weight is suspended from said curved lever, substantially as and for the purpose specified.



2. In an electric indicator, means for producing a magnetic field, and an oscillating conductor which is located in said field and is provided with an attachment having a curved surface, in combination with a cord running upon said curved surface and a weight which is suspended by said cord, substantially as and for the purpose specified.

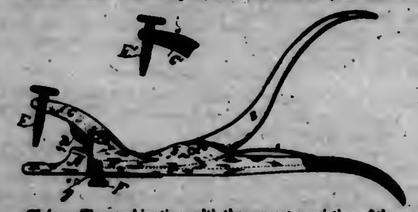
3. A stationary helix, an oscillating helix, and a plate which has a peripheral curvature and is attached to said oscillating helix, in combination with a weight and a flexible connection by which said weight is suspended from said plate, substantially as and for the purpose specified.

4. A stationary helix and an oscillating helix which is pivoted thereto and is provided with a pointer, in combination with a graduated scale, a plate which has a peripheral curvature and is attached to said oscillating helix, a weight, and a thread by which said weight is suspended from said plate, substantially as and for the purpose specified.

5. A stationary helix and a movable helix of copper wire, and an artificial resistance of low or negative temperature coefficient, all connected in series, in combination with a plate which has a peripheral curvature and is attached to said oscillating helix, a weight, and a thread by which said weight is suspended from said plate, substantially as and for the purpose specified.

387,131.

387,132. TYPE-WRITING MACHINE. EDWARD H. ARNOUX, New York, N. Y., assignor of one-half to J. Walter Ewin, Philadelphia, Pa. Filed Mar. 12, 1888. Serial No. 266,966. (No model.)

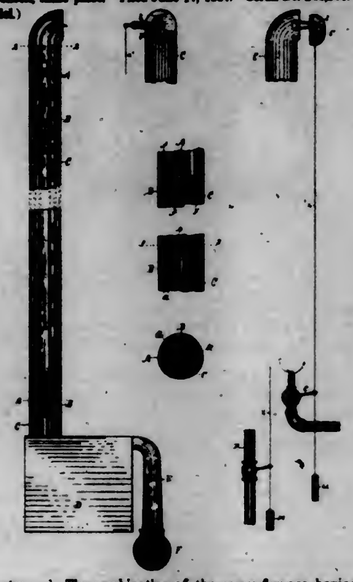


Claim.—1. In a type-writing machine, a carriage with a slip-holder secured thereto on the front thereof, and a pointer secured to the frame of the machine, said parts being combined substantially as described.

2. In a type-writing machine, a carriage with a metallic slip-holder attached thereto, said slip-holder having its upper edge notched, forming a scale, in combination with a pointer attached to the frame, all as described.

3. A slip-holder having a groove or trough in its lower part and end springs whereby a slip of paper may be secured therein, said holder being adapted to be connected to the carriage of a type-writing machine, all substantially as described.

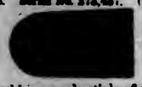
4. A slip-holder for a type-writing machine having a notched or toothed portion forming a scale or guide, substantially as described.



387,133. COMBINED SAW-SET AND PUNCH. WILLIAM G. AVERY, Cleveland, Ohio. Filed May 12, 1888. Serial No. 273,057. (No model.)

Claim.—The combination, with the saw-set consisting of the anvil-jaw A, with its chambered handle, having cam *d d* and spring *e*, lever-

handle B, and the movable gripping-jaw C, having die D, of the screw-threaded hollow punch E, substantially as set forth, and for the purpose specified.



387,134. SEWER-VENTILATOR. LYMAN L. BENSON and WILLIAM T. SHUWELL, Kalamazoo, Mich.; said Benson assignor to Elizabeth I. Benson, same place. Filed June 17, 1887. Serial No. 241,573. (No model.)

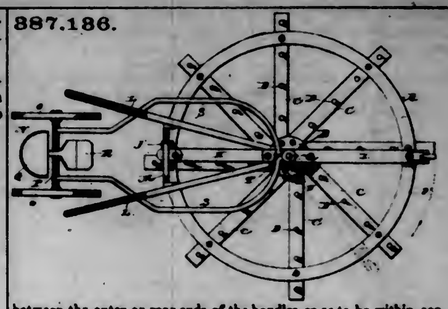
Claim.—1. The combination of the sewer-furnace having the space between the flame and the upper inclosure, a sewer-pipe, an induction-pipe diminishing in size from its connection with the sewer to its connection with the end of the furnace at the top, and an eduction-pipe diminishing in size from its connection with the top of the furnace at the other end to the delivery end of said pipe, whereby the results and advantages are effected substantially as set forth.

2. An updraft-pipe of a sewer-furnace, elbowed at its delivery end, a fulcrumed receptacle in position to receive the escaping heated air from said pipe, a furnace-burner, a suitable connection between said receptacle and the throttle of the burner, and a counter-balance to the receptacle, combined to effect the results substantially as set forth.

387,135. TOBACCO-PIPE BOWL. WALTER S. BLAKE, St. Louis, Mo. Filed May 10, 1888. Serial No. 272,467. (No model.)

Claim.—1. As a new and improved article of manufacture, a pipe-bowl composed of comminuted corn-cob and cementitious matter, as set forth.

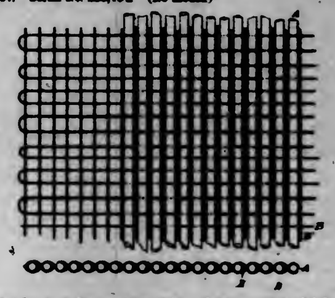
2. A corn-cob-pipe bowl having an outside coating of a mixture of kaolin and glue, substantially as described.



3. A pipe-bowl having an inside lining of a mixture of silicate of potash and calcined magnesia and an outside coating of a mixture of kaolin and white glue, substantially as described.

4. A pipe-bowl composed of disintegrated corn-cob pressed into shape, having an inside lining of a mixture of silicate of potash and calcined magnesia and an outside coating of kaolin and glue decorated, and the decorated surface varnished with silicate of potash, substantially as described.

387,136. ROTARY HARROW. MARLY D. BRESSLER, Ilion, N. Y., assignor of one-half to W. E. Jenner, same place. Filed Jan. 19, 1888. Serial No. 261,202. (No model.)

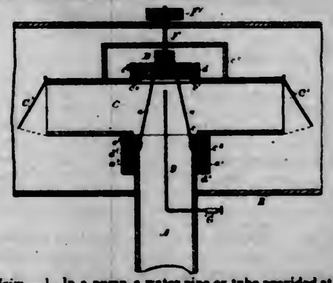


Claim.—In combination with the rotary harrow, the guide-beam H, the draft-beam I, the king-bolt G, on which the guide and draft beams are independently pivoted, the handles connected to the guide-beam, and the detachable sulky having its draft-bars fitted loosely over the king-bolt of the harrow and arranged on the outside of the handle so as to incline the same, the seat of the sulky being arranged

387,186.

between the outer or rear ends of the handles, so as to be within convenient reach of the same.

387,137. FIRE-PROOF MATERIAL FOR DROP-CURTAINS. ROBERT T. BROWN, Boston, Mass., and WILLIAM ORR, Trenton, N. J., assignors to the New Jersey Wire Cloth Company, Trenton, N. J. Filed Oct. 20, 1887. Serial No. 252,794. (No model.)



Claim.—1. A fire-proof curtain and scenery material for theaters and other places of amusement, consisting of interwoven strands of wire and fire-proof cord or fiber, substantially as described.

2. The combination, in the same fabric, of strands of wire and strands of fire-proof cord or fiber having the cord or fiber so woven in that the spaces between the wires are completely filled with the material, substantially as described, and for the purpose set forth.

3. The combination of fire-proofed cord or strand and wire woven together and forming a fire-proof fabric, the soft fibrous part of which can be pressed out and made to cover the wire and also form a flat surface upon which to paint the scenery, substantially as described.

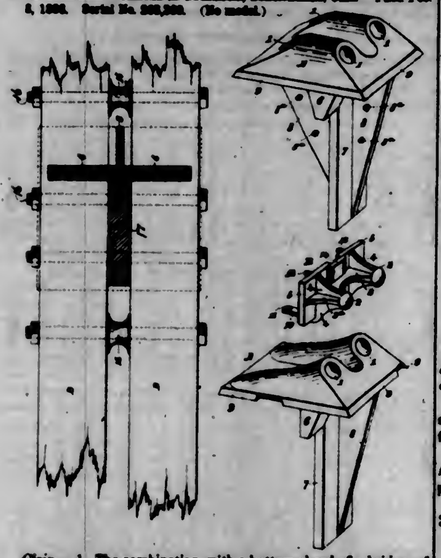
4. The combination, in the same fabric, of strands of wire and of strands of fire-proofed material so woven together that the whole will form a fabric which will be opaque and which can be used for fire-proof curtains and scenery, substantially as described.

387,138. PUMP. JOSEPH H. BROWN, Elberton, Ga. Filed June 1, 1888. Serial No. 275,296. (No model.)

Claim.—1. In a pump, a water pipe or tube provided at its upper end with a part or arms having valved ends and flanged upper and lower central openings, and supported by and revolving on a cap which is supported upon the upper end of said pipe by rods which pass entirely through the revolving part, combined with an air-pump or exhaust, the whole surrounded by an air-tight case or tank, substantially as and for the purposes set forth.

2. The combination of the vertical pipe A, having a cap, A', sup-

ported above its upper end, the hollow and revolving part or arms C, having two central openings, *c* and *c'*, embracing, respectively, the upper end of said pipe and cap, and provided at its outer ends with the flap-valves C', the air-exhaust G, and the case B, substantially as described.



3. In a centrifugal pump, the revolving part C, having horizontal arms with valved outer ends, and having openings at its top and bottom between said arms, in combination with the pipe A, which enters the lower opening in the said revolving part, and the cap A', supported upon said pipe A and closing the upper opening in the revolving part, said part being supported upon said cap, substantially as described.

4. In a pump, the hollow and revolving part C, thickest from side to side at the middle and of uniform vertical height, its arms or ends curving in opposite directions and tapered or contracted and provided with valves, and having a supporting part on its upper side, combined with a spindle fixed to said supporting part, and a pulley and the pipe A and cap supported thereon above its end and in line therewith, upon which said spindle rests, an air-exhaust, and an air-tight case, substantially as described.

5. In a pump, the air-tight casing B, the pipe A, having at its upper end the cap A', supported by rods attached to said pipe, the hollow part C, placed directly over the upper end of pipe A and having valves at its ends and flanged central openings to fit it upon said pipe and cap and its connections, and means for revolving said hollow part, substantially as described.

6. In a centrifugal pump, the case B, having a safety-valve and provided with an air-exhaust and an air-compressor, the water-pipe A, having cap A', supported above its end, the hollow part C, revolving on the upper end of said pipe and having valved ends and flanged central openings, and the spindle F, fixed to the support or arch *d'* of said part C and resting on said cap and revolved as described, all substantially in the manner and for the purposes set forth.

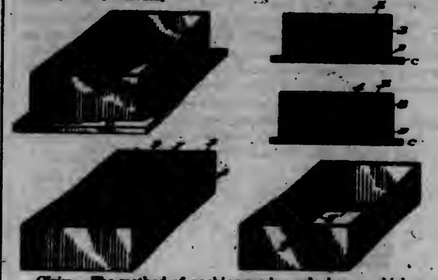
387,139. CONNECTING FOR END POSTS AND BOTTOM CHORDS OF BRIDGES. RANSOM A. BURNHAM, Bellefontaine, Ohio. Filed Feb. 6, 1888. Serial No. 263,359. (No model.)

Claim.—1. The combination, with a bottom chord of a bridge, of a plate, A, having sockets 1 for the reception of the end of the bow, the said plate being provided with a downwardly-projecting flange adapted to be mortised into the said chord, as set forth.

2. The combination, with chord C, of plates A, for supporting the ends of the bows, said plates being provided with flanges 9 for excluding water, as set forth.

3. The combination, with the bottom chord, C, formed of two or more members, of plates A, secured thereto for securing the ends of the bows, the said plates having flanges 6 and tongues 7 mortised into the chord, and the brackets or supports 8 extending between the members, as set forth.

4. The combination, with the bottom chord formed of two or more members, of plates for securing the ends of the bows and packing-blocks interposed between the members, the said plates having downwardly-projecting ribs or flanges adapted to abut against said packing-blocks, as set forth.



5. The combination, with a bow or truss of a bridge, of a plate secured to the end thereof for bearing against a seat on the chord, the said plate having the flanges 5, dowel 13, and projection 10, having screw-aperture 11, all set forth.

6. The combination of the plate A, having flanges and sockets, substantially as described, with the plate B, having projections 2, adapted to fit in said sockets, said plates being secured in place on the horizontal and inclined members of the bridge respectively, as set forth.

7. A bearing-plate for members of wooden bridges, consisting of the flanges 5, against which the ends of the pieces in said members bear, projections 2 on said flanges 5 for supporting the plate, and the strengthening webs or ribs 3, 3', and 4, said plates being secured to the members in the manner described.

8. The herein-described connecting-plate to be secured to the timbers of a bridge member, which consists of transverse bearing faces or flanges 5 for the ends of the said timbers in the member, projections 2, extending from said flanges 5, and strengthening-webs 14, substantially as set forth.

387,140. METHOD OF PACKING GRANULAR MATERIAL. FRANK R. BUSH, New York, N. Y. Filed Oct. 31, 1887. Serial No. 253,593. (No model.)

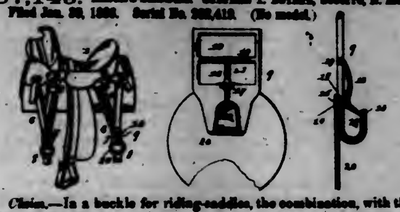
Claim.—The method of packing ready-made boxes, which consists in first properly placing the goods in a permanent frame whose outer dimensions correspond with the dimensions of the interior of the box to be packed, then fitting the box bottom side up over the frame so packed, then placing the box and frame open side up, and allowing the frame to retain its position surrounding the contents of the box, substantially as described.

387,141. MECHANICAL MUSICAL INSTRUMENT. HUGO DORNAS, Leipsic, Saxony, Germany. Filed Mar. 8, 1887. Serial No. 230,168. (No model.)

Claim.—1. In a mechanical musical instrument, the combination of the rod B with spring *a*, levers D E, and reed-valve F, arranged to operate in the manner and for the purpose described.

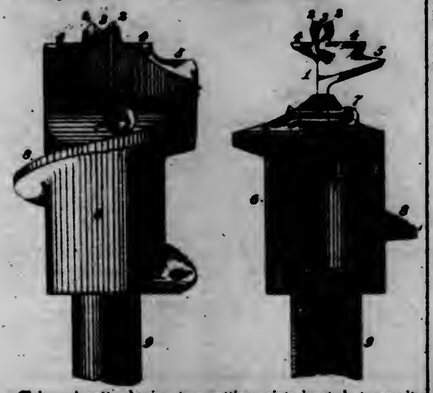
2. In combination with the reed-valve F, the spring *f*, closing said valve independent of its actuating mechanism, substantially as set forth.

3. In a musical instrument, in combination with the music-sheet A and driving-wheel K, the guiding pin or wheel *k*, guiding the outer periphery of the music-sheet, substantially as described.



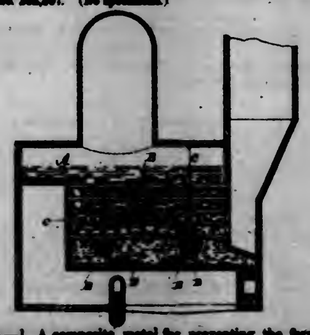
387,142. HAY-CARRIER-TRACK HANGER. WILLIAM H. BURNHAM and JOHN H. MILLER, Batavia, Ill., assignors to the United States Wind Engine and Pump Company, same place. Filed Mar. 26, 1888. Serial No. 268,482. (No model.)

Claim.—In hangers for tracks for hay-carriers, the bracket consisting of the central base, M, which terminates in the upwardly-pro-



jecting supporting-wings N, and bar formed transversely in its top portion a semi-cylindrical rest, R, and a slot, K, formed through it parallel with the wings N N, in combination with the semi-cylindrical rest O, the screw-threaded hanger-rod P, adapted to pass through the rest and having a head on its lower end, and the track S, as specified.

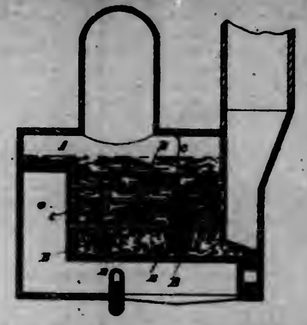
387,143. RIDING-SADDLE. STEPHEN T. BUTLER, Seaford, N. Hav. Filed Jan. 30, 1888. Serial No. 262,413. (No model.)



Claim.—In a buckle for riding-saddles, the combination, with the body portion 9, having two transverse strap-passages, 10 and 11, at the upper portion, and a hook portion, 12, at the lower end, an aperture, 14, below the lower strap-passage, and a cross-bar, 15, at its upper end, of the tongue 16, the middle of which is provided with a cross-piece, 17, and two lugs, 18 18, whereby the tongue may be secured to the cross-bar and kept from wabbling upon the same by means of the cross-piece 17, substantially as and for the purpose set forth.

387,144. CUTTER FOR MINING-MACHINES. EDWIN H. CARTER, Knoxville, Allegheny County, assignor to John S. Scully, Pittsburg, Pa. Filed Apr. 24, 1888. Serial No. 271,692. (No model.)

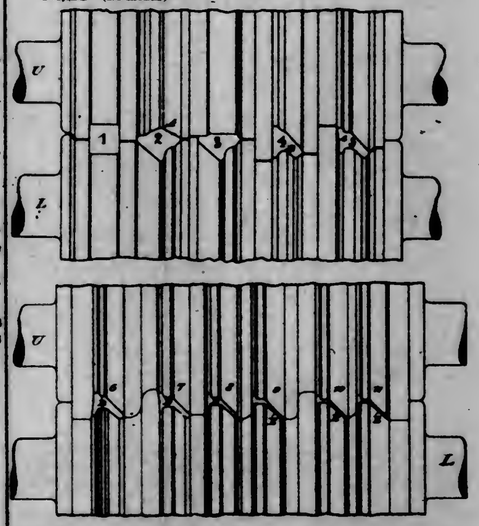
Claim.—A cutter having two cutting-points located at opposite sides of a central recess, a broad lateral cutting-lip located in a plane below each of said cutting-points, and a supplemental lateral cutting-lip located exterior to and in a plane below one of the cutting-lips first specified, substantially as set forth.



387,145. GALVANIC BOILER-CLEANING COMPOUND. FRANCIS J. CLARKE, Philadelphia, Pa., assignor of two-thirds to Charles Wolters and Joseph G. Hendrickson, both of same place. Filed Jan. 31, 1888. Serial No. 262,977. (No specimens.)

Claim.—1. A composite metal for preventing the formation of scale in and removing scale from steam boilers and generators, consisting of zinc and phosphorus, substantially as set forth.

2. A plate or mass of zinc and phosphorus, perforated, indented, or serrated, for use in water in and to be fed into steam boilers and generators, substantially as and for the purpose set forth.

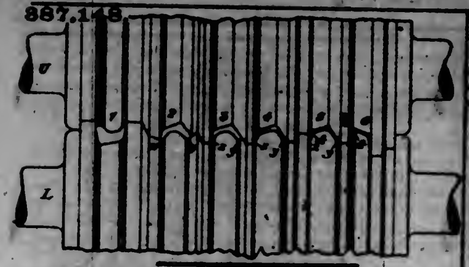


387,146. GALVANIC BOILER-CLEANING COMPOUND. FRANCIS J. CLARKE, Philadelphia, Pa., assignor of two-thirds to Charles Wolters and Joseph G. Hendrickson, both of same place. Filed Jan. 31, 1888. Serial No. 262,978. (No specimens.)

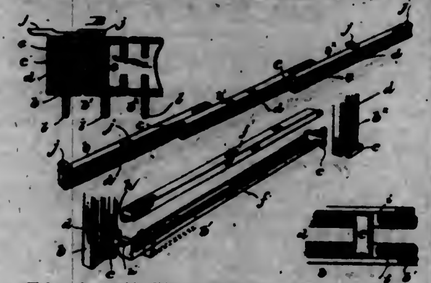
Claim.—1. A composite metal for preventing the formation of scale in and removing scale from steam boilers and generators, consisting of zinc, phosphorus, and copper.

2. A plate or mass of zinc, phosphorus, and copper, perforated, indented, or serrated for use in water in and to be fed into steam boilers and generators, as and for the purpose described.

387,147. ROLLS FOR ROLLING OVERHANGING SLOT-RAILS. FREDERICK GILLET, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed June 12, 1888. Serial No. 276,894. (No model.)



Claim.—A set of rolls for rolling overhanging slot-rails, having passes of the conformations indicated in the accompanying drawings by the numbers 1 to 11, inclusive, substantially as set forth.

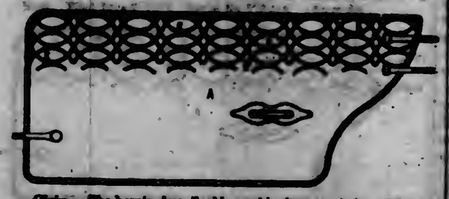


387,148. ROLLS FOR ROLLING ANGLE-SHAPED SLOT-RAILS. FREDERICK GILLET, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed June 12, 1888. Serial No. 276,895. (No model.)

Claim.—A set of rolls for rolling angle-shaped slot-rails, having passes of the conformations respectively illustrated and shown in the accompanying drawing by the numbers 1 to 6, inclusive, substantially as set forth.

387,148.

387,149. TABLE-SLIDE. WILLIAM S. GRAY, Springfield, Ohio. Filed Nov. 10, 1887. Serial No. 257,453. (No model.)

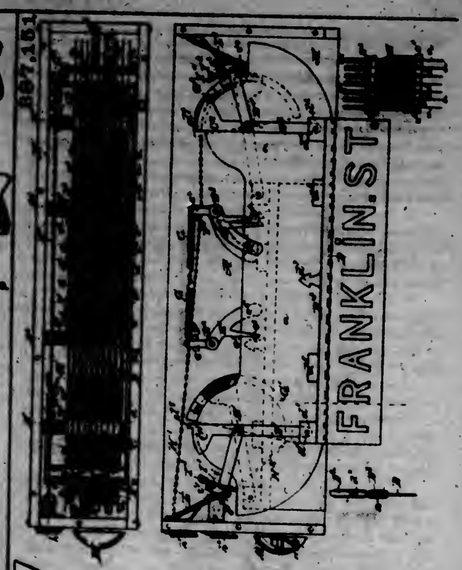


Claim.—1. A table-slide consisting of a series of sections, each provided with laterally-projecting T-shaped legs and longitudinal ways and grooves, with which the legs are adapted to engage, each alternate section being formed in two parts, as described, that the sections may be joined together by bringing said sections to an unusual position in relation to each other, substantially as set forth.

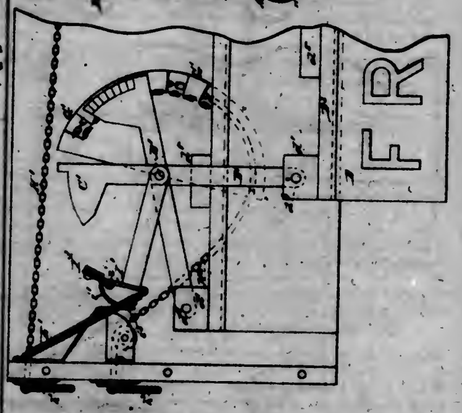
2. A table-slide, substantially as set forth, consisting of a series of single and double sections, each provided with T-shaped legs adapted to engage in longitudinal grooves in contact with guides or ways in the next succeeding section, stop projections for limiting the movement of the sections in relation to each other, and fastening lugs or cars on the upper portion of the end sections, adapted to form a bearing for said slide and furnish means for securing the same in position, substantially as set forth.

3. The combination, in a table-slide consisting of metal sections, as set forth, of end sections provided with metallic ears cast solid therewith and projected above the plane of the tops of the intervening sections for securing the same, substantially as set forth.

4. The combination, with the metallic sections having T-shaped legs extending laterally therefrom at the respective ends and provided with longitudinal grooves and ways therein, the said sections being arranged in series in such a manner that the T-shaped legs of the one shall engage with the slides or ways in the next succeeding one, each alternate section being formed of two parts, as described, stop projections in said sections for limiting the movement thereof in relation to each other, and longitudinal ribs or bosses at the bottom of said sections, substantially as set forth.



387,150. SIGNS-HANGER. ALFRED H. GROVER, Watertown, Mass. Filed June 7, 1888. Serial No. 276,445. (No model.)



Claim.—The herein-described horse-blanket, consisting of the two burlap fabrics A, having an intervening padding, B, and provided with a series of ornamental cords, E, attached on the blanket, as described, as and for the purposes set forth.

387,151. GRANITE-RUBBING. WILLIAM L. GROW, New York, N. Y. Filed July 23, 1887. Serial No. 244,603. (No model.)

Claim.—1. A street or station indicator having a series of signs

with the names of the stations of any given road printed or painted thereon and stored within an inclosing case or housing, each of said signs coupled by pivot-pins at or near its ends, respectively, to the lower ends of a pair of swinging lifter-bars, which are mounted on and operated simultaneously by transverse axles journaled in the sides of the inclosing case or housing, the whole arranged so that when the lower ends of the said swinging bars are thrown down the attached sign is thrown down below the housings or case, so that its name or station is fully disclosed below the said case or housing, and all the other signs are raised up into the case or housing, substantially as described.

2. In a street or station indicator, a sign or tablet having a street or station name on its face pivoted to the lower ends of two swinging lifter-arms, by which both its ends are raised or lowered simultaneously, the lateral actuating-arms by which said lifter-arms are operated, and the hinged followers attached thereto, in combination with the actuating-centers and their operating chains and pulls, combined and arranged substantially as described and set forth.

3. In a street or station indicator, swinging or vertically-moving signs provided with upwardly-projecting central hooks on their upper edges arranged to engage with either one of two pivoted dependent and pendulous hooks placed above the sign and supported by its ends, engagement with the said dependent hook made by the simple act of raising the sign up by means of its lifting-bars, which are pivoted to its ends and manipulated or moved laterally toward either end of the case so as to raise the signs up, in which lifting the sign is, by its pendulous lifting-bars, thrown toward one or the other end of the case or

housing, as the case may be, so as to make it engage with one or the other of the supporting-hooks, substantially as described and set forth.

4. In a street or station indicator, downwardly-depending pivoted pendulous hooks attached to the case or housing and placed at equal distances from its longitudinal center and also from the sustaining-axles on which the swinging arms of the signs are mounted, provided with laterally and downwardly moving projecting arms, which permit the engagement therewith of lugs on the next adjacent sign when it is raised up, thereby actuating and releasing the sign next to the one which is raised up, substantially as and for the purpose set forth.

5. In a street or station indicator, the lateral actuating-arms by which the pendulous swinging sign-arms are successively operated or moved so as to throw the signs up, the hinged spring-followers attached to the front ends of the said actuating-arms, in combination with the operating-sectors, their chains, and pulls, substantially as described.

6. In a street or station indicator, the combination of the hinged followers for operating the pendulous sign-arms, the spring-cushions attached to the ends of the followers, and spring fender-pieces attached to the inclosing-case, so as to contact with the said cushions when they are thrown down, substantially as described.

7. In a street or station indicator, a case or housing in which the indicator mechanism is inclosed, subdivided by longitudinal partitions or diaphragms into longitudinal pockets, in combination with bifurcated levers E' E², pivoted in and to the case or housing over and straddling the said diaphragms, and vertically-adjustable indicator-signs or station-indicators, as described and set forth.

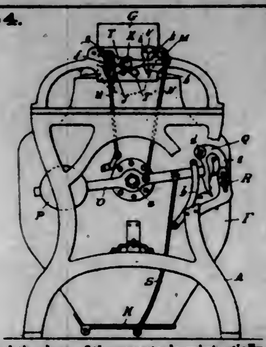
8. In a street or station indicator, longitudinal bars placed parallel with and above the sign-tablet, and attachable thereto by inwardly and upwardly projecting hooks or ledges adapted to catch to and hold up the sign-pieces, which, at their upper edges, are provided with horizontal ledges or ribs adapted to rest on the upper ends of said sustaining-hooks, the whole combined and arranged as described and set forth.

387,152. VEHICLE-REACH COUPLING. ELMER S. CORNHAM, Delhi Mills, Mich. Filed May 4, 1888. Serial No. 272,815. (No model.)

Claim.—1. The combination of the reach with the coupler C, having adjustable plate F and set-screw E, all constructed and arranged substantially as and in the manner and for the purpose described.

2. The combination of the reaches with the couplers C therefor, having a base, D, grooved side bars, a sliding plate, F, mounted between said bars, and the adjusting set-screw E, all constructed and arranged substantially in the manner and for the purpose described.

387,153. SPINNING-TOP. ELMER W. DOKERHAM, Westfield, Mass., assignor of one-half to George E. Whipple, same place. Filed Mar. 17, 1888. Serial No. 267,550. (No model.)



Claim.—A spinning-top having formed in the body thereof a vertical chamber, and the radial passages *b*, leading from the sides of the top thereto, and the flat block *b* in the bottom of the chamber to form a cap-rest, combined with the block *h*, loosely fitting and vertically movable in said chamber, and the stop-plug *d*, as described and shown, for the purpose set forth.

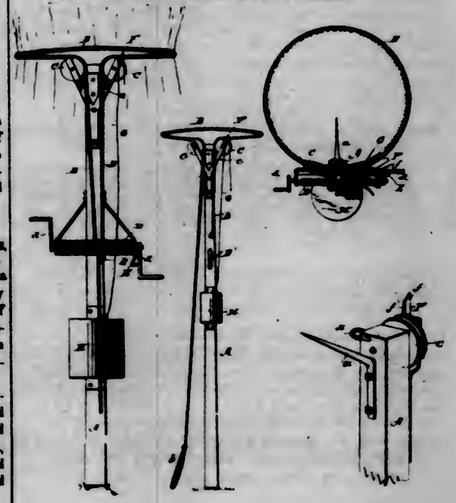
387,154. GRAIN, FLOUR, AND FEED SCALE. JOSEPH B. DUFFIE, Detroit, Mich. Filed Oct. 28, 1887. Serial No. 253,063. (No model.)

Claim.—1. The combination, with the weighing-receptacle of a grain-scale and the pivoted door H thereof, of a hopper independently supported from said receptacle and provided with an oscillating cut-off secured to and operated by a rock-shaft to close and disclose the discharge-opening from said hopper, and pivotal connections between the rock-shaft and the door H of the receptacle, substantially as described.

2. The combination, with the weighing-receptacle F of a grain-scale and the pivoted door thereof, of the independently-supported hopper G, the rock-shaft K, the segmental cylindrical cut-off to said hopper, the counter-weight L', the rock-arm T, secured to said shaft, the connecting-rod U, connected at one end with the receptacle and at the other to the rock-arm, and pivotal connections between said

387,154.

rock-shaft and the door of the receptacle, substantially as and for the purpose specified.



3. The combination, with the weighing-receptacle F of the grain-scale, of the independently-supported hopper G, the rock-shaft K, carrying the oscillating cut-off, the counter-weight L' on said rock-shaft, and a locking device consisting of the rock-arm T and the locking-lever V, with the hook *h*, and the link M, arranged to trip the lever V, all arranged to operate substantially as described.

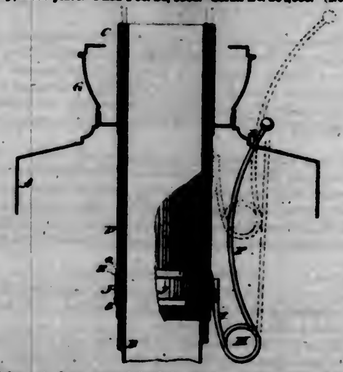
4. The combination, with the weighing-receptacle F of the grain-scale, of the independently-supported hopper G, the rock-shaft K, the oscillating cut-off carried thereby, the counter-weight L, the rock-arm T, the connecting-rod U, the rock-arm T', the locking-lever V, provided with the hook *h* and the arm *h'*, and the link M, arranged to trip said locking-lever V, substantially as described.

5. The combination, with the weighing-receptacle, of the independently-supported hopper G, the rock-shaft K, carrying the cut-off I, the cut-off or door H, the lever O, carrying the counter-weight P, the connecting-rod S, the locking-lever Q, provided with a hook, *e*, an arm, *e*, the stop R, the connecting-rod U, provided with slot *f*, the rock-arms T and T', secured to the rock-shaft K, the counter-weight L, the locking-lever V, provided with the hook *h* and arm *h'*, the link M, and the connecting-rod N, the parts being constructed and arranged to operate substantially as described.

6. In a grain-scale of the kind described, the combination of the weighing-receptacle, the independently-supported hopper, the cut-off controlling the flow of grain from the hopper, the automatically-operating devices to open and close said cut-off, the hinged cut-off controlling the discharge of grain from the weighing-receptacle, the automatically-operating mechanism for opening and closing said cut-off in the weighing-receptacle, pivotal connections M, N, and S between the two cut-offs, and the locking-levers V and O and their tripping devices, substantially as described.

387,155. CORE-SHOCKER. EDWARD F. EVANS, Wamego, Kans. Filed Oct. 22, 1887. Serial No. 252,669. (No model.)

Claim.—1. The improvement in shock-compressors herein described, consisting of the main bar, the pointed prong projected laterally from the upper end of said bar, the guide-pulleys supported at the opposite sides of the upper end of said bar, and having a space between them, and the compressing-rope secured at one end to the main bar below the said separated guide-pulleys, substantially as set forth.

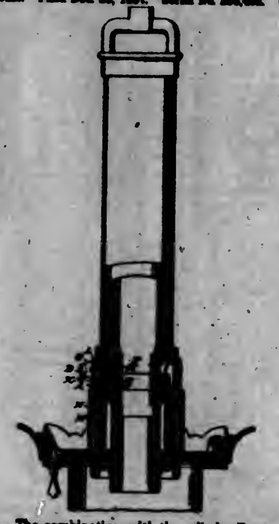


2. In a shock-compressor, the combination of a main bar, a prong projected laterally from the upper end thereof on the side next the shock, the compressing-rope secured at one end to the main bar, a guide-pulley for the compressing-rope arranged at the upper end of said bar on the side thereof away from the shock, and the blade F, secured adjacent to said guide-pulley, and having its edge next the shock blunted and its edge away from said shock sharpened, substantially as set forth.

3. In a shock-compressor, the combination of the main bar provided at its upper end with a guide for the compressing-rope, the compressing-rope secured to said bar and moveable over the guide, the blade secured to the bar near the upper end of the latter, and having its edge away from the shock sharpened and its edge next to the shock blunted and arranged adjacent to the guide for the compressing-rope, whereby to form a guide for the twine, and the twine-receptacle secured to the main bar below the blade, whereby the twine may be carried up behind the blade and be guided by the blunt edge of said blade next to the shock, substantially as set forth.

4. The combination, in a shock-compressor, of the main bar, the guide-pulleys supported at the opposite sides of the upper end of said bar, and having a space between them whereby the rope may be carried up between them over one pulley and brought back between them over the other pulley, the compressing-rope secured at one end to the main bar below the guide-pulleys, the blade secured to the bar adjacent to one of the guide-pulleys for the compressing-rope, and having its edge away from the shock sharpened and its edge next to the shock blunted or rounded, the prong projected laterally from the upper end of the main bar and pointed, whereby it may enter the shock, and the twine-receptacle secured to the main bar below the blade, substantially as described, and for the purposes specified.

5. The improved shock-compressor herein described, consisting of the main bar, the prong *a*, projecting laterally from the upper end thereof, the guide-pulleys arranged at the opposite sides of the upper end of said bar, the blade secured at the upper end of said bar adjacent to one of the guide-pulleys for the compressing-rope, and having its edge away from the shock sharpened and its edge next to the shock blunted or rounded, the windlass supported on the main bar below the guide-pulleys, the compressing-rope secured at one end to the windlass and suitably connected at its opposite end with the main bar, and the twine-receptacle, all substantially as and for the purposes specified.



387,156. LAMP-WICK ADJUSTER. CHARLES A. EVANS, Meriden, Conn., assignor to The Bradley & Hubbard Manufacturing Company, same place. Filed Feb. 20, 1888. Serial No. 264,602. (No model.)

Claim.—1. In a central-draft lamp, the combination of the inner tube, B, surrounding wick-holder D, adapted to carry the wick between it and the central tube, the said wick-holder constructed with an annular groove near its lower end, with a wick-adjuster consisting of an elastic segment-shaped clamp corresponding to and adapted to detachably embrace the said wick-holder within the said groove, and a rod extending into the flame outside the burner, downwardly below the said clamp, and thence turned upward to form an arm, I, the upper end of said arm attached to the said clamp, substantially as described, and whereby up-and-down movement of said rod will, through the said clamp and groove in the wick-holder, impart a corresponding movement to said wick-holder and the wick carried by said holder.

2. In a central-draft lamp, the combination of the inner tube, B, a wick-holder, D, surrounding said central tube and adapted to carry the wick, the said tube D constructed with an annular groove, E, combined with a wick-adjuster composed of the outwardly-curved rod F, extending into the flame outside the burner and to a point below said groove in the wick-holder, constructed with a torsion-spring at its lower end and with an arm extending upward therefrom to said groove in the wick-holder, and a segment-shaped elastic clamp attached to the upper end of said arm and adapted to embrace said wick-holder within the said groove, substantially as described.

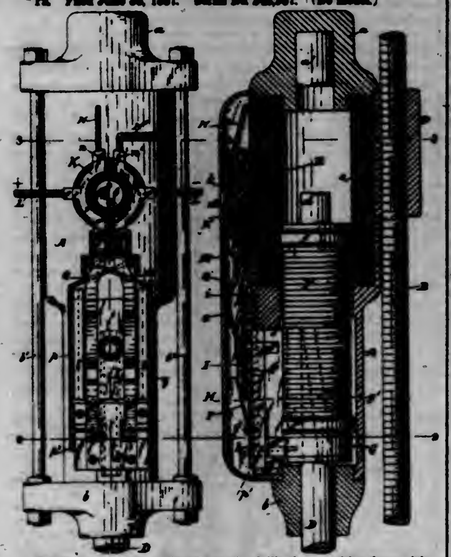
387,157. REGENERATIVE GAS-LAMP. JOHN FRANKLIN, Greenwood, Ohio. Filed Dec. 20, 1887. Serial No. 258,402. (No model.)

Claim.—The combination, with the cylinder F, external casing D, and flanged ring A, together forming the annular gas-chamber C, of the gas-tubes B, having their upper ends projecting up into said chamber, and the flanged annular deflector G, dividing said chamber into compartments and formed with notch-openings in its lower edge below the plane of the tops of the tubes B, substantially as set forth.

387,158. CLAY CRUSHER AND DRIER. ROBERT PFETZING, Rudelstadt, near Leipsic, Saxony, Germany. Filed June 27, 1887. Serial No. 242,603. (No model.) Patented in Germany Dec. 14, 1884, No. 32,633, and Aug. 22, 1885, No. 34,503, and in Austria-Hungary May 5, 1888, No. 4,347 and No. 32,732.

Claim.—1. A cylinder provided on its inside with longitudinal grates for comminuting the clay fed thereon, in combination with means for rotating said cylinder and grates, substantially as set forth.

2. In combination with a rotating cylinder and longitudinal grates, arranged as shown, a series of helical transporters D, arranged in the space between the grates and the wall of the cylinder, as shown, for the purpose set forth.



387,159. HYGIENIC BANDAGE. JONAS GROSSMANN, Berlin, Germany. Filed Feb. 4, 1888. Serial No. 263,068. (Model.)

Claim.—In a hygienic bandage, the combination of the ladies' open drawers having the front and rear patches *d* inserted between the legs and front and rear fastenings or hooks, *g g*, with the sustaining-bandage or holder *b*, detachably engaging said hooks, substantially as described.

887,159.

887,160. ELECTRIC ROCK-DRILL. GEORGE GOWN, White-Haven, Pa. Filed June 30, 1887. Serial No. 243,267. (No model.)

Claim.—1. In an electric rock-drill, the combination, with a solenoid-helix, of an armature provided with a coil, one of the said elements being stationary and having its current constant in one direction and the other element having its current reversible at each end of its stroke, a connection-piece at each end of the armature-coil, a metallic surface inside the solenoid-helix in constant contact with one of the said pieces, a strip of metal in constant contact with the other piece, and a commutator for reversing the current of the reciprocating element at each end of its stroke.

2. In an electric rock-drill, the combination, with a stationary solenoid-helix, of a reciprocating armature, a connection-piece at each end of the armature, a metallic surface inside the solenoid-helix in constant contact with one of the said pieces, a strip of metal in constant contact with the other said piece, and a commutator for reversing the direction of the current through the armature at each end of its stroke.

3. In an electric rock-drill, the combination of a single solenoid-helix, an armature provided with a coil working within the said helix for actuating the drill positively in both directions, insulated upper and lower rings connected to the ends of the said coil, a cylinder within the said helix and always in sliding contact with the upper ring, a metallic strip always in sliding contact with the lower ring, and a commutator for reversing the current through the armature-coil at each end of its stroke.

4. In an electric rock-drill, the combination of a single solenoid-helix, an armature provided with a coil working within the said helix for actuating the drill positively in both directions, the insulated rings *f* and *f'*, the cylinder *c* in contact with ring *f*, the metallic strip H in contact with ring *f'*, the projection *d*, connected to the armature, and a commutator reciprocating between electric contact-brushes and provided with lugs for the said projection to strike against, whereby the current through the armature-coil may be automatically reversed at each end of its stroke.

5. In an electric rock-drill, the combination of a solenoid-helix and an armature for reciprocating the drill, a switch connecting the terminals of the main wires with the actuating mechanism of the drill, and one or more casings wholly inclosing the said actuating mechanism and the switch, protecting them from wet, and provided with a small aperture, through which the said switch may be operated.

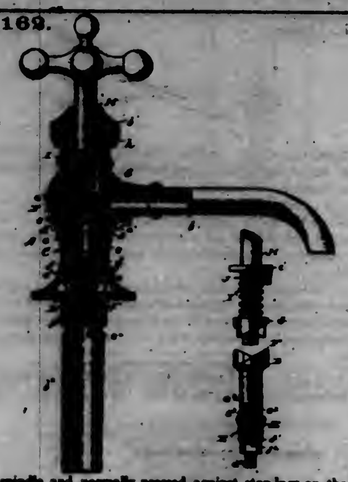
6. In an electric rock-drill, the combination of the solenoid-helix provided with wires N and N', consisting it continuously with the main-circuit wires, the armature provided with the coil and with the rings *f* and *f'* in contact with the ends of the coil, the cylinder *c* and the metallic strip H, always in contact with the rings *f* and *f'*, respectively, the contact-brushes P P' and Q Q', connected to the strip and to the cylinder, substantially as set forth, and the commutator connected to the main-circuit wires and reciprocated between the said brushes by the armature, whereby the current passing through the armature-coil may be automatically reversed at each end of its stroke.

7. In an electric rock-drill, the combination of the solenoid-helix provided with the wires N and N', connecting it continuously with the main-circuit wires, the armature provided with the coil and with the rings *f* and *f'* in contact with the ends of the coil, the cylinder *c*, and the metallic strip H, always in contact with the rings *f* and *f'*, respectively, the contact-brushes P P' and Q Q', connected to the strip and to the cylinder, substantially as set forth, the brushes O and O', connected with the main circuit, the commutator in constant sliding contact with the brushes O and O' and reciprocating between brushes P P' and Q Q', and a sliding bar provided with lugs and actuated by a projection on the armature-spindle for carrying the commutator, whereby the said commutator may be reciprocated and the current passing through the armature-coil reversed at each end of its stroke.

8. In an electric rock-drill, the combination of an indexing-cone provided with the cheating groove *g'*, a solenoid supported in the cone, a reciprocating armature provided with a spindle projecting from the cone for actuating the drill, an internal ratchet-wheel reciprocating with the armature and provided with a projection engaging with said groove *g'*, and a spring pawl pivoted to the spindle and engaging with the ratchet-wheel, whereby the drill will be revolved, substantially as set forth.

887,161. VALVE-LOCKING DEVICE. JOHN S. HALL, New York, N. Y. Filed Sept. 15, 1886. Serial No. 213,669. (No model.) Patented in France Jan. 6, 1887, No. 181,157; in Belgium Jan. 26, 1887, No. 74,026; in England Jan. 26, 1887, No. 1,291; in Austro-Hungary Feb. 24, 1887, and in Germany Mar. 5, 1887, No. 41,167.

Claim.—1. In a valve mechanism, the combination, with the valve-stem, of a threaded tube on the valve-chamber, through which said stem extends, a locking-key journaled loosely on said tube and adapted to reach to and detachably engage said stem, and a lock-nut working on said tube and serving to lock the key in any desired position relatively to said stem, substantially as and for the purpose specified.



2. In a valve mechanism, the combination, with the valve-stem, of a threaded tube on the valve-chamber, through which said valve-stem extends, a leaf-spring locking-key journaled loosely on said tube and adapted to reach to and detachably engage said stem, and a lock-nut working on said tube and serving to lock the key in any desired position relatively to said stem, substantially as and for the purpose set forth.

887,162. FAUCET. THOMAS HAYDEN, Kansas City, Mo., assignor of one-half to Richard T. Crumbo, New York, N. Y. Filed Aug. 5, 1887. Serial No. 246,194. (No model.)

Claim.—1. In a faucet, the combination, with a valve-shell and an axially-turning valve-stem having a cam, of a reciprocating valve, also having a cam and connected to said shell, to be thereby limited to endwise movement therein and guided by the shell, so that the pressure of the water on the valve normally elevates the same and causes its cam to engage the cam of the spindle, and a torsional spring connected to the spindle to hold and return the same to a position in which the two cams interlock when the spindle is released, substantially as described.

2. In a faucet, the combination, with a valve-shell and an axially-turning spindle having a cam, of a reciprocating valve having a loose pin-and-slot connection with the valve-shell and a cam on its upper end, a torsional spring connected to the spindle, and a stop-pin fixed to the spindle and normally pressed against stop-lugs on the valve-shell by the tension of the spring, to thereby hold the spindle in such position as to cause the two cams to interlock when the valve is elevated by the pressure of the water thereon, substantially as described.

887,163.

3. In a faucet, the combination, with a fixed valve-shell, of a reciprocating valve having a loose pin-and-slot connection with the shell to guide the valve in a direct line and permit it to be elevated solely by the pressure of water thereon, said valve having a longitudinal passage which extends centrally through the cam on the upper extremity thereof, and with lateral inlet-ports which open into the lower end of said passage, an axially-turning spindle having a cam, a torsional spring connected to the spindle, and a pin fixed to the spindle to limit the axial movement of the cams, substantially as described.

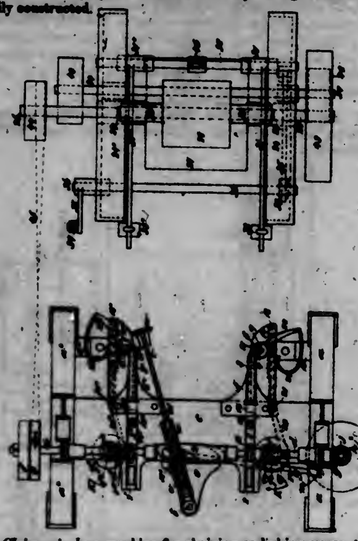
4. In a faucet, the combination, with a valve-shell, of a hollow valve having a pin-and-slot connection with the shell, an axially-turning spindle, and a torsional spring connected to the spindle, the meeting ends of the valve and spindle having cams located in the horizontal plane of the outlet-spout of the faucet, whereby, when the cams are separated to depress the valve, the water flowing through the latter escapes through the spaces between the opposing edges of the cams, substantially as described.

887,168. STOVE OR FURNACE GRATE. CHARLES B. HOWARD, Syracuse, N. Y. Filed Jan. 19, 1888. Serial No. 261,313. (No model.)

Claim.—1. The combination, with the ash-pit of a stove or furnace, of a spherical grate consisting of two perforated concave-convex shells connected together and provided with trunnions, and having a circumferential slot for the removal of cinders, substantially as specified.

2. The combination, with the ash-pit of a stove or furnace and the ring *r*, adapted to rest in bearings formed in the upper edge of the ash-pit, of the spherical grate consisting of two perforated concave-convex shells connected together and having a circumferential slot for the removal of cinders, one of said shells provided with trunnions adapted to rest in bearings made in the ring *r*, substantially as specified.

887,164. STRAIGHT-WAY VALVE. ROGER HUNTER, Waterford, N. Y. Filed Apr. 2, 1888. Serial No. 269,462. (No model.)

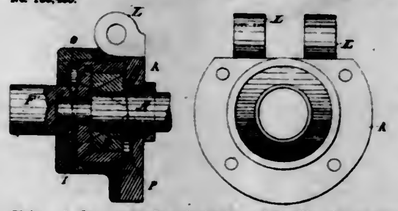


Claim.—The combination of the T-shaped valve-casing having the vertical plane guide and binding faces C at the inner ends of its lateral arms B, the plunger H, threaded internally and provided with the transverse opening I in line with the arms B, and the vertical slots K at right angles thereto, the disks T, provided on their inner faces with bosses that enter the opposite ends of the opening I, and with their outer faces adapted to close against the faces C, the cam-blocks M, with their stems resting in the slots K, with their ends bearing on the lower interior surfaces of the casing and their opposite inclined or beveled edges in the said slots, the pair of blocks F in the openings or slots K on each side of the inclined surfaces of the cam-blocks M, with their vertical edges resting against the inner surfaces of the disks T on the sides of the bosses thereof and their inclined edges against those of the cam-blocks, and the valve-stem F, with its threaded portion engaging within the plunger and moving the latter vertically, substantially as specified.

887,164.

887,165. MACHINE FOR LINKING WARPS. WILLIAM HOUGH, Rochdale, County of Lancaster, England. Filed Dec. 28, 1887. Serial No. 259,202. (No model.) Patented in England Oct. 24, 1888, No. 5,809.

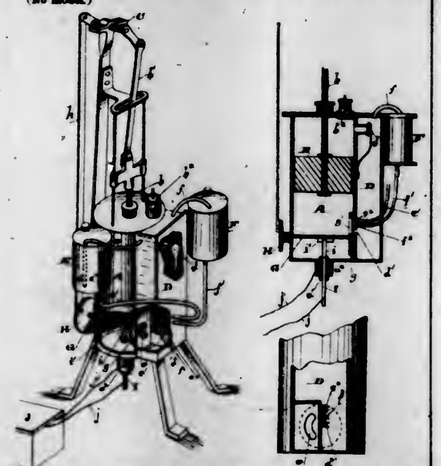
Brief.—The invention consists in the improved mechanism for double-linking warps, the object being to secure high speed with great certainty and regularity, and at the same time to subject the yarn to less strain and injury than is usual in warp-linking machines as ordinarily constructed.



Claim.—1. In a machine for chaining or linking warps, the combination, with the stationary hollow hooks 2 2°, the hooks 4 4°, and means, substantially as described, for reciprocating said hooks, the hooks 23 23°, and means, substantially as described, for operating the same, of a warp-guiding trumpet, *w*, and means, substantially as described, for imparting the combined lateral and vertical motions to said trumpet, as set forth.

2. In a machine for chaining or linking warps, the combination, with the stationary hollow hooks 2 2°, the hooks 4 4°, and the longitudinally-sliding bars 3 3°, carrying the same, the cams 12 12°, and springs 16 16°, for actuating said bars, the hooks 23 23°, the racks 18 18°, and means, substantially as described, for operating said racks and pinions 17 17° for oscillating the said hooks, of the warp-guiding trumpet *w*, and means, substantially as herein described, for imparting the combined lateral and horizontal movements to said trumpet, as set forth.

3. In a machine for chaining or linking warps, the combination, with the stationary hollow hooks 2 2°, the hooks 4 4°, and means, substantially as described, for reciprocating said hooks, the hooks 23 23°, and means, substantially as described, for operating the same, of a warp-guiding trumpet, *w*, the arm *v*, carrying said trumpet, the arm *u*, to which arm *v* is jointed, the vertical shaft *t*, carrying the arm *v*, means, substantially as described, for vibrating the shaft *t*, the cam *z*, and means, substantially as described, for revolving the same, all substantially as herein set forth.



387,166. VELOCIPEDE. ALFRED JOHANSSON, Helsingfors, Finland, Russia. Filed Mar. 31, 1888. Serial No. 269,081. (No model.) Patented in Sweden Aug. 16, 1887. No. 1,150, and in France Mar. 30, 1888, No. 190,480.

Claim.—1. In a center for velocipedes and the like, the combination, with the wheel-shaft provided with a cylindrical collar having a helical spline-groove, and the crank-shaft provided with a socket embracing said collar, and said socket also provided with a spline-groove, of a pair of integral splines longer than said collar and occupying said spline-grooves, and two like stationary inclined cams arranged, as shown, with respect to the ends of said splines, whereby when the shafts are rotated said cams impart to said splines an alternating reciprocating movement in their respective grooves.

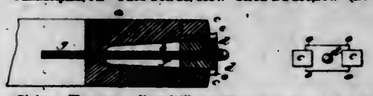
2. The combination, with the wheel-shaft, as A, provided with a cylindrical collar, B, having in its periphery a helical spline-groove, C, and the crank-shaft provided with a socket, F, which embraces the collar B, and which is also provided with a helical spline-groove, G, of the pair of integral helical splines D and E, occupying said spline-grooves, respectively, and the inclosing-box provided with cams, as described, for actuating said splines.

387,167. EXPLOSIVE ENGINE. LEOPOLD JULIG and EDWARD EWALD, San Francisco, Cal. Filed July 27, 1887. Serial No. 245,467. (No model.)

Claim.—In a motor, a valved cylinder, a piston reciprocating therein, and a crank-shaft with which the piston is connected, in combination with an air-chamber communicating with the cylinder in front of the piston, said communication being controlled by a valve and with the cylinder behind the piston, a vessel containing oil communicating with the air-chamber and the cylinder behind the piston, a vessel containing a lubricant communicating with the air-chamber and with the cylinder behind the piston, an exhaust from the cylinder behind the piston, a rotary ported valve within the cylinder controlling the communication of the air-chamber, the oil-vessel, and the lubricant-vessel with the cylinder, and also controlling the exhaust, a shaft by which the valve is rotated and a connection between the crank-shaft and said shaft, and an electrical sparking apparatus comprising a contact-spring within the cylinder, a rib or piece on the rotating valve-shaft coming in contact with the spring, and an electric circuit including said shaft and spring, all arranged and adapted to operate substantially as herein described.

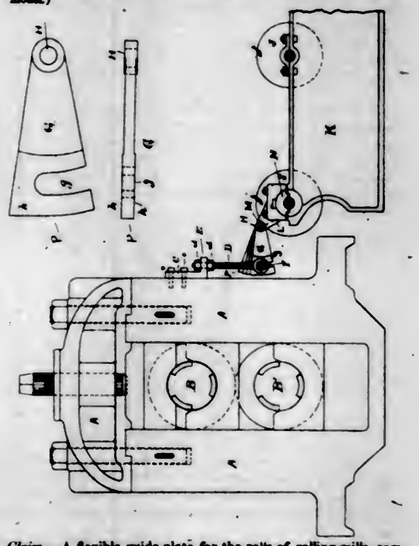
387,168. ROTATING TROLLING DEVICE FOR SHIPS' LOGS. OSCAR KOSTEL, San Francisco, Cal. Filed Dec. 12, 1887. Serial No. 257,616. (No model.)

387,168.



Claim.—1. A rotary trolling device for ships' logs, consisting of a twisted blade having ribs on opposite sides along its longitudinal margin, substantially as described.

2. A rotating trolling device for ships' logs, consisting of a plate twisted and having its longitudinal margins bent in reverse directions, forming curved flanges, and a wire secured on opposite sides of the plate along the longitudinal edges by said flanges, substantially as described.

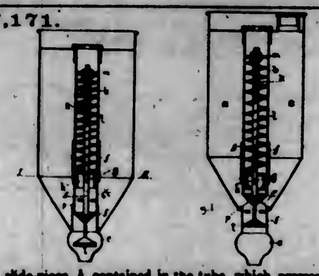


3. In a rotating trolling device for ships' logs, the twisted blade or rotator, bound on its longitudinal margins by a wire having its bend at and beyond the inner end of the blade, and provided with an eye or loop within said bent portion of the wire, essentially as shown and described.

387,169. EXPANSION DRILL OR REAMER. EDWARD A. LILLY, Philadelphia, Pa. Filed Dec. 26, 1887. Serial No. 259,267. (No model.)

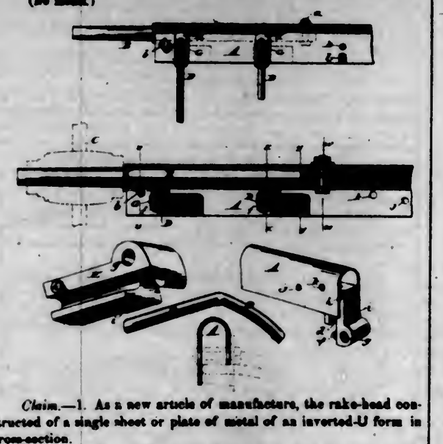
Claim.—The expanding-drill *a*, with wedge-shaped opening *b*, in combination with wedge *d*, provided with flanges *c c c c*, and the operating-screw *f*, substantially as shown and described.

387,170. FLEXIBLE GUIDE FOR ROLLING-MILLS. CHARLES F. LLOYD, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed June 12, 1888. Serial No. 276,514. (No model.)



Claim.—A flexible guide-plate, for the rolls of rolling-mills, composed of bars or plates combined together so as to flex in different planes, whereby irregular shapes of metal are guided to enter irregular-shaped roll-passes, substantially as set forth.

387,171. CARTRIDGE-LOADER. ADOLPH LUTZ, Mannheim, Baden, Germany. Filed Nov. 12, 1886. Serial No. 218,726. (No model.) Patented in Germany Feb. 18, 1886, No. 36,686, and in France June 2, 1886, No. 169,768.



Claim.—An apparatus for filling powder into cartridge-shells, consisting in the combination of a vessel, *a*, with a tube, *b*, fastened in it and intended to hold a bolt, *k*, round which a spiral spring, *l*, winds, the said bolt being provided with a valve or locking-piston, *i*, and a shell, *f*, made to slide over the tube and provided with lateral apertures *c* and funnel *e*, for the purpose of measuring the quantity of gunpowder for the cartridge-shell about to be filled, and, further, in combination

387,171.

with a slide-piece, A, contained in the tube, which presses the spring together, all for the purpose of filling a cartridge-shell automatously by pressing said apparatus on the hole of the cartridge-shell, substantially as described.

387,172. HORSE HAY-RAKE. EDWARD P. LYMAN, Davenport, Iowa. Filed Oct. 1, 1884. Renewed Nov. 21, 1887. Serial No. 255,794. (No model.)

Claim.—1. As a new article of manufacture, the rake-head constructed of a single sheet or plate of metal of an inverted-U form in cross-section.

2. In a rake-head, the combination of the metal axle of an inverted-U form in cross-section with the journals secured to and extending beyond its ends, substantially as described, to receive the ground-wheels.

3. In combination with the rake-teeth attached thereto, substantially as described, the rake head or axle consisting of the body portion of an inverted-U form in cross-section, and journals B, seated at one end within the axle and confined in place by bolts *a* and *b*, substantially as described.

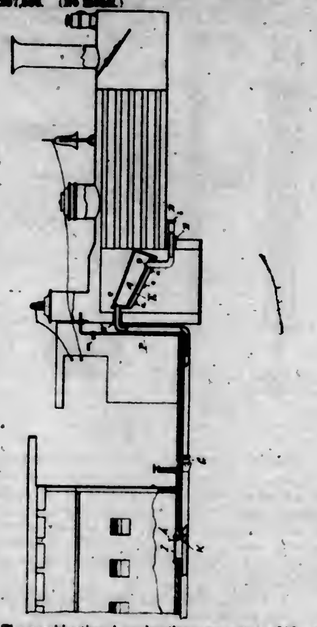
4. In a horse-rake, the combination of a ⊓-shaped axle, blocks secured within said axle, and rake-teeth having their forward ends seated in said blocks, substantially as described and shown.

5. The combination, with the ⊓-shaped axle, the tooth-retaining block E, provided with stud A, and the fastening-bolt inserted through the block and axle, substantially as described.

6. In combination with a series of rake-teeth attached thereto, substantially as described, the axle having its body portion of an inverted-U form in cross-section, journals B, seated at one end within the axle, and transverse bolts *b*, extended through the axle and acting to contract the same upon the journal.

7. The axle of an inverted-U form in cross-section, provided with holes *b* and vertical notches *l*, whereby it is adapted for use in a horse-rake, as described.

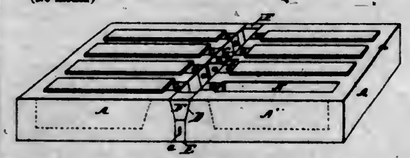
8. In combination with the hollow axle and the rake-tooth having its forward end bent at a right angle to form a journal or pivot, a grooved perforated block, E, seated within the axle and embracing the end of the tooth, and a bolt applied to confine the block in place, substantially as described.



9. The axle of an inverted-U form in cross-section, in combination with the rake-tooth having a laterally-bent end or journal, and the grooved block embracing said journal.

10. The grooved block E, provided with the stud A and reduced in thickness at the end bearing said stud, as and for the purpose described.

11. In combination with the axle of an inverted-U form in cross-section, provided with recesses *j* and holes *b*, the tooth-retaining block E, provided with stud A, and the fastening-bolt G, applied as described and shown.



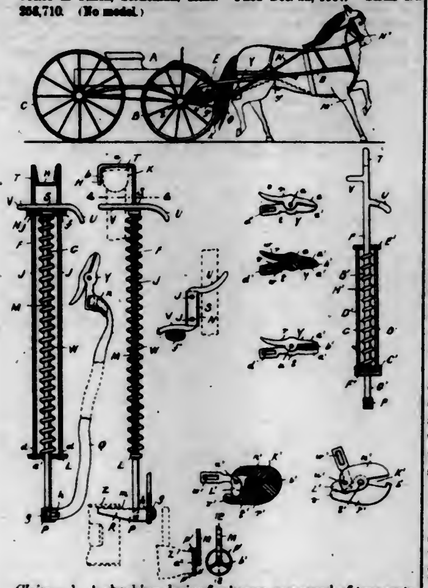
12. In combination with the hollow axle, the rake-teeth, and the tooth-retaining block within the axle, the vertical movable plate H, and the transverse bolt G, applied as described, for the double purpose of retaining the block in position and of covering the plate.

387,173. HEATING RAILWAY-CARS. WILLIAM A. LYON and SYLVESTER L. MORSE, Danbury, Conn., assignors of one-half to James S. Taylor and Abraham T. Glover, same place. Filed Dec. 10, 1887. Serial No. 257,866. (No model.)

Claim.—The combination, in a heating apparatus, of the metal chamber A, having underneath protective fire-brick, E, and resting upon lugs *a* on the inside of the fire-box, the cold-blast pipe B and distributing-pipe C, screwed into and through sleeves D D', said sleeves screwed into and through the shells of the outer legs of the boiler, and the steam-pipe P, leading from the dome and connecting with the distributing-pipe leading to the car, substantially as shown and described.

387,174. INGOT-MOLD. GEORGE F. MCCLEANE and WILLIAM M. FARRER, Jr., Pittsburg, Pa. Filed May 24, 1888. Serial No. 274,908. (No model.)

Claim.—1. In an ingot-mold having an open top and end, a removable end piece composed of fire-brick and provided with a gate or passage for molten metal, substantially as described.



2. The combination, with an ingot-mold consisting of two separate frames, each frame containing two or more molds and having inclined faces, whereby said frames when placed together form a single sprue having inclined sides, of a removable bar and end bricks situated between the two frames, substantially as described.

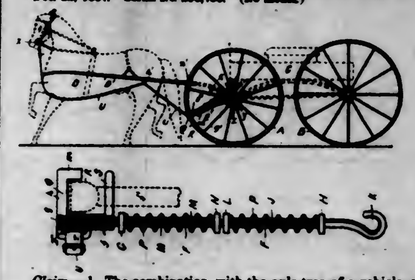
3. The combination, with an ingot-mold consisting of independent frames having a single sprue between them, of a removable bottom and end pieces for said sprue, said bottom consisting of a rod or bar of iron, substantially as described.

4. An ingot-mold consisting of the frames A A', having inclined

faces D, the removable bar E, and bricks F F, all constructed and combined substantially as described.

387,175. HORSE-CHECKING DEVICE. DEXTER S. MUNSON and CYRUS R. PRICE, Stoneham, Mass. Filed Dec. 22, 1887. Serial No. 258,710. (No model.)

Claim.—1. A checking device for horses, composed of two parts, one an arm or rod having one end suitably constructed to be applied over the rim of a wheel and provided with two laterally oppositely-projecting arms, U V, and connected by sliding joints to the other part, which consists of a rod or arm adapted to be attached to the hub of the wheel, and provided with a strap or rein adapted to be attached to the driving-reins or the bit or bridle of the horse, for the purpose specified.



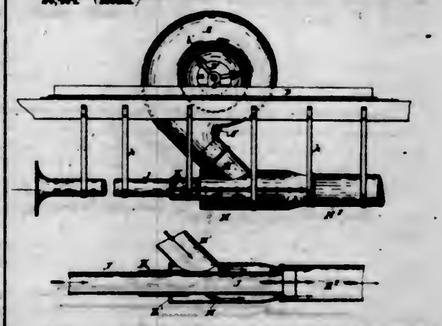
2. A checking device for horses, composed of two parts, one an arm or rod having one end suitably constructed to be applied over the rim of a wheel and provided with two laterally oppositely-projecting arms, U V, and connected by sliding joints to the other part, which consists of a rod or arm having a laterally-projecting arm, R, for attaching it to the hub of the wheel, and provided with a strap or rein adapted to be attached to the driving-reins or to the bit or bridle of the horse, for the purpose specified.

3. A device for checking horses, composed of two parts, one an arm or rod having one end suitably constructed to be applied over the rim or tire of a wheel, and provided with two laterally oppositely-projecting arms, U V, and connected by sliding joints controlled by a spring to the other part, which consists of a rod or arm having a laterally-projecting arm, R, for attachment to the hub of the wheel, and adapted to receive the end of a strap or rein having a clamp for its connection with the driving-reins or bit or bridle of the horse, for the purpose specified.

4. A device for checking horses, composed of two parts, F G, one a wire folded upon itself, and having a clamp end, T, for attachment over the rim of a wheel and carrying two laterally oppositely-projecting arms, U V, its two ends secured to a cross-bar, L, through which cross bar or rod or arm of the part G is adapted to move back and forth, one of its ends adapted to be secured to the hub of the wheel, and having a strap, &c., secured thereto, and its other end attached to a cross-bar, N, adapted to slide on the parallel portions of the part F, and having a spiral spring, W, substantially as and for the purpose specified.

5. A checking device for horses, composed of two parts, one an arm or rod having one end suitably constructed to be applied over the rim of a wheel, and provided with two laterally oppositely-projecting arms, U V, and connected by sliding joints to the other part, which consists of a rod or arm adapted to be attached to the hub of the wheel, and provided with a strap or rein having secured thereto a clamp, Y, formed of two parts, *r* and *l*, pivoted to each other and provided with a spring, *v*, for attachment to the driving-reins or bit or bridle of the horse, for the purpose specified.

387,176. HORSE-CHECKING DEVICE. DEXTER S. MUNSON, Stoneham, Mass., assignor of one-half to Cyrus R. Price, same place. Filed Dec. 22, 1887. Serial No. 258,720. (No model.)



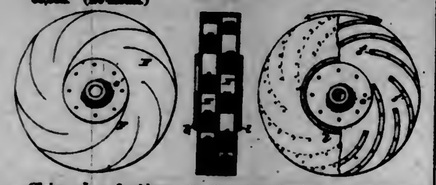
Claim.—1. The combination, with the axle-tree of a vehicle, of a check device formed of two parts adapted to slide from and toward each other on guiding-rods F F, and controlled by springs P, one part adapted to be secured to the axle-tree and the other part to be attached to the rim of the wheel, and provided with an arm, S, and a check-rein adapted to be secured to the bridle or bit of the horse or driving-reins, for the purpose specified.

2. The combination, with the axle-tree of the vehicle, of a check device formed of two parts adapted to slide from and toward each other on guiding-rods F F, and controlled by springs P, one part adapted to be secured to the axle-tree and the other part to be attached to the rim of the wheel, and provided with an arm, S, and a check-rein adapted to be secured to the middle portion of a short strap secured to the bridle or bit of the horse by its two ends.

3. A clasp or clip, Q, adapted to be attached and secured to a wheel made in one piece to partially surround the rim or tire of the wheel, and having a laterally-projecting arm, S, to engage with a spoke of the wheel, and connected to the axle-tree and to a check-rein adapted to be secured to the bridle or bit of the horse, for the purpose specified.

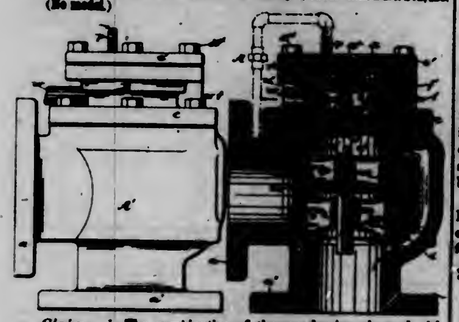
4. A fastening device adapted to be detachably secured to the axle-tree, consisting of the two parts A' B', one, A', provided with an offset-arm, *b'*, having an eye, *d'*, and adapted to slide within the other part, B', and connected and secured together by a screw-bolt, for the purpose specified.

387,177. COMBINED FAN-BLOWER AND INDUCTION APPARATUS. FRANCIS MURPHY, Chicago, Ill. Filed Feb. 18, 1881. Serial No. 26,464. (Model.)



Claim.—1. An air-blast apparatus for conveying light materials by the force of the blast, consisting of the induction-tube J and discharge-tube H², which together provide a passage adapted for the direct and free conveyance of materials, such as set forth, and a rotary fan-blower connected with the passage of the discharge-tube by an air-blast passage having an annular outlet around the end of the induction-tube which opens into the discharge-tube, substantially as described.

2. In an air-blast apparatus for conveying light materials, such as set forth, the combination of the discharge-tube H H², closed at one end, the induction-tube J, entering the closed end of the discharge-tube, and the rotary fan-blower having a hollow arm, H', extended from its casing and connected with the rear portion, H, of the discharge-tube, substantially as described.



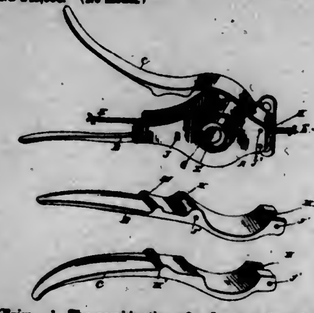
3. The combination, substantially as herein described, of a rotary fan-wheel blower having its casing capable of rotary adjustment about the axis of the fan-wheel, and a discharge-tube containing a portion of its length an induction-tube, said tubes being supported from the fan-wheel casing by a hollow arm, through which a blast from the blower is utilized as a means for forcing a current through the discharge-tube and inducing a current through the induction-tube, for the purpose set forth.

387,178. FAN-BLOWER AND INDUCTION APPARATUS. FRANCIS MURPHY, Chicago, Ill. Original application filed Feb. 7, 1881, Serial No. 26,464. Divided and this application filed Jan. 31, 1883. Serial No. 83,022. (No model.)

Claim.—In a fan-blower, the fan-wheel having an annular series of curved vanes subdivided into sub-sets of vanes, with the vane of each sub-set which stands first relatively to the direction of rotation of the wheel extended from a central opening of the wheel to the periphery of the latter, and the succeeding vanes of each of said sub-sets successively decreasing in length, so as to place their inner ends at points successively increasing in distance from the central opening of the fan-wheel, substantially in the manner and for the purpose described.

387,179. AUTOMATIC FIRE-EXTINGUISHING APPARATUS. ANDREW F. HAGLE, Chicago, Ill. Filed May 1, 1888. Serial No. 272,492. (No model.)

Claim.—1. The combination of the supply-pipe charged with water under pressure and the distributing-pipe charged with air under a less pressure, with a double-headed valve separating them normally, one head of the valve closing the supply-pipe and the other head closing a chamber communicating through a restricted by-pass with the supply-pipe, a waste-valve closing a waste-outlet from said chamber, and a diaphragm holding said waste-valve closed against the water-pressure, the said diaphragm being itself held by the light air-pressure, substantially as and for the purpose set forth.

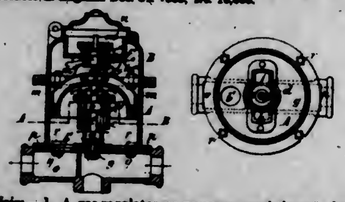


2. The combination of the supply-pipe charged with water under pressure and the distributing-pipe charged with air under a less pressure, with a differential valve separating them normally, the smaller head of the valve closing the supply-pipe and the other head closing a chamber communicating through a restricted by-pass with the supply-pipe, a waste-valve closing a waste-outlet from said chamber, and a diaphragm holding said waste-valve closed against the water-pressure, the said diaphragm being held by the light air-pressure, substantially as and for the purpose set forth.

3. The combination of the supply-pipe charged with water under pressure and the distributing-pipe charged with air under a less pressure, with a double-headed valve separating them normally, one head of the valve closing the supply-pipe and the other head closing a chamber communicating through a restricted by-pass with the supply-pipe, a waste-valve closing a waste-outlet from said chamber, and a diaphragm holding said waste-valve closed against the water-pressure, the said diaphragm being held by the light air-pressure, and an alarm mechanism connected with the waste-valve, substantially as and for the purpose set forth.

4. The combination of the supply and distributing pipes with the double main valve, the restricted by-pass around the said valve, whereby the water is allowed to act upon both faces of the valve, the diaphragm, exposed on one face to the light air-pressure of the distributing-pipe and on the other side to the atmospheric pressure, the waste-valve closing the waste-passage from one side of the main valve, the said waste-valve being normally held closed against the water-pressure by the diaphragm, and the said by-pass leading into the waste side of the valve-chamber just above the main valve, so as to be shut off by the said main valve during the first part of its movement.

5. The combination of the supply and distributing pipes with the double main valve, the restricted by-pass around the said valve, whereby the water is allowed to act upon both faces of the valve, the diaphragm exposed on one face to the light air-pressure of the distributing-pipe and on the other side to the atmospheric pressure, the waste-valve closing the waste-passage from one side of the main valve, the said waste-valve being normally held closed against the water-pressure by the diaphragm, and the said waste-valve being adapted to be held in its open position by the main valve when the latter is fully open.



387,180. FIRE-ESCAPE. JOHN H. O'HEE, Poughkeepsie, N. Y., assignor to Dorsey Neville, same place. Filed July 22, 1887. Serial No. 245,093. (No model.)

Claim.—1. The combination of a frame, a fixed hollow cylinder in the middle of the frame and adapted to have the rope coil around it, and two handles pivoted to the frame on opposite sides of the cylinder and adapted to be pressed against the rope-coil on opposite sides of the cylinder when the handles of the levers are grasped in the hand and pressed toward each other, substantially as and for the purpose herein specified.

2. In combination with the frame A and cylinder G, the handles B C, provided with the grooves or notches H' H', adapted to guide the coiled rope in proper position around the cylinder, substantially as and for the purpose herein set forth.

387,181. GAS REGULATOR OR GOVERNOR. GEORGE FOSTER, London, England. Filed Oct. 14, 1887. Serial No. 252,252. (No model.) Patented in England Dec. 31, 1886, No. 16,668.

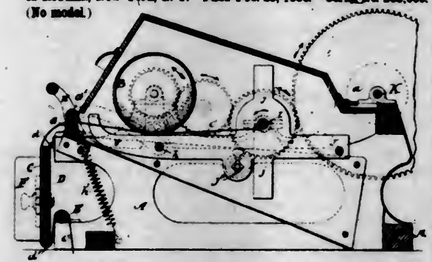
Claim.—1. A gas regulator or governor, consisting of a base having inlet and outlet pipes, an inner shell detachably secured to said base, containing one or more valves, and an outer shell consisting of two parts detachably secured together, the lower of which is provided with a dome-shaped partition, the whole of said outer shell being detachably secured to said base, substantially as described.

2. In a gas regulator or governor, the combination, with a base provided with inlet and outlet pipes, of an inner shell provided with two valve-seats and two guides secured to said base, an outer shell secured to said base, and a rod mounted in the guides in said inner shell and carrying two valves, substantially as described.

3. In a gas regulator or governor, the combination, with a base provided with inlet and outlet pipes, of an inner shell secured to said base and provided with two valve-seats and two or more valve-rod guides, an outer shell provided with a valve-seat and secured to said base, and a valve-rod mounted in the guides in said inner shell and having valves for engaging the valve-seat in the inner shell and a valve for engaging the valve-seat in the outer shell, substantially as described.

4. In a gas regulator or governor, the combination, with a base provided with inlet and outlet pipes, of an inner shell secured to said base and having valve-rod guides, an outer shell attached to said base and having a dome-shaped partition provided with a valve-seat, a portion of the said outer shell above said partition being removably se-

cured to the lower portion, a valve-rod mounted in the guides in the inner shell, and a diaphragm and valve attached to said rod above the partition of the outer shell, substantially as described.



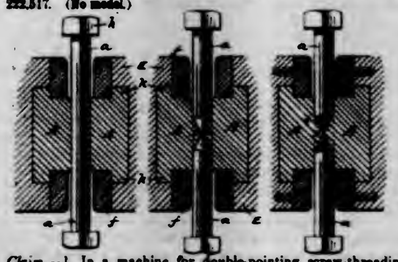
387,182. BAIL-EAR. THOMAS F. REILLY, New York, N. Y., assignor of one-half to Richard S. Reilley, same place. Filed Feb. 18, 1888. Serial No. 264,109. (No model.)

Claim.—1. The combination, with a vessel and a bail therefor, of ears, each of which is made in one integral piece, and comprising a base portion fitted to the side of said vessel and provided with rivet-holes, and an opening near its upper end, with a loop-piece extending vertically across the same, substantially as described.

2. A bucket-ear made in one integral piece, having a base portion to fit the side of a bucket, and an opening near its upper end, with a loop-piece extending vertically across the same, substantially as described.

387,183. MACHINE FOR MAKING PLASTER BANDAGES. JAMES R. RODMAN, New York, N. Y. Filed Feb. 23, 1888. Serial No. 265,009. (No model.)

Claim.—1. The combination, with the rotary perforated cylinder B, of the winding-up spindle I, the rolls G G' in front of the cylinder, and the guides J J, extending from the rolls to the spindle for guiding the ribbon or cloth, substantially as shown and described.



2. The combination, with the rotary perforated cylinder B, of the winding-up spindle I, the rolls G G', the guides J J, extending from the rolls to and beyond the spindle for guiding the cloth or ribbon, and means, substantially as described, for adjusting said guides toward and from each other, substantially as shown and described.

3. The combination, with the rotary perforated cylinder B, of the winding-up spindle I, the rolls G G', the roll E, and the smoothing-plate D between said rolls and engaging the cloth or ribbon, substantially as shown and described.

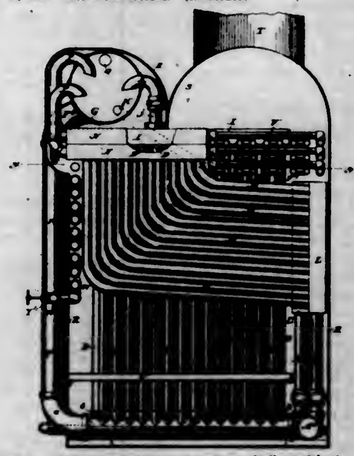
4. The combination, with the rotary perforated cylinder B, of the winding-up spindle I, the rolls G G', the roll E, the smoothing-plate D between said rolls, and the adjustable guides F F on said plate, substantially as shown and described.

5. The combination, with the rotary perforated cylinder B, of the winding-up spindle I, the rolls G G', the roll E, the hinged smoothing-plate D between said rolls, and the guides F F on said plate, substantially as shown and described.

387,184. DIE FOR FORMING AND THREADING THE POINTS OF SCREWS. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Dec. 24, 1886. Serial No. 222,517. (No model.)

Claim.—1. In a machine for double-pointing, screw-threading, and transversely dividing a rod of metal, the combination of a pair of oppositely-mounted dies, each having an ungrooved A-shaped rib projecting from its face, the same extending gradually and rearwardly from a point to a height substantially equal to one-half the diameter of the rod to be acted upon, and terminating in a grooved A-shaped portion having uniform angles and equal sides, adapted to simultaneously impress a screw-thread into the contiguous cone-shaped sections of the rod after the ungrooved portion of the ribs have completed their work, and mechanism for operating the dies, substantially as hereinbefore described.

2. The combination, with oppositely-arranged dies, each having a reducing portion, D, and a screw-thread-forming portion, D', secured to or formed thereon, of mechanism for reciprocating or operating said dies, and a frame in which the dies are mounted to travel, substantially as shown and hereinbefore described.

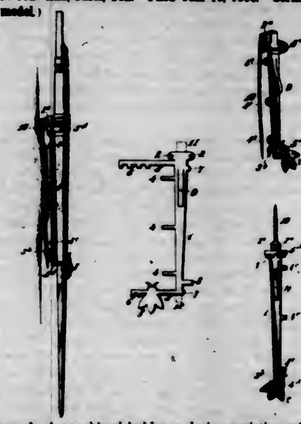


387,185. CHURN. ELI A. RUDASILL and NOAH R. LOVE, Shelby, N. C. Filed Jan. 20, 1888. Serial No. 261,573. (No model.)

Claim.—1. The combination, with an arched standard having a dasher therein and a vertical arm extending above the same, with a wheel-frame on the upper end of the arm, having stops on opposite sides of its front face, of a sector-rack meshing with a pinion on the dasher, having upwardly-extending arms united and pivoted to the wheel-frame, the arms of the sector-rack extending above their pivotal point and provided with a segment resting against the upper front face, and a curved rib on their inner side resting against the lower front face of the wheel-frame, the end of said segment and rib coming in contact with said stops at the same time, one above and the other below, as set forth.

2. The combination, with a standard having a dasher therein and a vertical arm on one side thereof extending above the same, with a wheel-frame on the upper end of the arm, having stops on opposite sides of its front face on the same plane with each other, of an adjustable guide-wheel secured to the standard resting against a rack-bar having upwardly-extending arms united and pivoted at the top of the vertical arm and in the center of the wheel-frame, said rack-bar arms extending above their pivotal point and diverging from each other to the periphery of the wheel-frame, and having their upper ends united by a segment resting against the upper front face, and a curved rib on their inner side resting against the lower front face of said frame, the end of said sector and rib coming in contact with said stops on the frame at the same time, one above and the other below, substantially as and for the purpose set forth.

387,186. STEAM-BOILER. CHARLES L. SEABURY, New York, N. Y., assignor to the Gas Engine and Power Company, same place. Filed Nov. 18, 1887. Serial No. 255,461. (No model.)



Claim.—1. The combination, in a steam-boiler, of the basal manifolds A A' A², connected and arranged to form a rectangle and inclose the furnace, lateral manifolds I I, placed, respectively, above the two lateral basal manifolds A A' and parallel therewith, interposed vertical

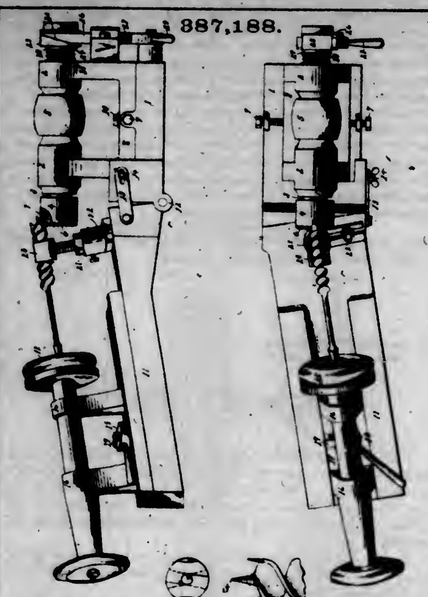
tubes D D, connecting said upper and lower lateral manifolds, a series of upright manifolds, L L, mounted vertically above the rear basal manifold, A², vertical tubes D' D', connecting the upright manifolds severally with the rear basal manifold, A², a series of horizontal manifolds, N N, placed between the two upper lateral manifolds, a series of bent tubes, M M, connecting each of said horizontal manifolds with one of the upright manifolds L, a steam drum or separator mounted transversely above the upper manifolds, coupling-pipes connecting separately each of the several upper manifolds with said drum, stand-pipes connected, respectively, with the front ends of the lateral basal manifolds A A' and with the bottom of the drum or separator, an outer casing inclosing the entire set of tubes and manifolds, a chimney connected with the upper part of said casing, and a water-supply pipe and steam-discharge pipe connected with the steam-drum, all substantially in the manner and for the purpose herein set forth.

2. The combination, in a steam-boiler, of a series of sections, each constructed of two manifolds, L and N, arranged in a vertical plane at a right angle to each other and connected by a series of bent tubes, M M, a steam-drum mounted transversely over the sections, a coupling-pipe connecting each horizontal manifold with said drum, a basal manifold, A², placed transversely beneath the sections, a coupling tube or tubes, D' D', connecting the lower end of each upright manifold L with said transverse basal manifold A², and pipes, substantially as described, connecting said basal manifold with the drum, to permit a circulation through each of said sections, substantially in the manner and for the purpose herein set forth.

3. The combination, with a stand-pipe, F, a drum, G, with which it communicates at its upper end, and a system of heating-pipes, substantially as described, connecting the lower end of said stand-pipe with said drum, of an injector, Y, fitted in said pipe, a steam-generating coil, W, to which said injector is connected and which is supplied from the drum G, and a pump, Z, interposed between and connected to the coil and drum to produce a pressure within the coil, all substantially in the manner and for the purpose herein set forth.

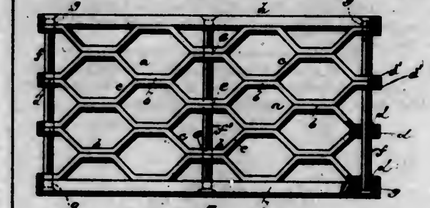
387,187. COMBINED PEN OR PENCIL HOLDER AND PIN. SAMUEL F. STEWART, Paris, Tex. Filed Jan. 18, 1888. Serial No. 261,262. (No model.)

Claim.—1. A combined holder and pin consisting of the bar 1, provided with pin 10, and having at each end adjustable bands 5⁴, adapted to receive a pen, pencil, or other article, substantially as described.



2. A combined holder and pin consisting of the bar 1, provided with pin 10, and having bands 5⁴, spring 9, and loops 4⁴, substantially as described.

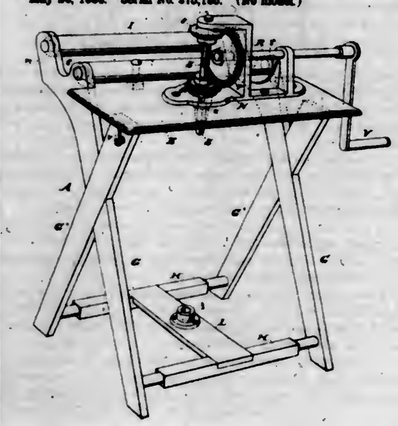
3. A combined holder and pin consisting of the bar 1, provided with pin 10, and having catches 7 and adjustable bands 5⁴, provided with notches 6, to engage said catches, substantially as described.



387,188. MACHINE FOR CUTTING FLOOR-LIPS AND SPURS ON AUGERS AND BITS. JAMES SWAN, Seymour, Conn. Filed May 14, 1888. Serial No. 272,760. (No model.)

Claim.—In a machine of the class described, the combination, with an adjustable plate carrying a cylindrical milling-tool with end and internal cutting-teeth, of an adjustable plate carrying a bit-chuck at an oblique angle to the milling-tool, said chuck and milling-tool being so located relatively to each other that in operation the end of one side of the bit passes within the milling-tool, causing the end teeth to cut the floor-lip and the internal teeth to cut a convex spur, substantially as described.

387,188.



387,189. METALLIC DOOR-MAT. SIMON TOPPLER, New York, N. Y. Filed Feb. 9, 1888. Serial No. 263,494. (No model.)

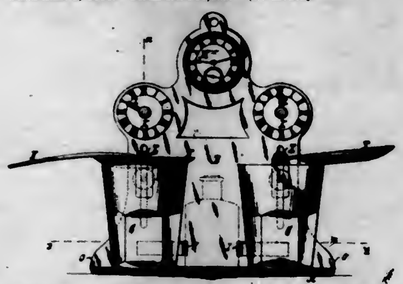
Claim.—A metallic door-mat composed of the perforated parallel frame-bars *h h*, the end bolts, *f f*, the intermediate bolt, *f'*, and the angular bars *a*, having perforated end ears, the perforations *e*, the oblique portions *c*, and the parallel abutting webs *b*, as shown and described.

387,190. CHURN. ASTON THOMSON, Wapakoneta, Ohio. Filed May 26, 1888. Serial No. 275,183. (No model.)

Claim.—1. A churn-frame consisting of the cross-bars G G', halved together, the cross-bar G having offsets, the rear transverse handle-round I, secured to said offsets, the top board, E, carrying gear mechanism and centrally perforated, the rounds H H, the base-bar L, the ends of the bars G' being beveled, substantially as specified.

2. The combination, with the cross-leg frame A, having the base-bar L, carrying the socket-casting *f*, the pivoted top board, E, and transverse handle-round I above the level of the top board, the cast frame N upon said board, and operating-gear carried by said frame, of a rotary churn having a marginal gain, a rotary dasher, and a churn-cover having a bowed handle, F, and locking-bar *l*, adapted to engage said gain, substantially as specified.

387,191. CONICAL WHEEL. AARON TWYMAN, Pullman, Ill. Filed Oct. 7, 1887. Serial No. 251,773. (No model.)



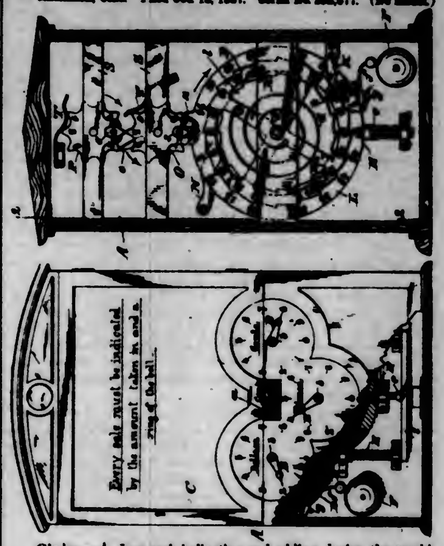
Claim.—1. A wheel having its circumference radically conical and provided at its center with a journal-bearing, the surface of which is concentric and parallel with the outer peripheral surface of the wheel, whereby to present a bearing-surface at right angles to the resultant of the pressure upon said wheel, substantially as shown and described.

2. The combination of a conical journal and a wheel or pulley having a central journal-bearing made conical and fitted to the journal, substantially as set forth.

3. The combination, with a pulley or wheel having a conical bearing, of a conical journal having a bearing-surface at right angles to the line of the resultant of the pressure upon said bearing and a detachable collar, the abutting surfaces of said collar and wheel being at right angles to the axis of the bearing and secured substantially as shown and described.

387,192. INDICATOR-STAND FOR MEDICINE-VESSELS. HENRY C. VELIE, Poughkeepsie, N. Y., assignor to Marion F. Velie, same place. Filed Mar. 3, 1888. Serial No. 266,095. (No model.)

Claim.—1. A vessel-stand consisting of the vessel-supporting base A, having a vertically-slotted back, B, the vertically-adjustable bracket C, having adjusting-screw D, and the swinging and vertically-moving vessel-closing cover F, pivoted to the bracket, substantially as described.



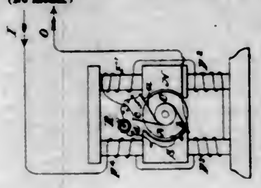
2. A vessel-stand consisting of a vessel-supporting base, A, having a vertical back, B, provided with a vessel-holding clamp, I, a vertically-adjustable bracket, C, on the back, and a vessel-closing cover, F, pivotally connected with the bracket, substantially as described.

3. A vessel-stand consisting of a vessel-supporting base, A, having a vertical back, B, provided with an adjustable time-index, a vertically-adjustable bracket, C, and a vessel-closing cover, F, pivotally connected with the bracket, substantially as described.

4. A vessel-stand consisting of a supporting-base, A, having a vertical back, B, provided with a time-piece, M, and an adjustable time-index, K L, and a swinging vessel-closing cover, F, pivotally connected with the back, substantially as described.

5. A vessel-stand consisting of a supporting-base, A, having a vertically-slotted back, B, provided with a time-piece, M, and an adjustable time-index, K L, a vertically-adjustable bracket, C, having adjusting-screw D, and a vessel-closing cover, F, pivoted to the bracket, substantially as described.

387,198. CASH INDICATOR AND REGISTER. JOSEPH H. VOSS, Cincinnati, Ohio. Filed Oct. 12, 1887. Serial No. 252,077. (No model.)

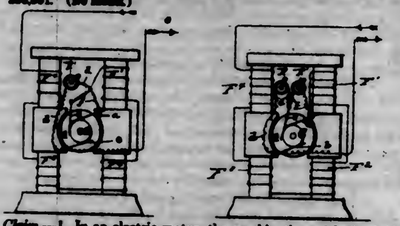


Claim.—1. In a cash indicating and adding device, the combination of an arbor, an indicator, B, and indicator-wheel D, secured thereto, a spiral spring which is wound when the indicator is turned, a registering-wheel, L, having two ratchet-wheels secured to it and revolving loose around the same arbor, a pawl, M, moving with the indicator-wheel, engaging with one of the ratchet-wheels on wheel L, a retaining-pawl, N, engaging the other ratchet-wheel on wheel L, a spring-catch, E, engaging in ratchet-teeth on indicator-wheel D, a stop, *k*, on the same wheel, and a stationary stop, K, all for the purpose described.

2. A cash indicating and adding device consisting in the combination of an accessible case, A, a display-opening, *a*, therein, an indicator, B, having a knob, a corresponding dial on the outside of the case, an indicator-wheel, D, being fast on the same arbor with indicator B, the two moving together, a spring-catch, E, to keep wheel D in a certain position, spring G, and stops K and *k*, to restore wheel D to its normal position, a bell, F, operated by the indicating mechanism, a registering-wheel, L, provided with two ratchets, *l* and *m*, sitting on same arbor with indicator B and wheel D, but loose therefrom, a spring-pawl, M, on wheel D, engaging in ratchet-wheel *l* of wheel L and revolving it in one direction every time the indicator is turned forward, a pawl, N, engaging the other ratchet-wheel, *m*, of wheel L and keeping it in the advanced position, a finger, *n*, on wheel L, engaging the first one of a series of adding-wheels, O P, turning it the space of one of its teeth to every revolution of wheel L, and a series of adding-wheels, O P, having fingers *o*, each indicating the number of revolutions of the one it is driven by, as and for the purpose described.

3. In a cash indicating and adding device with a series of adding and indicating wheels, of which the latter are so arranged that composed numbers of as many single figures as there are indicating-wheels may be shown in one opening in a case, all being held in such position in the opening by spring-catches, the combination of these wheels with a bar, to which all these spring-catches are secured, and which has a knob by which all the catches may be operated simultaneously for the release of the indicating-wheels, as explained.

387,194. REGULATOR FOR ELECTRIC MOTORS. ARTHUR G. WATERHOUSE, Hartford, Conn., assignor to The Waterhouse Electric and Manufacturing Company, same place. Filed May 26, 1887. Serial No. 239,363. (No model.)

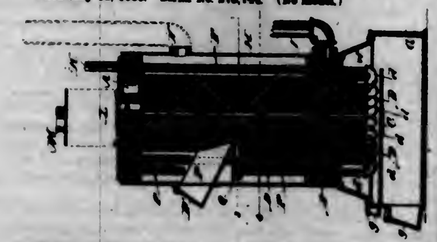


Claim.—1. The herein-described method of regulating the speed of an electric motor provided with a closed circuited armature, which consists in diverting a portion of the current transmitted to the motor through a locally-closed circuit including one or more of the armature-helices, and containing an adjustable resistance, substantially as and for the purpose set forth.

2. The herein-described method of regulating the speed of an electric motor provided with a closed circuited armature, which consists in diverting a portion of the current transmitted to the motor through a locally-closed circuit including one or more of the armature-helices and through a shunt-circuit around the armature containing a fixed or an adjustable resistance.

3. The herein-described method of regulating the speed of an electric motor provided with a closed circuited armature, which consists in diverting a portion of the current transmitted to the motor through a locally-closed circuit including one or more of the armature-helices and containing a fixed or adjustable resistance and through a shunt-circuit around the armature also containing a fixed or adjustable resistance.

387,195. REGULATION OF ELECTRIC MOTORS. ARTHUR G. WATERHOUSE, Hartford, Conn., assignor to The Waterhouse Electric and Manufacturing Company, same place. Filed Nov. 30, 1887. Serial No. 256,851. (No model.)



Claim.—1. In an electric motor, the combination, with the field-magnet coils located in the main circuit, of a pair of main collecting-brushes, an auxiliary collecting-brush placed near one of said main brushes, a conductor for connecting one of said main brushes directly to the auxiliary brush, and an adjustable resistance located in the said conductor, substantially as and for the purpose described.

2. In an electric motor, the combination, with the field-magnet coils located in the main circuit, of a pair of main collecting-brushes, an auxiliary collecting-brush, a conductor for connecting one of said main brushes to said auxiliary brush, a conductor for connecting said auxiliary brush to the opposite main brush and around the armature of said motor, and a fixed or adjustable resistance in said last-named conductor, substantially as and for the purpose set forth.

3. In an electric motor, the combination, with the field-magnet coils located in the main circuit, of a pair of main collecting-brushes, an auxiliary collecting-brush, a conductor for connecting one of the main brushes to said auxiliary brush, a fixed or adjustable resistance in said conductor and between said brushes, a conductor for connecting said auxiliary brush to the opposite main brush around the armature, and a fixed or adjustable resistance included in said conductor between said brushes, substantially as and for the purpose set forth.

387,196. WATER-HEATER. CHANCY A. WIBBER, Galesburg, Ill. Filed May 12, 1888. Serial No. 273,744. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with an upper and a lower water-chamber, of the series of tubes D, extending from the upper water-chamber downwardly to and below the lower water-chamber and thence upwardly to said lower water-chamber, for the purpose described.

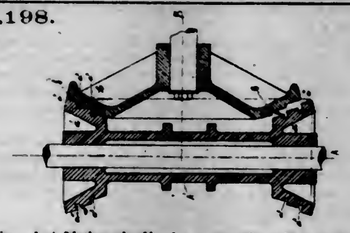
2. The combination, substantially as hereinbefore set forth, with an upper water-chamber and the lower annular water-chamber, B, of the tubes D, extending from the upper water-chamber downwardly to and through the space surrounded by the lower annular water-chamber and thence up to said lower chamber, for the purpose described.

3. The combination, substantially as hereinbefore set forth, with an upper water-chamber and the lower water-chamber, B, of the grate C, arranged below the lower chamber, and the pipes D, extending from the upper water-chamber down to the grate, and at their lower ends provided with return-bends whereof the terminals are connected with the lower water-chamber.

4. The combination, with the upper annular water-chamber, A, and the lower annular water-chamber, B, of the annular series of tubes D, connected with the upper water-chamber and extending below the lower water-chamber, to which latter said tubes are connected by means of return-bends, substantially as set forth.

387,197. CAR-AXLE. ARTHUR H. WIENER, Chicago, Ill. Filed Feb. 14, 1888. Serial No. 264,091. (No model.)

Claim.—1. A car-axle comprising, in combination, the main part A and complement B thereof, supplementary part C, incasing the part B and having a journal, *c*, to enter the journal-box and extend beyond the bearing thereof, and means at the inner end of the part C for securing the parts together, while permitting their independent revolution, substantially as described.



2. A car-axle for permitting independent revolution of the opposite wheels, comprising, in combination, the main part A and complement B thereof, provided with the flange *r*, supplementary part C, incasing the part B and having a journal, *c*, upon its outer end to enter the journal-box and extend beyond the bearing thereof, and the flange *r* upon its inner end, annular plate *q*, and bolts securing the plate *q* to the flange *r*, substantially as described.

3. A car-axle comprising, in combination, the main part A and complement B thereof, supplementary part C, incasing the part B and having a journal, *c*, to enter the journal-box and extend beyond the bearing thereof, and open at its outer end to admit into its interior caused oil from the front portion of the journal-box, and means for securing the parts together, while permitting their independent revolution, substantially as described.

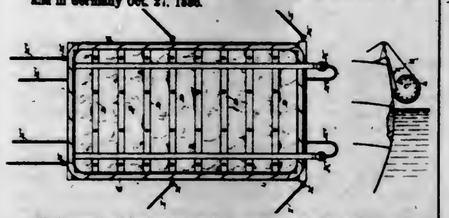
4. A car-axle comprising, in combination, the main part A, complement B thereof, tapering for a portion of its length and cylindrical thenceforward to its outer end, supplementary part C, incasing the part B and having a journal, *c*, to enter the journal-box and extend beyond the bearing thereof, and means at the inner end of the part C for securing the parts together, while permitting their independent revolution, substantially as described.

387,198. FRICTION-GEAR. Otto Reuss, Schmalkalden, Germany. Filed Jan. 10, 1888. Serial No. 260,266. (No model.) Patented in Germany Apr. 2, 1887, No. 41,172.

387,198.

Claim.—1. A friction-wheel having a series of annular steps formed on its periphery with alternating annular grooves a^2, in combination with another friction-wheel provided with annular steps, which do not enter said grooves, but leave them open, substantially as set forth.

2. A friction-wheel having successive steps a^2 formed on its surface, with alternating grooves a^3, in combination with another friction-wheel arranged to engage therewith and having broader steps, b', these two wheels forming spaces alternating with the parts which are in contact, as described.



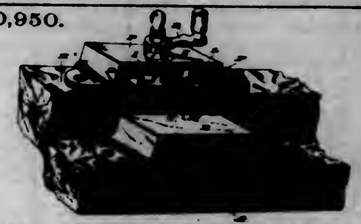
3. A sleeve with a friction-wheel on each end, each wheel being formed with a series of annular steps, a^2, and alternating grooves a^3, the said steps having faces of less inclination than the general surfaces of the friction-wheels, in combination with a wheel, b, arranged to be put into frictional contact with either one of said wheels a or a', at will, and having steps which are broader than the corresponding steps of the latter, whereby said wheels b and a or a' leave annular spaces between them, alternating with the parts in contact, substantially as set forth.

387,199. HYDRAULIC-CEMENT COMPOUND. GEORGE L. EAGAN, San Francisco, Cal., assignor of one-half to Richard P. Knox, same place; James C. Pennie administrator of George L. Eagan, deceased. Filed Sept. 1, 1887. Serial No. 248,543. (No specimens.)

Claim.—1. The herein-described cement, consisting in the combination of lime-rock, silex, mineral magnesite, and alumina, as specified.

2. The herein-described composition of matter to be used as a cement, consisting of lime-rock, silex, magnesite, alumina, and water, mixed and compounded in about the proportions specified and in the manner set forth.

387,200. LEAK-STOPPER FOR SHIPS, &c. CHARLES H. S. SCHULTZ, Stettin, Germany, assignor to the American Patent Rights Corporation, (Limited,) Philadelphia, Pa. Filed Nov. 12, 1886. Serial No. 218,677. (No model.) Patented in France Aug. 17, 1886; in Belgium Aug. 24, 1886; in Italy Aug. 31, 1886; in England Oct. 12, 1886, and in Germany Oct. 27, 1886.



Claim.—1. A leak-stopper for vessels, consisting of a mattress water-proof on the outside face to prevent the entrance of water from without, and porous on the inside, so that when used it will be quickly soaked with water, and thus weighted assist in sinking, substantially as described.

2. A leak-stopper for vessels, consisting of a mattress water-proof on the outside face to prevent the entrance of water from without, and porous on the inside, so that when used it will be quickly soaked with water, and thus weighted assisted in sinking, the inside face being provided with a bead at its edges, substantially as and for the purpose set forth.

REISSUES.

10,950. FASTENER FOR THE MEETING-RAILS OF SASHES. THOMAS S. SMITH, Washington, D. C., assignor, by direct and mesne assignments, to H. R. Ives and F. P. Andrews, both of New Haven, Conn. Filed Feb. 6, 1888. Serial No. 263,162. Original No. 266,850, dated Oct. 16, 1882.

10,950.

Claim.—1. In a fastener for the meeting-rails of sashes, the combination, with a suitable casing, of the shaft Q, having disk S, provided with stud T, the latch-bolt having hook L, and provided with a slot, K, by which it is mounted upon shaft Q, a notch engaging the stud T, and a rounded guiding-surface to guide it in its swing about the shaft Q, and the stationary flange for engaging such guiding-surface, substantially as and for the purpose set forth.

2. In a fastener for the meeting-rails of sashes, the combination of the base-plate having a flange, the pivot-shaft, suitable casing or means for bearings and support of such shaft, the disk thereon provided with an eccentrically-arranged stud, the latch-bolt provided with the longitudinal slot through which the shaft passes, the notch M, engaged by the stud on the disk, and the rounded guiding-edge for engaging the flange on the base, substantially as and for the purpose described.

3. In a fastener for the meeting-rails of sashes, in combination with a suitable support or casing, the rotary shaft, the disk thereon provided with an eccentric-stud, the hooked latch-bolt provided with a longitudinal slot through which the shaft passes, and a notch, M, engaged by the disk-stud, and engaging guiding-surfaces on the latch-bolt and base to prevent the latch-bolt being drawn inward until it has been swung outward, substantially as and for the purpose described.

4. In a fastener for the meeting-rails of sashes, in combination with a suitable support, the pivot-shaft, the disk thereon provided with an eccentric-stud, the hooked latch-bolt provided with the rounded guiding-surface, the longitudinal slot, the notch M, and the locking-notch, the flange H, and the stud I, substantially as and for the purpose described.

5. In a fastener for the meeting-rails of sashes, the combination of the base-plate having a perforation, a stud, and a flange relatively disposed, as described, the latch-bolt having a longitudinal slot, a hook, and notches in its upper and under sides, as set forth, and provided with a shoulder on one side, the shaft having an operating-disk provided with a stud on its under side and a suitable casing, all constructed to operate in connection with a stud upon the meeting-rail of the lower sash, substantially as set forth.

10,951. GAS-ENGINE. EDOUARD DELAHAIE-DESCOUTEVILLE and LÉON P. C. MALANDIN, Fontaine-le-Bourg, Seine-Inférieure, France. Filed Oct. 21, 1887. Serial No. 253,043. Original No. 332,898, dated Jan. 5, 1886. Patented in France Feb. 12, 1884, No. 160,267; in Belgium Feb. 23, 1884, No. 64,353; in England Feb. 26, 1884, No. 3,986; in Germany Mar. 4, 1884, No. 33,915; in Italy Mar. 20, 1884, No. 76,607; in Russia Apr. 3, 1884; in Spain May 26, 1884, No. 5,579, and in Austria-Hungary Aug. 29, 1884, No. 8,731.

Claim.—1. The combination of the cylinder and piston of a gas-engine with the head C, having a chamber, O, and a slide, D, provided with a series of longitudinal air-openings, Q, transverse gas-passages P, and port O.

2. The combination of the cylinder and piston of a gas-engine with a gas-supply pipe, I, having a spring-valve, i, and a separate slide-valve, D, carrying the air and gas passages and adapted to come into contact with the said valve to open the same periodically, substantially as set forth.

3. A gas-engine provided with an electric igniting device and a slide having a small outlet from the igniting-chamber to the atmosphere when the said chamber is open to the cylinder, whereby the burned gas therein may be expelled by the compressed gases in the cylinder, substantially as described.

4. A gas-engine having an electrical igniting device, a regulating-slide, and an igniting-chamber forming the only communication between the electrical igniting device and the cylinder for the direct ignition by the electrical igniting device of the gases in the cylinder under the control of the slide, which has an outlet from the igniting-chamber for expelling the burned gases, all substantially as set forth.

H. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

WEBSTER *v.* SANFORD.

Decided July 25, 1888.

ABANDONED OR REJECTED APPLICATIONS AS REFERENCES.

Prior to December, 1875, abandoned and rejected applications were cited as references; but after *Broisn* v. *Gould* (6 O. G., 302) that practice ceased. Although such was the practice, yet a reference of that character was illegal, for the reason that by statute a patent can be barred only by public use, a publication, or prior knowledge or use by others of the completed invention. Webster filed an application in 1867 showing but not claiming the invention. It was rejected and the rejection acquiesced in. In May, 1875, Sanford filed an application claiming the invention, and in July the patent issued. June, 1876, Webster filed a second application claiming the invention, and was put into interference with Sanford's patent. Sanford conceived the invention in December, 1873, and diligently reduced it to practice as early as July, 1874. Webster did nothing toward a reduction to practice except filing his application of 1867. *Held* that the filing of the application in 1867 constituted conception but not reduction to practice, and that showing no diligence priority of invention must be awarded to Sanford. The filing of such an application in the Patent Office does not constitute "prior knowledge or use by others" within the meaning of the statute. It requires the invention to be reduced to practice in "its concrete and perfect form to make it capable of prior knowledge or use by others." Mere drawing and description not published will not bring the invention within the requirement. An invention may exist in a state of conception or experiment, or in a state of completion and reduction to practice. In its former state it may be abandoned; but whether abandoned or not the subject is not taken out of the field of invention so as to prevent other inventors pursuing the same invention. When, however, the completed invention, reduced to practice, subject of knowledge and use, is abandoned by the inventor, whether before or after patent, it is abandoned to the public and is no longer the subject of new or original invention.

APPEAL from the Examiners-in-Chief.

WIRE MOTIONS FOR WEAVING PILE FABRICS.

Application of William Webster filed June 14, 1876. Patent granted Stephen Sanford July 13, 1875, No. 165,428.

Mr. H. A. Seymour for Webster.

Messrs. Mason, Fenwick & Lawrence for Sanford.

HALL, *Commissioner:*

The issue in interference is as follows:

The combination of a slotted wire box, a withdrawing hook or latch, an inserting pusher, and a reciprocating driving-slide with a wire-supporting table having a groove in line with the point of withdrawal and a groove leading to the point of insertion, and a spring-switch arranged to bear upon the wire head and place the wire in possession for insertion in the shed.

Webster, being junior applicant, sets up the following dates in his preliminary statement: Conception in the winter of 1865-'66; drawings, model, and disclosure to others about the same time; filing of application embodying the invention in controversy on or about May 23, 1867.

Sanford's preliminary statement sets up the following dates: Conception on or about the 1st of December, 1873; drawings and disclosure to others at about the same time; embodiment of the invention in a full-sized practically-operating loom as early as July, 1874; filing of application for patent May 28, 1875.

The decision of the Examiner of Interferences awarding priority of invention to Webster was affirmed by the Examiners-in-Chief, from which decision Sanford appeals.

In 1867 Webster filed an application showing the combination now covered by the issue in interference. The several elements, including the slotted wire box, were then all old. Webster, while showing the combination now claimed, only claimed in this early application a combination between some of the other elements relating to the wire-supporting table having grooves, the withdrawing hook or latch, &c. The difference between a combination of these several elements with the ordinary wire box and with the slotted wire box is so slight that it is exceedingly doubtful whether any patentable improvement is presented, as will be noticed briefly hereinafter. Whether Webster's omission to claim in this early application the combination with the slotted wire box was due to his failure to recognize any invention in its addition to the combination, or because, recognizing the slight difference, he did not believe it presented invention, is not shown; but the fact remains that he did not claim or define such invention. His application was promptly rejected by the Office on British Patent No. 791 of 1857, known as the "Moxon" patent, and he acquiesced in that decision. The correctness of that action is satisfactorily shown by the drawings and specification of the British patent, and not only did Webster acquiesce in it, but he at once proceeded to purchase the Moxon patent, and in his deposition declares that he was fairly rejected. Webster gave the subject of this particular invention "no further thought." His answer when testifying to the question why he waited so long before filing his present application is:

I did not give it a thought until I found that Sanford had patented it, then I woke up—

that is, until after the issue of Sanford's patent, July 13, 1875, nearly nine years. In the meantime, in November, 1870, he had applied for United States patent on the Moxon specifications, but abandoned that, as he found that it would expire in about a year, at which time the English patent of Moxon would expire.

Sanford filed his application on May 28, 1875, and

his patent issued on July 13, 1875, No. 165,428. There is no doubt that he is an original inventor. He has introduced no evidence as to date of conception, but stands upon the date of his application. He shows, however, that he reduced the invention to practice in a full-sized machine, which was put into actual use and operation in his factory at Amsterdam, N. Y. The loom was in operation long before the patent issued. After Webster had seen Sanford's patent, and after he "woke up," as he says, he filed the present application. It was rejected for want of invention, the examiner holding that the introduction of the slotted wire box into the combination showed no invention over the combination in which the ordinary or common wire box was an element. On appeal, the Examiners-in-Chief, relying upon affidavit of Webster that the slotted wire box in this combination was in quite general use and its actual operation demonstrated greatly-increased speed and improvement in results, overruled the examiner and held the invention patentable. It was thus brought into interference with Sanford's patent. The evidence of Webster taken in the case shows that the statements of his affidavit were "hearsay," as he now says, and that the facts are wholly different. Such evidence as has been taken strongly shows that there is no patentable difference in construction or results, and that the present contest is over an issue presenting no patentable matter whatever. But the issue is presented, and the easiest and quickest way to dispose of it is to decide it.

It is conceded that Webster has never reduced his invention to practice. At one time he claims to have made a model, and in 1867 he filed an application showing but not claiming the invention.

When Sanford came into the Office in 1875, the long-abandoned application of Webster was no bar to his application. It is true that at that period and up to December, 1875, it was the practice of the Office under its rules to cite as references abandoned and rejected cases; but since that time it has been decided by the Supreme Court of the United States in *Brown* v. *Guild et al.* (6 O. G., 392) that applications for patents which stand rejected will not in such case avoid subsequent patents. This practice ceased, and from that time until the present such abandoned and rejected applications remain in the secret archives of the Office and are no longer cited. (See *Rouse* v. *Stoddard*, 7 O. G., 169, and *Casilear* v. *McIntire*, 8 O. G., 474.) Hence, although it was the practice at that period to have cited Webster's abandoned case as a reference to Sanford's application, it would have been an illegal reference, and if Sanford's application had been rejected upon it, by proper appeals he could have obviated such reference and compelled the Office to issue a patent to him, if the Office believed that the invention was a patentable one. The ground of these decisions is that an application for a patent can only be barred by public use, or a publication, or knowledge or use by others of the *completed* invention, and that the filing in the Patent Office of an application with a description and drawing is not such a publication as is contemplated by the statute.

Even though at the time Webster filed his application he may never have perceived the alleged patentable difference between the slotted wire box and the common box, or, if he had perceived it, had never regarded it as worthy of claim, or had afterward forgotten and abandoned it as an invention, it is certain that he had never given it to the public by any other method of disclosure so far as the evidence shows, but by filing his application in the Patent Office. It had not been published, reduced to practice, put into use, or explained to others; at least the evidence shows nothing in this direction. Webster had simply filed an application containing drawings showing the invention and lodged them in the secret archives of the Patent Office.

In the decision of the Examiners-in-Chief there is discussed to some extent the question of abandonment of the invention by Webster, and a conclusion is reached that there was not sufficient evidence of such abandonment. It is necessary that an inventor shall have made an invention in the legal sense before it can be said that he has abandoned it. So long as it rests in experiment only, has never been embodied or reduced to practice, he cannot be said to have made the invention so that it is capable of abandonment as an invention. He may abandon it in either relation—that is to say, he may abandon the experimental invention or the mental conception and experiments founded upon that conception. This of course must be done before the invention has been so far completed and reduced to practice as to have that existence which makes it capable of the knowledge and use by others contemplated by the statute. An inventor may also abandon an invention after it is complete and perfect and is in use. He may abandon it by allowing it to go into public use for two years before he makes an application for a patent. It may be abandoned in various ways, but quite as completely as by the two years' public use.

In this case there is no pretense that Webster ever abandoned the completed and perfected invention, because it does not appear that he ever got beyond the status of conception, and if he abandoned anything he abandoned the conception of the invention and any experimental efforts that may have been made, and, as he says, for years gave it no thought whatever. It is possible that it was to this status of the invention that the Examiners-in-Chief gave their consideration in respect to the question of abandonment; but whether or not Webster had abandoned the invention in its state of conception or experiment, it is well settled that by his negligence and delays he kept the matter secret and undisclosed, and the state of his invention and the manner in which he conducted the same did not and could not deter or prevent others from rightfully entering upon this field of invention, for it is well settled that a man who has conceived an invention and has conducted experiments looking toward its reduction to practice cannot, by keeping the matter secret, declining to disclose or develop it, and permitting years to pass without giving it a thought, by such neglect and delay stop the progress of the world and deprive others from entering upon the field of discovery and invention and completing and perfecting with diligence the invention which he omits to so complete and perfect. But it may be stated that if the original inventor had abandoned the invention itself, as contradistinguished from the application, he has abandoned it to the world, and that when this has occurred no other inventor can be allowed to secure any rights under the statute with reference to the invention, although such other person may be an original inventor. But, as said above, before the invention can be thus abandoned to the world it must exist as a completed invention—one which has been reduced to practice and has become the subject of knowledge and capable of use. So long as it remains a mere conception or in a state of experiment it has no existence, it cannot cut off others from entering the same field of invention, and cannot be abandoned to the world in the sense contemplated.

Section 4886 of the Revised Statutes is as follows:

> Any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may * * * obtain a patent therefor.

With this section in view it is apparent that before the abandonment of an invention to the world by the inventor will have the effect of taking the subject of that invention out of the field of invention the world must obtain possession of it in such a way as that it can know how to enjoy it in all respects. The language of the statute is "not in public use or on sale for more than two years prior to the application," and, again, "not known or used by others in this country." If after abandonment to the world the world gets such possession of the invention that it comes into existence and is used but once, that would necessarily be a bar to any other inventor, because a single use of the completed machine or invention would cause it to be known or used by others in this country.

The decisions above referred to show conclusively that the filing of an application in the Patent Office is not such a publication as puts the world in possession of the invention so as to bar another application, and when this is said there is nothing left to determine how the world may obtain the knowledge and possession of an abandoned invention which cuts off the rights of future inventors of the same invention except the words "known or used by others in this country."

It may be said that Webster himself had prior knowledge of this invention, because he had filed an application in the Patent Office, in which it was shown, though not claimed. It may also be said that the officers of the Patent Office who examined the application and were cognizant of its contents had knowledge of the invention; but this is not such prior knowledge or use as is required by the statute to bar a subsequent invention.

The invention must exist in its concrete and complete form and be reduced to practice capable of actual use to be the subject of prior knowledge or use. (See *Walker on Patents*, 72, and cases cited.)

When an inventor abandons an invention to the public, it is abandoned to it for every purpose, which includes the purpose of reconceiving it and reducing it to practice, unless it be already known to others. To be "known to others"—even to be "known" to the first to conceive and to give it experimental use—it must have been reduced to practice. If it be thus "known or used," so that the world has acquired knowledge of it so as to be able to accept or use it, then it can no longer be the subject of new and original invention; but otherwise the abandonment is such that a new and original inventor may invent it anew, and neither the world nor the first inventor can claim the invention adversely.

The abandonment of an invention by an inventor under such circumstances means that he quits and surrenders the subject and leaves the field of invention as if he had never made such an invention. A new and original inventor may enter the field, and if he reinvents the same invention nothing can bar his right to a patent but "prior knowledge or use by others" when the same is not proved to have been abandoned. (See *Coffin* v. *Ogden et al.*, 7 Blatch., 61; *Perkins* v. *Nashua Card and Glazed Paper Co.*, 2 Fed. Rep., 451; *Campbell* v. *Mayor of New York*, 9 Fed. Rep., 500.) Consequently there is nothing in the status or history of Webster's invention which could have barred Sanford's application. It is insisted, however, that the filing of Webster's application in 1867 in itself constituted a reduction to practice of the invention. It is undoubtedly true that the filing of an application in the Patent Office and the disclosure of the invention by description and drawings are the foundation for a valid patent. At that stage in the progress of the invention and the application for a patent therefor the law does not require an applicant to assert or declare whether he has ever reduced the invention to practice or not. The statute requires only that he shall describe the invention and make an oath that he believes himself to be the first, original, and true inventor thereof, &c., but does not require that he shall make any statement as to reduction to practice. That he has reduced the invention to practice is implied in the statement that he has made the invention, and his patent is valid because he has made the statement and oath required by law; but when a controversy arises between two inventors, either in the Patent Office by way of interference or in the courts in litigation, the law requires the Office or the courts to ascertain who was in fact the first and original inventor, and as the patent law relates to the completed thing, adapted to its use and purpose, it is a settled principle that he who first reduces to practice or makes the invention in an embodied form, capable of use and adapted to the purposes for which the invention exists, is deemed to be the first inventor. The case then becomes a very simple one. Webster may be conceded to have been the first to conceive, although, judging by his long inaction and sleeping, there is much doubt of this; but, conceding it, he not only never reduced the invention to practice but he has shown great delay and neglect without any explanation whatever. His first application, in which he makes no claim to this invention, cannot be regarded as a reduction to practice to defeat a patent. At most, as just stated, it can only show conception. On the other hand, Sanford, though second to conceive, reduced the invention to practice at once, came into the Office promptly, and took his patent as soon as it was allowed. His conduct in all these particulars is in striking contrast to that of Webster.

I have not alluded to the character of proof necessary in a case of this kind to overcome the presumption in favor of a patentee. No such consideration is required.

The decision of the Examiners-in-Chief is reversed, and priority of invention is awarded to Sanford.

EX PARTE CARTY.

Decided July 9, 1888.

STATEMENT.

The examiner refused to receive a caveat for a Design, holding that there was no law authorizing the filing of caveats for Designs. Applicant petitions the Commissioner to direct that the filing fee be returned to him.

1. CAVEATS—CONSTRUCTION OF STATUTES.

Section 4902 of the Revised Statutes, providing for the filing of caveats for any new invention or discovery, does not apply to the subject of Designs, nor is there any statute authorizing the filing of caveats for this class of inventions.

2. SAME—DESIGNS.

A Design invention covers the form, contour, or ornamentation, and such Design cannot exist in an incomplete condition. A patent when issued covers all the dominant and controlling features, all the distinct and segregable parts. Petition granted and fee ordered to be returned to applicant.

IN THE matter of the request of Martin Carty for the return of the fee paid on the 30th of March, 1888, for filing caveat for Design for ladies' collars and cuffs.

HALL, *Commissioner:*

Martin Carty presented to the Office on the 30th of March, 1888, a caveat for a Design for ladies' collars and cuffs, paid the filing fee of ten dollars, and requested that his caveat should be filed in the confidential archives of the Office, in accordance with the rules and the statute. The examiner declined to file the caveat, or instrument called a "caveat," for the reason that, in his opinion, the subject of Design Patents, as provided by statute, was not comprehended in section 4902 of the Revised Statutes, which provides for the filing of caveats in the Patent Office. That section is as follows:

> Any citizen of the United States who makes any new invention or discovery, and desires further time to mature the same, may, on payment of the fees required by law, file in the Patent Office a caveat setting forth the design thereof, and of its distinguishing characteristics, and praying protection of his right until he shall have matured his invention. Such caveat shall be filed in the confidential archives of the office and preserved in secrecy, and shall be operative for the term of one year from the filing thereof; and if application is made within the year by any other person for a patent with which such caveat would in any manner interfere, the Commissioner shall deposit the description, specification, drawings and model of such application in like manner in the confidential archives of the office, and give notice thereof, by mail, to the person by whom the caveat was filed. If such person desires to avail himself of his caveat, he shall file his description, specifications, drawings, and model within three months from the time of placing the notice in the post-office in Washington, with the usual time required for transmitting it to the caveator added thereto; which time shall be indorsed on the notice. An alien shall have the privilege herein granted, if he has resided in the United States one year next preceding the filing of his caveat, and has made oath of his intention to become a citizen.

After receiving notice of the action of the examiner the caveator, being in doubt as to the correctness of the decision and desiring to file the caveat, if it could be done, and if not to have the filing fee returned to him, raised the question before the Commissioner by a petition setting forth the facts and requesting the return of such filing fee. In answer to this petition the examiner has renewed his statement that section 4902 does not apply to Design patents, and that there is no law authorizing the filing of caveats for such class of inventions. Briefly stated, his proposition is, that before a Design can have an existence for any purpose whatever it must be invented and completed, and that a Design which is incomplete can have no recognition under any of the statutes relating to the subject.

As is well understood, the subjects of Design patents are form or contour and surface ornamentation, and it is physically impossible for any entity of that character to exist in an incomplete condition. There can be no circle when a segment of it is absent. There can be no continuous line when it is broken. I concur fully in what the examiner has said upon this subject. At first I was disposed to think, in view of the decision announced in *ex parte Gérard*, (43 O. G., 1235,) that it would be proper to file a caveat for the predominant and controlling features of a Design, enabling the caveator within the period provided by law to fill out the details and subordinate parts, in much the same manner as a caveator of a mechanical device would be enabled to describe generally his invention in the caveat and reserve the period allowed by law within which to complete and put it in practical operation or reduce it to practice. But I am satisfied upon reflection that this is not the correct view, because if the Design has reached such a state of completion that it may be said to be perfect in its distinct and segregable parts, it is in a condition to be patented and there is no necessity for a caveat, and the caveat could serve no useful purpose.

As was stated in the case of Gérard, above cited, a patent which covers a completed Design covers all the distinct and segregable parts with the mere minor details omitted, so that it may be conceded that the immaterial and subordinate details of Designs are not regarded as a part of the patent: that so long as the dominant and controlling features, called the "distinct and segregable parts," occupying their proper place and relation to each other, exist the patent relates to and covers them, and, as just stated, when the Design has reached this state of perfection it may be said to be complete and capable of becoming the subject of a patent.

I therefore sustain the petition of the applicant for the return of the filing fee, and direct that it be returned to him.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of the publication,) to June 30, 1873, it was published and bound in semi-annual volumes; since July 1, 1873, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1886,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1886,) full sheep, $6.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Proposals for Photolithographing.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 21, 1888.

Sealed proposals will be received at the Office of the Commissioner of Patents until 12 M. of August 8, 1888, for the reproduction by photolithography, or otherwise, of the drawings of the weekly issues of patents, and for the illustrated portion of the OFFICIAL GAZETTE.

Specifications and specimens will be furnished upon application to the Commissioner.

BENTON J. HALL,
Commissioner of Patents.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGiehan, No. 135 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Mellado*.

Issue of August 7, 1888.

DESIGNS.

18,498.—BOTTLE AND SPREADING TIP.—*William W. Beach*, New York, N. Y. Application filed May 14, 1888. Serial No. 273,918. Term of patent 14 years.

18,499.—FAN OR SIMILAR ARTICLE.—*James B. Beatty*, Brooklyn, N. Y. Application filed June 28, 1888. Serial No. 278,460. Term of patent 3½ years.

18,500.—FAN OR SIMILAR ARTICLE.—*James B. Beatty*, Brooklyn, N. Y. Application filed July 2, 1888. Serial No. 278,861. Term of patent 3½ years.

18,501.—PICTURE-FRAME.—*Elizabeth Edmonston*, Newburg, N. Y. Application filed June 25, 1888. Serial No. 278,133. Term of patent 7 years.

18,502.—BADGE.—*James Damant Fahnestock*, Cincinnati, Ohio. Application filed June 26, 1888. Serial No. 278,251. Term of patent 3½ years.

18,503.—HAT.—*Edward H. Hart*, New York, N. Y. Application filed July 2, 1888. Serial No. 278,860. Term of patent 3½ years.

18,504.—LAMP-SHADE.—*Louis Hinrichs*, New York, N. Y. Application filed April 30, 1888. Serial No. 272,395. Term of patent 7 years.

18,505.—BUTTON.—*Rudolph Liebmann*, New York, N. Y. Application filed June 16, 1888. Serial No. 277,381. Term of patent 3½ years.

18,506.—BUTTON.—*Rudolph Liebmann*, New York, N. Y. Application filed July 6, 1888. Serial No. 279,226. Term of patent 3½ years.

18,507.—SLIPPER.—*Hugo Nollner*, Jersey City, N. J., assignor to *Siegmund Baum* and *Jacob Tarlow*, New York, N. Y. Application filed June 9, 1888. Serial No. 276,639. Term of patent 3½ years.

18,508.—TYPE.—*William F. Capitain*, Chicago, Ill., assignor to *Marder, Luse & Co.*, same place. Application filed June 15, 1888. Serial No. 277,397. Term of patent 7 years.

18,509.—ADVERTISING-CARD.—*Charles H. Durphy*, Chicago, Ill. Application filed February 2, 1888. Serial No. 262,830. Term of patent 14 years.

18,510.—BEVELED GLASS.—*Obed Charles Hawkes*, Birmingham, county of Warwick, England. Application filed July 11, 1888. Serial No. 279,667. Term of patent 14 years.

18,511.—BADGE.—*Hiram Howard*, Providence, R. I. Application filed April 23, 1888. Serial No. 271,631. Term of patent 3½ years.

18,512.—BADGE.—*Stephen C. Howard*, Providence, R. I. Application filed April 21, 1888. Serial No. 271,468. Term of patent 3½ years.

18,513 and 18,514.—HANDKERCHIEF.—*Joseph M. Jones*, Paris, Ky. Applications filed July 13, 1888. Serial Nos. 279,871 and 279,872. Term of patents 3½ years.

18,515.—BUTTON.—*Rudolph Liebmann*, New York, N. Y. Application filed June 16, 1888. Serial No. 277,380. Term of patent 3½ years.

18,516.—TYPE.—*John West*, Chicago, Ill., assignor to *The Union Type Foundry*, same place. Application filed May 18, 1888. Serial No. 274,318. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,736.—CONDENSED MILK.—*John Babillion*, Detroit, Mich. Application filed May 28, 1888. Used since May 7, 1888.
"The word 'PORCELAIN.'"

15,737.—ANTISEPTICS FOR PRESERVING PERISHABLE ARTICLES OF FOOD.—*John H. Bani, William Maegerlein, and Alexander Bruce*, Chicago, Ill. Application filed June 20, 1888. Used since April 15, 1888.
"The word 'BANIANI.'"

15,738.—CHEMICAL FLUID MIXED WITH OIL-PAINTS USED ON FABRICS AND RENDERING THEM WASHABLE.—*Phillie Blackman*, New Haven, Conn. Application filed June 16, 1888. Used since June 6, 1888.
"The outline of an artist's palette and the words 'INDELIBLE PROCESS' on it."

15,739.—MEDICINE FOR RHEUMATISM AND KIDNEY DISEASES.—*Buckeye Medicine Co.*, Kent, Ohio. Application filed June 23, 1888. Used since May 15, 1888.
"The representation of a branch of a buckeye-tree."

15,740.—BLOOD-PURIFYING MEDICINE.—*Julia A. Callahan*, New York, N. Y. Application filed February 25, 1888. Used since February 1, 1888.
"The words 'ST. THOMAS' and the bust-picture of a man representing St. Thomas carrying a spear in his hand."

15,741.—BAKING-POWDER AND HOP YEAST.—*Churchill & Co.*, Toronto, Ontario, Canada. Application filed February 17, 1888. Used since September 9, 1887.
"The words 'BREAD MAKER'S.'"

15,742.—FARINACEOUS COMPOUND WITH FRUIT FLAVORINGS.—*Wm. Pitt Clotworthy*, Baltimore, Md. Application filed June 20, 1888. Used since June, 1888.
"The word 'PUDDINE.'"

15,743.—CIGARS.—*Gumersindo Garcia Cuervo*, Havana, Cuba. Application filed June 18, 1888. Used since July 1, 1887.
"The words 'MANUEL GARCIA ALONSO.'"

15,744.—CIGARS.—*Gumersindo Garcia Cuervo*, Havana, Cuba. Application filed June 18, 1888. Used since 1867.
"The words 'LA FUCHA DE FLORES' supported by a shield, flowers, plants, clouded background, and a marine view."

15,745.—CIGARS.—*Gumersindo Garcia Cuervo*, Havana, Cuba. Application filed June 18, 1888. Used since July 1, 1873.
"The words 'LA CREMA DE CUBA' supported by the portrait of a young lady, flowers and plants, clouded coloring, and a sea view."

15,746.—CIGARS.—*Diego Lopez Trujillo & Sons*, Key West, Fla., and New York, N. Y. Application filed June 27, 1888. Used since May 1, 1887.
"The representation of a sea-dragon."

15,747.—RAZORS.—*William H. Hambleton*, of Philadelphia, Pa., and *Robert Vom Cleff*, of New York, N. Y. Application filed February 20, 1888. Used since December 6, 1887.
"The word 'DIAMONDINE' and a fabulous figure having the head, neck, mane, shoulders, and fore legs of a horse and the body, tail, scales, and fins of a fish."

15,748.—CHEWING-GUM.—*Charles T. Heisel*, Cleveland, Ohio. Application filed June 26, 1888. Used since June 21, 1888.
"The words 'RED BANDANA' associated with a red bandana handkerchief."

15,749.—BARBERS' SHAVING-SOAP.—*Theodore A. Kochs*, Chicago, Ill. Application filed June 15, 1888. Used since March 1, 1888.
"The representation of a barber standing with straddled legs over the legs of a seated man whom he is in the act of shaving."

15,750.—LIQUID MEDICINE TO AID DIGESTION.—*Charles Ludlow & Co.*, Springfield, Ohio. Application filed July 5, 1888. Used since May, 1888.
"The word 'DYSPEPTICURE.'"

15,751.—WHISKY.—*John Holmes Magruder*, Washington, D. C. Application filed February 29, 1888. Used since October 1, 1887.
"The words 'JEFFERSON CLUB' in connection with the medallion picture of Jefferson, one of the Presidents of the United States."

15,752.—TONIC MEDICINE FOR THE BRAIN, NERVES, AND MUSCLES.—*Elias Edwin Matthews*, Indianapolis, Ind. Application filed June 15, 1888. Used since August, 1886.
"The words 'PERUVIAN CELERY.'"

15,753.—CURE FOR ERYSIPELAS.—*Henry Matthews*, Walden, N. Y. Application filed May 31, 1888. Used since March, 1888.
"The words 'GOOD-INTENT.'"

15,754.—VEGETABLE MEDICAL COMPOUNDS.—*Charles Mendenhall*, Wapakoneta, Ohio. Application filed July 12, 1888. Used since January 1, 1883.
"The word-symbol 'DR. MOH-GOH-YAH.'"

15,755.—SOAP.—*Procter & Gamble*, Cincinnati, Ohio. Application filed July 16, 1888. Used since August 6, 1877.
"A diagonal green bar or ribbon in connection with the words 'OLEINE OXIDE.'"

15,756.—SOAP IN BARS.—*Rutherford & Barnes*, Brooklyn, N. Y. Application filed May 29, 1888. Used since February 1, 1888.
"The words 'SABAO PROGRESSO.'"

15,757.—SOAP IN BARS.—*Rutherford & Barnes*, Brooklyn, N. Y. Application filed June 5, 1888. Used since December 1, 1887.
"The words 'SABAO IMPERIAL BRAZILEIRO' and the representation of the seal of Brazil."

PATENTS

GRANTED AUG. 7, 1888.

387,201. CENTRAL-STATION HEATING SYSTEM. ARTHUR V ABBOT, Chester, N. J., and FRANK C. P. KNAAK, New York, N. Y., assignors, by mesne assignments, to the National Heating Company, New York, N. Y. Filed Aug. 27, 1887. Serial No. 248,099. (No model.)

Claim.—1. In a heating system, the combination of a superheater, a supply-main, a force-pump, an expansion joint or coupling provided with a double-acting check-valve, and means for conducting water from the supply-main into a house or other building and utilizing the same for heating purposes.

2. In a heating system, the combination of a superheater, a supply-main, a force-pump, expansion joints or couplings, a supply-pipe, a housing, N, branch pipes leading from said supply-pipe to different houses, a converter and regulator with which the branch supply-pipes communicate, and a radiator connected with the converter, substantially as shown and described.

3. In a heating system, the combination of a heater, a supply-main, a force-pump, a supply-pipe leading from the supply-main, a movable coupling, *c'*, pipes leading from said coupling to a regulator and converter, a regulator and converter, and radiators, substantially as shown and described.

4. In a heating system, the combination of a superheater, a supply-main, a force-pump, a supply-pipe leading from said main, a box or housing, N, a movable coupler or T-head attached to said supply-pipe and located in said box or housing, and branch pipes leading from said coupler to the buildings to be heated, substantially as shown and described.

5. In a heating system, the combination of a superheater, a supply-main, a force-pump, a supply-pipe, a box or housing into which said supply-pipe extends, a coupler attached to said pipe within said housing, and a branch pipe or pipes leading from said coupler into the house or houses to be heated, substantially as shown and described.

6. In a heating system, the combination of a heater, a supply-main, a force-pump, a supply-pipe, a housing into which said supply-pipe extends, a coupler within said housing, a branch pipe or pipes attached to said coupler and extending out of said housing into a building or buildings to be heated, a regulator and converter, and a radiator or radiators, substantially as shown and described.

7. In a heating system, the combination, with a heater, supply-main, and a force-pump, of a box or housing located beneath the sidewalk, said box being provided with ways or bearings, and a plate, *n''*, resting thereon, a supply-pipe extending from the said main into said housing, a coupling attached to said supply-pipe and resting movably upon the plate *n''*, and branch supply-pipes communicating with said coupling and extending into the house or houses to be heated, substantially as shown and described.

8. In a hot-water heating system, the combination of a superheater, a supply main, a force-pump, a box or housing provided with side openings, N', as shown, a supply-pipe leading from the main into said housing, a coupler and branch supply-pipes leading from said coupler through said openings into the building to be heated, substantially as shown and described.

9. In a hot-water heating system, the combination of a heater, a supply-main, a force-pump, a box or housing provided with side openings, N', and ways or brackets *n'*, as shown, of a plate at *n''*, resting on said ways, a coupler resting on said plate, a supply-pipe connecting the main and coupler, and branch supply-pipes leading from said coupler into the building or buildings to be heated through the openings N', substantially as shown and described.

10. In a hot-water and steam heating system, the combination of a heater, a supply-main, a force-pump, a housing, N, provided with ways or brackets, *n'*, a plate, *n''*, having a longitudinally-convexed upper surface, a coupler, C', having a convexed lower surface resting on said plate, a supply-pipe connecting the main and coupler, and a branch pipe or pipes leading from the coupler to the building or buildings to be heated, substantially as shown and described.

11. In a hot-water circulating system, the combination of a superheater, a supply-main and force-pump, an automatic double-acting check-valve located in the supply-main, a return-main, a return water-tank, and a pump for forcing the water from the tank into the heater, substantially as shown and described.

12. In a central-station heating system, the combination of a heater, a supply and a return main, a bracket at M, having an upper

and lower opening, and a removable cap and revoluble supports in said openings, whereby the mains are permitted to move freely in the direction of their lengths, substantially as shown and described.

13. In a central-station heating system, the combination of a heater, a supply and a return main, a bracket at M, having upper and lower openings, a removable cap for the upper opening, and revoluble supports for the mains in said openings, said bracket being secured firmly to its support, whereby said mains are held in place and their free longitudinal movement provided for, substantially as shown and described.

14. In a hot-water circulating system, the combination of a superheater, a supply-main, a force-pump therefor, a return-main, a supply-pipe, a box or housing, a movable coupling within said box, a branch supply-pipe leading from said movable coupling to the house to be heated, a branch return-pipe leading from the house to the said box and provided with a movable coupling therein, and a return-pipe leading from said coupling to the return-main, substantially as shown and described.

15. In a hot-water circulating system, the combination of a superheater, supply and return mains, a force-pump, supply and return pipes, branch supply and return pipes, and a box or housing within which the supply and return pipes and branch supply and branch return pipes connect, substantially as shown and described.

16. In a hot-water circulating system, the combination of a heater, force-pump, supply and return pipes, a housing within which the supply and return pipes connect with branch supply and return pipes, regulator and converter, a radiator or radiators, a condense-water tank, and connecting-pipes, substantially as shown and described.

17. In a hot-water circulating system, the combination of a heater, supply and return mains provided with expansion-joints, force-pumps, supply and return pipes, movable couplings, a housing containing the couplings, branch supply and return pipes, a regulator and converter, and radiators and connecting-pipes, substantially as shown and described.

18. In a hot-water and steam-heating system, the combination, with the supply-main, of an automatic pressure-regulator provided with a steam or converting chamber, said chamber being surrounded by a hot-water chamber, the supply-main, hot-water chamber, the regulator, and steam or converting chamber being in communication with each other, substantially as shown and described.

19. In a hot-water heating system, an automatic pressure-regulator provided with a steam or converting chamber, said chamber being partially inclosed by a hot-water chamber, the hot-water chamber, regulator, and steam or converting chamber being in communication, substantially as shown and described.

20. An automatic differential fluid-pressure regulator, consisting of a casing provided with chambers R″ O″ O‴, a piston, R‴, provided with a valved stem, *s*′, and a weighted lever, S‴, in combination with a converter, R, provided with the chamber R′, and a pipe or passage communicating with the chamber O‴ of the regulator, as shown and described.

387,202. HARROW. James H. Bailey, Sedalia, Mo. Filed Dec. 12, 1887. Serial No. 257,602. (No model.)

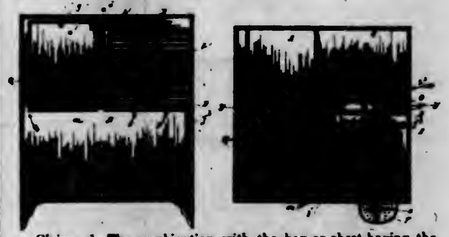
Claim.—1. In a harrow, the combination, with metal tooth bars or rails forming the sections thereof having tooth-supports detachably connected with their lower portions, and perforations through the side of their upper portion which receive and support the upper ends of said teeth, of the harrow-teeth having their upper bent ends passing through said perforations, said teeth having integral self-retaining heads formed on the outer ends of their upper bent portion that projects through said bars or rails, whereby said teeth are held in their respective places, substantially as specified.

2. The combination of a metal harrow-tooth bar or rail having holes through the side of its upper portion and the harrow-teeth bent at their upper ends passing through said holes, said teeth having integral self-retaining heads formed on the outer end of their upper bent portion that project laterally through said bar or rail, and the lower supports for said teeth detachably connected with the lower portion of said bar or rail, to which the upper ends of said teeth are attached and supported at different angles, substantially as specified.

3. The combination, with a metal harrow-tooth bar or rail having perforations through the side of its upper portion and the harrow-teeth bent at their upper ends passing through said perforations, said teeth having self-retaining heads formed on the outer end of their upper bent portion that project laterally through said bar or rail, of an angle or L shaped detachably-connected base having perforations through its lower lateral projecting portion which receive and form the lower supports for said teeth, substantially as specified.

4. The combination, with a metal harrow-tooth bar or rail having perforations through the side of its upper portion and the harrow-teeth bent at their upper ends passing through said perforations, said teeth having self-retaining heads formed on the outer ends of the upper bent portion thereof, of an angle or L shaped base having its vertical flange detachably connected to the lower portion of said bar or rail that supports the upper ends of said teeth, and the lateral projecting flange of said L-shaped base, having oblong perforations adapted to support and limit the horizontal movement of the self-adjusting teeth to stand at different angles, substantially as specified.

5. The combination of a two-part metal harrow-tooth-supporting bar or rail detachably connected, each one with the other, having perforations A^4 in the side of its upper vertical part, A, forming supports for the upper ends of the harrow-teeth, and having corresponding perforations through the lower lateral projecting part, A′, of an angle or L shaped detachably-connected base forming the lower supports for said teeth, substantially as specified.



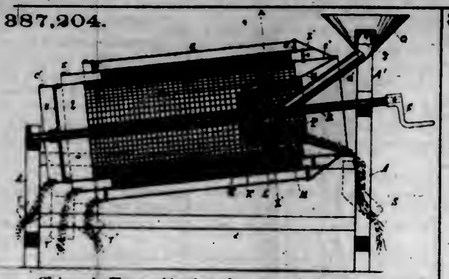
6. The combination of a two-part metal harrow-tooth-supporting bar or rail detachably connected, each one with the other, having perforations A^4 in the side of its upper part, A, and oblong perforations A^5 in the lower lateral projecting part, A′, of an angle or L shaped detachably-connected base, substantially as shown and described, and for the purpose specified.

7. The combination of a harrow-tooth and rail, said tooth having its upper end bent, with said bent end passing through a perforation formed through the side of the upper portion of said rail, said tooth having an integral self-retaining head, B^9, formed on the outer end of the upper bent portion, B′, thereof, said head adapted to catch or bear against the opposite side surface of said rail, to which the tooth is applied, and detachably supported at its lower portion, substantially as specified.

8. The combination of a harrow-tooth and rail, the lower tooth-supports detachably connected to said rail, the perforations in the side thereof, and the tooth having a hook-shaped self-retaining head formed on its upper end passing through said perforations, substantially as specified.

9. The combination of the harrow-teeth and rail, the perforations in the side thereof, and the harrow-teeth bent at their upper ends forming hook-shaped self-retaining heads pivotally supported in said perforations, the lower tooth-supports detachably connected with said rail, having longitudinal space between their shoulders adapted to support the teeth either vertically or inclined with respect to the direction in which the harrow is drawn, substantially as specified.

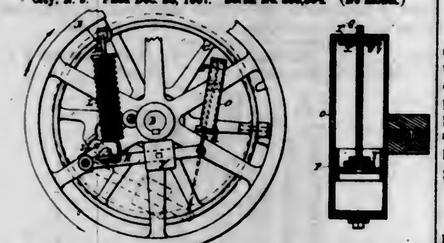
387,208. REFRIGERATOR. Chester M. Bates, Lebanon, Pa., assignor of one-half to Frederick H. Raggio, same place. Filed Feb. 11, 1888. Serial No. 263,734. (No model.)



Claim.—1. The combination, with the box or chest having the large lower compartment, of the L-shaped compartment located in the upper part of said box or chest, and having one side wall and its top parallel with the adjoining side and top of said box or chest, forming a space, G, therebetween, and the ice-box located in the re-entering angle of the L-shaped compartment, with its walls adjacent to the walls forming said angle, whereby a space or passage-way is formed between the ice-box and the adjacent walls of said angle, substantially as shown and described.

2. The combination, with the box or chest having the large lower compartment, of the L-shaped compartment located in the upper part of said box or chest and having a continuous space, G, surrounding one side and the top thereof, the wire or screen walls of the re-entering angle of said L-shaped compartment, the ice-box provided with two slatted walls, also located in the said angle, said slatted walls being adjacent to and parallel with said wire or screen walls, forming a space or passage-way between the same, substantially as shown and described.

387,204. GRAIN-SEPARATOR. George C. Berman, Minneapolis, Minn. Filed Oct. 13, 1887. Serial No. 252,157. (No model.)



387,204.

Claim.—1. The combination of a rotary shaft, a series of cylindrical screens of different degrees of fineness mounted thereon, a coarser conical screen in the receiving end thereof closed at its small end and opened at its larger end, and a finer removable conical screen adapted to fit within the coarser conical screen, substantially as set forth.

2. The combination of a rotary shaft, a series of cylindrical screens of different degrees of fineness mounted thereon, a conical screen in the receiving end thereof, closed at its small end and open at its larger end, a finer removable conical screen adapted to fit within the coarser conical screen, and a detachable feed-hopper having a discharge-spout projecting into said conical screen, substantially as set forth.

387,205. STEAM-ENGINE GOVERNOR. Julius Bouteet, Jersey City, N. J. Filed Dec. 20, 1887. Serial No. 258,594. (No model.)

Claim.—1. In an engine-governor, an inertia-weight combined with an eccentric rigidly connected therewith, substantially as described.

2. In an engine-governor, an inertia-weight combined with an eccentric, said weight and eccentric both moving about a common center of oscillation not coincident with the axis of the driving-shaft, substantially as described.

3. In an engine-governor, an inertia-weight, an eccentric, and a fly-wheel, said inertia-weight and fly-wheel revolving about centers not coincident, substantially as described.

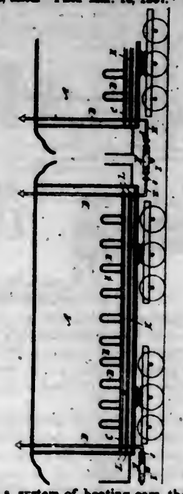
4. In an engine-governor, a weight pivoted to a revolving part of the engine and controlling an arm combined with an inertia-weight, to which said arm is connected, said inertia-weight revolving about an axis not coincident with axis of the driving-shaft, substantially as described.

5. In an engine-governor, a weight, a fly-wheel to which it is pivoted, and an arm controlled by said weight, combined with an inertia-weight, to which said arm is connected, said fly-wheel and inertia weight revolving about axes not coincident, substantially as described.

6. In an engine-governor, an inertia-weight supported at and free to revolve about a point outside of its center of gravity, combined with an eccentric, substantially as described.

7. In an engine-governor, the combination of an inertia-weight and a dash-pot connected thereto, substantially as described.

8. In an engine-governor, the combination of an inertia-weight, a centrifugal weight, and a dash-pot, substantially as described.

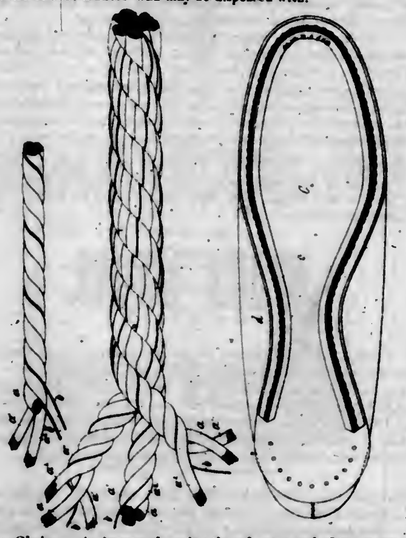


9. In an engine-governor, a dash-pot having a slotted cover to permit lateral motion of the piston-rod, and a plate fitted on the piston-rod adapted to slide on said slotted cover, substantially as described.

10. In an engine-governor, a flexible or elastic bearing consisting of metal bushing combined with an elastic packing, substantially as described.

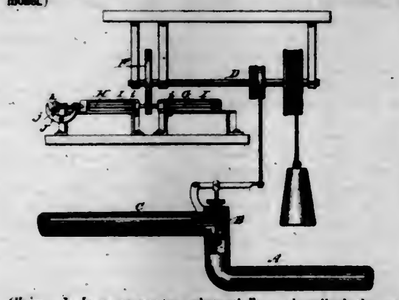
11. In an engine-governor, the combination of an inertia-weight revolving about an axis not coincident with the axis of the driving-shaft, a centrifugal weight, and a rocker-arm to which the centrifugal weight is immediately attached, substantially as described.

12. In an engine-governor, the combination of an inertia-weight supported at a point outside of its center of gravity, and a centrifugal weight arranged to counterbalance each other under the influence of gravity, substantially as described.



387,206. APPARATUS FOR HEATING CARS. Thomas H. Dortomley, Ogden, Mich. Filed Mar. 10, 1887. Serial No. 230,317. (No model.)

Claim.—In a system of heating cars, the combination of two stand-pipes supported at opposite ends of a car, projecting through the car-roof and open to the atmosphere, and provided at their lower ends with suitable couplings to connect between the cars, with a main pipe connecting the stand-pipes within the car, a radiating-circuit independent of the said main pipe and connecting the two stand-pipes, and two-way valves at the connection of the stand-pipes with the main pipe and radiating-circuit, substantially as described.



387,207. SEWING THREAD OR CORD. J. Henry Bilgen, Philadelphia, Pa., assignor to J. Walter Douglass, same place. Filed Oct. 12, 1887. Serial No. 252,143. (No specimens.)

Brief.—The invention is an improvement upon that covered by United States Letters Patent No. 346,577, dated August 3, 1886, the object being to produce an improved thread, particularly for sewing boots and shoes, which shall be inelastic and pliable, and by which the use of shoe-makers' wax may be dispensed with.

Claim.—An improved sewing-thread composed of two or more strands of filamentous material and a metallic wire or wires, the said filamentous strands and wire or wires being twisted together, as described, and the said wire or wires lying between and parallel with the filamentous strands, as shown and described.

387,208. AUTOMATIC TEMPERATURE-REGULATOR. James W. Brock, Lynchburg, Va. Filed Nov. 26, 1886. Serial No. 220,092. (No model.)

Claim.—1. In an apparatus substantially as described, the combination, with a friction-plate, of a longitudinally-contractible rod bearing at one end thereagainst and adapted to be contracted under the influence of cold, whereby said plate may be normally held by the said rod, but will be released on a considerable fall in temperature, substantially as set forth.

2. In an apparatus substantially as described, the combination, with a friction-plate, of a longitudinally-contractible detent-rod arranged to bear at one end against said plate, and a screw for adjusting said rod, substantially as set forth.

3. A friction-plate movably supported combined with a longitudinally-contractible detent-rod arranged to bear at one end against said plate and located at an angle to said plate, substantially as described, whereby to operate as a friction-pawl, as and for the purposes specified.

4. The combination, with a friction-plate, of rods arranged on opposite sides thereof and having their inner or adjacent ends set to bear against the friction-plate, substantially as set forth.

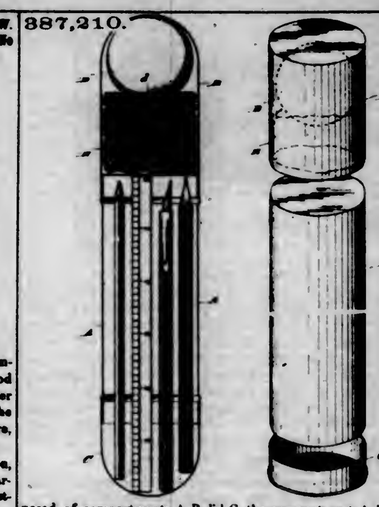
5. The combination of the friction-plate, the detent-rods, and the guide-frames I, having anti-friction bearings for said detent-rods, substantially as set forth.

6. The combination of the friction-plate, the rod bearing thereagainst, the set-screw, and a pointer, and scale whereby to determine at what degree the plate will be released, substantially as set forth.

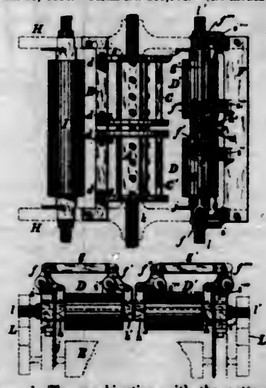
7. In an automatic apparatus substantially as described, the combination, with a friction-plate having a flat side, of a longitudinally-contractible rod bearing at one end tightly against the flat side of said plate, all substantially as and for the purposes specified.

8. In an automatic apparatus substantially as described, the combination of a shaft, connections between said shaft and the device to be operated, a friction-plate fixed to said shaft, and a longitudinally-contractible rod bearing at one end tightly against said plate and adapted to be contracted under the influence of cold, whereby said plate and shaft may be normally held by the rod, but will be released on a considerable fall in temperature, substantially as set forth.

387,209. CAR-WHEEL. William H. Brown, Jersey City, N. J., assignor, by mesne assignments, to The Brown's Seamless Metal Company, of New Jersey. Filed Sept. 9, 1886. Serial No. 213,051. (No model.)



Claim.—The combination of the two principal wheel-sections *a b c d* and *e f*, the filling *i*, the bushing *g*, and the clamping-bolts *h*, one of the said sections consisting of a disk, *a*, tread *c*, flange *d*, and central tubular projection, *b*, and the other of a disk, *e*, having a central tubular projection, *g*, the said bushing fitting both of the said tubular projections and the clamping-bolts clamping the filling between the disks *a e*, all substantially as herein described.



387,210. SCHOLAR'S COMPANION. Thomas G. Cookings and John J. McVaney, Jr., Riverside, Ohio; said Cookings assignor to Alvin Knop, same place. Filed May 11, 1886. Serial No. 273,618. (No model.)

Claim.—1. As a new article of manufacture, a scholar's companion composed of two detachable compartments, one containing the pencils and the other a ball filled with water and a sponge, substantially as set forth.

2. As a new article of manufacture, a scholar's companion composed of compartments A B, lid C, the compartment A being closed at one end, ball D, and sponge E, substantially as set forth.

387,211. PLANING-MACHINE. John Cornell, Rochester, N. Y. Filed Jan. 26, 1888. Serial No. 199,571. (No model.)

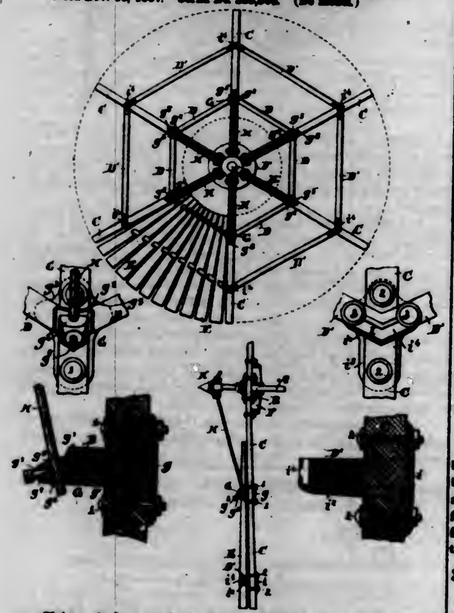
Claim.—1. The combination, with the cutter-head A, of the pressure-bar B, extending across the machine in rear of the cutter-head, and removably attached to the upper surfaces of the side frames at each of its ends, and the independently-movable chip-breakers C C', provided at their ends with the arms *c c*, extending over the cutter-head and pivoted at their rear ends to the pressure-bar, whereby provision is made for the simultaneous removal of the pressure-bar and the divided chip-breakers C C' from the machine, substantially as described.

2. The combination, with the cutter-head A, of the pressure-bar B, extending across the machine in rear of the cutter-head, the independently-movable chip-breakers C C', provided with an arm or arms *c*, extending over the cutter-head and pivoted at their rear ends to the pressure-bar, and the independently-movable feeding-rollers D D', substantially as described.

3. The combination, with the lower feed-roll, E, of the movable upper feed-roll, D, provided at each end with boxes *h h'*, and bell-cranks *f f'*, connected together by link *g*, extending parallel with the axis of the roll, whereby an equal pressure is secured at each end of the roll during the rising and falling movement, substantially as described.

4. The combination, with the lower feed-roll, E, of the independently-movable upper feed-rolls, D D', provided at their ends with the boxes *h h' h² h²*, and bell-cranks *f f' f² f²*, connected together by the links *g g'*, extending parallel with the axes of the rolls, whereby the upper rolls are permitted to rise and fall independently of each other, substantially as described.

5. The combination, with the upper movable feed-roll, D, provided at its ends with the boxes *h h'*, and bell-cranks *f f'*, connected together by the link *g*, of the cross-bar F, having arms *i i'*, extending over the rolls and supporting the pivots of the bell-cranks, substantially as described.



6. The combination, with the upper feed-roll, D, provided at each end with the boxes *h h'*, and bell-cranks *f f'*, connected together by link *g*, of the cross-bar F, having tongues *s* extending inward and forming a guide for the box *h'*, substantially as described.

7. The combination, with the movable feed-roll, of bearings at the ends thereof, supports for causing their movements in parallel lines, and a link or rod connecting said supports for causing their simultaneous movement in the same direction, substantially as described.

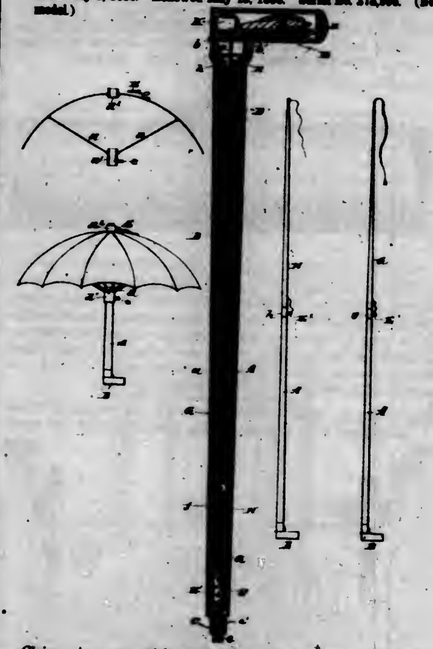
8. The combination, with the movable feed-roll, of bearings at the ends thereof, supports for causing their movements in parallel lines, a link or rod connecting said supports and causing their simultaneous movements in the same direction, and a weight applied to one of said bearings.

9. The combination, with the support for the material, of the pressure-roll, bearings for the same, and levers connected to said bearings for supporting them, and a link connecting said levers for equalizing their motion, substantially as described.

387,212. WINDMILL. Andrew J. Chrisman, Jersey City, N. J. Filed Nov. 10, 1887. Serial No. 255,203. (No model.)

Claim.—1. In a windmill, the combination, with the wheel-shaft, the radial arms, section-bars, and stay-rods, of a clip for securing said arms and section-bars together, provided with an adjustable holding device, substantially as described, for securing the ends of the stay-rods.

2. The clip G, for securing the section-bars to the radial arms, comprising a web, *g*, arms *g' g'*, cap g^2, lugs g^3 g^3, and vertical flanges g^4 g^4, the said clip adapted to be slipped over the radial arms and embrace the ends of the section-bars and fastened in place upon the radial arms by bolts, substantially as shown and described.



3. The clip G, for securing the section-bars to the radial arms, comprising a web, *g*, arms *g' g'*, cap g^2, lugs g^3 g^3, and vertical flanges g^4 g^4, and provided with a perforated lug for the reception of the stay-rod, and a set-screw for adjustably securing the stay-rod in place, substantially as shown and described.

4. The clip I, for securing together the radial arms and the section-bars, consisting of a web, *i*, a V-shaped flange, i^2, and a strut, i^4, the V-shaped flange i^2 being provided with an aperture for the reception of the radial arm, the whole being secured in place by means of bolts, substantially in the manner shown and described.

5. The clip I, for securing together the radial arms and the section-bars, consisting of a web, *i*, a V-shaped flange, i^2, side flanges, i^3, and a strut, i^4, the V-shaped flange i^2 being provided with an aperture for the reception of the radial arm, the whole being secured in place by means of bolts, substantially in the manner shown and described.

6. In a windmill, the combination, with the wheel-shaft A, the annular beam K, mounted on the outer end thereof, the radial arms C, secured to the shaft by means of the spider B, and braced by the annular collar F, bolted to said arms, the section-bars D, and the stay-rods H, secured at their inner ends to the annular beam K and adjustably secured at their outer ends to the radial arms C, all constructed and arranged substantially as shown and described.

387,213. COMBINATION-CANE. Daniel Crowley, Boston, Mass. Filed May 1, 1888. Renewed May 15, 1888. Serial No. 273,906. (No model.)

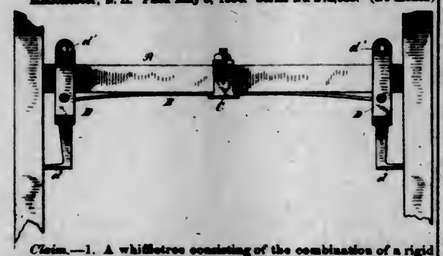
Claim.—As a new article of manufacture, a cane having a hollow body adapted to receive an umbrella-top, a whip-tip, or fishing-rod tip, and provided with a handle adapted to open and close the upper or larger end of the body, the said cane having at its smaller end a ferrule adapted to enter a socket in the umbrella-top, whip-tip, or fishing-rod tip, the said ferrule having a transverse opening therein for the entrance of a locking-pin, substantially as set forth.

387,214. BOG-BEATER. John J. Dull, Marysville, Ohio. Filed Oct. 26, 1887. Serial No. 253,253. (No model.)

Claim.—1. The beaters comprising end plates made in sections, beater-rods between the end plates, and a hook on one section of the end plate engaging a stud on the adjacent end plate, as set forth.

2. The combination of the body, the hollow shaft G, journaled in one end of the same and having an angular bore, H, on its inner end, the shaft L, inserted through the shaft G and having an angular bore, M, in its inner end, mechanism for rotating said shafts in opposite directions, the inner beater comprising the end plates and the beater-

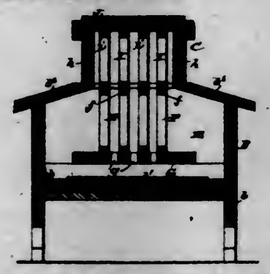
rods between the same, one of said end plates having an angular socket, S², to receive the angular bow M, and the outer beater consisting of end plates and beater-rods, one of said end plates having an angular opening adapted to fit around the angular bow H, as set forth.



3. In an egg-beater or churn, the combination, with the body A, of the beater R, journaled therein and comprising the end plates R' and the beating-rods *r*, and the outer beater, T, surrounding the beater R and comprising the end plates T' T', formed in sections *t' t'*, the beating-rods *t t*, attached at the ends to the said sections, the links V V, attached at the ends to the beating-rods at adjacent edges of the sections, and the hooks W on the opposite edges of the sections, adapted to engage studs W on the other sections, substantially as and for the purpose specified.

387,215. LOCKING DEVICE FOR STOVE-PIPE DAMPERS. Valentine Doane, Jr., Harwich, Mass., assignor to Fred V. Dunne, same place. Filed Jan. 10, 1887. Serial No. 223,960. (No model.)

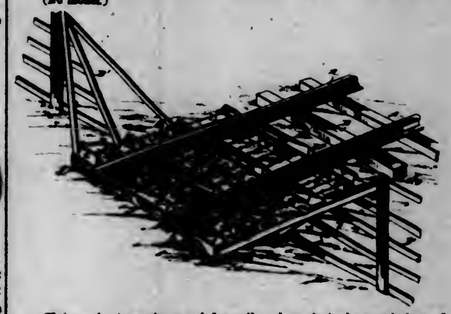
Claim.—In a locking device for dampers in stove-pipes, the combination of the stove-pipe provided with a locking-catch having tapered recesses or openings smallest at their open ends to prevent slipping, as described, with a damper whose diameter is less than that of the pipe, having a stationary handle for engagement within the recesses in the locking-catch, said damper being held at any desired angle to the line of the pipe by the locking-catch and by its own gravity, substantially as and for the purposes specified.



387,216. WHIFFLETREE. George B. H. Dow and John H. Willey, Manchester, N. H. Filed May 3, 1888. Serial No. 272,695. (No model.)

Claim.—1. A whiffletree consisting of the combination of a rigid bar, a spring secured to the front side of said bar, and yokes pivotally connected with the spring embracing the bar and having connecting-bolts, substantially as described.

2. A whiffletree consisting of the combination of a rigid bar, a spring secured to the front side of said bar, yokes pivotally connected with the spring embracing the bar, and supplemental cushions or springs attached to the yokes, substantially as described.

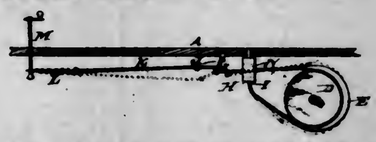


387,217. BEE-HIVE. Ira C. Doyal, Gumley, Ala. Filed Apr. 30, 1888. Serial No. 272,377. (No model.)

Claim.—1. In a bee-hive, the combination, with the brood-frames having the projections of the upper rails inserted in recesses in boards secured to the inner surfaces of the back and front walls of the lower or brood section, B, of the partial horizontal partition G, running from front to back in said section, touching and supporting the lower rails of each of said frames, and provided with the series of perforations *g* between each two of said frames, substantially as specified.

2. The herein-described bee-hive, comprising the lower section, B, the upper section, C, the inclined bottom forming a resting-place for the bees, which resting-place is in front of the hive and widest in front of the bee-entrance, the sliding gate D, having a notch in its lower side to form the bee-entrance, the partial partition G, running from front to back and provided with perforations arranged in series, and the frames F, with their lower rails resting on said partition between the series of perforations, substantially as specified.

387,218. CATTLE-GUARD FOR RAILROAD-TRACKS. Robert H. Elliott, Birmingham, Ala. Filed Feb. 24, 1888. Serial No. 265,095. (No model.)



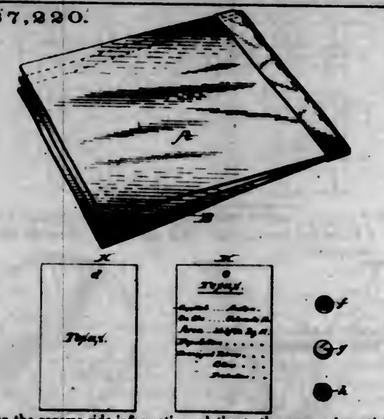
Claim.—1. A cattle-guard for railroad-track beds, consisting of the combination of metallic caps or covers of angular shape secured to the cross-ties and series of bars or strips of metal crossing the spaces between the ties, the same being corrugated, substantially as described.

2. A cattle-guard for railroad-track beds, consisting of the combination of metallic caps or covers of angular shape secured to the cross-ties between the rails, similar caps secured to the projecting ends of the ties, the ends of said caps contiguous to the rails being beveled or slanting, and series of bars or strips of metal crossing the spaces between the ties, the same being corrugated, substantially as described.

3. A cattle-guard for railroad-track beds, consisting of the combination of metallic caps or covers having the seating-flanges on their edges and of angular shape at the top, screws or bolts securing them to the ties, and series of bars or strips of metal crossing the spaces between the ties, the same being corrugated and secured to the ties by rivets or screws, substantially as described.

4. In a cattle-guard for railroads, the angular metallic cap attached to the cross-ties by the seating-flanges with which its edges are provided, substantially as described.

387,219. CAR-BRAKE. Charles B. Fythian, Camden, N. J. Filed Nov. 24, 1885. Serial No. 183,577. (No model.)



Claim.—1. A car-brake consisting of a grooved wheel, D, a curved substantially C-shaped spring-band, E, carrying a series of bearing-blocks fitted to said groove, said spring-band being secured at one end to a rigid support carried by the car, and at the other end to the brake-operating devices, the spring-band being arranged to positively throw the blocks out of engagement with the grooved wheel when released, substantially as described.

2. In a car-brake, the combination of a brake-wheel, an encircling friction-strap engaging therewith, a slotted support, H, carried below the car, to which one end of the brake-strap is secured, and the brake-rod connected to the free end of the brake-strap and supported to slide in the slot in the support H, substantially as described.

387,220. GAME. William Forker, Glenwood Springs, Colo. Filed Apr. 2, 1888. Serial No. 269,291. (No model.)

Claim.—1. A game-board consisting of a field appropriately printed or engraved thereon having tally-columns around its four sides, in combination with cards representing geographical divisions or subdivisions of said map, and bearing on one side the name of said division

387,220.

and on the reverse side information relative to the same, substantially as described.

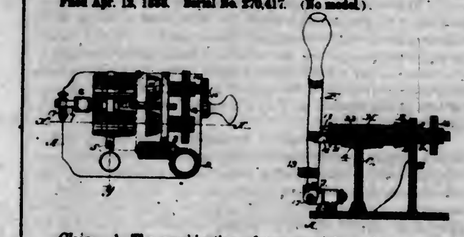
2. A folding game-board having on one half thereof a complete geographical map and on the other half an outline-map of the same geographical division, in combination with a fly-leaf for covering the complete map while a game is being played, and a pack of cards representing geographical divisions or subdivisions of said map, and bearing on one side the name of said division and on the reverse side information relative to the same, substantially as described.

3. A game apparatus consisting of a board having on one half a complete geographical map and on the other half an outline-map of the same geographical division separated by a fly-leaf, in combination with a pack of cards representing geographical divisions or subdivisions of said map, and bearing on one side the name of said division and on the reverse side information relative to the same, and tally-columns around the margin of the board which bears the outline-map and counters, substantially as described.

387,221. COMPOSITION FOR BUILDING-STONE. Albert Fürst and Rudolph Schawbleiber, Denver, Colo. Filed Oct. 14, 1887. Serial No. 252,263. (No specimens.)

Claim.—The herein-described composition for building-stone, consisting of powdered clay and plaster-of-paris, as set forth.

387,222. POTATO-PLANTER. R. Darwin Gaines, Sterling, Ill. Filed Feb. 25, 1888. Serial No. 264,915. (No model.)



Claim.—1. The combination of the revolving chamber C, containing an interior circular shell, D, adapted to be rotated by the traction of said chamber, and the fixed shell G, having a closed outer end and open inner end adapted to be partially inserted within the shell D, and provided with slot J, substantially as shown, and for the purpose described.

2. The combination of the rotating shell D, provided with seed-openings E and radial seed-ducts F, and the fixed shell G, having a closed outer and open inner end adapted to be inserted within the shell D, and also provided with seed-entrance L and seed-exit J, substantially as shown, and for the purpose described.

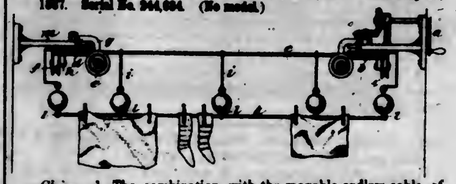
3. The combination of the circular seed-chamber D, adapted to be rotated by traction, and provided with seed-openings E and seed-ducts F, the fixed shell G, having a closed outer end, and its inner end adapted to be projected partially within the fixed shell G, and provided with seed-exit J, and exterior guards, M and O, adapted to close the outer ends of the seed-ducts F during a portion of their orbital movement, substantially as shown, and for the purpose described.

4. The combination of the frame A, a revolving chamber, C, suitably pivoted therein, so as to be rotated by traction in the forward movement of said frame, and herein provided interiorly with the circular shell D, having seed-openings in its periphery, the shell G, provided with seed-exits J, and suitably attached to the frame A and projected partially within the shell D, so that the seed-openings in the latter will register at the opening J, and the exterior guards, M and O, substantially as shown, and for the purpose described.

387,223. CARTRIDGE-LOADER. Holly Gardner, Albany, N. Y. Filed Apr. 13, 1888. Serial No. 270,417. (No model.)

Claim.—1. The combination of two revolving crimpers, which are geared to rotate together, shell-guides whose center lines range with the centers of said crimpers, and a lever by which the shells are held in a non-rotative position, and are forced into said crimpers, the said lever being fitted to swing sidewise into correspondence with the centers of said crimpers, as and for the purpose herein specified.

2. A charging-cylinder having a trunnion arranged tangentially to the bore of said cylinder, so that the lower end of a cartridge-shell fixed in the latter will be swung directly to bear evenly on the level surface of a seat on which said cartridge-shell rests when said cylinder is in a vertical position, as and for the purpose herein specified.



387,224. OPERATING ELEVATOR-GATES. James Gibbons, Springfield, Mass., assignor of one-half to Stephen H. Howland, same place. Filed July 22, 1887. Serial No. 245,088. (No model.)

Claim.—1. The combination, with an elevator, of a pressure-actuated motor that comprises the cylinders C C, pistons in said cylinders, an inlet-pipe and a waste-pipe connected to said cylinders and provided with a valve, A, having a spring, S, and part V, projecting in the path of said elevator, and a gate joined to and movable with said pistons, substantially as described.

2. The combination, with the elevator E and a motor that comprises cylinders C C, pistons in said cylinders, the inlet-pipe 2 and a waste-pipe 3, connecting to said cylinders and provided with a valve, A, having a spring, S, and a part, V, that projects in the path of said elevator, and a gate joined to and movable with said piston, the whole arranged and operating substantially as described.

387,225. CLOTHES-DRIER. Matthew Gerhovy, Chicago, Ill., assignor of one-half to Mathias Dapper, same place. Filed July 19, 1887. Serial No. 244,694. (No model.)

Claim.—1. The combination, with the movable endless cable, of weighted supports secured thereto at intervals, and the clothes-line suspended from said weighted supports, whereby the clothes-line is carried with the cable and held down in position out of the way of the cable, substantially as specified.

2. In a clothes-drier, the combination, with a bracket, of a horizontal pulley and two swinging arms, each carrying a separate pulley, the upper edges of the pulleys carried on the swinging arms being tangent to the horizontal pulley and adapted to support a cable, substantially as described.

3. The combination, with the clothes-line, of weighted supports provided with eyes through which the clothes-line is strung, of an endless cable to which the supports are attached, and pulley devices for supporting and guiding the cable, each pulley device consisting of a horizontal wheel and two wheels tangent thereto upon pivoted arms and adapted to run under and support the cable without coming into the path of the supports as they are carried around with the cable, substantially as specified.

4. The combination, with a horizontal pulley, of two pulleys slightly inclined inwardly from the perpendicular and suspended upon swinging arms, a cable passing around the horizontal pulley and over the said slightly-inclined pulleys, and the supports attached at intervals to the cable, whereby said slightly-inclined pulleys may be adjusted to support the cable running at different angles without coming into the path of the supports, substantially as described.

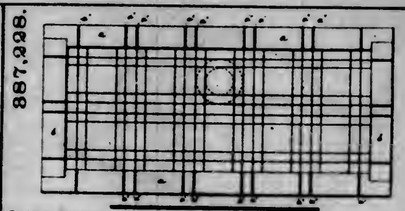
5. The combination, with pulley mechanism for carrying the endless cable which supports the clothes-line, of gear mechanism for turning one of the pulleys and thereby moving the endless cable in either direction, the weighted hangers suspended upon the cable at intervals, and the clothes-line *k*, run through eyes *l*, provided upon the weights, substantially as specified.

387,226. HOSE-COUPLING. PHILIP GLEICH and HORATIO S. KRAMER, St. Paul, Minn. Filed Oct. 13, 1886. Serial No. 216,154. (Model.)

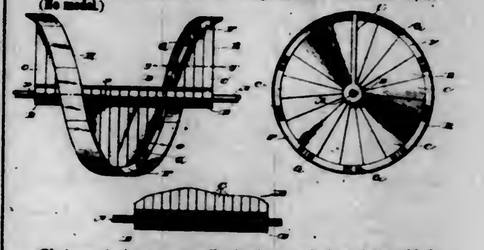
Claim.—1. In a hose-coupling formed of male and female shells, the combination of the female shell A, adapted to receive the end of a hose-pipe inside of the same, having an inwardly-projecting flange, *a*, of equal interior diameter to that of the hose-pipe inserted therein, the said flange having a coved packing-seat retaining the packing-ring C therein, the said female shell also having in its overlapping part inwardly-springing catch-blocks *h h*, with their outer ends housed in projections of the shell, as set forth, the packing-ring C, and the male shell B, also adapted to receive the end of a hose-pipe inside of the same, and having an inwardly-projecting flange, *b*, of equal interior diameter to that of the hose-pipe, inserted therein, the said flange extending to the inner end of the shell and having a coved packing-seat at its inner end, adapted to fit against the packing-ring when the shells are coupled together, the said male shell also having a catch-flange, *g*, around the exterior periphery of its insertible portion, adapted to receive the said catch-blocks of the female shell, all as and for the purpose herein set forth.

2. The combination of the lift-pins *l l*, housings *t t*, having flared open sides *u u*, and the forked lifting-tongs D, adapted to enter the said open sides of the housings and to be guided thereby to the said lifting-pins, substantially as and for the purpose herein set forth.

387,227. HOG-CRATE. WILLIAM R. GREENE, Marlborough, N. Y. Filed Feb. 24, 1888. Serial No. 265,142. (No model.)



Claim.—1. The combination of frame *a* with two sets of crossing wires arranged beneath one another, the wires in each set forming alternate squares and rectangular figures, and with braces *g*, traversing the rectangular figures between the squares, substantially as specified



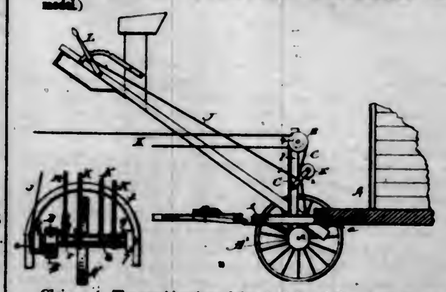
2. The combination of frame *a* with two sets of crossing wires *b c* and *d e*, and with the braces *g*, having shoulders *g'* and nuts *g*, substantially as specified.

387,228. HOG-CRATE. WILLIAM R. GREENE, Marlborough, N. Y. Filed Apr. 4, 1888. Serial No. 269,581. (No model.)

Claim.—The combination of an open frame composed of longitudinal rails *a* and transverse rails *b* notched at their upper and lower edges, with wires stretched across the frame and extending first through two opposite upper notches, then along the side of the rail, and then through two opposite lower notches, the whole constituting a frame with two sets of open squares, substantially as specified.

387,229. SCREW-PROPELLER. ALEXANDER D. HALL and GEORGE B. EGAN, San Francisco, Cal. Filed Apr. 2, 1888. Serial No. 269,642. (No model.)

Claim.—1. A screw-propeller having a spiral continuous blade with no openings therein, making one complete revolution, and provided at its outer edge with the spiral laterally-extending flange, for the purpose set forth, the said flange being disposed in a plane parallel with the axis of the propeller, the length of the said blade being in excess of the diameter of the propeller, substantially as described.



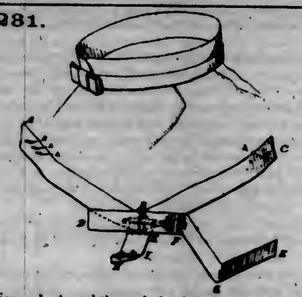
2. The propeller having the continuous spiral blade formed of separable sectors, the said sectors being separably keyed to the propeller-shaft, and having their opposing edges secured together, substantially as described.

3. The propeller having the continuous spiral blade forming one complete revolution, the said blade being made of separable sectors the said sectors having their opposing edges tongued and grooved, and thereby adapted to effect tight joints, substantially as described.

4. The combination, in a propeller, of the spiral blade and the flange E at the outer edge of said blade, said flange having the flanges F embracing the opposite sides of the spiral blade and bolted thereto, substantially as described.

5. The propeller having the continuous spiral blade, forming one complete revolution, and the flange E on the outer edge of the blade, the said flange being disposed in a plane parallel with the axis of the propeller and having its rear edge or projecting portion broader than its forward projecting portion, for the purpose set forth, substantially as described.

387,230. HORSE-CHECKING DEVICE FOR HARVESTERS. DANIEL COLLINS HALL, Stockton, Cal.; LIZZIE F. HALL administratrix of said Daniel Collins Hall, deceased. Filed Jan. 17, 1887. Serial No. 224,656. (No model.)



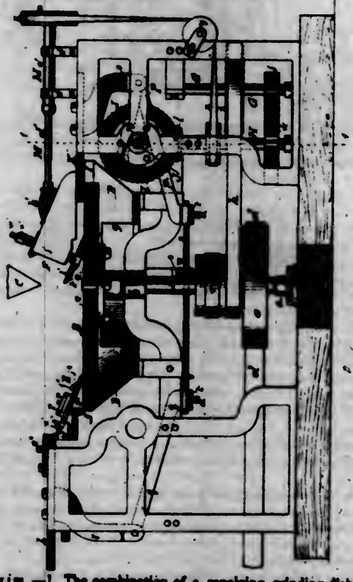
Claim.—1. The combination of the shaft 9 and the wheel A' with the sheaves and belt, the belt-tightener, and the lines J and K, as set forth.

2. The combination of the lines K, the shaft 9, the sheave B, the belt C, the wheel A', having the hub 2, the arm 4, pivoted to the standard 7, the sheave E, and the line J, as set forth.

387,231. HECKTIE. WILLIAM H. HARRISON, Jr., New York, N. Y. Filed Oct. 26, 1887. Serial No. 253,243. (No model.)

387,231.

Claim.—1. A necktie made by fastening together the strips A B C, D F G E, and H I K in the manner shown and described, the strip D F G E being folded at F and G and the tie being fastened to the collar-button at the front of the shirt by the button-hole *a*.



2. A necktie constructed in a bow-knot by fastening together the strips A B C, D F G E, and H I K in the manner shown and described, the strip D F G E being folded at F and G, and the necktie being fastened to the collar-button at the front of the shirt by the button-hole *c* and to the collar-button at the back by the button-holes *b* and *b*.

387,232. BOTTLE-STOPPER. WILLIAM RENDEN and JOHN M. ARMS, Alliance, Ohio. Filed Jan. 5, 1888. Serial No. 255,914. (No model.)

Claim.—In a bottle-stopper, the combination, with the ball and the cap, of an operating-lever forming a connection between the ball and the cap, the said lever being provided with two pairs of malleable-metal jaws extending in opposite directions from its head and closed around the ball, and a loop on the cap, respectively, substantially as set forth.

387,233. MACHINE FOR BEVELING THE EDGES OF GLASS PLATES. JOSEPH HOLLEY, Brooklyn, N. Y. Filed May 19, 1888. Serial No. 273,609. (No model.)

Claim.—1. The combination of a revolving grinding-disk and one or more glass-plate-holding clutches having a reciprocating movement radially over the face of the grinding-disk in adjustable positions, for the purpose herein specified.

2. The combination of a revolving grinding-disk and one or more glass-plate-holding clutches having a reciprocating movement radially over the face of the grinding-disk in adjustable positions, for the purpose herein specified.

3. The combination of a revolving grinding-disk and two glass-plate-holding clutches placed diametrically opposite to each other across the disk, and having a radial reciprocating movement over the disk, the movement of each clutch being outward, while that of the other is inward, for the purpose herein set forth.

4. The combination of a revolving grinding-disk, a circular-glass-plate-holding clutch having a reciprocating motion radially over the disk, and a rotating mandrel for imparting a rotary motion to the glass plates during the reciprocations of the clutch.

5. The combination of a revolving grinding-disk, a circular-glass-plate-holding clutch having a reciprocating motion radially over the disk, and a straight-edge glass-plate-holding clutch having a reciprocating motion over the disk imparted to it directly by the other clutch or its sliding carriage, substantially as and for the purpose herein specified.

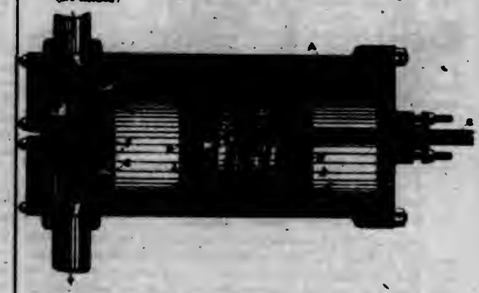
6. The reciprocating circular-glass-plate-holding clutch provided with a revolving spindle or mandrel, and a revolving-mandrel driving-shaft constructed in two parts, one part sliding in and coupled to the other, substantially as and for the purpose herein specified.

7. A reciprocating circular-glass-plate clutch provided with a revolving spindle or mandrel, in combination with a longitudinally-movable driving-shaft geared to the mandrel, having its adjacent journal coupled in its bearing, and a holding and releasing catch, substantially as and for the purpose herein specified.

8. A circular-glass-plate clutch having two clamping-plates, one plate being smaller in diameter than the glass plate to be held, and the other plate being as large as or larger than the glass plates in diameter, for the purpose herein specified.

9. A circular-glass-plate clutch having two clamping-plates, one smaller and the other larger in diameter than the glass plates to be held between them, and the larger plate having a projecting rim or flange adapted to surround and hold in central position the said glass plates.

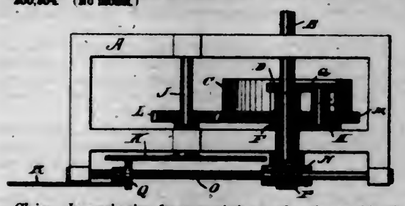
10. A circular-glass-plate clutch having two clamping-plates, one smaller and the other larger than or as large as the glass plates in diameter, and the surfaces of the two plates having a thickness of india-rubber or other elastic soft material upon them, substantially as and for the purpose herein specified.



11. In a glass-plate beveling or grinding machine, a reciprocating straight-edged-glass-plate clutch pivoted to its slide-carrier, the bearings of the carrier having swinging caps to cover the removable journals of the clutches, substantially as and for the purpose herein specified.

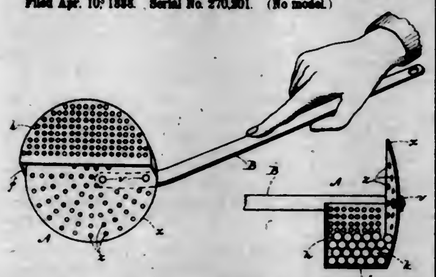
12. The straight-edged-glass-plate clutch constructed with two clamp-plates hinged together at one edge and tightened by wedge-acting hooks projecting from one plate, and a swinging bar on the other plate catching into the hooks, substantially as herein specified.

13. A straight-edged-glass-plate clutch hinged at one edge to its slide-carrier, and provided with a series of attachable and removable weights for graduating the pressure of the glass plate on the grinding-disk, substantially as herein specified.



14. The combination of the movable part *d'* of the shaft M, and the handle *h'*, in which said shaft freely turns, substantially as and for the purpose herein specified.

387,234. COMPRESSION-PUMP FOR ICE-MACHINES. ARTHUR M. HUTCHINSON, Philadelphia, Pa. Filed Dec. 2, 1886. Serial No. 254,259. (No model.)



Claim.—The combination, with the cylinder A, of the hollow piston D D' E, the piston-rod G, guide-piece J, and spring L, arranged within said hollow piston and on each side of said guide-piece, the whole operating in the manner set forth.

387,235. TRANSMITTING MOTION. Willis C. Jones and Winfield S. Rogers, Cincinnati, Ohio. Filed Nov. 23, 1887. Serial No. 256,904. (No model.)

Claim.—In mechanism for transmitting motion, the combination, substantially as set forth, with mechanism employing planetary gearing and a loose center gear, of a friction-disk arranged to be rotated from such mechanism, a splined shaft, a bush-wheel splined to and adjustable along said shaft and engaging such friction-disk, and means, substantially as set forth, for transmitting motion from such splined shaft to said loose center gear.

387,236. SKIMMER. George K. Knowlton, Hamilton, Mass. Filed Apr. 10, 1888. Serial No. 270,201. (No model.)

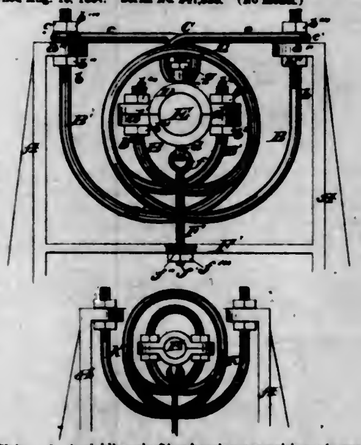
Claim.—1. In a skimmer, the combination, of a handle, a perforated dish-shaped plate secured to said handle, a semicircular perforated strip of sheet metal secured vertically to the edge of said plate, and a semicircular perforated plate secured to the upper edge of said strip, substantially as set forth.

2. In a skimmer, the handle B, in combination with the dish-shaped perforated plate *x*, semicircular perforated strip *f*, and semicircular perforated plate A, said plates and strip being secured together to form a skimmer provided with a drain-cup, substantially as described.

3. As an improved article of manufacture, a foraminous dish-shaped skimmer having a handle and provided at one side with a foraminous drain-cup for receiving the vegetables from the skimmer and holding them while being drained, substantially as set forth.

387,237. WAGON. Henry G. Lane, Bucyrus, Ohio. Filed Mar. 19, 1888. Serial No. 267,755. (No model.)

Claim.—1. The herein-described running-gear for vehicles, composed of the front and rear axles formed from double-flanged bars, the axle-arms removably held between the ends of the angle-bars, the front hounds having their rear portion bent down, the guard-rail, the truss-braces secured to the horizontal flange of the hounds, the sand-board made of metal and having flanges at its edges, the rear hounds having their front ends converging and united by an upper and a lower plate, the reach, the angle-brackets for the reach on the rear axle, the bolsters of double-flanged angle metal, and the stakes having rear ribs constructed, arranged, and operating substantially as specified.



2. In a running-gear for vehicles, the combination of the front axle, the hounds having their rear portions bent down to about flush with the top of the axle, the sand-board resting on the hounds, the guard-rail J, located above the hounds and parallel therewith, the reach passing between the hounds and the said guard-rail J, the truss-braces C', the bolts *f'*, securing the hounds, the sand-board, the axle, and the truss-braces together, the bolts *j*, securing the front ends of the truss, the guard-rail, and the hounds together, and the bolts *j'*, holding the rear ends of the truss-braces, the hounds, and the said guard-rail J together, substantially as described.

3. The combination, with the axle composed of two bars and the frames arranged between and bolted to the bars, of the axle-arm held in the frames, substantially as specified.

4. The combination, with the axle composed of two double-flanged bars arranged with the flanged sides opposite to each other, and the frames placed between the bars and the flanges and secured to the said bars, of the axle-arm having a shank inserted in the frames and held therein by a shoulder at one end of the shank and a key at the other end of the shank, substantially as described.

5. The combination, with the axle composed of two double-flanged angle-bars, of the frames having lateral arms, which arms extend through the bars and are secured thereto, substantially as specified, for the purpose described.

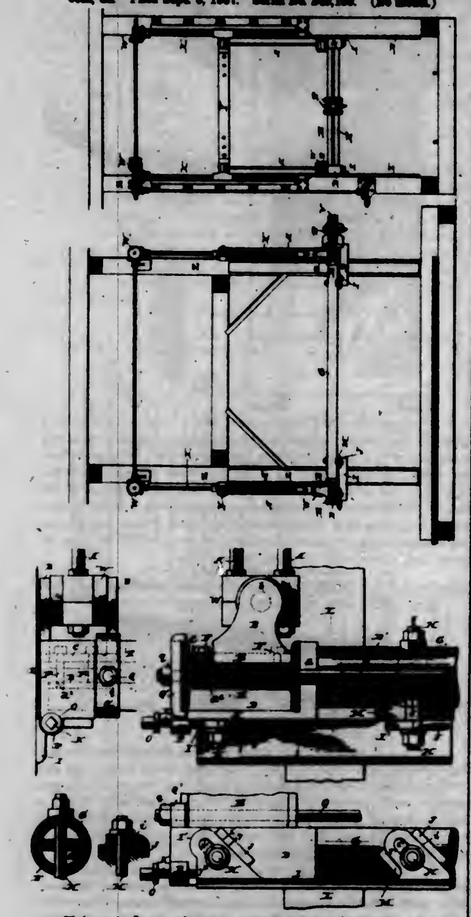
387,238. SHAFTING-BEARING. Charles D. Magee, Chicago, Ill. Filed Aug. 18, 1887. Serial No. 247,333. (No model.)

Claim.—1. A yielding shafting-bearing comprising a journal-box and coiled springs encircling the shaft and secured to the journal-box, and whose outer ends are secured to a fixed support, substantially as and for the purpose set forth.

2. A yielding shafting-bearing comprising a journal-box and coiled springs encircling the shaft and secured to the journal-box, and whose outer ends are adjustably secured to a fixed support, substantially as and for the purpose set forth.

3. A yielding shafting-bearing comprising a journal-box and coiled springs encircling the shaft, secured at their inner ends to the journal-box and at their outer ends to a fixed support, substantially as and for the purpose set forth.

4. A yielding shafting-bearing comprising a journal-box and coiled springs encircling the shaft, secured at their inner ends to the journal-box and at their outer ends to a fixed support, the said securement at each end being adjustable, whereby the tension of the springs may be increased or diminished, substantially as and for the purpose set forth.



5. In a yielding shafting-bearing, the combination, with the journal-box and coiled springs encircling the shaft, of a spring, C, secured at its ends to a fixed support and at or near its middle point connected adjustably to the journal-box, substantially as and for the purpose set forth.

6. In a yielding shafting-bearing, the combination, with the journal-box, coiled springs encircling the shaft, and the cross-bar F', of the stay-bolt F, connected at one end to the journal-box and at the other end connected adjustably to the cross-bar F', substantially as and for the purpose set forth.

7. A yielding shafting-bearing comprising, in combination, a journal-box, coiled springs encircling the shaft, secured at their inner ends to the journal box and at their outer ends to a fixed support, the spring C, secured at its ends to the said fixed support and at or near its center connected adjustably to the journal-box, and the stay-bolt F, connected at one end to the journal-box on the side opposite the spring C and connected adjustably at the other end to the cross-bar F', substantially as and for the purpose set forth.

8. A yielding shafting-bearing comprising, in combination, a journal-box and two coiled springs, C, both formed of one piece, which encircles the shaft and is secured to the journal-box and at its outer ends to a fixed support, substantially as set forth.

387,239. GANG FOR SAWING STONE. James W. Maloy, Hartford, Ga. Filed Sept. 8, 1887. Serial No. 249,169. (No model.)

Claim.—1. In a reciprocating saw-carrying frame, the combination, with the tubular side bars and the end bars, E, of corner connecting-pieces secured to the end bars, and having hollow cylindrical portions D', provided with transverse strengthening-ribs d^6, adapted to extend into the ends of the tubular side pipes, and bolts passing through the side pieces and the hollow cylindrical portions D', thereby uniting them, substantially as described.

2. In a reciprocating saw-carrying frame, the combination, with the side bars and the end bars, of corner connecting-pieces secured to the side bars and having seat portions, in which rest the end bars, plates C, arranged above the seat portions of the corner-pieces and carrying journals for the suspension-links, and through-bolts uniting plate C, the end bars, and corner-pieces together, substantially as described.

3. In a reciprocating saw-carrying frame, the combination, with the side bars and the end bars, consisting at each end of two bars, E E, of corner connecting-pieces secured to the side bars and having seat portions D, which receive the end bars, which are separated by a web portion, d^3, of part D, a plate, C, carrying journals for the suspension-links resting upon the upper end bar, and through-bolts F, uniting plate C, the bars E, and part d^3 of the corner connecting-piece, substantially as described.

4. In a reciprocating saw-carrying frame, the combination, with the side bars, the end bars, and the connecting corner-pieces, of the brace-rods Q Q, extending longitudinally of the frame by the sides of the side bars and connected to the end bars independently of the corner-pieces, substantially as described.

5. In a stone-sawing machine, the combination, with the supporting-frame having cross-bars Y, and the swinging saw-frame, of journals and boxes carried by the saw-frame, and two suspension-links uniting each journal-box with bar Y, substantially as described.

6. In a stone-sawing machine, the combination, with the supporting-frame having cross-bars Y, and the swinging saw-frame carrying journals *b*, of boxes surrounding said journals, consisting of the separable parts W W and two suspension-links for each box, uniting it with one of the bars Y, and also uniting parts W of the boxes, substantially as described.

7. In a reciprocating saw-carrying frame, the combination, with the side bars and the end bars, of corner connecting-pieces having seat parts, in which rest the end bars, plates C, carrying connections for the suspension-links, bolts uniting said parts together, and bearing-plates I, secured below the corner connecting-pieces, substantially as described.

8. In combination with the swinging saw-carrying frame of a stone-sawing machine, a bearing-plate, I, adjustably secured thereto and having inclined edges *i*, and inclined projections carried by the frame, and against which the edges *i* of the bearing-plate rest, whereby it is maintained in line with the motion of the frame at different adjustments, substantially as described.

9. In combination with the swinging saw-carrying frame of a stone-sawing machine, a bearing-plate, I, adjustably secured thereto, inclined projections J, carried by the frame against which the bearing-plate rests, and an adjusting-screw, K, substantially as described.

10. In combination with the swinging saw-carrying frame of a stone-sawing machine, an adjustable bearing-plate, I, supports for the plate carried by the frame, inclined projections J, against which the plate rests, and interlocking projections between the plate and its supports, whereby the plate is held against projections J whatever its position of adjustment, substantially as described.

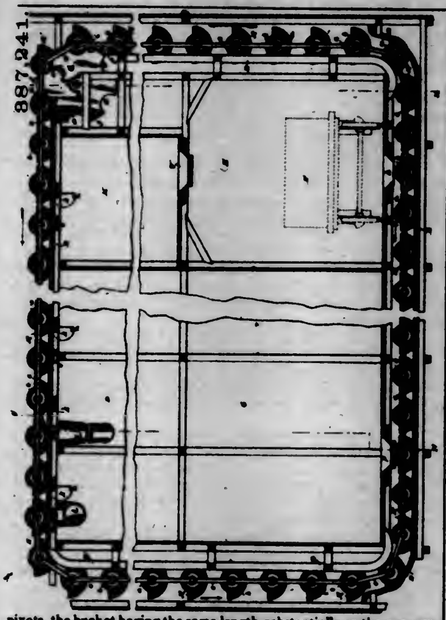
11. In combination with the swinging saw-carrying frame of a stone-sawing machine, having end channel-bars, E, brackets R, bolted to the webs of the channel-bars and having lugs *r* projecting beyond the flanges thereof, and pitman-pin T, bolted to the lugs of said brackets, substantially as described.

12. In combination with the swinging saw-carrying frame of a stone-sawing machine, a bearing-plate carried thereby, an adjusting-screw therefor, a lug carried by the swinging frame, in which said screw is mounted, and a collar carried by the screw, substantially as and for the purpose set forth.

387,240. ROOF-PAINT. German J. Mayer, New Buffalo, Mich., assignor of one-half to Merl D. Peters, Panama, N. Y. Filed May 2, 1888. Serial No. 272,003. (No specimens.)

Claim.—A liquid slate-paint compounded of common gum-shellac, water, and potash, in the quantities and manner described, in combination with linseed-oil, balsam of fir, white lead, and flour of emery, in quantities named, substantially as shown, and for the purpose set forth.

387,241. CONVEYER. George W. McCahlin, New York, N. Y. Filed Dec. 16, 1886. Serial No. 221,704. (No model.)



Claim.—1. The combination, to form a conveyer, of an endless series of pivotally-mounted gravity-buckets, A, the rigid links *e*, connecting and distancing said buckets and coupled at their ends to the pivots of said buckets, and the track-wheels on the pivots of said buckets and supporting the centers of the latter, substantially as set forth.

2. The combination, with the pivotally-mounted gravity-buckets A, provided with oval symmetrical cams *i* on their ends, the connecting-links *e*, and supporting-wheels, of the dumping-cam *k*, of symmetrical form, arranged along the track in the path of the cams on the buckets, said cams being relatively arranged, substantially as described, whereby the buckets are tilted on their pivots, for the purpose set forth.

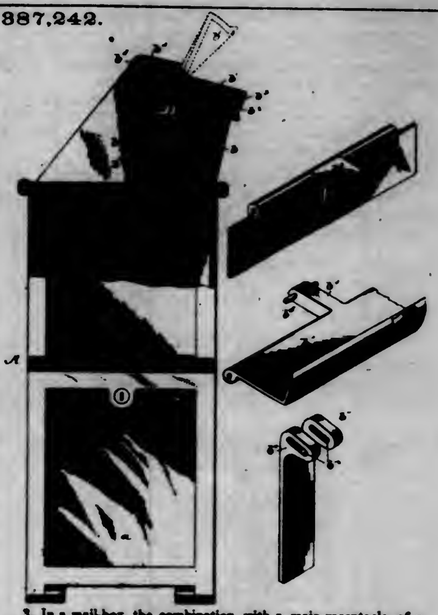
3. The combination, with the buckets A, of semi-cylindrical form and provided with pivots at their axes, of the distancing-links connecting said buckets in series and coupled to the buckets at their

387,241.

pivots, the bucket having the same length substantially as the connecting-link, whereby the lips or adjacent margins of the buckets are brought together, for the purpose set forth.

4. An apparatus comprising an upper and lower chamber in a structure, adapted to receive and hold materials such as coal and the like, an endless and continuous conveyor having connected gravity-buckets which stand close together when receiving, and supporting track-wheels for said buckets, the driving sprocket-wheels, and a track on which said track-wheels run, said track comprising a lower portion below the said lower chamber, an upright portion for the ascending part of the conveyor, an upper portion over the said upper chamber, and an upright portion for the descending part of the conveyor, said track lying wholly in a vertical plane, as set forth.

5. An apparatus comprising the elevated chambers or receptacles, as D and H, with chutes *l* leading into the upper part thereof, and the lower chambers or receptacles, as E and C, with outlets, as *k* and *p*, in their floors, the horizontal track below the lower chambers, the horizontal track over the upper chambers, and the two vertical or upright tracks, all of said tracks being in the same vertical plane, the endless conveyor having supporting-wheels mounted on said tracks, the dumping-cams on said upper track, and the driving-wheels G of said conveyor, substantially as set forth.



6. The combination, with the buckets of the conveyor and their cams *i*, of the dumping-cam *k*, pivoted at one side, and the locking-bolt *o*, adapted to engage and support the other side of said cam, substantially as and for the purpose set forth.

387,242. LETTER-BOX. Joseph H. McDonald, New York, N. Y. Filed Nov. 3, 1887. Serial No. 254,266. (No model.)

Claim.—1. In a mail-box, the combination, with a main compartment, of a second compartment, in which the matter is first deposited and through which it passes to the main compartment, said second compartment being provided with a cover at its upper end and a movable plate at or near its lower end actuated by movement of the cover, whereby said plate may be caused to act as a temporary bottom to said second compartment and close the opening to the main compartment, substantially as shown and described.

2. In a mail-box, the combination, with a main receptacle, of a second compartment, said second compartment being provided with a pivoted cover at its upper end and a pivoted plate at its lower end, a sliding plate having a lug or lugs at its upper end provided with slots, being engaged by a pin in said cover and its lower end engaging the pivoted plate, whereby upward movement of the cover will cause the pivoted plate to close the lower end of the smaller compartment, and reverse movement of the cover will release said pivoted plate and permit it to fall to its normal position, substantially as and for the purpose set forth.

387,242.

3. In a mail-box, the combination, with a main receptacle, of a second compartment provided with a pivoted cover, said cover having a lug extending from it carrying a pin; a vertically-sliding plate having slotted lugs extending from it, the slots being engaged by the pin carried by the cover, and a pivoted plate near the lower end of the smaller compartment, said plate being provided with a flange against which the sliding plate bears, whereby movement of the cover to open the compartment will cause said compartment to be closed at its opposite end, substantially as shown and described.

387,243. DRIER. Wallace McPherson, Texarkana, Tex. Filed Apr. 2, 1888. Serial No. 269,982. (No model.)

Claim.—1. In a drier, the combination of a furnace and flue having a closing wall at its rear end, an arch its whole length, and side walls having openings below the base of said arch, with spark-arresters opposite said openings, and consisting of a vertical plate, *d*², and a horizontal plate, D, bent lengthwise and having vertical partitions on each side of the plate *d*², with a passage on top of the latter, substantially as and for the purpose described.

2. The combination of a furnace and flue having an arch its whole length, and side walls having openings below the base of said arch, with spark-arresters, as described, opposite said openings, a grate at one end of the furnace, and a damper under the rear end of said grate, substantially as and for the purpose described.

387,244. FLOOR-CLOTH. David H. Elwin, Lansdowne, N. Y. Filed July 7, 1887. Serial No. 243,691. (No model.)

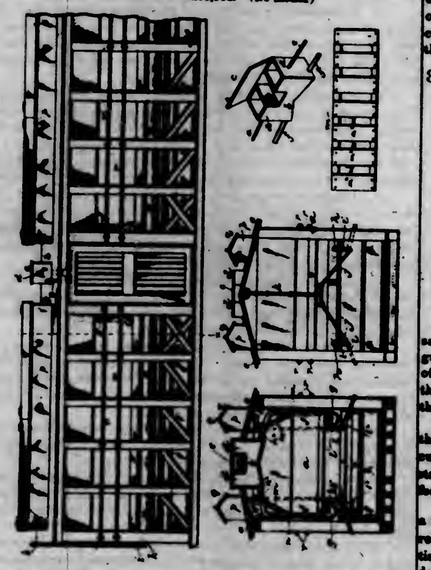
Claim.—As a new article of manufacture, a floor-covering consisting, essentially, of an upper or wearing layer, an under or cushion layer of granular elastic material, and an intermediate layer of woven fabric, the three layers being united by adhesive substances, substantially as set forth.

387,245. SPINDLE FOR CAP-SPINNING MACHINES. John R. Hilden, Newton, Mass. Filed Feb. 2, 1888. Serial No. 262,606. (No model.)

Brief.—The object of the invention is to facilitate lubrication of the spindle and improve its running.

Claim.—1. The combination of the following instrumentalities,

387,245.

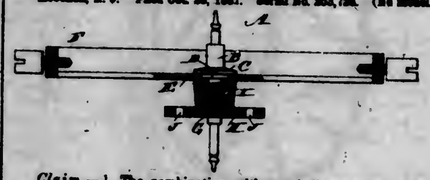


to wit: a bolster-rail, a spindle-step secured in said rail and provided with an oil-cup, a spindle secured in said step, a driving-sleeve mounted on said spindle above said rail and provided with a longitudinal groove or grooves and with a driving-pulley, a lifting-rail disposed above said bolster-rail, a bobbin-sleeve mounted on said driving-sleeve above the lifting-rail and provided with a plate for supporting the bobbin, means for coupling the bobbin and said plate, means for coupling the driving-sleeve and bobbin-sleeve, and a guide-sleeve secured to the upper portion of said spindle for preventing the bobbin-sleeve from vibrating, substantially as described.

2. The combination of the spindle A, the driving-sleeve E, mounted thereon and provided with the groove *r* and pulley F, the bobbin-sleeve G, mounted on the sleeve E and provided with the plate H, coupling-pin 26, and stud *v*, the guide-sleeve I, secured to the spindle A, the cap M, mounted on said spindle, the rails B C, and an oil-cup for supplying the spindle and sleeves with oil, substantially as set forth.

3. The improved device herein described, the same consisting, essentially, of the spindle proper, A, step D, sleeves E G I, pulley F, plate H, stud *v*, pin 26, cap J, guard M, felt K, absorbent ring *p*, and rails B C, constructed, combined, and arranged to operate substantially as set forth.

387,246. STOCK-CAR. James Montgomery, East Millstone, N. J. Filed Apr. 4, 1888. Serial No. 269,901. (No model.)



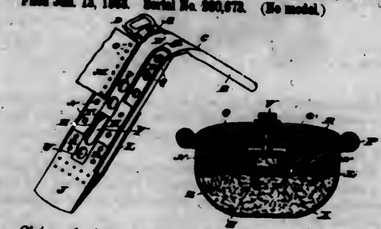
Claim.—1. A water-tank for use in stock-cars, consisting of a vessel having its bottom slanting in opposite directions from a median line or plane, discharge-pipes leading from the lower levels thereof, and inlet-columns adapted to straddle the ridge-pole of the car-roof, and overflow-pipes leading down from the said inlets, substantially as described.

2. Water appliances for application to ordinary stock-cars, comprising a tank or receiver straddling the ridge-pole and suspended within the car from its roof and over the doors, distributing-pipes leading from such tank each side of such car and terminating in spouts or outlets, and drinking-troughs, over which said spouts are arranged and into which they discharge the water, substantially as described.

3. The hay-rack *m* for cars, having fixed slats *m*², of about twice the width of the fixed openings *m'* between them, so as to impede the withdrawal and consequently prevent the waste of hay, and flexibly hinged at its lower end to the side of the car and adapted to fold up flat against the side of the car, and provided with a lip, *n'*, to engage stationary stops *n*², depending from the car-roof, to hold the rack in position for use, substantially as described.

4. The gutter composed of the vertical protection-boards *l*, slanting bottoms, and braces *P*, for connecting the protection-boards and bottoms and securing them to the sides of the car, in combination with the drinking-trough, arranged wholly within said gutter and having its journal projecting through the ends of the car, and provided with a crank, an operating-rod, and a link connecting the crank and rod, whereby the trough may be tilted within the gutter to discharge its contents and again be brought and held in position for use, substantially as described.

387,247. BALANCE-STAFF FOR WATCHES. Charles Mosley, Hoboken, N. J. Filed Oct. 20, 1887. Serial No. 253,728. (No model.)

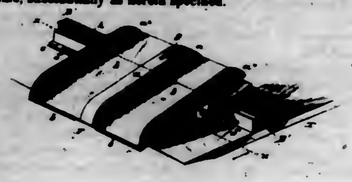


Claim.—1. The combination, with a spindle provided with a shoulder and having a part screw-threaded, of a roller screwing on the threaded part of said spindle and against the hub or cross-bar of the balance-wheel, substantially as shown and described.

2. A spindle for balance-wheels provided with a shoulder and a screw-threaded part on which screws a roller, substantially as shown and described.

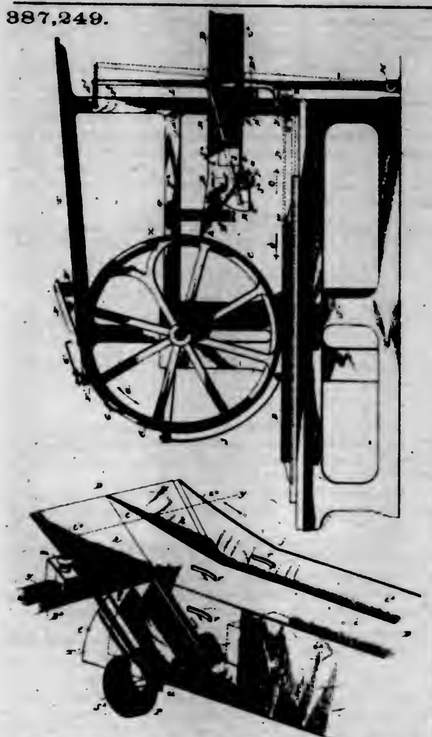
3. The combination, with a balance-wheel and a roller, of a spindle provided with a fixed shoulder and having part screw-threaded, on which screw-threaded part said roller screws against the hub or cross-bar of the said balance-wheel held between the said shoulder on the spindle and the roller, substantially as shown as described.

387,248. HARNESS-SADDLE. Allen A. Moe, Canton, Ohio. Filed Jan. 13, 1888. Serial No. 260,572. (No model.)



Claim.—1. As an improved article of manufacture, the harness-saddle having the upwardly-turned flanges B at its edges, longitudinal grooves D D', located in the upper side of the tree on opposite sides of the center, the longitudinal groove E, located on the under side of the tree between the grooves D D', and perforations in the bottoms of the grooves, substantially as set forth.

2. The combination, with a saddle-tree as herein described, of the flexible end piece, J, having straps K and H, bottom piece, L, secured to the tree by clinch-nails N, and the pad M, secured to the strap H and K, substantially as described, and for the purpose set forth.



3. As an improved article of manufacture, a harness-saddle having a tree constructed and padded as herein shown and described, and a removably-secured trimming composed of a housing, P, skirt S, a continuous back strap, T, jockey R, and bolt V, constructed as shown and described, and for the purpose set forth.

387,249. CYLINDER PRINTING-MACHINE. Andrew O. Hass, Newark, N. J. Filed July 19, 1887. Serial No. 244,713. (No model.)

Claim.—1. In combination with the front gage of a cylinder printing-machine, a double feed-guide for each operator, whereby each operator is enabled to feed the machine with envelopes or the like two at a time, substantially as herein specified.

387,249.

2. In combination with a suitable front gage, a double feed-guide having a middle gage with parallel lateral guide-surfaces at right angles to the gage-surface of said front gage, substantially as herein specified, for the purpose set forth.

3. In combination with a suitable front gage, a double feed-guide having a middle gage with parallel lateral guide-surfaces, and side gages parallel with said middle gage, substantially as herein specified, for the purpose set forth.

4. In combination with a suitable front gage, a double feed-guide having a middle gage with parallel lateral guide-surfaces, and a pair of side gages movable toward and away from said middle gage, substantially as herein specified, for the purpose set forth.

5. The double feed-guide F, having parallel middle and side gages, and bottoms formed by overlapping flanges attached to the respective gages, substantially as herein specified.

6. The combination, substantially as herein specified, of the middle gage, a, and side gages, a^2, provided, respectively, with a swivel-bearing and screw-nuts attached thereto, and a right-and-left screw swiveled in said bearing and fitted to said nuts, for the purpose set forth.

7. The combination of the middle gage, a, and side gages, a^2, having overlapping flanges forming bottoms b, adjustable in width, and provided, respectively, beneath said bottoms with a swivel-bearing and screw-nuts, and a right-and-left screw swiveled in said bearing and fitted to said nuts, substantially as herein specified.

8. The combination, with an ordinary feed-table, of a superposed double feed-guide, and a bolster beneath the rear end of said guide, giving it a greater inclination than the table, substantially as herein specified.

9. The combination of a divided transverse bolster, one part of which is fixed and the other part movable lengthwise thereon, and a double feed-guide attached to said movable part, substantially as herein specified.

10. The combination of a horizontally-divided transverse bolster having a dovetail joint with a groove in the top of the lower part, a superposed double feed-guide, and a clamp which attaches the latter to the upper part of the bolster and acts within said groove to lock the whole upon said lower part, substantially as herein specified.

11. The combination of a transverse bolster, a superposed double feed-guide adjustable as to width, and independent means, substantially as described, for laterally adjusting said guide as a whole, for the purpose set forth.

12. The combination, with an ordinary cylinder printing-machine, of a double feed-guide for each operator attached to the ordinary feed-table, and an automatic delivery apparatus having an incline or inclines at its receiving end and substituted for the ordinary delivery apparatus, substantially as herein specified.

13. The combination, with an ordinary cylinder printing-machine, of a double feed-guide for each operator attached to the ordinary feed-table, and a double delivery-trough aligned with said guide and substituted for the ordinary delivery apparatus, substantially as herein specified.

14. The combination, in a cylinder printing-machine, of a double feed-guide having a thick middle gage, and a double delivery-trough having a thin central partition in line with said gage, and sides which flare at its receiving end, substantially as shown, for the purpose set forth.

15. The double delivery-trough D, having a central partition and substantially parallel sides provided with overlapping flanges, the latter forming bottoms for its respective compartments, which are adjustable in width, substantially as herein specified.

16. The double delivery-trough D, adjustable in width, in combination with the horizontally-divided bolsters B^3 B^4, and means, substantially as described, for fastening the respective sections of the trough independently of each other upon the lower parts of said bolsters, for the purpose set forth.

17. The combination, with the movable delivery-trough D, of bolsters B^3 B^4, provided, respectively, with devices, substantially as described, for adjusting said trough lengthwise, for the purpose set forth.

18. In combination with the movable delivery-trough D and the frame of the machine, the bolster B^3, bar B^4, saddle B^5, and screw B^6, substantially as specified, for the purpose set forth.

19. In combination with the movable delivery-trough D and the frame of the machine, the bolster B^3, provided at its ends with swiveled screw-nuts, the link-rods L^2, having swiveled and screw-threaded lower ends fitted to said nuts, and the pivotal rod R^2 at the upper ends of said link-rods, substantially as specified.

20. In combination with the receiving end of the movable delivery-trough D, and with the frame of the machine and connecting devices, substantially as described, the link-rods L^2, having swiveled and screw-threaded lower ends provided with wrench-squares, and hollow upper sections, rendering them telescopic, and provided with fastening devices, substantially as described, for the purposes set forth.

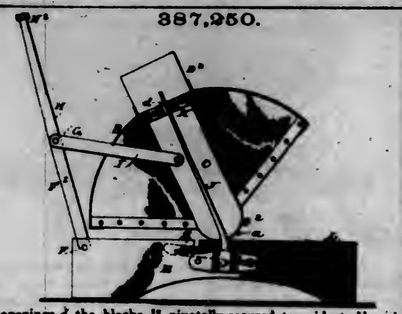
21. A delivery-trough having a receiving end constructed with inclined bottoms and with openings in said bottoms adjacent to the inner end of the inclines, in combination with oscillating turners pivoted at said inner end of the inclines and working through said openings, substantially as herein specified.

22. In combination with a delivery-trough having a receiving end constructed with inclined bottoms, the withie-described oscillating turners pivoted at the inner end of the inclines and having segmental outer ends, substantially as herein specified.

23. A delivery-trough adjustable in width, in combination with oscillating turners, two or more to each compartment, a pivotal shaft common to all extending transversely below the bottom of said trough, and means, substantially as described, for adjusting said turners laterally upon said shaft, for the purpose set forth.

24. The combination of the delivery-trough D, oscillating turners T, pivotal shaft S^9, pulley P, rack R, lever L, and retracting-spring S^8, substantially as specified, for the purpose set forth.

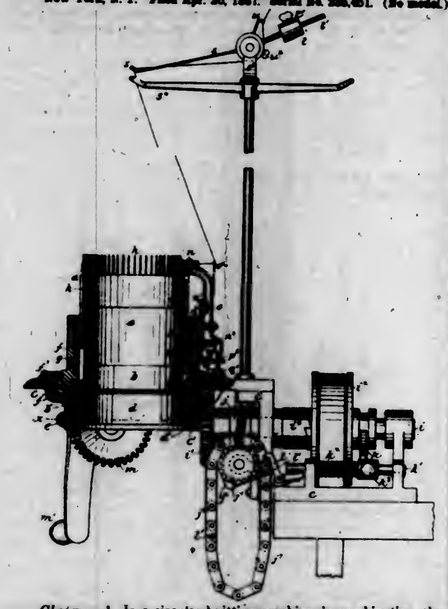
25. The combination of the reciprocating bed B, provided with tappet w, and lever L, provided with cushion x, the rack R, pinion P, shaft S^9, and oscillating turners T, substantially as specified, for the purpose set forth.



26. In combination with a reciprocating part provided with a tappet, w, the lever L, connected with the delivery apparatus and provided with a cushion, x, within a socket, y, and with a screw, z, which projects said cushion more or less, substantially as specified, for the purpose set forth.

387,250. WASHING-MACHINE. Stephen H. Neal, Durango, Tex. Filed Nov. 9, 1887. Serial No. 254,603. (No model.)

Claim.—The combination, with the supporting-stand and the suds-box, of the cleats K at the upper end of said box and formed



387,250.

with openings d, the blocks J^2, pivotally secured to said stand and provided at one end with the thumb-screw e, and the springs secured at their lower ends in said blocks and their upper ends working loosely in the openings d in the cleats, substantially as described.

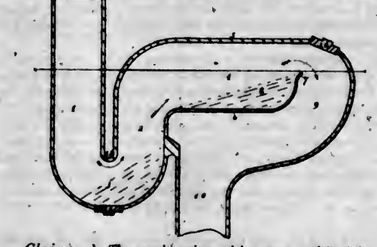
387,251. CIRCULAR-KNITTING MACHINE. Jeremiah F. O'Neil, New York, N. Y. Filed Apr. 20, 1887. Serial No. 236,451. (No model.)

Claim.—1. In a circular-knitting machine, in combination, the main frame provided with a cylindrical opening, a base-ring fitted to slide longitudinally therein and provided with an internal screw-thread, a needle-cylinder attached to the base-ring, a hollow nut fitting into the screw-thread of the base-ring and having a flange provided with worm-teeth, and a worm fitted to rotate in bearings on the frame and meshing into the worm-teeth of the nut, substantially as and for the purpose set forth.

2. In a circular-knitting machine, the combination of a cam-cylinder provided with bevel-teeth, a driving-shaft provided with a pinion working therein, a worm on the driving-shaft, a shaft provided with a sprocket-wheel arranged in bearings at right angles to the driving-shaft, a worm-wheel secured to this shaft, a pattern-chain provided with projecting lugs carried by the sprocket-wheel, a driving-pulley and a clutch on the driving-shaft, a spring-actuated sliding shifter, and a bell-crank spring-actuated catch locking the shifter to hold the clutch and pulley in gear and actuated by the lugs on the pattern-chain to release the shifter, substantially as and for the purpose set forth.

3. In a circular-knitting machine, in combination, a cam-cylinder provided with bevel-teeth, two bevel-pinions arranged to act thereon, a crank-handle shaft carrying one of the bevel-pinions, a spring-actuated lever normally holding this pinion out of gear, a driving-shaft carrying the other bevel-pinion, which is always held in gear with the wheel, and means, substantially as described, for automatically stopping the driving-shaft.

4. In a circular-knitting machine, in combination, a cam-cylinder provided with bevel-teeth, a crank-handle and shaft provided with a bevel-pinion, a spring-actuated lever for holding the pinion away from the bevel-wheel, and a spring-catch acting on the lever to hold the pinion in gear with the bevel-wheel, substantially as set forth.

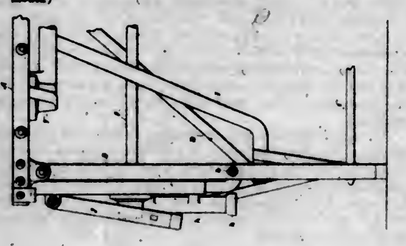


5. In a circular-knitting machine, in combination, a needle-cylinder, needles carried thereby, a cam-cylinder provided with a single V-shaped cam and surrounding the needle-cylinder, a guard having a long slot carried by the cam-cylinder, a yarn-guide pivoted behind the guard, a fixed frame in which the cam-cylinder is held, and a friction-shoe held in contact with the fixed frame and arranged to act on the lower end of the pivoted yarn-guide, so as to throw its upper end into position to lead the cam on the cam-cylinder, substantially as and for the purpose set forth.

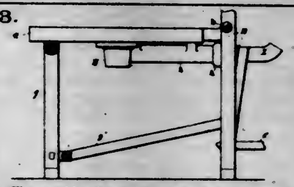
6. In a circular-knitting machine, in combination, a rotating cam-cylinder, a single V-shaped cam in the interior thereof, a guard having a long slot and a pivoted yarn-guide carried by the cam-cylinder, a fixed frame in which the cam-cylinder is held, a friction-shoe resting on the fixed frame, a pin connecting the friction-shoe to the lower end of the yarn-guide, a plate fastened to the cam-cylinder and having a circular slot, and a spring between the shoe and the plate, substantially as set forth.

7. In a circular-knitting machine, in combination, a fixed frame, a cam-cylinder fitted to rotate therein, a pivoted yarn-guide carried by the cam-cylinder, having an eye at its upper end and a slot in its lower end, a friction-shoe having a pin engaging in the slot in the guide, a driving-plate having a circular slot and two adjustable stops, located above the shoe, a spring located between the driver and the shoe, and two pins projecting from the shoe through the slot in the driver, against which the adjustable stops on the driver act, substantially as set forth.

8. In a circular-knitting machine, in combination, the needle-cylinder a, the needles A, held therein, the cam-cylinder f, the cam-ring g, secured thereto, having the single V-shaped depression, the piece g^6, and the V-shaped part g', adjustably secured to the cam-cylinder by the screw g^6, passing through a slot in the cam-cylinder and fitted to slide down to open a straight path for the feet of the needles, whereby all the needles are held up in one plane, substantially as and for the purpose set forth.



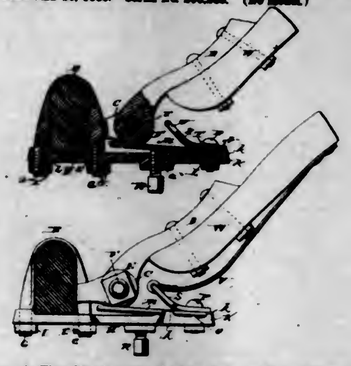
387,252. ANTI-SIPHONING TRAP. Frank H. Paradice, Denver, Colo. Filed Apr. 6, 1888. Serial No. 269,841. (No model.)



Claim.—1. The combination, with a trap and its inlet and discharge pipes, of a chamber interposed between the trap and the discharge-pipe and having an upturned end or flange at its union with the discharge-pipe, substantially as set forth.

2. The combination of the inlet-pipe 1, the trap 3, discharge-pipe 10, the chamber 4, interposed between the trap and the discharge pipe and longitudinally and transversely enlarged and having the upturned end or flange 7, substantially as set forth.

387,253. VAPOR-BURNER-STOVE ATTACHMENT. Charles A. Pope, Cleveland, Ohio. Filed Nov. 14, 1887. Serial No. 255,150. (No model.)



387,253.

Claim.—The combination, with vapor-burner stove, of folding shelf hinged or pivotally connected with the stove so as to be folded to an upright or approximately vertical position against the stove or extended to a horizontal position, said shelf bearing one or more burners, with suitable pipe-connection for supplying such auxiliary burners with fuel from the stove proper, substantially as set forth.

387,254. THILL-COUPLING. HENDERSON M. POWERS, Lancaster, Pa. Filed Jan. 10, 1888. Serial No. 260,228. (No model.)

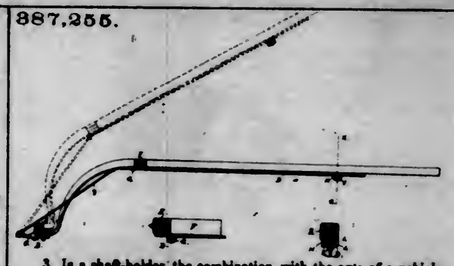
Claim.—1. The clip-plate attached to the axle-clip and having a chair on its outer end, provided with vertical lugs forming shoulders, the spring mounted in the chair between the shoulders, and the set-screw to force the free end of the spring against the thill-box, substantially as specified.

2. The clip-plate attached to the axle and having a transverse rib, O, on its upper side, the spring bearing on the said rib, the bolt passing through the spring and the clip-plate, and the set-screw under the free end of the spring, substantially as and for the purpose specified.

3. The clip-plate attached to the axle-clip and having the chair on its front end, provided with an inclined surface and a central aperture, and the spring bearing on the inclined surface of the chair, and secured thereto by a bolt which passes through the spring and the aperture in the chair, whereby the rear end of the spring bears against the under side of the thill-bearing, substantially as and for the purpose specified.

4. In combination with the axle-clip having the thill mounted thereon, the clip-plate secured to the axle-clip, the spring secured to the clip-plate, the set-screw to operate the spring, and the bracket on the upper side of the spring, having an eye, U, to receive the end of the safety-strap, substantially as and for the purpose specified.

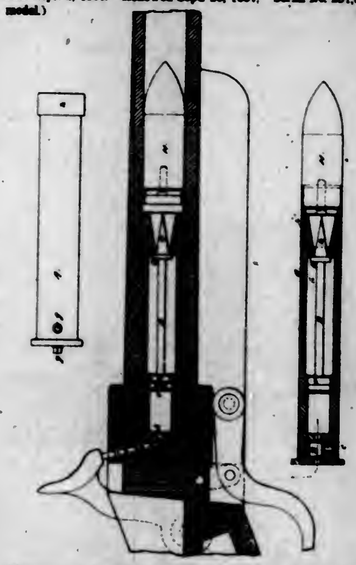
5. The clip-plate attached to the axle-clip and having the bracket S, provided with an eye, U, to receive the safety-strap, as set forth.



6. The clip-plate attached to an axle-clip and having a chair, K, on its outer end, and the spring M and bracket S, attached to the chair by the same bolt, the spring bearing under the thill-iron bearing, and the bracket O, receiving the safety-strap, as set forth

387,255. SHAFT-SUPPORTER. HENDERSON M. POWERS, Lancaster, Pa. Filed Feb. 15, 1888. Serial No. 264,126. (No model.)

Claim.—1. In a shaft-holder, the combination, with the axle of a vehicle, of a rod hinged to an arm extending rearwardly from said axle, the said rod projecting forward along the shaft through a staple at or near the cross-piece of the shafts, and a device for adjustably connecting the rod and shaft, substantially as and for the purpose specified.



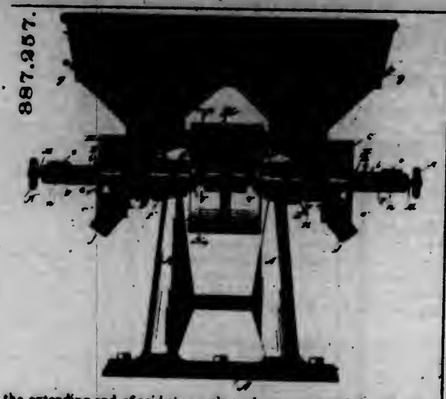
2. In a shaft-holder, the combination, with the axle of a vehicle, the rearwardly-projecting arm C, and a staple secured to the shaft at or near the cross-bar of the shafts, of a rod hinged to said arm C and extending forward along the shaft through the staple, and a clamp fastened to said shaft, the clamp being provided with means whereby it can be loosened about or closed upon the rod, substantially as and for the purpose specified.

387,255.

3. In a shaft-holder, the combination, with the axle of a vehicle, a rearwardly-extending arm, C, and a staple secured to the shaft at or near the cross-bar F, of a rod hinged to said arm C and extending forward along the shaft through a staple, and a clamp, H, fastened to said shaft, and the clamp H, composed of two plates, A, provided with the semicircular serrated cavities *i* upon their inner faces and operated by the set-screw I, all constructed and operating substantially as specified.

387,256. PNEUMATIC CARTRIDGE. NAT. W. PRATT, Brooklyn, assignor to the Pneumatic Dynamite Gun Company, New York, N. Y. Filed Apr. 2, 1886. Renewed Sept. 20, 1887. Serial No. 251,054. (No model.)

Claim.—1. A cartridge containing air or gas under compression, provided with a valve-seat and valve, said valve having a conical projection extending through the valve-seat to effect a gradually-increasing discharge of the contained air.



2. A cartridge containing air or gas under compression, provided with a discharge-valve, said valve being connected to a reciprocating piston which upon the exhaustion of air or gas from the chamber at its rear is retracted to operate said discharge-valve, as described.

3. A cartridge containing air or gas under compression, having interiorly a piston-valve adapted to be held seated by the contained air or gas, and a second valve which governs the air or gas passage leading to the chamber at the rear of said piston-valve, whereby the pressure of the air or gas is relieved upon one side of said piston-valve to move it from its seat, substantially as described.

387,257. GRINDING-MILL. GEORGE RAYMOND and ALBERT RAYMOND, Chicago, Ill., assignors to the Appleton Manufacturing Company, Appleton, Wis. Filed June 4, 1887. Serial No. 240,265. (No model.)

Claim.—1. In a grinding-mill in which the rotatable disk is mounted on a horizontal shaft, the combination, with a disk so mounted and having for support thereon a sleeve or tubular formation of such length as to extend beyond the end of the shaft, and screw mechanism adapted to operate against the end of said sleeve for adjusting the disk, of a spiral spring so interposed between the end of the shaft and

387,257.

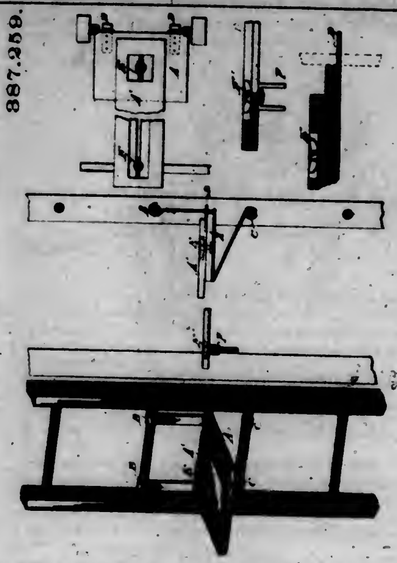
the extending end of said sleeve that when pressure of the adjusting mechanism is retracted said spring will operate to withdraw the rotatable disk from the stationary disk.

2. In a double mill, the combination, with a shaft, *a*, sleeves *c* adjustable thereon, which latter support the rotatable grinding-disk, and mechanism exterior thereto for adjusting said disk, of springs R, bearing at one end, respectively, against the end of shaft *a*, and at the other end against the step P, secured to the sleeve by pin *i*, whereby the sleeve is forced outwardly when the adjusting mechanism is retracted to withdraw the disk *f*, substantially as set forth.

387,258. ARGAND LAMP. FRANK REED, Meriden, Conn., assignor of one-half to Charles S. Upton, New York, N. Y. Filed Dec. 15, 1887. Serial No. 257,949. (No model.)

Claim.—1. The combination, with the central tube of an Argand lamp, of a perforated cone, the base of which fits said tube, the top being open and formed into a tube, as D', said cone being provided with a removable hollow spreader and distributer, the top of which is closed and the bottom open, the side walls being perforated and the lower opening being so formed as to fit the tube D', which extends up within said spreader and distributer, substantially as shown and described.

2. The combination, with the central tube of an Argand lamp, of a perforated cone, D, the top thereof being open and formed into a tube, D', which is perforated, said cone being provided with a removable hollow spreader and distributer, the top of which is closed and the bottom open, the side walls being perforated and the lower opening being so formed as to fit the perforated tube D', which extends up within said spreader and distributer, substantially as shown and described.



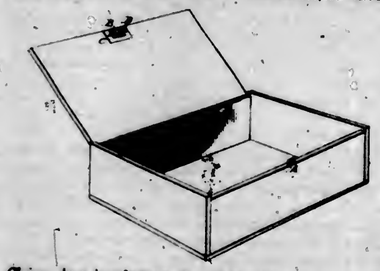
3. The combination, with the central tube of an Argand lamp, of a perforated cone, D, the base of which fits the inner wall of said tube, and an air distributer and spreader, E, said cone and distributer being provided one with an opening and the other with a tube which fits within said opening, and whereby the distributer is held in place on the top of said cone, substantially as shown and described.

387,259. COMBINED STEP AND ARM FOR PLATFORM ATTACHMENTS FOR LADDERS. WILLIAM D. ROSS, Adrian, Kans. Filed Jan. 28, 1888. Serial No. 262,022. (No model.)

Claim.—1. The combination, with the ladder, of the step and the hook-bars for connecting the step to the ladder, said hook-bars being pivotally jointed together, and hooks or guards to control the action of said pivotal joints and prevent the step from turning outward and downward, substantially as described.

2. The combination of the step and the hook-bars B and C, the said hook-bars being pivotally jointed together, substantially as described.

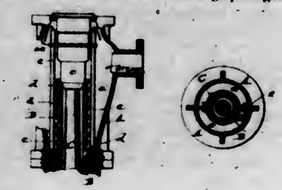
387,259.



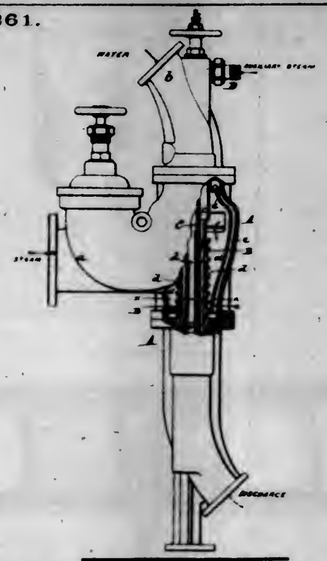
3. The combination of the step adapted to be secured to the rounds of a ladder, and of the arm attachment removably secured thereto, substantially as described, and for the purpose set forth.

4. The combination of the step, its removable arm attachment, and the clip F, substantially as described, and for the purpose set forth.

5. The combination of the ladder, the step A, hook-bars B and C, the hooks or guards D, arm attachment A', the clip F, and the thumb-screws, substantially as described, and for the purpose set forth.

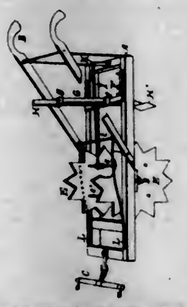


387,260. BOX-FASTENER. WILLIAM RUSH and JOHN RUSH, Shelburne Falls, Mass. Filed Mar. 16, 1888. Serial No. 267,261. (No model.)



Claim.—In a box-fastener, the combination, with a box and its lid, of a loop or staple secured to one of said parts, and a plate provided with a tongue and secured to the other part over a recess therein, substantially as shown.

387,261. JET-CONDENSER. LOUIS SCHUTTE, Philadelphia, Pa. Filed Apr. 3, 1888. Serial No. 269,496. (No model.)

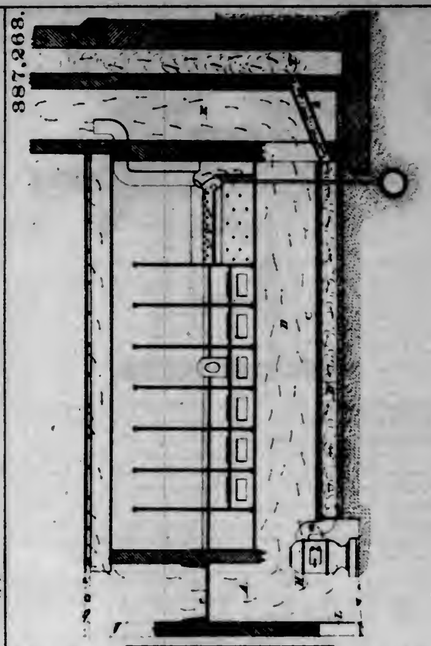


Claim.—In a condenser of the type herein described, an isolated passage or passages leading from the upper part of the condensing or steam-receiving chamber to the lower part of the combining tube or chamber at or near the mouth of the discharge-passage.

387,261.

387,262. COTTON-CHOPPER. Calvin H. Benson, Munford, Ala. Filed Mar. 24, 1886. Renewed Jan. 9, 1888. Serial No. 260,154. (No model.)

Claim.—1. The combination, in a cotton-chopper, of a vertical shank carrying the chopper at its lower end, a lever pivoted to said shank and hinged rearwardly to the cross-piece of the frame, driving-wheels connected by transverse tappet-bar, and a pair of springs and a cross-bar resting upon said lever, whereby a positive motion is imparted to the chopper, substantially as herein set forth.



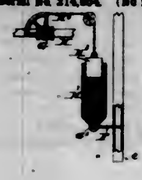
2. The combination of the frame A, the toothed wheels E, the transverse bars *c*, the rearwardly-projecting springs L, and cross-bar *l*, the lever R, vertical shank H, having horizontal openings therein, and chopper H' at its lower end, substantially as herein set forth and described.

387,263. DRY CLOSET. Isaac D. Snead, Toledo, Ohio. Filed Apr. 6, 1888. Serial No. 269,936. (No model.)

Claim.—1. The combination, in a dry closet, of a vault having a duct, D, connected to the vent-shaft E at one end for the passage of a current of air, and a separate duct, D', underneath the former and connected at one end to a smoke-flue, T, for the passage of smoke, with a heater located at or near the entrance or mouth of said vault and having its smoke-pipe connected to the lower duct, substantially as and for the purpose set forth.

2. The combination, in a dry closet, of a vault provided with the two horizontal ducts D and D', arranged one over the other and separated by a horizontal partition of absorbent material, the upper of said ducts being connected with a vent-shaft for the passage of air, and the lower of said ducts being connected with the smoke-flue T, and a heater, H, located at or near the mouth of said ducts and having its smoke-pipe connected to the lower duct, substantially as and for the purpose set forth.

387,268.



387,264. CENTRIFUGAL PUMP. Edgar L. Strean, New Orleans, La. Filed Mar. 31, 1888. Serial No. 269,193. (No model.)

Claim.—The combination, with the casing of a centrifugal pump and a screw-threaded pipe-section provided with a flange, *a*, connected to the side thereof around or over the opening in the casing by the bolts *b*, of a suction-elbow formed with flange *c*, the interiorly-threaded flange E, secured to the flange *c* and engaging the threads of the pipe-section, and the interiorly-threaded nut or ring C, independent of the flange E and adjustable on the pipe-section and adapted to be jammed against the back of the flange E, substantially as shown and described, and for the purpose specified.

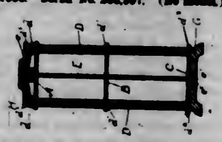
387,265. ALARM. J. Franklin Stoudebt, Philadelphia, Pa. Filed Sept. 27, 1886. Serial No. 214,054. (No model.)

Claim.—1. A device of the character named, consisting of an electric circuit with fusible wires therein, an armature in said circuit, a vessel containing sand and with cock at its bottom with projecting stem sustained by said armature when circuit is open, and a weight resting on said sand and connected to and adapted to operate an alarm, substantially as described.

2. A device of the character named, consisting of the weight H³, connected to and adapted to operate an alarm when lowered, a vessel containing sand on which said weight normally rests, and provided with an opening having a cock therein, the said cock having a projecting stem sustained by an armature in an electric circuit, the latter having fusible wires, said parts being combined, substantially as described.

3. A device of the character named, consisting of a detachable weight, a tube, a vessel containing sand or equivalent material and provided with an opening having a cock, the latter having a stem projecting into said tube and across the path of said detachable weight, and a second weight normally resting on the material in said vessel and connected with an alarm, said parts being combined and operated substantially as described.

4. A weight connected to and adapted to operate an alarm, a vessel containing sand, on which said weight rests and provided with an outlet, a cock controlling said outlet, a stem connected to said cock and projecting into or across the path of a detachable weight, said parts being combined and operated substantially as and for the purpose set forth.



387,266. LOCOMOTIVE. William L. Steer, St. Mary's, Pa. Filed May 24, 1888. Serial No. 274,282. (No model.)

Claim.—1. The combination, in a locomotive, of the trucks, each of which has the axles provided with driving-wheels, the shafts F, arranged midway between the axles, the endless chains and sprocket-wheels connecting the said shafts F and axles, the counter-shafts arranged on the platform of the locomotive directly above the shafts F, the endless chains and sprocket-wheels connecting said counter-shafts and shafts F, connections between said counter-shafts, whereby they are caused to rotate in unison, and the engines connected to one of the counter-shafts, substantially as described.

2. In a locomotive, the combination of the platform or frame, the pivoted trucks under the same, each truck having the pair of wheeled axles, the shaft F, midway between the axles, and sprocket-wheels and chains connecting said shaft and axles, and the counter-shafts arranged directly above the shafts F and connected thereto, and means, substantially as set forth, to rotate the said counter-shafts, whereby all the axles of the trucks will be positively impelled, substantially as described.

387,267. BOOK-RACK. Sylvanus J. Talbot, Hilliard, N. H., assignor of one-half, by mesne assignments, to Edgar F. Talbot, same place. Filed Mar. 30, 1888. Serial No. 268,997. (No model.)

Claim.—1. A book-rack consisting of the combination of upper and lower shelves, A and C, having corner holes, one or more intermediate shelves, B, provided with end slots, *b*, corner-posts D, having doweled portions *d' d²* and reduced portions *d'*, screw-threaded end rods, E, and clamping-pieces G and H, substantially as and for the purposes described.

2. A book-rack consisting of the combination, with perforated shelves, of solid corner-posts D, having doweled ends *d²*, flush with the outer surface of one of the shelves, doweled ends *d'*, projecting beyond the outer surface of the other of said shelves, screw-threaded end rods, E, lower clamping-pieces, G, and upper clamping-pieces, H, provided with holes *d²*, substantially as and for the purposes described.

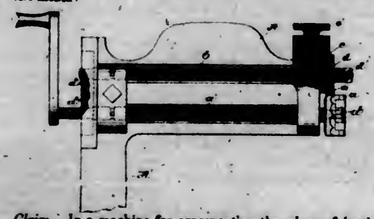
387,268. TARGET-TRAP. Benjamin Tripp, Covington, Ky., assignor to John L. Winston, same place, and Edwin H. Spear, Toledo, Ohio. Filed Sept. 30, 1887. Serial No. 250,694. (No model.)

Claim.—1. In a trap for throwing targets, the combination of arm E, arm D, pivoted to arm E, arm H, pivoted to arm D, and provided with raised handle H², and raised lip H³, for grasping the target, and tension-spring forcing arm H toward arm D, substantially as and for the purposes specified.

2. The combination of arm E, arm D, bolt D', rigidly attached to arm D and projecting through arm E, spiral spring *d*, surrounding bolt D', tension-nut F, arm H, provided with lip H³ and pivoted to arm D, bolt H', tension-spring *h*, and tension-nut *h'*, substantially as and for the purposes specified.

3. The combination of arm E, arm D, bolt D', rigidly attached to arm D and projecting through arm E, spiral spring *d*, surrounding bolt D', tension-nut F, arm H, provided with lip H³ and pivoted to arm D, bolt H', tension-spring *h*, and tension-nut *h'*, facing G, provided with lug *g*, and flange *g'*, and facing G', provided with lug *g²*, substantially as and for the purposes specified.

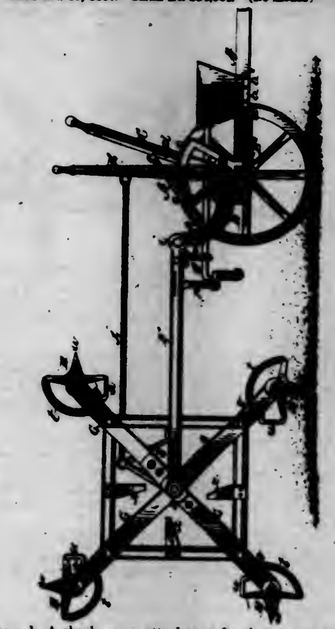
4. In a trap for throwing targets, the combination of arm E, arm D, bolt D', rigidly attached to arm D and projecting through arm E, spiral spring *d*, surrounding bolt D', and tension-nut F, to regulate spring *d*, substantially as and for the purposes specified.



5. In a trap for throwing flying targets, the combination of the arm E, arm D, pivoted to arm E, arm H, pivoted to arm D, pin *h*, projecting from the under surface of arm H into a depression in arm D, and elastic means for pressing arm H to arm D, substantially as and for the purposes specified.

6. In a trap for throwing flying targets, the combination of the arm E, arm D, pivoted to arm E, arm H, pivoted to arm D and provided with handle H³, pin *h²*, projecting from the under surface of arm H into a depression in arm D, and elastic means for pressing arm H to arm D, substantially as and for the purposes specified.

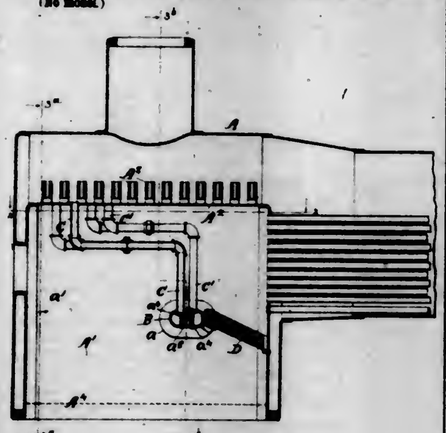
7. In a trap for throwing flying targets, the combination of arm E, arm D, pivoted to arm E, arm H, provided with handle H³, pin *h²*, projecting from the under surface of arm H into a depression in arm D, bolt H', pivoting arm H to arm D, spring *h*, surrounding bolt H', adapted to force arm H toward arm D, and tension-nut *h'*, substantially as and for the purposes specified.



8. In a trap for throwing targets, the combination of arm E, arm D, pivoted to arm E, arm H, pivoted to arm D, elastic means for forcing arm H toward arm D, and elastic facings G G', attached to the arms D and H, and provided with a flange or flanges, as *g'*, substantially as and for the purposes specified.

387,269. MACHINE FOR ORNAMENTING LEATHER. Andrew J. Townsbury, Haverhill, Mass. Filed Dec. 27, 1887. Serial No. 259,083. (No model.)

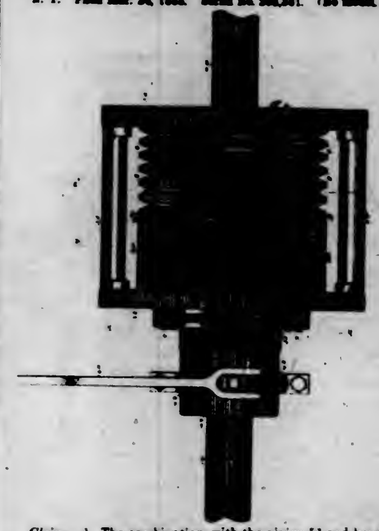
Claim.—In a machine for ornamenting the edges of leather and other material, the revolving recessed metallic bed-roll *a*, over which the material passes, the said roll having its rear portion scalloped and its front portion perforated, combined with an oppositely-revolving ornamenting or pattern roll co-operating therewith, the curved gage *c*, embracing a portion of the roll *a*, the shafts *a' b* for the said rolls, the adjustable bearing-block *c* for one end of the shaft *b*, and gearing connected to the rear ends of the shafts to revolve them in opposite directions, as and for the purpose set forth.



387,270. CHECK-ROWER. Alfred J. Thostrup, Fair Grange, Ill. Filed Oct. 10, 1887. Serial No. 251,901. (No model.)

Claim.—1. A check-rower attachment for planters, consisting of four projecting arms having end-pivoted feet provided with curved guide-rods surrounded by coiled springs, a frame joined to said arms and provided with inclined trip projections adapted to contact with the bent ends of operating-rods connected with seed-slides, in combination with side bars formed and pivoted to a metal frame, as shown, levers and connecting-rods for operating said bars and frame, substantially as shown and described.

2. A check-rower attachment for planters, consisting of revolving arms having pivoted feet, side bars journaled to the axle of said arms and carrying operating-rods connected with a bent rod that is in turn connected with the seed-slide of a seeder, cross-bars secured to said projecting arms and provided with trip projections adapted to contact with the bent ends of said operating-rods, substantially as shown and described.



387,271. STEAM-GENERATING ATTACHMENT FOR BOILERS. George W. Tilton, Chicago, Ill. Filed Mar. 13, 1888. Serial No. 267,113. (No model.)

Claim.—1. In a locomotive-boiler, the combination, with the fire-box, of the horizontal transverse tube B, provided with annealing-flanges and rigidly secured to the inner inclining sides of the fire-box, and opening at both ends into the water-compartment of the boiler, a number of water-circulating and steam-generating pipes having the lower ends inserted in said water-tube and extending upwardly and outwardly in an angular path therefrom, and finally terminating in the crown-sheet and communicating with the water-space above the same and below the water-line, and the solid inclined plate or wall D, closing the space between said water-tube and the rear side of the fire-box, whereby a continuous circulation is maintained, as described, and the heat forced to pass upward in front of said water-tube and between the series of pipes inserted therein, substantially as and for the purpose set forth.

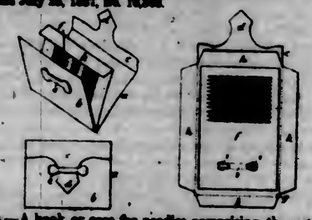
2. In a locomotive or other boiler, the combination, with a water-supply tube opening at both ends into the water-space of the boiler below a central line, of the series of circulating-pipes C, inserted in said tube and following an angular course upward therefrom, and finally ending in the crown-sheet and opening on a level with the interior surface of the same, and the second series of companion pipes, C', arranged in the same manner as the pipes C and just back of the same, and alternating, so that each of the pipes C comes opposite the space separating the companion series, whereby the heat passing between the first series has a full impact on the surface of the second series, substantially as set forth.

387,272. CLUTCH MECHANISM. William B. Tubbs, New York, N. Y. Filed Mar. 24, 1888. Serial No. 268,381. (No model.)

Claim.—1 The combination, with the pinion 51 and head 41, fast upon the parts to and from which motion is to be communicated, of a disk, 52, carried by one of said parts and free to turn thereon a pinion, 20, carried by said disk and turning freely in engagement with the pinion 51, and having an extension to engage frictionally with the head 41, substantially as described.

2. The combination, with the pinion 51 and head 41, fast upon the parts to and from which motion is to be communicated, of the disks 52, carried by said parts and free to turn thereon, the pinions 20, carried by and supported between said disks and turning freely in engagement with the pinion 51, and having extensions to engage frictionally with the head 41, substantially as described.

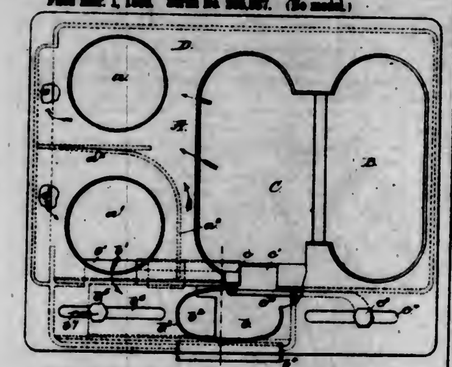
3. The combination, with the pinion 51 and head 41, fast upon the parts from and to which motion is to be communicated, of the eccentric shafts 30, mounted in the loose disks 52, and the sleeves 31, having the pinions 20, and having extensions which engage frictionally with the head 41, substantially as described.



4. The combination, with the pinion 51 and head 41, having the circumferential grooves 9, said pinion and head being fast upon the parts from and to which motion is communicated, of the eccentric shafts 30, mounted in the loose disks 52, and the sleeves 31, having the pinions 20, engaging with the pinion 51, and having ribbed extensions which engage frictionally with the head 41, substantially as described.

5. The combination, with the pinion 51 and head 41, fast upon

the parts from and to which motion is to be communicated, of the eccentric shafts 30, mounted in the loose disks 52, and the sleeves 31, having the pinions 20, engaging with the pinion 51, and extensions which engage frictionally with the head 41, the gears 25 upon the shafts 30, and the pinions 24, engaging with the gears 25, substantially as described.



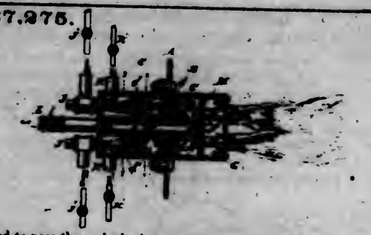
6. The combination, with the pinion 51 and head 41, fast upon the parts from and to which motion is to be communicated, of the disks 52, the eccentric shafts 30, carrying the sleeves 31, engaging frictionally with the head 41, and having the pinions 20, engaging with the pinion 51, the gears 25 upon the shafts 30, the pinions 24, engaging with the gears 25 and having the spiral rib and groove 10 12, and the sleeve 40, connected to said pinions 24, substantially as described.

387,273. BRIDLE-GAGE. Ernest L. Tuesey, London, England. Filed Feb. 27, 1888. Serial No. 265,697. (No model.) Patented in England July 30, 1887, No. 10,982.

Claim.—A hook or case for needles comprising the outer covering, *a*, having a tongue and loop for closing the case, the piece of fabric, *f*, for receiving the needles, and the intermediate piece of material, *g*, having the flaps A, for covering the edges of the piece of material *f*, all the said parts being united and held in position by means of prongs formed upon the said loop, all substantially as described.

387,274. COOK-STOVE. George W. Walker, Holden, Mass. Filed Mar. 1, 1888. Serial No. 265,857. (No model.)

Claim.—1. The stove-body, the flue *b*, flues *c c'*, the sliding draft-checking damper, the sliding kindling-damper, and their knobs or handles, combined with the top plate having guides for both the said knobs or handles, substantially as described.



2. In a cook-stove, the body, flues *c c'*, having openings *b' c'* in one of its vertical plates, the flue *b*, into which enter the products of combustion passing through the said openings *b'* or *c'*, the oven, the top plate, and wall *a*², dividing the space between the top plate and the body of the stove on one side and the oven on the other side, combined with the draft-checking damper and the kindling-damper, both arranged to slide in the same direction, substantially as described.

3. The combination, with the stove-body, top plate, and flue *b*, of the sliding draft-checking damper and the sliding kindling-damper, both arranged at the same side of the stove and made movable in the same direction, substantially as described.

387,275. OIL-BURNER. Thomas B. White, Philadelphia, Pa. Filed Mar. 3, 1888. Serial No. 266,093. (No model.)

Claim.—1. In an oil-burner, the combination of a mixing-cylinder having a series of internally-unobstructed compartments formed by perforated dividing-plates between said compartments, oil and steam pipes opening into the first of said compartments for admitting oil and steam and mixing them, and which mixed oil and steam is more intimately mixed by passing through the perforated dividing-plates and

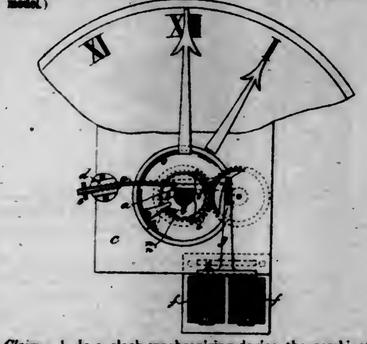
387,276.

caused to pass through the burner without rotary motion, and nozzles opening from the last of said compartments to allow the escape of the mixed steam and oil for combustion, and air-passages around each nozzle to supply air.

2. In an oil-burner, the combination of a mixing-cylinder having a series of compartments formed by perforated dividing-plates between said compartments, oil and steam pipes opening into the first of said compartments for admitting oil and steam and mixing them, and which mixed oil and steam is more intimately mixed by passing through the perforated dividing-plates, nozzles opening from the last of said compartments to allow the escape of the mixed steam and oil for combustion, and an air-blast passage within the cylinder and exterior to the mixing-compartments and terminating in openings surrounding the nozzles for the mixed oil and steam.

3. In an oil-burner, a cylinder having a central air-passage and surrounding mixing-compartments divided by perforated plates or walls, and a blast-chamber at the discharging end of the full diameter of the cylinder, communicating with the air-passage, and having blast-orifices through its end, pipes to admit steam and oil to the first compartment, and a blast-nozzle opening from the last compartment, extending through the blast-chamber, and arranged with its end between the blast-orifices, whereby the air is sucked through by the force of the central jet of oil and steam.

4. In an oil-burner, the combination of the cylinder having compartments E D D, separated by perforated dividing walls or partitions, and an air-blast compartment, F, at the end, an oil-pipe, K, and steam-pipe J, entering said compartment E at one end and arranged to spray the oil by a jet of steam, nozzles H, extending from the compartment D through the compartment F for the passage of the oil and steam vapor, and very small orifices A from the compartment F and close to and surrounding the nozzles H for air-supply to the flame.



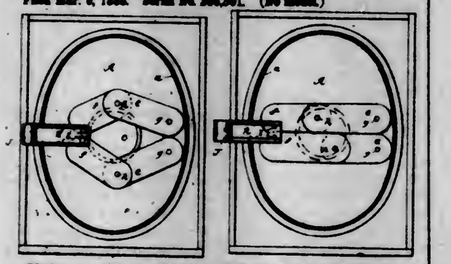
5. In an oil-burner, the combination of the cylinder having compartments E D D, separated by perforated dividing walls or partitions, and an air-blast compartment, F, at the end, an air-pipe leading through the burner and close to the hot mixing-chamber, so as to heat the air before becoming burned, an oil-pipe, K, and steam-pipe J, entering said compartment E at one end and arranged to spray the oil by a jet of steam, nozzles H, extending from the compartment D through the compartment F for the passage of the oil and steam vapor, and very small orifices A from the compartment F and close to and surrounding the nozzles H for air-supply to the flame.

6. In an oil-burner, a long annular mixing-chamber divided into separate compartments by transverse perforated walls, pipes to admit steam and oil to the first of said compartments, long removable nozzles opening out from the last of said compartments, a central blast-passage through the mixing-chamber having an enlarged end forming a chamber surrounding the nozzles, and openings for air from said last-mentioned air-chamber around and close to the orifices of the nozzles.

7. In an oil-burner, a mixing-cylinder having two or more mixing-compartments separated by perforated plates or walls and in which oil and steam are mixed, having a passage for air under pressure through its center and opening into a compartment, F, at the end of the cylinder formed by the wall M, in combination with tubular nozzles for oil vapor opening through the wall M and extending through but closed to the compartment F, a series of perforations in the end of the cylinder about the nozzles opening from the compartment F, oil and steam pipes entering said mixing-chamber, and an air-blast pipe entering said air-passage.

8. In an oil-burner, a mixing-cylinder for the mixture of oil and steam, divided into two longitudinal compartments by a horizontal wall, *e*, and into a series of smaller compartments within said longitudinal compartments by vertical perforated walls *d*, and having a compartment, F, at its end unconnected with said upper and lower compartments, and also having a passage-way, *f*, passing through it and opening into said compartment F, but unconnected with said other compartments, in combination with steam and oil pipes entering in close proximity the first of the mixing-compartments, and vapor-nozzles opening out of the last of the mixing-compartments, and blast-orifices from the blast-compartment F in close juxtaposition to the vapor-nozzles.

387,276. ELECTRIC CLOCK-SYNCHRONIZER. ARTHUR G. WISHAR, St. Louis, Mo. Filed Apr. 17, 1888. Serial No. 270,967. (No model.)



Claim.—1. In a clock-synchronizing device, the combination of the minute-hand toothed wheel *i*, having a conical surface, *j*, and boss or hub *k*, formed with one or more flats or depressions, *l*, (or *l'*,) and carrying toothed plate *m*, for engaging with toothed friction-disk *o*, actuating clock-work, spindle *b*, with spring arm or lever *a*, fulcrumed to clock, and spring *p*, substantially as shown, and for the purpose described.

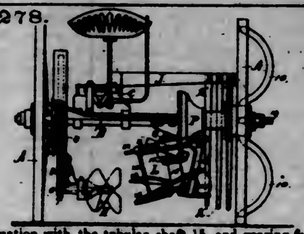
2. In a clock-synchronizing device, the combination of the minute-hand toothed wheel *i*, having a conical surface, *j*, and boss or hub *k*, formed with one or more flats or depressions, *l*, (or *l'*,) and carrying toothed plate *m*, for engaging with toothed disk *o*, actuating clock-work spindle *b*, with spring arm or lever *a*, fulcrumed adjustably by set-screw *c* to clock, and spring *p*, substantially as shown, and for the purpose described.

3. In a clock-synchronizing device, the combination of the minute-hand toothed wheel *i*, having a conical surface, *j*, and boss or hub *k*, formed with one or more flats or depressions, *l*, (or *l'*,) and carrying toothed plate *m*, for engaging with toothed disk *o*, actuating clock-work spindle *b*, with spring arm or lever *a*, fulcrumed to clock and having bar or link *g*, carrying armature *h*, magnets *f*, and spring *p*, substantially as shown, and for the purpose described.

387,277. SHELF ATTACHMENT FOR STOVE-PIPES. WILLIS J. YOUNG, SHAFFER H. YOUNG, and ZACHARIAH U. KNOOP, Hebron, Nebr. Filed Mar. 6, 1888. Serial No. 266,901. (No model.)

Claim.—1. The combination, with a stove-pipe shelf having an opening in its bottom, of a damper to close said opening, composed of a series of pivotally-connected plates secured to the under side of the shelf and a sliding handle pivotally connected to said plates, as set forth.

2. The combination, with the shelf and the hood having aligned openings, of the damper composed of pivotally-connected plates and a sliding handle connected thereto having longitudinal guide-ribs and extending through a correspondingly-shaped opening in the hood, as set forth.



3. The combination, with a stove-pipe shelf having an opening, of a damper to close said opening, composed of a series of pivotally-connected plates and a handle connected to said plates, as set forth.

387,278. POTATO-DIGGER. LEWIS A. ASPINWALL, Three Rivers, Mich., assignor to the Aspinwall Manufacturing Company, same place. Filed Mar. 12, 1888. Serial No. 266,936. (No model.)

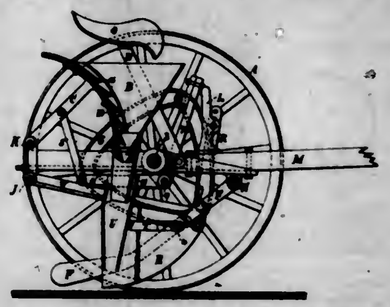
Claim.—1. The combination, with the plow F, of the screw H, and the gearing for revolving the same, the revolving spreader L, and the incline I, between the screw H and the said spreader, substantially as set forth.

2. The spreader L, having the arms 20, inclines 24, and rim 21,

387,278.

in combination with the tubular shaft 15, and gearing for revolving the same, substantially as set forth.

3. The spreader L, having the arms 20 and inclines or blades 24, and the rim 21, in combination with the gearing for revolving the same, and the screw H, which acts to deliver the earth and potatoes upon the spreader, substantially as set forth.



4. The plow F and fingers G, in combination with the incline I, the screw H, opposite to the incline I, and the spreader L, behind the incline and with the front portion thereof in line, or nearly so, with the axis of the screw, so that the earth and potatoes pass upon the front portion of the spreader and are thrown off, substantially as set forth.

5. The combination, with the spreader L and the gearing for revolving the same, of the open wheel A, having the curved spokes 10, substantially as and for the purposes set forth.

6. The combination, with the plow and the spreader, of the fingers K, curved downwardly and backwardly and adjacent to the wheel A, for preventing the potatoes being thrown by the spreader beneath the wheel A, substantially as set forth.

7. The combination, in a potato-digger, of the plow F, for raising the earth and potatoes, the fingers G at the rear edge of the said plow, the revolving screw H, behind the fingers, acting to separate the earth and potatoes and pass them to the rear and toward the separator, the incline I, up which the earth and potatoes are passed by the action of the screw, the revolving separator L, having arms or inclines, and the open wheel A, having curved spokes, substantially as set forth.

387,279. PLANTER FOR COTTON OR OTHER SEEDS. LEWIS A. ASPINWALL, Three Rivers, Mich. Filed Apr. 30, 1888. Serial No. 272,218. (No model.)

Claim.—1. The combination, with the wheels and axle and the hopper and plow, of a curved toothed segment within and at one side of the hopper, and means for reciprocating the segment so as to cause the teeth thereof to drop down and discharge the materials of the hopper progressively, substantially as set forth.

2. The combination, in a planter, of a hopper for containing the material to be planted, a plow for opening the furrow, a bar, V, pivoted at its rear end to the frame of the machine, a link and lever for raising or lowering the plow, coverers pivoted at their front ends to the frame of the machine, and a bolt connecting the coverers and passing through a slot in the plow, substantially as set forth.

3. The combination, with the hopper in a planter for cotton or other materials, of the toothed segment, an arm and pivot upon which the same are moved, and stationary teeth within the hopper and standing in opposite direction to the teeth of the segment for causing the delivery of the cotton-seed or other material from the teeth of the segment, substantially as set forth.

387,280. COMBINED INKSTAND AND PEN-RACK. EDWARD A. DEUEL and HUGH J. CAMPBELL, Yankton, Dak. Filed Oct. 13, 1886. Renewed Dec. 22, 1887. Serial No. 258,782. (No model.)

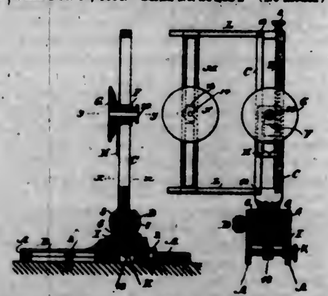
387,280.

Claim.—1. A pen-holder comprising a drip pan or tray and a receptacle elevated above and carried by the said pan, substantially as described, for the purpose set forth.

2. A pen-holder comprising a drip pan or tray and an inverted cone-shaped receptacle suspended above the tray and having an open lower end, substantially as described.

3. A pen-holder comprising a drip pan or tray, one or more cone-shaped receptacles arranged above the pan, and a bridge intermediate of the pan and the receptacle or receptacles, substantially as described, for the purpose set forth.

4. A pen-holder comprising a single drip pan or tray, a series of inverted conical receptacles grouped and connected together and having the open lower and upper ends, and a bridge intermediate of the drip-pan and the receptacles to elevate the lower ends of the latter above the pan, substantially as described.



5. As a new article of manufacture, a combined inkstand and pen-holder comprising a base, the ink-wells arranged at one side thereof, the receptacles E, and the grouped tubes connected with a drip-pan removably fitted on the base, substantially as described.

387,281. THILL-COUPLING. WILLIAM DUNBAR, Lake Village, Ind. Filed Mar. 22, 1888. Serial No. 268,144. (No model.)

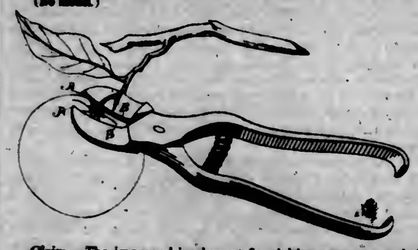
Claim.—In a thill-coupling, the combination, substantially as set forth, of a clip-iron having forwardly-projecting ears with front and rear bolt-apertures therein, a removable headed bolt mounted in the front aperture, an open box or cap coming hinged to the rear part of said projecting ears, consisting of two side pieces, E and E', connected by a top raised cross-piece or bridge, D', and a flat spring, F, secured at one end to the central part of the cross-piece or bridge D', and its free end extending over and loosely bearing upon that part of the clip-iron which surrounds the axle.

387,282. SIGHT FOR FIRE-ARMS. JAMES W. GARVER, Pawlet, Vt., Filed Feb. 17, 1888. Serial No. 264,204. (No model.)

Claim.—1. The base A, having a hole for the screw 2 and a longitudinal slot for the screw 3, in combination with the slide-cover B, passing into the slot above the screw for closing the slot, and the frame above the base, and the adjustable sight sliding vertically in the frame, substantially as set forth.

2. The combination, with the base A and the frame or leaf C, and vertically-adjustable sight G within the frame, of transverse slide I and the joint 5 and 6, for connecting the frame C to the slide, and the spring 7 upon the slide, acting to hold the joint-piece 6 and frame C in any position to which it may be turned upon the hinge, substantially as set forth.

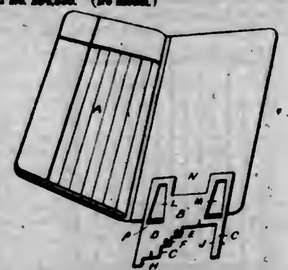
3. The combination, with the vertical frame C, the sight G, and the adjustable block F, sliding in the frame and supporting the sight, of a separate removable tubular screw passing through the block and into the sight and forming the peep-hole of the sight, such screw being changeable to vary the size of the tubular peep-hole, substantially as set forth.



4. The combination, with the sight G, frame C, and base A, of the transverse slide I within ways or grooves across the base, and the hinge-pieces on the transverse slide for connecting it to said frame C, and the screw K across the base A, for adjusting the slide transversely of the base A, substantially as set forth.

5. The combination, with the sight and the frame for supporting the same, of lateral bars L, extending from the sight-frame, the vertical bars M, supported by the said bars L, and the shade or shield carried by such vertical bars M and vertically adjustable upon such bars M, substantially as set forth.

6. The vertically-adjustable peep-hole sight and the shield or shade to intervene between one eye and the object aimed at and shut off the vision, in combination with a frame and vertical bars for carrying the sight and the shield and in which the same can be adjusted vertically, substantially as set forth.

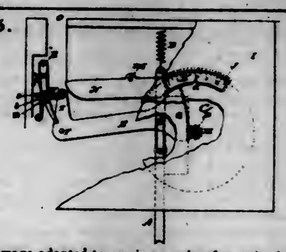


7. The base A, having a hole and a screw, 2, therein, and slotted longitudinally at one end, and a screw, 3, therein, in combination with the adjustable slide and frame above the base, and the adjustable sight sliding vertically in the frame, substantially as set forth.

387,283. INSTRUMENT FOR PICKING ORANGES. CHARLES DUCHESNE, Los Angeles, Cal. Filed Aug. 30, 1887. Serial No. 248,167. (No model.)

Claim.—The improved implement for picking oranges, consisting of a pair of clippers provided with blades having that part of each blade provided with the cutting-edge slightly curved from the point to the heel of the blade, the curve at the heel being less than that at the point, and having the under face of the blades sloped from the cutting-edges to the backs of the blades, the slope being less at the heels than at the points, making the under faces of said blades present when closed a surface convex both transversely and longitudinally, the convexity being more abrupt at the points of the blades than at the heels thereof.

387,284. DEVICE FOR MEASURING THE THICKNESS OF LUMBER. GEORGE H. DAVIS, Boston, Mass. Filed Nov. 7, 1887. Serial No. 254,536. (No model.)



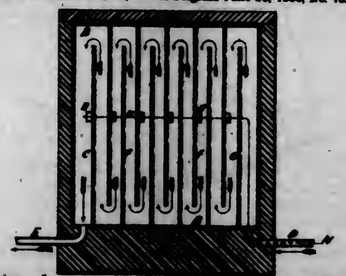
Claim.—1. A device for measuring the thickness of boards, lumber, or other material, having suitable measuring notches, spaces, or marks, and provided with a spring or springs for attaching it to the cover of a book or other article.

2. A device for measuring the thickness of boards, lumber, or other material, having suitable measuring notches, spaces, or marks, and provided with a spring or springs for attaching it to the cover of a book or other article, and all made of one piece of material.

387,285. INDICATOR FOR WEIGHING APPARATUS. HENRY FAIRBANKS, St. Johnsbury, Vt. Filed July 19, 1888. Serial No. 280,372. (No model.)

Claim.—1. The combination of a disk adapted to be rotated under the force or weight applied to the apparatus, an inclosing-case, its front having an opening through it to expose the graduations on

387,285.

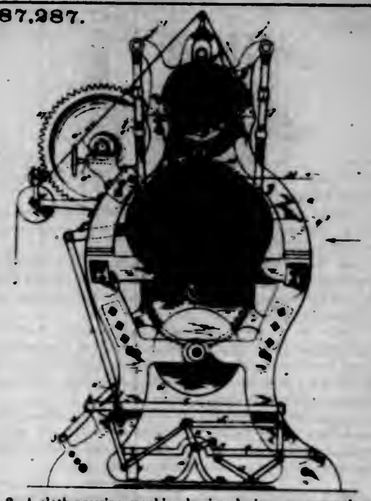


the disk, a passage adapted to receive a coin of certain size, a cover for said opening, and an obstruction in said passage in connection with said cover, substantially as described, and whereby the coin so introduced will strike the said obstruction, and by its weight remove the cover from said opening and expose the graduations on the disk.

2. The combination of the graduated disk C, a revolving shaft to which said disk is fixed, said shaft carrying a toothed pinion, H, a corresponding toothed rack, G, working into said pinion H and in connection with the weighing apparatus, a plate in front of said disk having an opening, J, adapted to expose the graduations of the disk, and a lever, one arm, L, of which extends between said disk and plate, so as to cover said opening, the other arm extending to the opposite side of the fulcrum, and the inclosing-case constructed with a coin-passage, through which a coin may be introduced, the said arm N of the lever extending into said coin-passage and in the path of a coin introduced therein, a lever, P, hung in the side of the coin-passage opposite the said arm N, and its inner surface of segment shape, of which the fulcrum of the said lever L N is the center, and mechanism, substantially such as described, to turn said lever P from said lever N, substantially as described.

3. The combination of the graduated disk C, arranged upon a shaft, D, carrying a toothed pinion, H, a plate in front of said disk constructed with an opening, J, adapted to expose the graduations on said disk, a lever, one arm of which extends between said plate and disk, and so as to serve as a cover for said opening, but adapted to be turned away from said opening to expose said disk, a coin-passage upon the side of the fulcrum opposite said opening to the disk, the other arm of said lever extending into said passage and in the path of a coin introduced, a lever, E, terminating at its free end in a toothed segment to work into the said pinion H and the said lever E, in connection with the weighing apparatus, a lever, P, hung in the side of the coin-passage opposite the end of the arm N therein, and a dog, U, hung upon said lever E and adapted to engage said lever P in the returning of the said lever E, substantially as and for the purpose described.

387,286. APPARATUS FOR TREATING NOXIOUS GASES WITH ELECTRICITY. Hartley Fevens, Buckingham, County of Bucks, England. Filed Dec. 3, 1886. Renewed July 11, 1888. Serial No. 279,634. (No model.) Patented in England May 26, 1886, No. 7,176; in France June 26, 1886, No. 177,047, and in Belgium June 26, 1886, No. 72,649.



Claim.—In an apparatus for the treatment of sewer-gases, the combination of the box A, lined with glass, the glass partitions C, so arranged as to give the gas a zigzag course, the inlet-pipe D, and the outlet E, all combined as shown, and acted upon by an electric current, for the purpose set forth.

387,287. CLOTH-PRESSING MACHINE. David Greene, Worcester, Mass. Filed Sept. 4, 1886. Serial No. 212,762. (No model.)

Claim —1. In combination, a cylinder and a surface, whereby pressure is exerted upon the cloth against the cylinder provided with perforations, connected with a supply of moisture, whereby the cloth is treated with moisture while under pressure, substantially as described.

387,287.

2. A cloth-pressing machine having devices constructed to press the cloth at three points, the pressing-surfaces at the intermediate point being provided with means for depositing moisture on the cloth while under pressure, and the pressing-surfaces at the other two points being adapted to exert a comparatively dry pressure, substantially as described.

3. A machine for pressing cloth, having pressing devices constructed to press the cloth, a heated surface traveling in contact with the cloth after receiving a pressure, and a second pressing-surface, to press the cloth against said heated surface, provided with means, substantially as described, to permit moisture to be deposited on the cloth while the latter is traveling in contact with said heated surface and under pressure, substantially as described.

4. In combination, a cylinder and two bed-plates, and a pressing-surface provided with perforations interposed between the bed-plates, whereby, after receiving pressure, the cloth may be moistened while the pressure is retained, substantially as described.

5. In combination, a cylinder and two bed-plates, and a steamer or moistener provided with a pressing-surface attached to one bed-plate and extending nearly to the opposite bed-plate, whereby the cloth will be retained almost continuously under pressure, substantially as described.

6. In combination, a cylinder, a bed-plate, means for heating the bed-plate, and a steamer or moistener connected with the bed-plate, whereby the heat from the bed-plate will heat the steamer, so as to produce the proper conditions for the use of the steamer, substantially as described.

7. In combination, two cylinders, a bed-plate operating with the first cylinder, a moisture-absorbing jacket enveloping the second cylinder, a steamer or moistener for supplying moisture to the jacket, and a pressing-surface arranged to press the cloth against the moistened jacket on the second cylinder, substantially as described.

8. In combination, two cylinders, a bed-plate operating with the first cylinder, a moisture-absorbing jacket enveloping the second cylinder, a steamer or moistener for supplying moisture to the jacket, and a bed-plate arranged to press the cloth against the moistened jacket on the second cylinder, the said bed-plate being provided with means for heating the same, substantially as described.

9. In combination, two cylinders, a bed-plate operating with the first cylinder, a moisture-absorbing jacket enveloping the second cylinder, a steamer or moistener for supplying moisture to the jacket, and a bed-plate arranged to press the cloth against the moistened jacket on the second cylinder, the said second cylinder being provided with means for heating the same, substantially as described.

10. In combination, the two cylinders, two bed-plates operating with the first cylinder, the steamer arranged to moisten the cloth in contact with the first cylinder, the moisture-absorbing jacket enveloping the second cylinder, a steamer or moistener for supplying moisture to the jacket, and a pressing-surface arranged to press the cloth against the moistened jacket on the second cylinder, substantially as described.

11. In combination, the two cylinders, a bed-plate operating with the first cylinder, a bed-plate operating with the second cylinder, a moisture-absorbing fabric interposed between the second cylinder and its bed-plate, and a moistener or steamer for moistening said fabric, whereby the cloth will be pressed with the moistened fabric against the second cylinder, substantially as described.

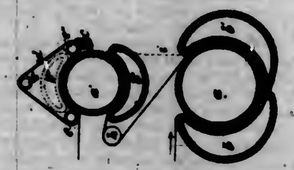
12. In combination, the two cylinders, a bed-plate operating with the first cylinder, a moisture-absorbing fabric operating with the second cylinder, a steamer or moistener for moistening the fabric, and mechanism whereby the moistened fabric and the cloth are pressed together against the second cylinder, substantially as described.

13. In combination, the two cylinders *a a'*, the bed-plates *b b' b''*, the three-armed lever connected with each of said bed-plates, and mechanism whereby said lever is reciprocated, substantially as described.

14. In combination, the two cylinders *a a'*, the bed-plates *b b' b''* the rods *j*, whereby two of the bed-plates are supported, the reciprocating bearings whereby the third bed-plate is supported, and the three-armed lever connected with each bed-plate, substantially as described, whereby the weight of the two bed-plates tends to counterbalance the weight of the third, substantially as described.

15. In combination with a bed-plate, a lever whereby it is reciprocated, and the jointed links 1 2, provided with the handle 4, whereby the lever is reciprocated, substantially as described.

16. A cloth-pressing machine having a cylinder and a bed-plate and a steamer, the steamer being arranged to deposit steam upon the cloth after receiving pressure by the bed-plate, and also being provided with a pressing-surface whereby the cloth is held against the cylinder while being moistened, substantially as described.



17. A cloth-pressing machine having a cylinder and a bed-plate and a pressing-surface, the said pressing-surface being provided with means for depositing moisture on the cloth as it is held against the cylinder, substantially as described.

18. In combination, the cylinder *a*, the bed-plates *b* and *b'*, and the swinging rods *j j*, by which the bed-plates are suspended from above, the points of suspension being a greater distance apart than the diameter of the cylinder, whereby the weight of the bed-plates assists in relieving the pressure, substantially as described.

19. In combination, the cylinder *a*, the bed-plates *b* and *b'*, the pendants *j j*, by which the bed-plates are suspended from above, an actuating-lever, and the rods *l l'*, by which the bed-plates are connected with said actuating-lever, substantially as described.

387,288. CLOTH-PRESSING MACHINE. David Greene, Worcester, Mass. Filed Dec. 27, 1887. Serial No. 258,903. (No model.)

Brief.—The cloth passes between a cylinder and two bed-plates, then over a stretching-roll, and between a second cylinder and a bed-plate and moistened apron.

Claim.—1. In a cloth-pressing machine, a dry pressing-surface provided with a heating-chamber, and an apron arranged successively along the path in which the cloth travels, means whereby the cloth is pressed against said pressing-surface and said apron, and means for moistening said apron, substantially as described.

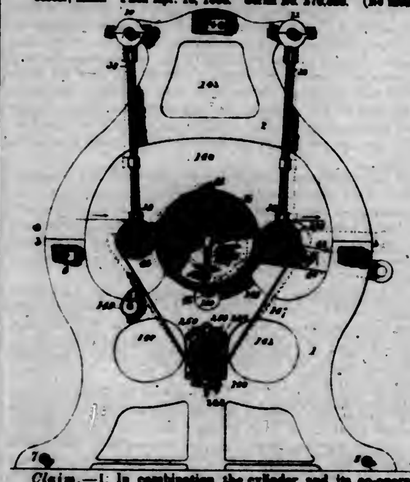
2. In combination, the cylinder, a pressing-surface, an apron, means whereby the apron is pressed upon the cloth between it and the cylinder, and means whereby the apron is moistened, substantially as described.

3. In combination, a cylinder, a press-plate, a moisture-absorbing apron, a steamer for moistening said apron, and mechanism whereby said apron is pressed in contact with the cloth against the cylinder, whereby the cloth, after receiving pressure from the press-plate, is again pressed in contact with the moistened apron, substantially as described.

4. In combination, the cylinder and apron, means whereby the apron is pressed upon the cloth between it and the cylinder, and a steamer or moistener arranged to deposit moisture on the face of the apron which comes next the cloth, substantially as described.

5. In combination, a cylinder, an endless apron, the rollers *c d e*, supporting said apron, arms *f f' f''*, and a central shaft, *g*, substantially as described

6. In combination, two cylinders, one or more bed-plates arranged to press the cloth against one of said cylinders, and the endless apron arranged to press the cloth against the other of said cylinders, and means whereby the apron is pressed upon the cloth, and the steamer arranged to deposit moisture upon the said apron, substantially as described.



7. In combination, the cylinder *a*, one or more bed-plates operating therewith, the cylinder *c'*, the bed-plate *b''*, the endless apron *d*, and means for supporting said apron, substantially as described.

387,289. MACHINE FOR PRESSING CLOTH. David Greene, Worcester, Mass. Filed Dec. 27, 1887. Serial No. 258,188. (No model.)

Claim.—In combination with the cylinder and its attendant bed-plate or bed-plates, the apron and its supporting-rollers *c* and *e*, all arranged substantially as described, whereby the cloth, after being pressed by the bed-plate, is subjected to pressure upon the cylinder by the apron, substantially as described.

387,290. CLOTH-PRESSING MACHINE. David Greene, Worcester, Mass. Filed Apr. 16, 1888. Serial No. 270,883. (No model.)

Claim.—1. In combination, the cylinder and its co-operating pressing devices, pendants upon which the bearings of the pressing devices are located, and an end frame containing an opening, opposite which the bearing of the cylinder and pressing devices are located, and having upward extensions, upon which are hung or pivoted the said pendants.

2. In combination, the cylinder and its co-operating pressing devices, an end frame containing a fixed bearing for the cylinder and having an opening extending on both sides of said bearing, projections from the ends of the pressing devices extending through said opening, and mechanism for supporting and operating said pressing devices, connected, respectively, with said pressing devices and said projections therefrom inside and outside of said end frame.

3. The combination, with the bed-plate and its sheet-metal facing, of a hook arranged to engage the edge of the sheet metal at or near the middle thereof, whereby the sheet metal is held down in contact with the bed-plate, substantially as described.

4. In combination with the bed-plate and its sheet-metal facing, a clamp, 34, secured by the cam 35 and bolts to the end of the bed-plate, substantially as described.

5. In combination, a cylinder, a bed-plate, pendants whereby the bed-plate is supported, the journals whereby the bed-plate is connected with the pendants, and a stop whereby the rotation of the bed-plate upon the pendants is limited and the proper position of the bed-plate maintained, substantially as described.

6. In combination, a cylinder, two pressing devices connecting therewith, and suspending means for said pressing devices having screw-threaded rods, whereby the length thereof may be adjusted, substantially as described.

7. In combination, a cylinder, two bed-plates, each having end journals, the rings 30, the rods 31, the hangers 38, the rings 44, the rods 45 and 46, and the levers 40, all combined and arranged substantially as described.

8. In combination, a cylinder, and two pressing devices coacting therewith, a three-armed lever at each end of the cylinder, rods connecting the journals of each pressing device with an arm of each lever, and the rod 47, whereby said levers are coupled together, substantially as described.

9. In combination with the end frames of the machine, the cylinder, and its two co-operating pressing devices located between the frames, the said pressing devices having journals projecting outside of the frames, and a lever located outside of each frame and connected with one journal of each pressing device, whereby the pressing devices are moved to and from the cylinder, substantially as described.

10. In combination, the cylinder, pressing devices co-operating therewith, a lever at each end of the cylinder for operating the pressing devices, toggle-joints adjacent to said levers and connected therewith, one of the links of each of said toggle-joints being provided with a screw-threaded rod, substantially as described, whereby the pressure exerted by the toggle-joints may be equalized, and means for operating said toggle-joints.

11. In combination, the cylinder, the pressing devices co-operating therewith, a lever at each end of the cylinder for operating the pressing devices, and rods connecting each of said levers with the ends of the respective pressing devices, said rods being provided with screw-threads, whereby the pressing-surfaces of the pressing devices may be adjusted parallel with the cylinder, substantially as described.

12. In combination, the cylinder, the bed-plates co-operating therewith, the rods by which said bed-plates are suspended at each end, means for adjusting the length of each of said rods, the levers whereby said bed-plates are actuated, rods connecting said levers with the ends of said bed-plates, and means for adjusting the lengths of said last-mentioned rods, all arranged substantially as described, whereby the beds are leveled and brought parallel to the cylinder, as set forth.

13. In combination, the cylinder, the pressing devices co-operating therewith, a lever arranged at each end of said pressing devices for operating the same, rods connecting the arms of said levers with the pressing devices, toggle-joints adjacent to and connected with said levers, the screw-threaded rod 51, by which both of said toggle-joints are operated, and the forked bearings 52 for said rods, substantially as described.

14. In combination, two cylinders arranged one above the other, two bed-plates co-operating with the lower cylinder on opposite sides thereof, and a bed-plate co-operating with the upper cylinder below the same, and two levers and devices whereby the said levers are connected, respectively, with the opposite ends of all said bed-plates, substantially as described.

15. In combination, the two cylinders, two bed-plates co-operating with one of said cylinders, another bed-plate co-operating with the second cylinder, two levers arranged one at each end of the machine, devices embracing connecting-rods, whereby each of said levers is connected with the adjacent end of each bed-plate, and means whereby said rods are made adjustable lengthwise, substantially as described.

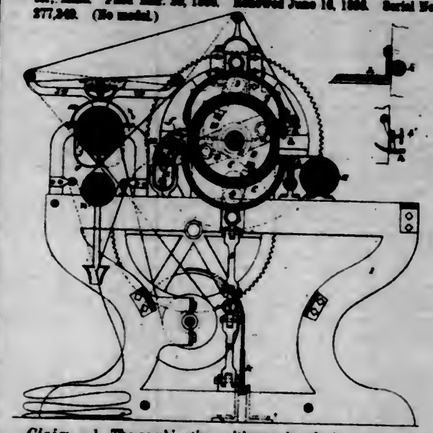
16. In a cloth-pressing machine, in combination, the bed-plate, an exhaust-pipe for the escape of water of condensation, the steamer, and a pipe leading from the bed-plate to the steamer and taking dry steam from the bed-plate at a point above the exhaust.

17. In a cloth-pressing machine, in combination with the bed-plate and the steamer, a pipe whereby the steamer is supplied with steam from the bed-plate, and a valve in said pipe, whereby the steam may be cut off from the steamer until the bed-plate has become heated, substantially as described.

18. In a cloth-pressing machine, in combination with the bed-plate, a steamer mounted upon the same in such manner as to receive heat from it, a pipe supplying steam to the steamer from the bed-plate, and a valve in said pipe, whereby the steam may be cut off from the steamer until the latter has become heated by the bed-plate, substantially as described.

19. In combination with the bed-plate, the steamer, and the pipe connecting the steamer and bed-plate, all mounted upon the bed-plate, substantially as described.

20. In combination with the pressing devices, a stretcher and a brush located successively along the path of the cloth, in which brush the bristles are arranged in rows diverging from the middle, substantially as described.



21. In combination, pressing devices and a stretcher, and a brush in the path of the cloth, the brush acting on the cloth after the latter has been stretched by the stretcher and before the cloth is pressed, substantially as described.

22. In a cloth-pressing machine, in combination, the two cylinders, the gear-wheel 135, the double-faced gear-wheel 137, and the gear-wheel 136, two of said gear-wheels being movable longitudinally of their shaft, substantially as described.

23. In a cloth-pressing machine, in combination with a cylinder and its co-operating pressing devices and a steamer arranged below the cylinder, an end frame having an opening opposite to the end of the steamer and adapted to permit the steamer to be inserted or removed endwise, substantially as described.

24. In combination with a cylinder, a bed-plate having its bearings arranged in guideways upon the frame, stirrups arranged upon vibrating arms, whereby said bed-plate is reciprocated, means of adjustment, whereby the length of said vibrating arms may be made adjustable, the levers 60, to which power is applied for moving the bed-plates, and rods connecting the said levers with the said vibrating arms, substantially as described.

387,291. CLOTH-PRESSING MACHINE. David Gessner, Worcester, Mass. Filed Mar. 20, 1888. Renewed June 16, 1888. Serial No. 277,269. (No model.)

Claim.—1. The combination, with pressing devices constructed to press the cloth at two or more points successively, of a steamer or moistening apparatus interposed between the successive pressing-points, and mechanism constructed to heat the pressing devices succeeding the steamer or moistening apparatus, whereby the cloth receives a steaming or moistening intermediate two pressings, the latter of which pressings is hot, substantially as described.

2. The combination, with pressing devices constructed to press the cloth at two or more points successively, of a steamer or moistening apparatus interposed between the successive pressing-points, whereby the cloth receives steaming or moistening intermediate the pressings, and a steamer or moistener arranged to deposit steam or moisture on the cloth before the first pressing, substantially as described.

3. The combination, with pressing devices constructed to press the cloth at two or more points successively, of a steamer or moistening apparatus interposed between the successive pressing-points, whereby the cloth receives steaming or moistening intermediate the pressings, and a steamer or moistener arranged to deposit steam or moisture on the cloth after the last pressing, substantially as described.

4. The combination, with pressing devices constructed to press the cloth at two or more points successively, of a steamer or moistening apparatus interposed between the successive pressing-points, whereby the cloth receives steaming or moistening intermediate the pressings, and a steamer or moistener arranged to deposit steam or moisture on the cloth before the first pressing, and a steamer or moistener arranged to deposit steam or moisture on the cloth after the last pressing, substantially as described.

5. The combination, with pressing devices constructed to press the cloth at two or more points successively, of a steamer or moistening apparatus interposed between the successive pressing-points and provided with mechanism for adjusting it to and from the cloth, whereby the cloth may or may not be steamed or moistened intermediate the pressings, substantially as described.

6. The combination, with a cylinder, of two or more bed-plates arranged around the same, and a steamer or moistener interposed between the bed-plates, whereby the cloth receives a steaming or moistening as it passes from one bed-plate to the next, substantially as described.

7. In a cloth-pressing machine, in combination with the apparatus for stopping the feed of the machine and a steamer or moistener for supplying moisture to the cloth, connections, substantially as described, interposed, whereby the act of stopping the feed intercepts the passage of the moisture onto the cloth, substantially as described.

8. In a cloth-pressing machine, in combination with the pressing-surfaces and a steamer arranged in the path of the cloth as it leaves the pressing-surfaces, a brush arranged in the path of the cloth as it leaves the steamer, whereby the moisture is diffused among the fibers on the face of the cloth, substantially as described.

9. In a cloth-pressing machine, in combination with the pressing-surfaces, a brush arranged in the path of the cloth after it leaves the pressing-surfaces and on the side of the cloth which was presented to the cylinder in pressing, substantially as described.

10. In a cloth-pressing machine, the combination, with the pressing-surfaces, of a brush arranged in the path of the cloth after leaving the pressing-surfaces, and three guides, whereby either surface of the cloth may be brought in contact with the brush, substantially as described.

11. In combination with a rotary brush, a flock-receptacle extending only partially round the lower semi-circumference of the brush and adapted to be shifted from one part of the lower semi-circumference to another, as botanically as described.

12. A machine for pressing cloth having pressing devices constructed to press the cloth, a heated surface arranged to be in contact with the cloth after it receives a pressing, a steamer or moistener movable independently of the pressing devices and arranged to deposit steam or moisture on the cloth after being pressed and as it is in contact with said heated surface, and mechanism for adjusting the steamer or moistener to and from the cloth, substantially as described.

13. In combination, the cylinder, the bed-plates mounted in reciprocating supports *v*, the sliding beam *v'*, and means for adjusting the same in said supports, whereby the bed-plates may be adjusted in their supports, substantially as described.

14. In combination, the cylinder and the bed-plate, whereby the cloth is pressed, and a stripper arranged with its edge close to the surface of the cylinder where the cloth is to leave the cylinder, and means, substantially as described, whereby the stripper is supported and rendered adjustable, as specified.

15. A machine for pressing cloth having pressing devices constructed to press the cloth, a heated surface traveling in contact with the cloth after receiving a pressing, and a steamer or moistener, whereby steam or moisture is deposited on the cloth while it is in contact with said heated surface, substantially as described.

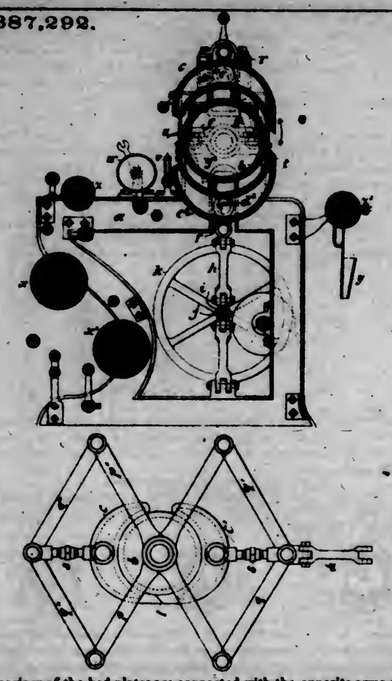
16. A machine for pressing cloth having pressing devices constructed to press the cloth, a continuously-operating feed, a heated surface arranged to be in contact with the cloth after it receives a pressing, and a steamer or moistener, whereby steam or moisture is deposited on the cloth when it is in contact with said heated surface, substantially as described.

17. A machine for pressing cloth having pressing devices constructed to press the cloth at two or more points successively, a heated surface arranged to be in contact with the cloth between the successive pressing-points, and a steamer or moistener, whereby steam or moisture is deposited on the cloth while it is in contact with said heated surface, substantially as described.

18. A machine for pressing cloth having pressing devices constructed to press the cloth at two or more points successively, a continuously-operating feed, a heated surface arranged to be in contact with the cloth between said pressing-points, and a steamer or moistener, whereby steam or moisture is deposited on the cloth while it is in contact with said heated surface, substantially as described.

19. The combination of a cylinder and a bed-plate and devices constructed to hold the cloth in contact with the cylinder after it leaves the bed-plate, and a steamer or moistener, whereby the cloth receives steaming or moistening after pressing and while in contact with the cylinder, substantially as described.

387,292. MACHINE FOR PRESSING FABRICS. David Gessner, Worcester, Mass. Filed Jan. 6, 1888. Renewed June 16, 1888. Serial No. 277,268. (No model.)



Claim.—1. In combination, a cylinder, two oppositely-arranged bed-plates, a lever pivoted concentric with the cylinder, and rods connecting the bed-plates with the opposite arms of said lever, substantially as described.

2. In combination, a cylinder, two bed-plates, one arranged above and the other below the cylinder, a lever or levers pivoted at each end of said cylinder, and rods connecting the bed-plates with the opposite arms of said lever or levers, whereby the weights of said bed-plates will counterbalance each other, substantially as described.

3. In a cloth-pressing machine, in combination, a frame having fixed bearings for the cylinder and guideways for the bearings of the bed-plates arranged on opposite sides of said cylinder-bearings, the cylinder, and the bed-plates arranged on opposite sides of the cylinder, and each bed-plate being provided with bearings arranged to slide in said guideways, whereby the bed-plates may reciprocate to and from the cylinder, substantially as described.

4. In combination, the cylinder, the two bed-plates, each provided at each end with a bearing, a lever or levers arranged between the end bearings of the opposite bed-plates, and rods, whereby the end

387,292.

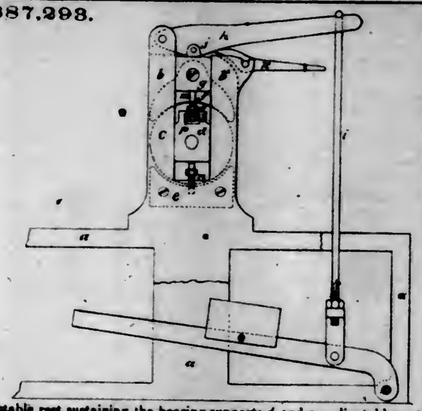
bearings of the bed-plates are connected with the opposite arms of the lever or levers, substantially as described.

5. In combination, the cylinder having fixed bearings, the two bed-plates arranged, respectively, above and below the cylinder and provided with bearings at each end, a lever interposed between the opposite bed-plate bearings, rods connecting the bed-plate bearings with said lever, and a toggle-joint arranged below the lower bed-plate, whereby the said bed-plate is pressed against said cylinder, substantially as described.

6. In combination, a cylinder, two bed-plates arranged on opposite sides thereof, a lever or levers, and connections between the lever or levers and bed-plates, whereby the motions of one bed-plate are transmitted to the other, and the spring or springs interposed in the mechanism connecting said bed-plates, whereby the one bed-plate may be permitted to yield without affecting the position of the other, substantially as described.

7. In combination, a cylinder and two bed-plates having their adjacent ends or edges beveled, whereby a smooth passage of cloth from one to another is secured, substantially as described.

8. In combination, a heated cylinder, a bed-plate, and a stripper arranged at the point where the cloth leaves the heated cylinder, whereby the cloth at that point is stripped from the cylinder, substantially as described.



9. In combination, the cylinder, the frame upon which it is journaled, the two bed-plates, and the bed-plate-actuating mechanism provided with means of adjustment interposed between each bed-plate and the journal of the cylinder, substantially as described, whereby the bed-plates may be adjusted to and from the cylinder independently and the pressure of one bed-plate may be removed from the cloth without interfering with the operation of the other bed-plate and cylinder, substantially as described.

10. In combination, the feed-rollers, the cylinder having fixed bearings, the two bed-plates, mechanical means for exerting and relieving pressure on the bed-plates, and supports for the bearings of the bed-plates movable relatively to and independently of the bearings of the cylinder and feed-rollers, whereby the bed-plates may be moved back from the cylinder without disturbing the position or operation of the cylinder or feed-rollers, substantially as described.

387,293. CLOTH-PRESSING MACHINE. David Gessner, Worcester, Mass. Filed Mar. 20, 1888. Renewed June 16, 1888. Serial No. 277,261. (No model.)

Claim.—In a cloth-pressing machine, in combination, the cylinder *c*, two bed-plates, *e* and *f*, movable bearing-supports *g* and *d*, an ad-

387,293.

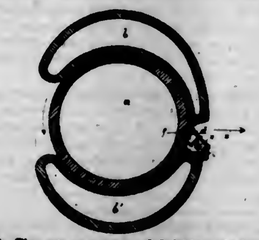
justable rest sustaining the bearing-supports *d*, and an adjustable rest interposed between the bearing-supports *d* and *g*, whereby the pressure can be relieved between the cylinder and either bed-plate, substantially as described.

387,294. ART OF FINISHING CLOTH. DAVID GESSNER, Worcester, Mass. Filed May 26, 1886. Renewed June 16, 1888. Serial No. 277,292. (No model.)

Claim.—1. The art or process of finishing cloth, consisting of subjecting the same to a hot-pressing and then to a steaming or moistening, and subsequently to another hot-pressing, substantially as described.

2. The art or process of finishing cloth, consisting of subjecting the same to a steaming or moistening and then to a hot-pressing, and then to steaming or moistening, and then to another hot-pressing, substantially as described.

3. The art or process of finishing cloth, consisting of subjecting the same to a steaming or moistening, then to a hot-pressing, then to a second steaming or moistening, then to a second hot-pressing, and then to a third steaming or moistening, substantially as described.



4. The art or process of finishing cloth, consisting of subjecting the same to a hot-pressing, then to a steaming or moistening, then to a second hot-pressing, and then to a second steaming or moistening, substantially as described.

5. The art or process of finishing cloth, which consists of subjecting the same to a steaming or moistening after it has received a pressing and while it is traveling in contact with a heated surface, substantially as described.

6. The art or process of finishing cloth, consisting of subjecting the same to a pressing and then to a steaming or moistening, and then to a hot-pressing, substantially as described.

387,295. ART OF FINISHING CLOTH. DAVID GESSNER, Worcester, Mass. Filed Sept. 4, 1886. Renewed June 16, 1888. Serial No. 277,293. (No model.)

Brief.—The invention consists in the introduction of vapor into the cloth after having received a pressure and while being held under pressure.

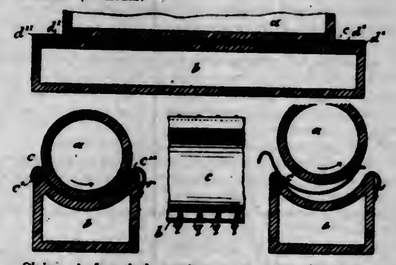
Claim.—1. The art or process of finishing cloth, which consists in pressing the cloth and then moistening or steaming it while it is held under pressure, substantially as described.

2. The art or process of finishing cloth, which consists in pressing the cloth and then moistening or steaming it while it is being pressed against a heated surface, substantially as described.

3. The art or process of finishing cloth, which consists in pressing the cloth and then moistening it by pressing the same in contact with a moistened apron or jacket between two heated surfaces, substantially as described.

4. The improvement in the art or process of finishing cloth, which consists in feeding the same continuously and without intermission between pressing-surfaces, whereby it receives pressure, and thence between other pressing-surfaces, the cloth being treated with moisture while under pressure between the latter pressing-surfaces, substantially as described.

387,296. CLOTH-PRESSING MACHINE. DAVID GESSNER, Worcester, Mass. Filed June 9, 1887. Renewed June 16, 1888. Serial No. 277,294. (No model.)

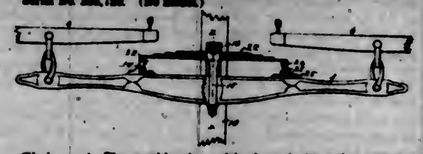


Claim.—1. The combination, with the cylinder *a* and its attendant bed-plates, of the apron *b*' and rollers supporting the same, substantially as described, whereby the cloth is pressed into contact with the apron before leaving the cylinder *a*, and a second cylinder, *a*', between which and the apron the cloth is pressed, substantially as described.

2. In combination, the cylinder *a* and its attendant bed-plate or bed-plates, the cylinder *a*', the apron *b*', and rollers supporting said apron, one of said rollers being interposed between said two cylinders, and the said apron being pressed between it and each of the cylinders, substantially as described.

3. The combination, with the cylinder *a* and its attendant bed-plates, of the apron *b*' and rollers supporting the same, substantially as described, whereby the cloth is pressed into contact with the apron before leaving the cylinder *a*, substantially as described.

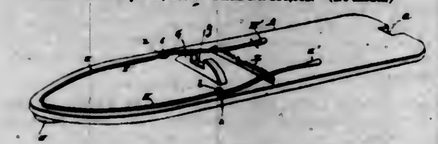
387,297. CLOTH-PRESSING MACHINE. DAVID GESSNER, Worcester, Mass. Filed May 26, 1886. Renewed June 16, 1888. Serial No. 277,295. (No model.)



Claim.—1. In a cloth-pressing machine, the combination, with the bed-plate and the cylinder and the sheet-metal jacket, of means, substantially as described, whereby the ends of the sheet-metal jacket are secured to the bed-plate and the margins thereof are prevented from springing into contact with the cylinder, as set forth.

2. In combination with the cylinder and the bed-plate, a sheet-metal jacket secured at one edge to the bed-plate and extending between the bed-plate and the cylinder, and the clamp overlapping the opposite edge of the sheet-metal jacket and holding it in place, substantially as described.

3. In a cloth-pressing machine, in combination, the cylinder, the bed-plate having a concave face, and a sheet-metal jacket formed in conformity with the face of the bed-plate, terminating at one edge substantially on the face of the bed-plate, and at the other edge extending into a flange overlapping the side of the bed-plate on the side where the cloth enters, the jacket at the first-named edge being sufficiently thin to pass through the opening between the cylinder and bed-plate when the cylinder is raised, whereby the sheet-metal jacket may be removed from between the cylinder and bed-plate transversely, substantially as described.

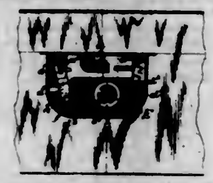


387,298. SPRING-DOUBLETREE. JAMES S. HARRIS, Minneapolis, Minn., assignor to Jacob Harris, same place. Filed Oct. 20, 1887. Serial No. 252,720. (No model.)

Claim.—1. The combination, with the pole 10 and the plate 8, secured to the pole and having the slot 14 to receive the hammer-strap bolt, of the strap 18, secured at the back end to the plate, the draft-pin 16, passing through the forward ends of said plate 8 and strap 18, the abutment 19, secured between the plate 8 and the strap 18, and the spring 20, attached to said abutment and to said doubletree in the manner and for the purpose substantially as described.

2. In a spring-doubletree, the combination, with the spring 20, secured to the pole, of the shoes 26, connected to the ends of the said spring by links 26, of the projection or stops 27 on the shoes 26, arranged to bear against the outer side of the links and limit the lateral movement of the doubletree, substantially as described.

387,299. IRONING-TABLE. BENJAMIN H. HARRISON, Lincoln, Nebr. Filed Sept. 24, 1887. Serial No. 250,502. (No model.)

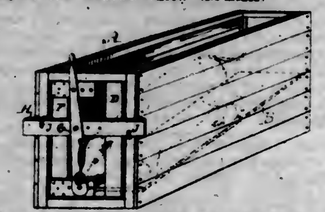


Claim.—1. The combination, with the ironing-table, of the screws *i i*, secured to the under side thereof near the opposite edges, the bent wire stretcher 1, having the arms K K, pivoted to the said screws, and the handles K' on the ends of the arms, adapted, when drawn together, to spread the arms K, substantially as and for the purpose specified.

2. The combination, with the ironing-table, of the screws *i i*, secured to the under side thereof, the bent wire stretcher passing around the outer edge of the board, and comprising the arms K K, provided with loops to engage around the screws *i*, the handles K' K', formed as extensions of the said arms and adapted to be drawn together to spread the said arms, and the toothed racks L L, adapted to engage the handles to hold the stretcher in the desired position, substantially as and for the purpose specified.

3. The combination, with the rigid stand composed of the standard C, having a notch in its side near its upper end, the crossed braces extending from said standard, the brace E, having a notch, *e*, in its upper end, and the brace E', having a foot, F, on its lower end, and the standard C' between the braces, of the ironing-board having the notch *e* in one end to engage the notch in the standard, and provided with a cross-bar having a notch, *g*, to engage the notch *e* in the brace E, as specified.

387,300. COMBINATION-LOCK. CAVAN HENDERSON, Boston, Mass., assignor of one-half to John W. Horne, same place. Filed Jan. 24, 1888. Serial No. 261,792. (No model.)

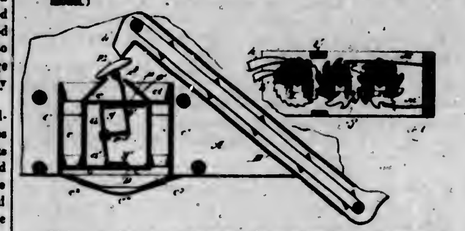


Claim.—1. The combination, in a combination-lock, of the slide-plate, having a bolt, *a*, and the locking-bar *f*, means for moving the slide-plate and bar, the tumbler-casing C, having the opening d^6, the annular tumblers B B' B^2, or two or more of them, having the openings *b*, and the projections or teeth, as specified, and the operating-spindle E, having the wing *e'*, which engages the projections of the tumblers, as and for the purposes described.

2. The combination, in a combination-lock, of the tumbler-case C, the annular tumblers B B' B^2, having the openings *b* and inward-extending projections, and the washers D, having the openings *d* and holding-extensions *d'*, substantially as described.

3. The combination of the slide-plate a^6, the bolt *a*, the locking-bar *f*, the stud a^4, lever a^5, connecting the stud with the said slide-plate, the tumbler-case C, having the opening d^6, the tumblers B B' B^2, having openings *b* and projections, as specified, the washers D, having the openings *d* and extensions *d'*, and the operating-spindle E, having the wing *e'*, substantially as described.

4. The combination, in a combination-lock, of the tumbler-case C, having the openings d^6 d^6, the tumblers B B' B^2, having the openings *b* and projections, as specified, the washers D, having the openings *d* and locking-extensions *d'*, the spindle E, having the wing *e'* and a square head, with the button *e*, having a square hole to receive the end of the spindle and permit it to be adjusted into other positions in relation thereto, substantially as described.

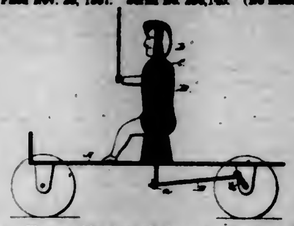


387,301. HOG-TRAP. JOHN HEPPENSTEIN, Fontanelle, Iowa. Filed May 21, 1888. Serial No. 274,617. (No model.)

Claim.—1. A trap for catching and holding hogs, comprising a box, frame, or chute having open ends, a floor or platform pivoted to the sides and central portion of said box, two hinged gates, a lever pivoted to the lower portion of one of the gates, a cross-bar pivoted to the lever, and hooks fixed to the ends of the sides of the box to engage the cross-bar, arranged and combined to operate in the manner set forth.

2. The box A, having a fixed cross-piece, C, the pivoted platform B, the gates D and F, the lever G, the cross-bar H, and the fixed hooks J, constructed and combined substantially as shown and described, for the purposes stated.

387,302. GRAIN MEASURE AND TALLY. JOHN H. HOLLAND, Thorp's Spring, Tex. Filed Mar. 21, 1888. Serial No. 267,954. (No model.)



Claim.—1. In a grain-measurer, the combination of the pivoted oscillating chute, the two similar and equal measuring-compartments arranged on the sides of the chute, the slides above and below the compartments, arranged to cover alternately one the top and the other the bottom of the compartments, and moving in opposite directions, and mechanism, substantially as described, whereby said slides are operated, substantially as specified.

2. In a measuring device, the combination of the pivoted oscillating chute, the similar and equal measuring-compartments, the inclined planes leading from the chute to the mouths of said compartments, the upper and lower slides moving in opposite directions, and the mechanism, substantially as described, whereby the said slides are operated, substantially as specified.

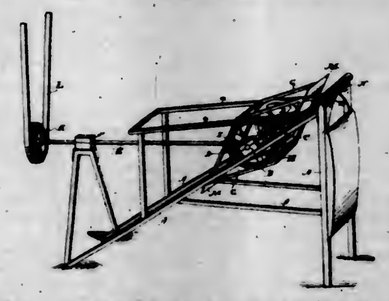
3. The combination, with the oscillating chute, the grain-measuring compartments, and the upper and lower slides, of the shaft F, the arm *f* thereon, the arm e^4 on the shaft of the chute, the link-rod *f'*, the arms G G', and the link-rods *g g'*, substantially as specified.

4. In a grain-measuring device, the combination, with the oscillating chute, the similar and equal measuring-compartments, the upper and lower slides, and the mechanism, substantially as described, whereby the same are actuated, of the double-armed lever H, the pawls *h h'*, the wheel I, having twenty teeth, the pin *i'*, and pointer *i*, and connected with the unit-dial having twenty graduations, the wheel J, having the pointer *j* and pin *j'*, the wheel K, having the pointer *k'*, and the detents M M', the wheels J and K having ten teeth and the tens and hundreds dials each having ten graduations, substantially as specified.

387,303. MECHANICAL TOY. William F. Hopkins, Carbonate, Dak. Filed Nov. 26, 1887. Serial No. 256,145. (No model.)

Claim.—The combination of the carrying-wheels having the cranked axle a^2, the plate A, supported on said carrying-wheels, the image mounted on said plate, the stem C, passing vertically through the body of the image and carrying the head of the same, and provided at its lower end with a crank, *a*, at right angles to the crank of the axle a^2, the rod D, secured to and extending between said cranks, and a flag removably secured in the hand of the image, substantially as specified.

387,304. JAR-FASTENER. Thomas R. Howe, Scranton, Pa., assignor of two-thirds to G. A. Clearwater and H. A. Goodwin, same place. Filed Dec. 30, 1887. Serial No. 260,203. (No model.)



Claim.—1. In a jar-fastener, and in combination with the jar and its cover, a bail passing over said cover and a spring-wire locking-lever formed into eyes surrounding the bail and into large coils resting on the jar-cover at the bottom, said bail taking a bearing on the top of said coils, substantially as described.

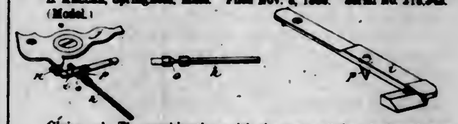
2. In a jar-fastener, and in combination with the jar and its cover, a bail passing over said cover, and a spring-wire locking-lever doubled at the center to form the handle, then formed into the outwardly-circling coils resting on said cover and affording a bearing for the bail, the ends of said wire being formed into eyes surrounding the bail, substantially as described.

3. The combination, with a jar, a bail passing over its cover, and a wire locking-lever pivotally connected to the bail and formed with large coils resting on the cover, of a cote-piece passing through said coils, having enlarged ends for preventing the longitudinal expansion of said coils, and a handle for operating the lever, substantially as described.

387,305. MACHINE FOR STAKING LEATHER. James P. Isgraham, West Peabody, assignor of one-half to John P. Murphy, Boston, Mass. Filed Jan. 13, 1888. Serial No. 260,562. (No model.)

Claim.—1. In a machine for staking and stretching leather, the combination, as herein described, with the fixed bearing to which the hide is clamped, of an operating-blade mounted on a swinging arm and adapted to support the portion of the hide being operated upon, whereby the hide may be pressed against said blade at any desired point by the operator's hand, substantially as described.

2. In a machine for staking and stretching leather, the combination, as herein described, with the fixed bearing to which the hide is clamped, of an operating-blade moving continuously in one direction and adapted to support the portion of the hide being operated upon, whereby the hide may be pressed against said blade at any desired point by the operator's hand, substantially as described.



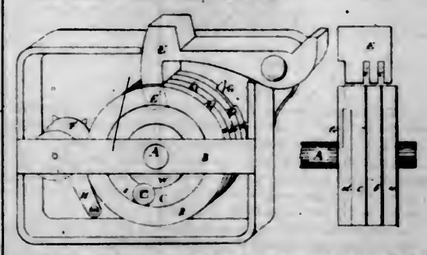
3. In a machine for staking and stretching leather, the combination, as herein described, with the fixed bearing to which the hide is clamped by one of the operator's hands, of a blade mounted on a rotary beam and adapted to support the portion of the hide being operated upon, whereby the hide may be pressed against said blade at any desired point by the operator's other hand, substantially as described.

4. In a machine substantially such as described for treating hides, the combination of the frame, the fixed bearing or hand-hold, the beam and the knives or blades carried thereby, and the driving-shaft, pinion, and gear-rim for rotating said beam, as set forth.

5. The combination, as herein described, with the frame of a leather staking and stretching machine adapted to serve as a table or support for the hide, of a swinging blade or knife moving above the level of said frame, whereby the hide is supported by said blade when the latter is swung above the frame, substantially as described.

6. The combination, as herein described, with the frame of a leather staking and stretching machine adapted to serve as the table or support for the hide, and a bearing at one end of said frame, to which the hide is clamped, of an operating-blade mounted on a rotary beam and adapted to swing above the level of said frame, as and for the purpose set forth.

387,306. STEM WINDING AND SETTING WATCH. Abraham L. Keller, Springfield, Mass. Filed Nov. 8, 1886. Serial No. 218,343. (Model.)



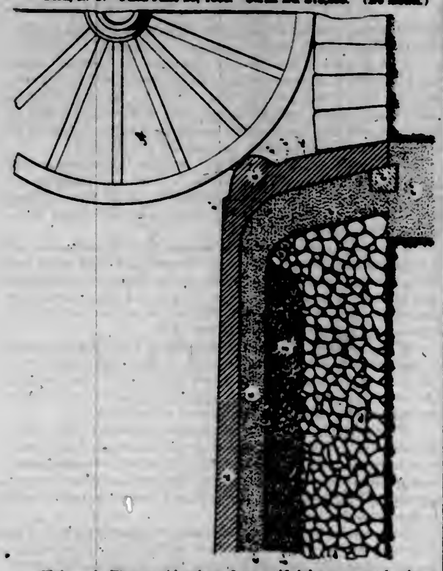
Claim.—1. The combination, with the gears of the winding-drum and dial hand-arbor, of the vibrating yoke provided with the intermediate gears, and the spring-plate *i*, having an inclined end for connection with the conical pin on the yoke and spring *m*, and the crown-stem having both a rotary and longitudinal movement, and intermediate mechanism whereby the watch may be either wound or the hands adjusted, as set forth.

2. The combination, with the winding and hand arbors, of the vibrating yoke pivoted concentric about the axis of gear *a* and provided with intermediate gears for engaging and disengaging with the gears upon said arbors, the spring-plate *i*, having an inclined surface, and the conical pin *n*, the spring *m*, and the crown-stem provided with the conical surface and operating-pinion, all substantially in the manner and for the purpose set forth.

3. The vibrating yoke *j*, provided with a conical pin, *n*, and operating in conjunction with the inclined end of the spring-plate *i*, whereby said yoke *j* is caused to vibrate for alternately winding and setting the watch, in the manner substantially as shown and described.

4. The combination, substantially as hereinbefore set forth, of the crown-stem *h*, spring-plate *i*, oscillating gear-plate *j*, gear-wheels *a*, *b*, *c*, *d*, *e*, and *f*, all arranged to operate in the manner and for the purpose set forth.

387,307. PERMUTATION-LOCK. William A. Lawrence, Sheridan, Ontario, Canada. Filed June 6, 1887. Serial No. 240,330. (Model.) Patented in Canada Jan. 24, 1887, No. 25,686.



Claim.—1. In a permutation-lock constructed as described, the combination of the axle A, wheels *a b c* loose thereon, rings R, having

nuts *e*, eccentric-rivets C, adapted to secure said rings to the wheels, with the fastened wheel *d*, washers W upon said wheels, the arm G, journaled in the wheel *d*, the pivoted arm H, and cylinder P, substantially as and for the purpose set forth.

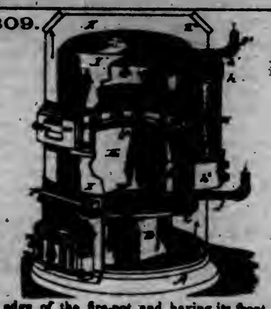
2. In a permutation-lock, the cylinder P, having cogs 1 2 3 4, and a short cog, D, upon its lower end, and having grooves in and partially round its periphery, in combination with the wheels *a b c*, having slits adapted to engage the solid portion of the periphery of the cylinder at the proper times, the fastened wheel *d*, having an arm, G, journaled thereon and adapted to engage the cogs 1 2 3 4, and also to engage cog D indirectly by means of the pivoted arm H, whereby the notches in the wheels may be brought into line in the opening of the lock or moved out of line in the closing of the lock, substantially as and for the purpose set forth.

387,308. ARTIFICIAL PAVEMENT. John W. MacKnight, New York, N. Y. Filed June 30, 1888. Serial No. 278,268. (No model.)

Claim.—1. The combination of an artificial pavement having a foundation and two upper layers, *c d*, that are bent down at the curb, with the laterally-extending foundation c^3 of layer *c*, and with the key c^4 within such foundation, substantially as specified.

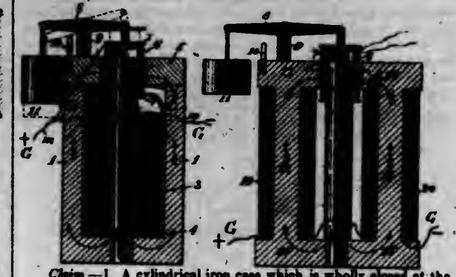
2. The combination of an artificial pavement with a composite curbing, *d'*, having a bead, *e*, that projects forwardly beyond the line of the curbing, substantially as specified.

3. The combination of an artificial pavement having upper layer, *d*, with a composite curbing, *d'*, joined to the upper layer at an obtuse angle, and provided with forwardly-projecting bead *e* and with the groove e^2, substantially as specified.



4. The combination of an artificial pavement, consisting of a series of layers, of which the upper layer is curved downward at the curb, with a bead, *e*, projecting forwardly from the upper corner of the curb, substantially as and for the purpose specified.

387,309. COMBINED HOT AIR AND WATER HEATER. Meshach Mabbett, Troy, N. Y. Filed Aug. 1, 1887. Serial No. 245,877. (No model.)



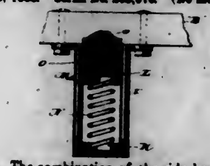
Claim.—1. In a combined hot air and water heater, the combination of a hollow tubular fire-pot extending down to the level of the grate, a series of pipes secured vertically to the upper end of said pot between its inner and outer edges and in communication with its interior, an annular superheater secured to the upper end of said pipes, a surrounding division-plate secured to the top of the fire-pot and having pendent deflecting-plates at the ends thereof, a drum inclosing said fire-pot and superheater, an uptake leading from the top and also from the bottom of said drum, and a jacket inclosing said drum, substantially as described.

2. The combination of the ash-pit and its top plate, a hollow tubular fire-pot, a series of pipes secured to the upper end of said pot, an annular superheater secured to the upper end of said pipes, a drum resting upon the top plate of the ash-pit, and a division-plate surrounding the upper edge of the fire-pot, and having its front edge extending down against the upper half of said fire-pot, substantially as and for the purpose described.

387,309.

387,310. ELECTRO-MECHANICAL MOVEMENT. Richard H. Mather, Winsted, Conn. Filed Jan. 9, 1888. Serial No. 260,172. (No model.)

Claim.—1. A cylindrical iron case which is wholly closed at the base, a close-fitting annular iron cap by which said case is partly closed at the top, and a magnetizable rod or core which is rigidly inserted in said base and extends axially through said case and through the middle of said cap, in combination with a helix of insulated wire which is inclosed in said case, and a movable spool-shaped solenoid which incloses a variable portion of the free end of said core and has a constant number of its individual helices within the annular space which is formed between said core and said annular cap, substantially as and for the purpose specified.



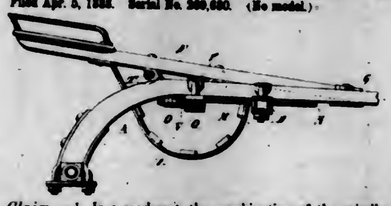
2. A cylindrical iron case which is solid at one end and hollow in the middle, an electro-magnetic core which is inserted axially in said case, and a helix of insulated wire which is placed upon a spool surrounding said core and surrounded by said case, and an annular iron cap which is fastened upon the other end of said case and is separated from a terminal portion of said core by an annular space, in combination with a movable solenoid surrounding said core and having helices within said annular space, substantially as and for the purpose specified.

3. A cylindrical iron case which is wholly closed at one end, a close-fitting annular cap by which said case is partly closed at the opposite end, and a magnetizable rod or core which extends axially through said core and cap, in combination with a helix of insulated wire which surrounds the body of said core and is contained in said case, and a movable solenoid surrounding a variable portion of the free end of said core, and having a constant number, less than all, of its constituent helices in the narrow space between said cap and core, substantially as and for the purpose specified.

4. A cylindrical iron case which is closed at one end, an annular cap by which said case is partly closed at the other end, and a magnetizable core which is inserted in the bottom of said case and extends axially through said case and cap, in combination with a helix of insulated wire which surrounds a portion of said core and is contained in said case, and a movable solenoid surrounding a terminal portion of said core, and constantly occupying the entire length of the annular space which separates said core and cap, substantially as and for the purpose specified.

5. A cylindrical iron case which is hollow in the middle, a magnetizable core which extends from end to end axially through said case, and an annular iron cap which is fastened upon one end of said case and surrounds the adjacent end of said core, in combination with a stationary helix which surrounds said core, and a movable solenoid which surrounds said core and is surrounded by said cap, substantially as and for the purpose specified.

387,311. ROAD-CART. Carrs A. Miller, Spring Valley, Ill. Filed Feb. 20, 1888. Serial No. 265,670. (No model.)



Claim.—1. The combination of the side bars mounted at their front ends on the thills, the depending loops I, embracing and guiding the said side bars, and the extensile springs N, mounted in the loops and bearing against the under sides of the side bars, substantially as specified.

2. The combination, with the thills and the cross-bar B, of the side bars mounted on or pivoted to the thills, the loops depending from the cross-bar and having sockets in their lower ends, the plates attached to the under sides of the side bars and having sockets therein, and the coiled springs seated at their ends, respectively, in the said sockets, substantially as specified.

3. The combination, with the thills and the cross-bar B, of the side bars mounted at their front ends in shackles depending from the thills, the loops I I, depending from the cross-bar and having sockets in their lower ends, the socket-plates attached to the under sides of the said bars, the springs mounted at their ends in the said sockets, and the elastic cushions on the under side of the cross-bar within the loops I, substantially as and for the purpose specified.

387,312. ROAD-CART. Carrs A. Miller, Spring Valley, Ill. Filed Apr. 5, 1888. Serial No. 269,680. (No model.)

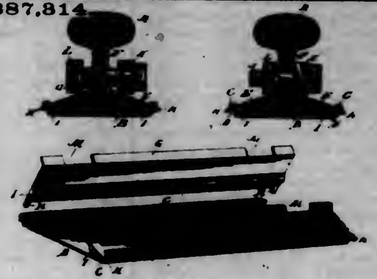
Claim.—1. In a road-cart, the combination of the spindles attached to the thills and having studs on their inner ends, the seat-bars having sockets in their front ends to receive the spindles, and provided with grooves to receive the said studs, and the spring attached to the seat-bars, substantially as specified.

2. In a road-cart, the combination of the wear-plates attached to the thills and having spindles D, provided with lateral studs E E, the wear-plates attached to the seat-bars and having sockets H, provided with grooves I I, and the springs attached to the seat-bars, substantially as specified.

3. In a road-cart, the combination, with the seat-bars mounted on the thills, of the torsion-springs mounted on the thills and having the arms O, the depending bars on the under sides of seat-bars, and the links between the inner ends of the arms O and the lower ends of the said bars, substantially as specified.

4. In a road-cart, the combination of the torsion-springs attached to the thills and having the arms O, provided at their inner ends with bearings, the depending bars T T, attached to the under sides of the seat-bars and connected at their lower ends by the bolts *t*, and the double links U, comprising the arms *u u*, connected at their lower ends by the barrels V, which are mounted on the bolts *t*, and are connected at their upper ends by bolts which are mounted in the bearing on the arms O, substantially as and for the purpose specified.

5. In a road-cart, the thills having the cross-bar B, the seat-bars F, pivotally attached to the thills, and the torsion-springs mounted on the thills and having their front ends formed with loops N, which are connected to the cross-bar B, and their rear ends provided with inwardly-extending arms O, and the links connecting the arms O to the seat, as set forth.



387,313. MEDICAL COMPOUND. Rafer Motta, Burton, assignor to William R. Gaylord, San Joaquin County, Cal. Filed Nov. 26, 1887. Serial No. 256,261. (No specimens.)

Claim.—The herein-described medical compound for the treatment of piles, consisting of gunpowder, salt, and vinegar, in the proportions specified.

387,314. RAIL-JOINT. Milton C. Hill, Chicago, Ill. Filed Dec 13, 1887. Serial No. 257,570. (No model.)

Claim.—1. In a rail-joint, the base-plate and the clamping-plates connected thereto, in combination with bolts passing through

387,314

the rail bearing upon but not otherwise engaging said clamping-plates, whereby they are held rigidly in position, substantially as described.

2. In a rail-joint, the rails, the base-plate, the clamping-plates, and a connection between said base and clamping plates, in combination with bolts working through the web of the rail, and nuts upon one side and washers upon the opposite side of the rails engaged by said bolts, said nuts and washers bearing upon and prevented from rotating by the clamping-plates, substantially as described.

3. In a rail-joint, the rail and the base-plate, in combination with clamping-plates, a hinge-like connection between said clamping and base plates, said clamping-plates being fulcrumed on the rail-flange and adapted to clamp the rail when the inner edges are forced downwardly, substantially as described.

4. In a rail-joint, the rail, the base-plate, the clamping-plates, and a hinge-like connection between said clamping and base plates, said clamping-plates being fulcrumed upon the rail-flange, in combination with screw-bolts passing through the rail-web, and non-rotatable nuts and washers on said bolts, actuated thereby to depress the inner side edges of said plates, substantially as described.

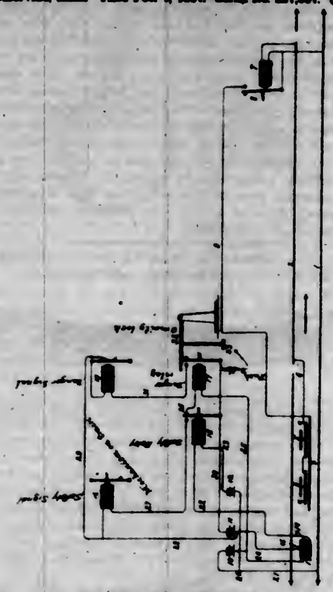
5. In a rail-joint, the rails, the base-plate, the clamping-plates, and a connection between the outside edges of said clamping and base plates, in combination with ribs on the under side of said clamping-plates near the outer edges thereof, and means for depressing the inner free side edges of said plates, substantially as described.

6. In a rail-joint, the rails, the base-plate, clamping-plates, and a connection between the outside edges of said clamping and base plates, in combination with ribs on the under side of said clamping-plates near the outer edges thereof, and bolts passing through the rail engaging and depressing the inner free side edges of said plates, substantially as described.

7. In a rail-joint, the rails, the base-plate, clamping-plates, and a connection between the outside edges of said clamping and base plates, in combination with ribs on the under side of said clamping-plates near the outer edges thereof, bolts passing through the rails, and nuts and washers upon said bolts engaging and prevented from rotating by the clamping-plates, substantially as described.

8. In a rail-joint, the rails, the base-plate, clamping-plates, and a connection between the outside edges of said clamping and base plates, in combination with ribs on the under side of said clamping-plates near the outer edges thereof, bolts passing through the rails, and nuts and washers upon said bolts upon each side of the rail engaging and depressing the free side edge of said clamping-plates when the bolt is screwed up, substantially as described.

9. In a rail-joint, the rails, the base-plate, clamping-plates, a detachable connection between said plates and the base-plate, and lugs or projections on one of said plates for preventing a longitudinal shifting of these plates relative to each other, in combination with bolts passing through the rails, bearing upon said clamping-plates and securing them in position, and notches or projections upon said plates engaging the bolts, substantially as described.



387,315. PIPE-WELDING BALL. John Hoffus and William P. Gilbert, McKeesport, Pa., assignor of one-third to Charles E. Manby, same place. Filed Feb. 16, 1888. Serial No. 264,214. (No model.)

Claim.—1. A pipe-welding ball made in segments arranged around a central core, one of said segments being integral with or secured to the core, said core being removable from the remaining sections or segments, substantially as and for the purpose specified.

2. The core 2, having ball-segments arranged around it, said core being movable longitudinally, so as to enable it to be withdrawn from the ball, and one or more sections, 7, fixed to the core and situate between two or more of the detachable segments or sections, substantially as and for the purpose specified.

387,316. RAILWAY SIGNALING SYSTEM. Edward L. Crosby, Somerville, Mass. Filed Feb. 7, 1887. Serial No. 227,027. (No model.)

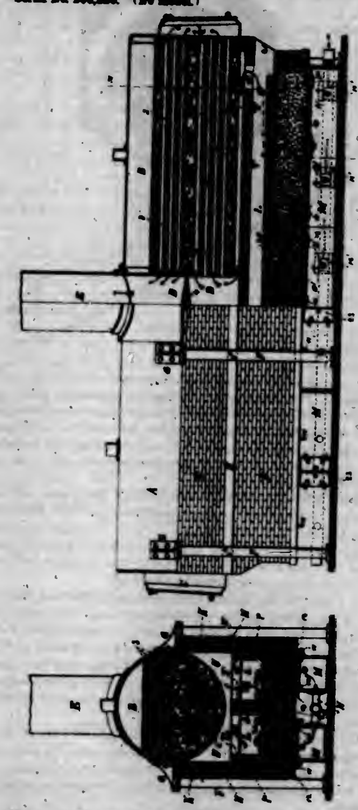
Claim.—1. In an electric railway signaling system, the combination of an incomplete circuit partly composed of the rails of the track and including an electro-magnet, two incomplete circuits on the train, each operating signals, said circuits being controlled by said electro-magnet, and contact plates and brushes for completing such circuits, substantially as described.

2. In an electric railway signaling system, the combination of an incomplete circuit partly composed of the rails of the track and including an electro-magnet, an incomplete circuit operating a safety-signal and controlled by said magnet, contact plates and brushes for completing said track-circuit, another incomplete circuit controlling a danger-signal, and other contact plates and brushes for completing the last said circuit when the safety-signal circuit fails to operate, substantially as described.

3. In an electric railway signaling system, the combination of an incomplete track-circuit including an electro-magnet, a battery on the train for charging said circuit when completed, and a second circuit including another battery composed in part of the track and controlled by the track-magnet, with signaling devices on the train controlled by said circuit, substantially as described.

4. In an electric railway signaling system, the combination of the incomplete circuit composed partly of the rails, having an electro-magnet included therein, a second circuit parallel with the track controlled by said magnet, contact brushes and plates for completing the track-circuit, and an incomplete circuit controlling signaling devices on the train and controlled by the circuit under the control of the magnet, substantially as described.

5. In an electric railway signaling system, the combination of safety and danger signals mounted on the train, a battery for actuating either of them, with a magnet on the track, and circuit-connections, as described, for completing the circuit of the battery to either the safety or the danger signal, according to the condition of the road, substantially as described.



6. In an electric railway signaling system, the combination of a safety and a danger signal mounted on the train, a single battery for charging either of them, automatic switching mechanism for diverting the current of the battery through one or the other of the signals, with an electro-magnet on the road charged by a circuit composed partly of the track, another circuit parallel therewith controlled by said magnet, and contact brushes and plates for completing the circuits to the switching mechanism, substantially as described.

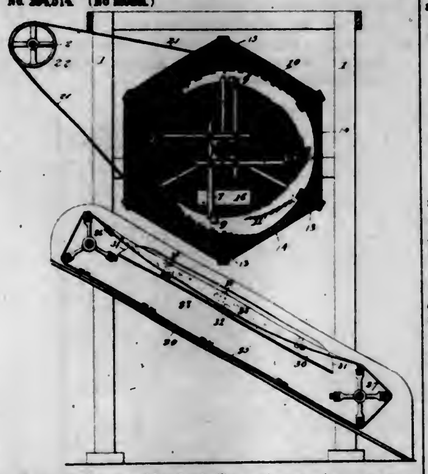
7. In an electric railway signaling system, the combination of two series of contact-plates located on the track, two contact-brushes carried by the train, separate signaling-circuits closed by said brushes and plates at one end, and an electro-magnet on the track for closing said circuits at the other end, substantially as described.

8. In an electric railway signaling system, the combination of a circuit composed partly of the rails and an electro-magnet therein, a contact-brush on the train, and a contact plate or plates on the track for closing said circuit, with a circuit parallel to the first closed at one end by contact brush and plate and controlled at the other by the magnet, relays on the train controlled by said parallel circuit, and separate safety and danger signals controlled by said relay, substantially as described.

9. In an electric railway signaling system, a single-stroke safety-bell and a trembler danger-bell, both charged by the same battery located on the train, with a relay for momentarily diverting the current of the battery into the single-stroke bell, a relay for permanently diverting the current of the battery into a trembler-bell, with a magnet charged through the rails and a circuit parallel with the track controlled by said magnet, and contact plates and brushes, substantially as described, for actuating the safety or danger signal according with the condition of the road, substantially as described.

387,317. FURNACE. Matthew L. Ritchie, New York, N. Y., assignor to the Eagle Tube Company, same place. Filed Mar. 8, 1888. Serial No. 266,269. (No model.)

Claim.—1. The combination, with the steam-boiler, and the walls K, inclosing the sides thereof and forming the flue U, of the fire-chambers extending from end to end of the boiler, the ash-pit inclosures M, grate-bars O, side walls, P, central wall, R, and partition S, and tiles T, also extending from end to end of the boiler, there being an opening at 16 in the tiles near the front of the boiler for passing products of combustion, and a front opening at 21, substantially as and for the purposes set forth.



2. The combination, with the steam-boiler, inclosing-walls, and fire-chambers, of the ash-pit inclosures M, formed of cast-iron boxes

and having flanges along their upper edges, upon which the walls of the boiler rest, substantially as set forth.

3. The combination, with the steam-boiler, inclosing-walls, and fire-chambers, of the ash-pit inclosures M, formed of cast-iron boxes and having flanges along their upper edges, upon which the walls of the boiler rest, and the grates O, supported at one side by the hinges 10 within the ash-pit inclosures, and the pins 11, passing through the ash-pit inclosures and upon which the free end of the grate-bars rest, substantially as set forth.

4. The ash-pit inclosures M, formed of cast-iron boxes having flanges at their upper edges, in combination with the grates O, supported at one edge by hinges within the ash-pit inclosures, the outer walls, P, supported on the flanges of the ash-pit inclosures, the central wall, R, and partition S, the tiles T, forming a partition above the fire-chamber, the steam-boilers A and B and the supports for the same, and the damper 4 in the flue D between the said steam-boilers, substantially as set forth.

387,318. **MACHINE FOR HULLING AND SEPARATING GREEN PEAS.** Robert P. Scott, Baltimore, Md. Filed Nov. 7, 1887. Serial No. 254,514. (No model.)

Claim.—1. In a machine for hulling and separating green peas, the combination of an inclined endless separating-apron provided with transverse overlapping slats on its inner side, prismatic rollers for moving and agitating said apron, and side boards having inwardly-projecting inclined flanges for raising the upper edges of said apron, substantially as described.

2. In a machine for hulling and separating green peas, the combination of an inclined endless separating-apron provided with transverse overlapping slats on its inner side, two prismatic rollers for moving and agitating said apron, and side boards provided with guide-flanges at their lower edges for supporting the edges of the lower portion of said apron, substantially as described.

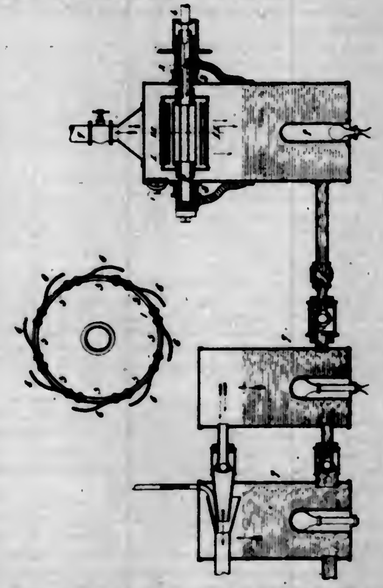
3. In a machine for hulling and separating green peas, the combination of an inclined endless separating-apron provided with overlapping transverse slats on its inner side, two prismatic rollers or reels for moving and vibrating said apron, inclined side boards provided with guide-flanges upon their lower edges for supporting the edges of the lower portion of said apron, and with inclined guide-flanges for raising the edges of the upper portion of said apron, substantially as described.

4. In a machine for hulling and separating green peas, an endless separating-apron provided with long cross-slats upon its inner side, which extend nearly to its edges, and with short slats overlapping the ends of said long slats and extending quite to its edges, substantially as described.

5. In a machine for hulling and separating green peas, an endless inclined separating-apron provided with transverse slats arranged on the inside thereof, in combination with the rollers and the vertical side boards arranged at the sides or edges of said apron and operating to keep the same straight upon said rollers, substantially as described.

6. In a machine for hulling and separating green peas, the combination of two prismatic rollers or reels journaled at different heights, an endless separating-apron provided with long cross-slats upon its inner side, which extend nearly to its edges, and with short slats overlapping the ends of the long slats and extending to the edges of said apron, and side boards provided with guide-flanges at their lower edges for supporting the edges of the lower portion of the apron, and with inwardly-extending inclined guide-flanges having rounded ends and serving to raise the short slats and edges of the upper portion of said apron, substantially as described.

7. In a machine for hulling green peas and separating the same from their hulls or pods, the combination of a revolving prismatic separating-cylinder provided with a covering for the greater portion of its length having round perforations of a sufficient size to allow hulled peas to drop therethrough, and with a covering for the remainder of its length having larger meshes of a sufficient size to allow the hulls or pods to drop therethrough, and hulling devices arranged within said separating-cylinder, with a vibrating raised-edge upwardly-traveling separating-apron arranged beneath and extending the entire length of said cylinder, whereby in the co-operation of said cylinder and apron the released peas and open pods are delivered out of the former at different points, fall upon the latter at different points, and are kept practically separate from each other while being agitated, and respectively delivered at the lower and upper portions of said aprons, substantially as described.



387,319. **LUBRICATOR.** Charles L. Scoville, Ashtabula, Ohio. Filed Oct. 24, 1887. Serial No. 253,252. (No model.)

Claim.—1. The combination of an oil-pipe, B, and a connecting-rod, A, having a passage from the outside thereof to the bearing-surface, with which passage the lower end of the oil-pipe connects with a hot-water pipe, C, surrounding said oil-pipe, secured to said connecting-rod, substantially as described, and for the purpose specified.

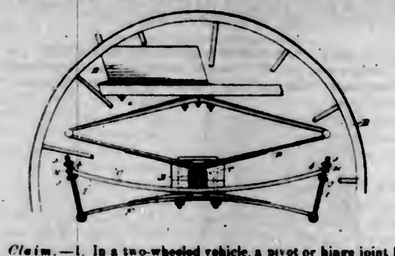
2. The combination of an oil-pipe, B, and a hot-water pipe, C, surrounding said oil-pipe and secured to the connecting-rod, with a connecting-rod having a passage connected with said oil-pipe and leading to the bearing-surface, and also passages extending therethrough and connected with said hot-water pipe, substantially as and for the purpose specified.

387,320. **FEED-WATER HEATER.** Daniel W. Smith, St. Louis, Mo., assignor of one-half to Joseph C. Addington, same place. Filed Nov. 26, 1887. Serial No. 256,344. (No model.)

Claim.—1. In a steam-generator, in combination with a tank, a cylinder provided with perforations or holes, wings secured to the periphery of the cylinder opposite the holes, and a hollow shaft or spindle upon which the cylinder is supported, substantially as set forth.

2. In combination with the tank provided with means for heating it, the cylinder 1, having openings 5, curved wings 6, secured to the cylinder opposite the openings, hollow shaft or spindle 2 on which the cylinder is supported, and escape-pipe 7, substantially as and for the purpose set forth.

387,321. **WATCH-CASE.** George C. Smith, New York, N. Y. Filed Nov. 27, 1888. Serial No. 194,071. (No model.)



Claim.—1. A watch-case, in combination with a separate leaf secured to said case and a movement-ring or other like part permanently hinged to said leaf or other part, substantially as described.

2. A separate and independent leaf, in combination with a movement-ring or other like part hinged to said leaf, with a seat in the case-center for the reception of the leaf, substantially as described.

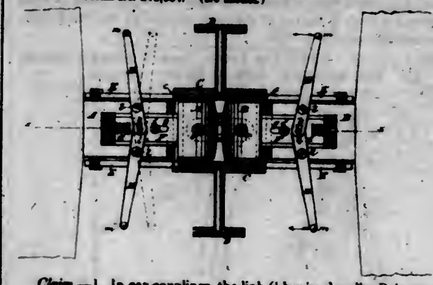
3. In a watch-case, a case-center and a ring or other attachment, in combination with a single hinged leaf detachably secured to one of said members and pivoted to the other member, substantially as described.

387,322. **TWO-WHEELED VEHICLE.** James A. Sieber, Marysville, Cal. Filed Nov. 10, 1887. Serial No. 254,993. (No model.)

Claim.—1. In a two-wheeled vehicle, a pivot or hinge joint between the axle and portion of the vehicle to be connected therewith, in combination with a limiting-spring under the axle, whereby the movement of the joint is controlled, and an adjustable connection with said spring, whereby it is regulated, substantially as described.

2. In a two-wheeled vehicle, a pivot or hinge joint between the axle and the portion of the vehicle to be secured thereto, in combination with the means for limiting and adjusting the joint, consisting of a spring passing under the axle, and bolts and nuts by which the ends of the spring are connected with parts above, substantially as described.

3. In a two-wheeled vehicle, the axle and the jacks G, rigidly secured thereto, in combination with the boxes carrying the body of the vehicle and pivoted on the axle, the limiting-spring secured to the boxes under the axle, and the stirrup-bolts connecting the ends of the springs with the ends of the jacks, and nuts for adjusting said bolts, substantially as described.



4. In a two-wheeled vehicle, the axle and the jacks G, rigidly secured thereto, in combination with boxes pivoted on the axle, the main springs clipped to the boxes, and the body or seat carried by the springs, the limiting-springs clipped under the boxes, and the adjustable bolts connecting the ends of the limiting-springs with the ends of the jacks, substantially as described.

5. In a two-wheeled vehicle, the axle, the shafts, and a pivot or hinge connection between them, in combination with the limiting-springs secured under the axle and adjustable bolts between each end of the springs and the shafts above, substantially as described.

6. In a two-wheeled vehicle, the axle, the shafts, the stirrups *k* on the shafts, and a hinge-connection between said stirrups and the axle, in combination with the limiting-springs under the axle and adjustable bolts connecting the ends of said springs with the stirrups, substantially as described.

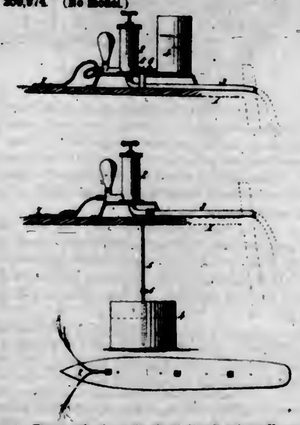
7. The combination, in a two-wheeled vehicle, of the adjustable and limited hinge-connection of the body and the shafts with the axle, consisting of the jacks secured to the axle, the pivoted boxes on the axle, the limiting-springs F, secured to the boxes, and the bolts I, connecting said springs and jacks, the stirrups under the shafts, the limiting-springs L under the axle, and bolts *l*, connecting said springs with the stirrups, all arranged and adapted to operate substantially as described.

387,323. **CAR-COUPLING.** Hermann Sonnenfeld, Canton, assignor of one-half to Archie Brown, McPherson, Kans. Filed May 7, 1888. Serial No. 273,697. (No model.)

Claim.—1. In car-couplings, the link C, having handles D, in combination with the bumpers having recesses *a* and slot *a'*, and provided with sliding plates F, operated by pivoted levers H, in the manner shown and herein specified.

2. The combination of the bumpers A and B, provided with sliding plates F, actuated by springs G and levers H, with the links C, having cross-bars *c*, to engage with the recesses *a* and slots *a'*, all constructed and arranged as herein shown and set forth.

3. The combination of the bumpers A and B, provided with sliding plates F, actuated by springs G and pivoted levers H, with the links C, having cross-bars *c* and supported by springs E, and arranged to engage with the slots *a'* and recesses *a*, in the manner and for the purpose herein specified.



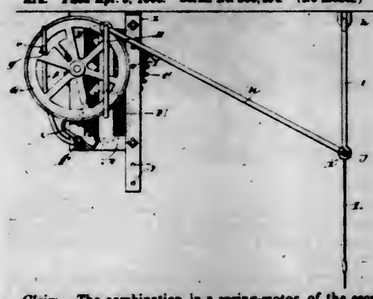
4. The link C, supported on adjustable springs E and provided with handles D, in combination with the bumpers A B, having recesses *a* and slots *a'*, and provided with sliding plates F, actuated by springs G and pivoted levers H, all operating as shown at set forth.

5. The car-coupling herein described, consisting of the bumpers A B, provided with sliding plates F, actuated by springs G and levers H, and having springs E, in combination with the link C, having cross-bars *c* and arranged to engage with the slot *a'* and recess *a*, all as shown and specified.

6. In car-couplings, the spring-actuated sliding plate F and levers H, arranged to secure the link C, having handles D, in the slotted groove *a* in the bumpers A B, provided with springs E, for supporting said link C, and all constructed and arranged as shown and specified.

7. In a car-coupling, the combination of a link, C, having handles D and cross-bars *c*, with bumpers having slotted grooves *a*, and arranged to engage by a movable sliding plate and pivoted levers attached thereto, in the manner and for the purpose herein described.

387,324. **METHOD OF DISTRIBUTING OIL DURING STORMS AT SEA.** Charles H. Stevens, New York, N. Y. Filed Jan. 6, 1888. Serial No. 259,974. (No model.)



Claim.—1. The method set forth of distributing oil upon the surface of the ocean in storms, said method consisting in introducing

said oil into the cylinder of a pump and projecting it, together with the water driven by the pump, over the surface, substantially as described.

2. The method set forth of scattering oil upon the surface of the sea in storms, said method consisting in pumping water from a suitable source and forcing it through a flexibly-connected nozzle, oil being admitted in fixed quantities to the pump-cylinder at each stroke, substantially as described.

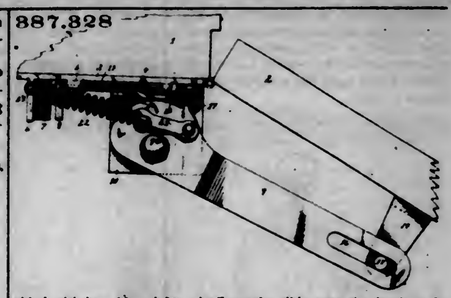
387,325. **MOTOR FOR FANS.** James G. Stephens, Sheridan, Ark. Filed Apr. 3, 1888. Serial No. 269,464. (No model.)

Claim.—The combination, in a spring-motor, of the escapement-pawl, the balance-wheel, and the arm extending from the escapement-shaft to the balance-wheel and engaging the same, as set forth.

387,326. **HARNESS FOR KICKING COWS.** Alonzo Sweet, Ferndale, Cal. Filed Sept. 24, 1887. Serial No. 250,631. (No model.)

Claim.—The harness for kicking cows, comprising the strap for encircling the body and the block secured to the strap for pressing on the flank directly in front of the hip-bone, substantially as herein described.

387,327. **WHEELBARROW.** Adolph Taigner, Greenstreet, Wis. Filed Mar. 26, 1888. Serial No. 268,515. (No model.)

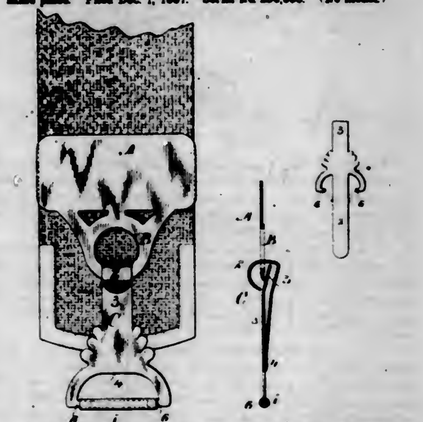


Claim.—1. In a barrow, the combination, with the side bars provided with wheel-pivot journals at their ends and pivoted plates for retaining the pivots in the journals, of the single runner curved upwardly at each end and provided with central pivots projecting laterally from its upper edge, brackets for carrying the runner-pivots, and a cross-piece substantially under the center of gravity of the load for the attachment of the said brackets.

2. In a barrow, the combination, with the side bars and the cross-piece secured to the side bars substantially under the center of gravity of the load, of the single runner curved upwardly at each end and provided with central pivots projecting laterally from its upper edge, and the brackets secured to the said cross-piece for carrying the runner-pivots.

3. The combination, with the frame-work of the barrow, of a single runner curved upwardly at each end and provided with laterally-projecting central pivots supported in the said frame-work substantially under the center of gravity of the load.

387,328. **DOOR-CHECK.** Peter W. Tobey, Waterbury, Conn., assignor to William F. Lewis, same place. Filed May 5, 1888. Serial No. 273,192. (Model.)



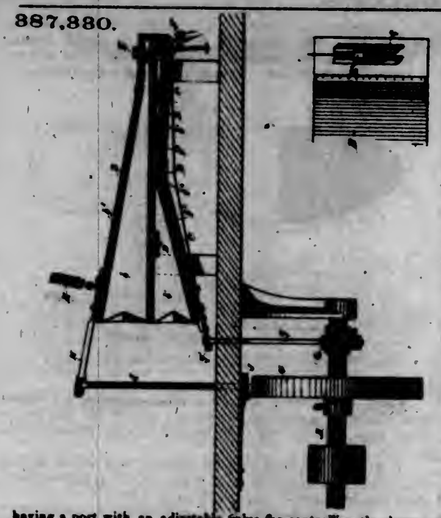
Claim.—1. A door-closer and buffer consisting, essentially, of a closing-arm pivoted to the jamb and connected to the door and provided with lugs 19 and 20, a buffer and a slide upon the jamb, and a pivoted dog upon the slide, whereby when the door is closed quickly lug 20 raises the dog which is engaged by lug 19, and the slide is carried against the buffer, which then recoils, allowing the dog to drop back of lug 20 and lug 19 to pass over it, so that the door is closed without slamming.

2. The base-plate having extension 10, the closing-lever pivoted thereto and having lugs 19 and 20, and a closing-spring, in combination with the buffer, a slide engaging said buffer and carrying a pivoted dog having an enlargement which engages the edge of the extension, and a head which is engaged by said lugs, as and for the purpose set forth.

3. The base-plate having ways 5, the buffer secured to the base-plate, and the slide moving in said ways and having a plate, 8, adapted to engage the buffer, in combination with the pivoted dog carried by the slide and having a head, 12, the closing-lever having lugs 19 and 20, and a closing-spring, substantially as described.

387,329. **SPRING-HOOK FOR SUSPENDER-BUCKLES.** Calvin Voorhis, New York, N. Y., assignor of one-half to Abraham Shenfield, same place. Filed Dec. 1, 1887. Serial No. 256,660. (No model.)

Claim.—1. The spring-hook for suspender-buckles, having a spring-tongue and a hook passing over the end of the tongue, with a nearly flat portion in close proximity to the end of the tongue, and the tongue closing against the point of the hook, said tongue being of sufficient length to prevent the buckle-ring from passing over the end and to the rear side thereof, substantially as described.



2. The spring-hook having the hook and the spring-tongue of one piece of sheet metal folded at 4, and the tongue within the hook, and the prongs 6, extending toward each other to receive the head of the suspender-ends, substantially as specified.

387,330. **SPEED-REGULATOR.** George F. Wells, San Francisco, assignor of one-half to Manley C. Lawton, Staten Island, Cal. Filed May 12, 1888. Serial No. 273,730. (No model.)

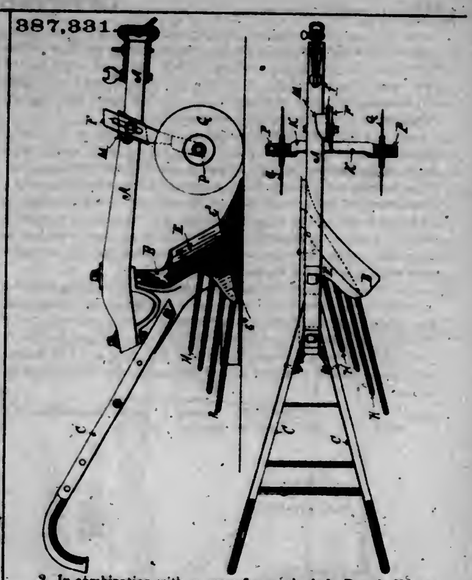
Claim.—1. The combination of a bellows-like frame operated by the engine or motor and having a port with an adjustable valve for controlling the degree of its expansion or contraction, and suitable connections, comprising a connecting-rod and a brake-shoe operated thereby, by which the speed of the motor is affected, substantially as herein described.

2. The bellows-like frame operated by the engine or motor and having a port with an adjustable valve for controlling the degree of its expansion or contraction, in combination with a brake acting upon the motor for checking it, and a connecting-rod between the frame and brake, whereby the latter is operated, substantially as herein described.

387,330. **SPEED-REGULATOR.** George F. Wells, San Francisco, assignor of one-half to Manley C. Lawton, Staten Island, Cal. Filed May 12, 1888. Serial No. 273,730. (No model.)

3. The combination of a bellows-like frame consisting of an expanding and contracting portion above and an expanding and contracting portion below and communicating with the portion above to expand or contract the portion above, said bellows having a port with an adjustable valve for regulating and controlling the degree of expansion or contraction of the portion above, and a brake and connections connected with said portion above for affecting the speed of the motor, substantially as herein described.

4. The combination of a bellows-like frame consisting of the upper valved chamber having a hinged lid or top wall, a lower valved chamber communicating therewith and having a hinged bottom wall, a connection between the motor and the hinged bottom wall, whereby the latter is operated to exhaust the upper chamber and draw down its top wall, said bellows having an entrance-port with an adjustable valve to the upper chamber for regulating the depression of the top wall, and a brake and connections with said top wall for controlling the speed of the motor, substantially as herein described.



5. The combination of a bellows-like frame consisting of the upper chamber having a hinged top wall, the lower chambers having oppositely-working connected bottom walls, the valves D between the lower chambers and the upper chamber and the valves C in the bottom walls, a connection with the motor for operating the bottom walls to exhaust the upper chamber and depress its top wall, said bellows having an entrance-port with an adjustable valve to the upper chamber for controlling the degree of depression of said wall, a spring for holding it up, and a brake and connections with said top wall for controlling the speed of the motor, substantially as herein described.

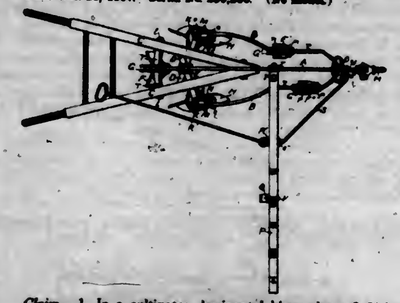
6. The combination, with the shaft A, of the motor having wheel *a* and eccentric G, the bellows-like frame having communicating upper and lower chambers controlled by valves, said upper chamber having a hinged top wall and the lower chambers having hinged bottom walls, the eccentric-rod *g*, by which the bottom walls are operated to exhaust the upper chamber and depress its top wall, the spring for holding said wall up, said bellows having the entrance-port with sliding valve for controlling the depression of the top wall, and the brake acting on the wheel *a* and connected with the top wall, substantially as herein described.

7. The bellows-like frame operated by the motor, said bellows having a port for regulating the degree of its expansion or contraction, said port consisting of an elongated narrow slit, and a slide-valve controlling the port, in combination with a brake acting on the motor, and connecting-rods from the brake to the bellows-like frame, substantially as herein described.

387,331. **POTATO-DIGGER.** Samuel L. Allen, Chesaninsen, N. J. Filed Oct. 26, 1886. Serial No. 217,203. (No model.)

Claim.—1. In combination with a revolving wheel or disk, a gang frame or axle having attached to its end the bolt R, and a removable and stationary axle, N, substantially as described.

2. In combination with a gang-frame, the bolt R, axle N, provided with lugs, and the hub P, provided with sand-shields *p p'*, substantially as described.



3. An adjustable mold-board provided at its lower edge with lugs and at its upper edge with an adjusting-bolt, substantially as described.

4. An adjustable mold-board consisting of the piece E, having at its lower edge pivots and at its upper edge an adjusting device, and provided with a supplementary skeleton, substantially as described.

5. The gang-frame arm F, having a longitudinal slot, *f'*, and a series of teeth, *f f*, in combination with the bolt R and plate M, provided with the guide-bars m' m^2 and lug m^3, all arranged substantially as described.

6. The gang-frame K, having an arm provided with a longitudinal slot, n^1, or a series of holes, n^1, and lug-notches, in combination with the axle N and bolt R, all arranged substantially as herein described.

387,332. **CULTIVATOR.** Samuel L. Allen, Chesaninsen, N. J. Filed Dec. 26, 1887. Serial No. 259,260. (No model.)

Claim.—1. In a cultivator, horizontal hinge-plates O O', having shoulders *a a'* and fastening-bolts *b*, whereby the central bar of a cultivator-frame is rigidly held in position and provided with separate pivotal studs C and side flanges, *d'*, whereby the hooked side bars of a cultivator-frame may be pivotally secured between said studs and flanges, substantially as described.

2. In a cultivator, the combination, with horizontal shouldered hinge-plates O O', provided with fastening-bolts *b*, separate pivotal studs C, and side flanges, *d'*, of the central bar, A, and the adjustable side bars, B, provided with hooks *d* and bent, whereby when opened to medium width the straight portions *r r* of the said side bars, to which the tooth-standards G' G^2 are attached, are parallel to the line of motion, substantially as and for the purposes described.

3. In a cultivator, the combination, with the side bars, B, of uni-

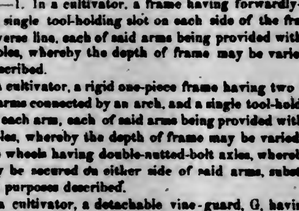
form thickness throughout, of the detachable bearing-box N, provided with the horizontal bolts *e*, whereby the box is secured to the face of said bar, vertical bolt-holes *m*, for the reception of the tooth-standard fastening-bolt, and having the seat *f* on the under side thereof, substantially as and for the purposes described.

4. In a cultivator, a detachable marker consisting of the combination of a graduated bar, P, hinged to the central bar of a cultivator-frame, and adjustable furrowing-blade Q, provided with the staple-bolt V, embracing said graduated bar, a bent diagonal brace, S, having a screw-threaded end passing through the said bar P, and provided at its forward end with a ring, S', whereby it is hinged to a horizontal pin, U, on the hinge-plate O, and a handle, R, pivotally attached to the nut R' on the said diagonal brace, all constructed and arranged substantially as and for the purposes described.

5. In a cultivator, bent adjustable side bars of uniform thickness throughout, provided with hooks *d*, in combination with detachable bearing-boxes N, provided with fastening-bolt holes and seats *f*, substantially as described, and horizontal shouldered hinge-plates O O', provided with fastening-bolts, separate pivotal studs, and side flanges, all constructed and arranged substantially as and for the purposes described.

387,333. CULTIVATOR. Samuel L. Allen, Cinnaminson, N. J. Filed Feb. 6, 1888. Serial No. 263,096. (No model.)

Claim.—1. In a cultivator, a frame having forwardly-projecting arms and a single tool-holding slot on each side of the frame in the same transverse line, each of said arms being provided with a vertical series of holes, whereby the depth of frame may be varied, substantially as described.

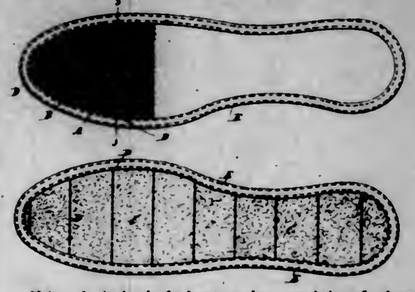


2. In a cultivator, a rigid one-piece frame having two forwardly-projecting arms connected by an arch, and a single tool-holding slot at the rear of each arm, each of said arms being provided with a vertical series of holes, whereby the depth of frame may be varied, in combination with wheels having double-nutted-bolt axles, whereby the said wheels may be secured on either side of said arms, substantially as and for the purposes described.

3. In a cultivator, a detachable vine-guard, G, having a shouldered seat, H', provided with a series of holes *n'*, whereby the said vine-guard is adjustable at different heights on either side of the perforated arm of the cultivator-frame, substantially as described.

4. The combination, in a cultivator, of a frame provided with forwardly-projecting perforated arms, adjustable vine-guards provided with perforated shouldered seats, and wheels having double-nutted-bolt axles, whereby the relative positions of said wheels, arms, and guards are interchangeable, thereby varying the width of track, substantially as described.

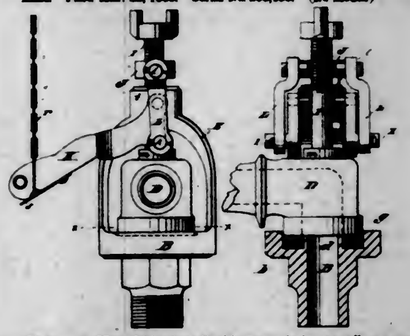
5. In a cultivator, a pair of adjustable curved tooth-rakes, each of which is provided with a single standard out of center, whereby the said rakes may be secured to a double-slotted cultivator-frame, substantially as and for the purposes herein set forth.



387,334. DUMPING-PLATFORM. Asahiah Baker, Bloomington, Ill. Filed Oct. 13, 1887. Serial No. 252,230. (No model.)

Claim.—1. In a dumping-platform, the combination, with a lever connected with shafts by means of suitable gearing, the said shafts being provided with tension-springs, sliding gates having rack-bars, gear-wheels meshing with said rack-bars, and a ratchet-wheel on one of said shafts, of a pawl adapted to engage the ratchet and a trigger for automatically releasing the ratchet and opening the gates, substantially as shown and described.

2. In a dumping-platform, the combination, with a lever connected with the shafts by means of suitable gearing, sliding gates and rack-bars secured thereto, cog-wheels on the shafts gearing with said rack-bars, and a ratchet-wheel on one of said shafts, of a pawl adapted to automatically engage the ratchet and lock the gates in closed adjustment, substantially as shown and described.

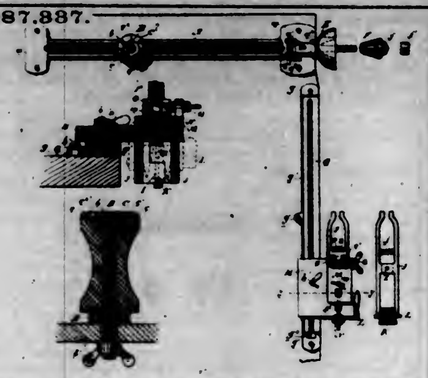


387,335. SOCK OR INSOLE FOR BOOTS OR SHOES. Thomas Barker, Todmorden, County of Lancaster, England. Filed May 31, 1887. Serial No. 239,949. (No model.) Patented in England June 11, 1886, No. 7,860.

Claim.—1. An insole for boots or shoes, consisting of a bottom layer of foraminous metal, an intermediate layer of hair, and a layer of soft fibrous material, the whole fastened together, substantially as set forth.

2. An insole for boots or shoes, consisting of a bottom layer of wire-netting, an intermediate layer of hair, and a layer of wool, the whole fastened together, substantially as set forth.

387,336. PIPE-COUPLING. Sidney H. Barrett, Springfield, Mass. Filed Mar. 22, 1883. Serial No. 269,133. (No model.)



Claim.—1. The within-described improved pipe-coupling, consisting of one section, B, having an outside support thereupon forming a guide for a stem in line with its orifice, a stem provided with a thread and adapted to move longitudinally in said guide, a nut inclosing said stem to one side of said guide, a lever hinged to the guide-support, a link hinged to a crank-arm of said lever and to the nut upon the stem and operating to hold the nut from rotation, a stop combined with the lever-handle and guide-support for limiting the swing in one direction of said lever, means combined with the screw-stem for enabling it to be rotated, and a section, D, having a joint-face conforming to that of section B, and an outside surface-bearing interposed between the combined joint-faces of the two sections and the inner end of the stem, all combined and operating substantially as shown and described.

2. The within-described improved pipe-coupling, consisting of a section, B, provided with a support, E, extended above its joint-face, a guide, *i*, in line with its orifice and in support E, a threaded stem, I, observed in said guide and provided upon its outer end with means for rotating it, a nut, J, upon said stem, a forked lever, K, fulcrumed upon opposite sides of stem *i* and to support E, links L from shorter arms of the lever upon opposite sides thereof to opposite sides of nut J, and operating, as shown and described, to hold the nut from rotating, and a section, D, having a joint-face conforming to that of section B, and an outer bearing-surface in the path of stem I when moved centrifugally inward, substantially as shown and described.

387,337. SAW FILING AND SETTING MACHINE. William H. Beardsley and Reuben Perry, Eureka, Cal. Filed Nov. 10, 1887. Serial No. 254,932. (No model.)

Claim.—1. In a saw filing and setting machine, a support for the saw, in combination with the sliding adjustable clamp for gripping and holding the saw when being filed, said clamp consisting of hinged jaws embracing at their forward ends the edge of the saw-plate, and the rotary wedge-roll operating between the rear ends of the clamp,

387,337.

whereby their forward ends are set up on the saw-plate, substantially as herein described.

2. In a saw filing and setting machine, a support for the saw, in combination with a fixed frame forming ways or guides, an apron-plate sliding on said frame, and a clamp carried by said apron-plate for embracing the edge of the saw-plate to hold it on its support, said clamp consisting of hinged jaws, a spring for holding the forward end of the jaws normally open, and a rotary wedge-roll carried by the apron-plate and operating between the rear ends of the jaws for closing their forward ends on the saw-plate, substantially as herein described.

3. In a saw filing and setting machine, a support for the saw, in combination with a fixed slotted frame, the apron sliding on said frame, the bolt and handled nut by which the apron is held to the frame and adjusted in position, the clamp carried by the apron and consisting of hinged jaws, the spring for holding the jaws normally open, and the rotary wedge-roll for closing them upon the saw-plate and holding it while being filed, substantially as herein described.

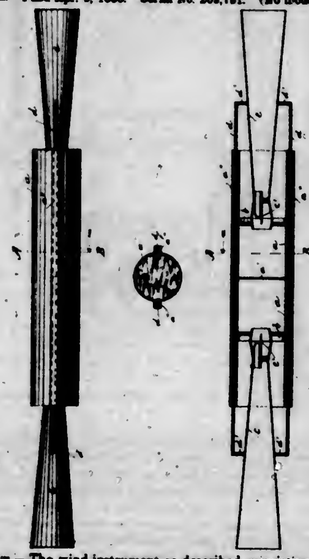
4. In a saw filing and setting machine, a frame provided with guide-lugs or a notched bearing on its end, and a mandrel hinged to said frame and fitted between the guides, said mandrel having a bearing-plate, cone, and nut for holding the saw, in combination with a second frame at right angles to the first frame, a sliding adjustable apron on said second frame, a clamp consisting of hinged jaws carried by the apron, a spring for holding the jaws normally open, and a rotary wedge-roll operating between the rear ends of the jaws to close their forward ends on the saw-plate and hold it steady on its mandrel while being filed, substantially as herein described.

5. In a saw filing and setting machine, a support for the saw, in combination with a sliding adjustable file-holder for setting the file up against the saw-teeth, said file-holder being mounted in transverse grooves, and a thumb-screw for moving it laterally and adjusting it in place, substantially as herein described.

6. In a saw filing and setting machine, a support for the saw, in combination with a sliding adjustable plate, a file-holder consisting of a recessed piece and set-screws for binding on the file, said holder being carried by the sliding plate and mounted thereon, and a thumb-screw, whereby said file-holder may be moved laterally, substantially as herein described.

7. In a saw filing and setting machine, a support for the saw, in combination with a frame forming guides or ways, an adjustable sliding apron thereon, an adjustable sliding plate on the apron, a clamp carried by the apron, and a file-holder carried by the plate and having a lateral adjustment, substantially as herein described.

8. In a saw filing and setting machine, a fixed frame forming ways or guides, and a hinged mandrel at one end for receiving the saw, and a bearing-plate, cone, and nut for holding the saw on the mandrel, in combination with a sliding adjustable anvil on the ways or guides of the frame having a beveled rim on its top, whereby the saw-teeth may be set, substantially as herein described.



9. In a saw filing and setting machine, a frame forming ways or guides, a hinged mandrel at one end thereof, and a bearing-plate, cone, and nut on the mandrel for holding the saw, in combination with an adjustable sliding anvil on the ways or guides of the frame having a rotary disk in its top, with a downwardly-beveled outer edge or rim, whereby the teeth of the saw may be set, substantially as herein described.

10. In a saw filing and setting machine, a guide-frame, a hinged mandrel at one end thereof, and a bearing-plate, cone, and nut for holding the saw on the mandrel, in combination with an adjustable sliding anvil on the guide-frame, and a rotary disk with a beveled edge or rim on the top of the anvil, and a hole through the disk and anvil top, substantially as herein described.

11. In a saw filing and setting machine, a guide-frame, a hinged mandrel at one end thereof, and a bearing-plate, cone, and nut for holding the saw on the mandrel, in combination with a sliding adjustable anvil on the frame, a rotary top disk having beveled outer rim, and a countersink in said disk, substantially as herein described.

12. A saw filing and setting machine, comprising a guide-frame having at one end a hinged mandrel provided with bearing-plate, cone, and nut for holding the saw on the mandrel, a sliding adjustable anvil on said frame and having a rotary disk with a beveled rim for setting the teeth of the saw, a second guide-frame at right angles to the first and near its end, a sliding adjustable apron on said frame, and a clamp carried by the apron for embracing and holding the saw while being filed, said clamp consisting of hinged jaws, a spring for holding the jaws normally open, and a rotary hinged roll operating between their rear ends for closing their forward ends on the saw-plate, substantially as herein described.

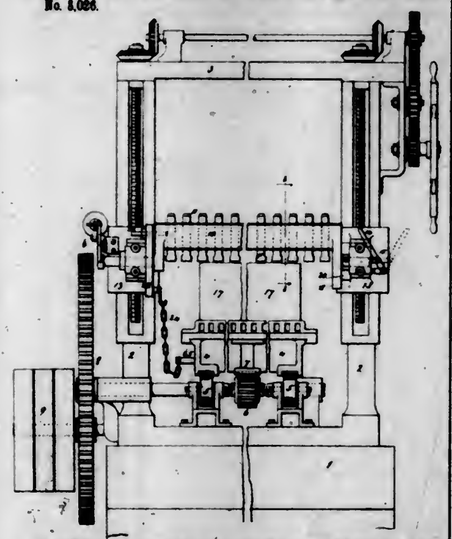
387,338. WIND-INSTRUMENT. Mary F. Cabnet, Groveland, Mass. Filed Apr. 6, 1888. Serial No. 269,781. (No model.)

Claim.—The wind-instrument as described, consisting of the cylinder *a*, having the partition or diaphragm *a'*, and a pair of movable sounding-horns, *c c*, provided with pistons *b b* and connected together for operation, as and for the purpose set forth.

387,339. PROCESS OF PURIFYING HYPOSULPHITE SOLUTIONS USED IN LEACHING ORES. Roswell D. Clark, Cortez, Nev. Filed Dec. 19, 1887. Serial No. 258,402. (No specimens.)

Claim.—The improvement in leaching ores with hyposulphite solutions, consisting in regenerating and improving the leaching solution employed for this purpose by the addition of bicarbonate of soda, substantially as herein described.

387,340. CLOTHES-DRIER. George Crouch, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Apr. 9, 1888. Serial No. 270,068. (No model.)



Claim.—1. The combination, with the back plate, A, and its lugs B, of a rod, D, the hubs E, and their sockets E', the movable rod-arms F, pivoted in the sockets E', and a spring adapted to bear frictionally against the hubs, as and for the purposes set forth.

2. The back plate, A, having lugs B, and slotted at 2, in combination with the rod D, the hubs E, and their sockets E', and the mov-

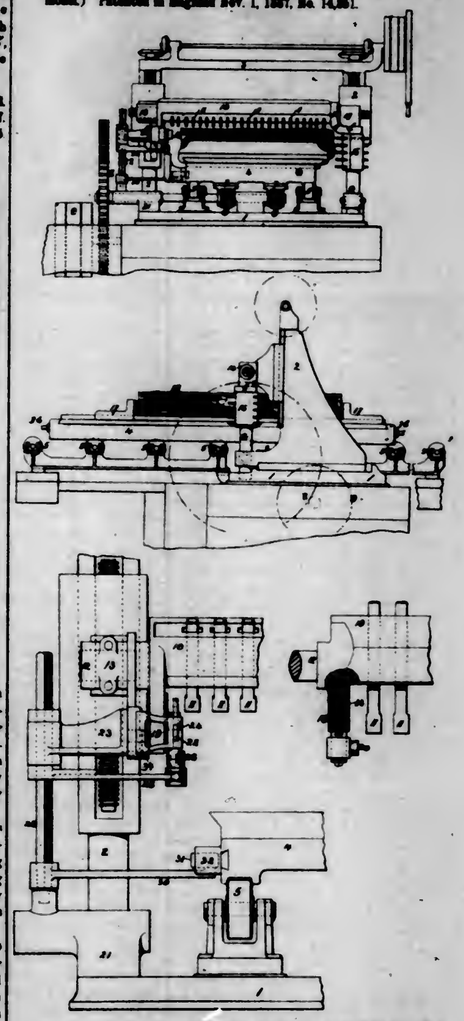
able rod-arms F, pivoted in the sockets E', said hubs having three sides flattened, and a spring adapted to bear against the flattened sides to hold the hubs in place, substantially as specified.

3. The combination, with the slotted back plate, A, having lugs B at right angles thereto, of the rod D, the hubs E upon said rod, the spring-plate C, adapted to bear frictionally against the hubs, the sockets E' upon one side of the hubs, which are shorter in length than the hubs E, and the movable rod-arms F, pivoted in the sockets E', and adapted to be held in place beneath the upper lug and the base of each socket, substantially as set forth.

387,341. MACHINERY FOR DRESSING AND PLANING STONE. James Coulter, Batley, County of York, England. Filed May 5, 1887. Serial No. 237,163. (No model.) Patented in England July 2, 1886 No. 8,026.

Claim.—1. In a stone-dressing machine, a reciprocating bed which carries the stone to be dressed, in combination with a laterally-adjustable tool-holder mounted above said reciprocating bed, which holder holds the cutting-tools in a stationary position while the same are operating upon the stone, and said holder having sliding journals which slide in their bearings, and means for moving said holder laterally when the cutting-tools are not operating upon the stone, substantially as set forth.

2. In a stone-dressing machine, a reciprocating bed which carries the stone to be dressed, in combination with an oscillating and laterally-adjustable tool-holder mounted crosswise of said reciprocating bed, the bearings for said tool-holder, said tool-holder having sliding journals which slide in said bearings, and an operating-lever pivotally connected to one of said journals and to said bearing, substantially as set forth.



3. In a stone-dressing machine, a reciprocating bed which carries the stone to be dressed, in combination with an oscillating tool-holder mounted crosswise of said reciprocating bed, the axis on which said holder oscillates being in a plane nearer to the surface of the bed than the cutting-edges of the tools carried by the holder, substantially as set forth, whereby when the holder is oscillated the cutting-edges of the tools will be lifted from the surface of the stone.

4. In a stone-dressing machine, a reciprocating bed which carries the stone to be dressed and an oscillating tool-holder journaled crosswise of the bed, in combination with a chain attached at opposite ends to said bed and said holder, substantially as set forth.

5. In a stone-dressing machine, a reciprocating bed which carries the stone to be dressed and an oscillating tool-holder journaled crosswise of said bed, in combination with a lever, 22, carried by said tool-holder and extending in the direction of the bed, and a chain attached at opposite ends to said lever and to said bed, substantially as set forth.

6. In a stone-dressing machine, a reciprocating bed which carries the stone to be dressed and an oscillating tool-holder journaled crosswise of said bed, said holder carrying a single set of tools which dress the stone during both movements of the bed, in combination with a fixed stop, 20, having oppositely-inclined faces, and an arm, 18, on the tool-holder, which encounters said stop on one face, the holder itself encountering the other face of the stop, substantially as set forth, whereby the tools are presented to the stone at the proper angle during both movements of the bed.

387,342. STONE-DRESSING MACHINE. James Coulter, Batley, County of York, England. Filed Oct. 6, 1887. Serial No. 251,669. (No model.) Patented in England Nov. 1, 1887, No. 14,851.

Claim.—1. In a stone-dressing machine, a reciprocating table which carries the stone to be dressed, in combination with an oscillating tool-holder journaled crosswise of said table, a second oscillating tool-holder at right angles to the first holder and perpendicular to the plane of the surface of the table, both of said tool-holders remaining stationary and immovable while the cutting-tools fixed thereto are operating upon the stone, and gearing intermediate between said holders, substantially as set forth, whereby the oscillation of one effects also the oscillation of the other holder.

2. In a stone-dressing machine, a reciprocating table which carries the stone to be dressed, in combination with an oscillating tool-holder journaled crosswise of said table, a second oscillating tool-holder at right angles to the first holder and perpendicular to the plane of the surface of the table, both of said tool-holders remaining stationary and immovable while the cutting-tools fixed thereto are operating upon the stone, gearing intermediate between said holders, substantially as set forth, whereby the oscillation of one effects also the oscillation of the other holder, and means for automatically oscillating said tool-holders when the reciprocating table reaches its limit of travel in each direction.

3. In a stone-dressing machine, a reciprocating table which carries the stone to be dressed, and an oscillating tool-holder journaled crosswise of said table, in combination with the longitudinally-sliding bar 25, with which said holder is connected, the rock-shaft 22, levers connecting said shaft with said sliding bar, the lever-arm 30, carried by said shaft, and dogs or tappets 33 on said reciprocating table, which encounter said lever-arm, substantially as set forth.

4. In a stone-dressing machine, the oscillating tool-holder and the longitudinally-sliding bar 25, having a perpendicular slot therein, in combination with the arm 19, connected with said holder, said arm having a projection, 20, which enters said slot, substantially as set forth.

5. In a stone-dressing machine, the oscillating tool-holder having arm 19, and a spring-actuated sliding block in said arm, in combination with the fixed curved track or disk 34, against which said block bears, substantially as set forth, whereby vibrations of the holder are prevented.

6. In a stone-dressing machine, a reciprocating table having a laterally-movable bed-plate upon which the stone is placed, a rock-shaft journaled in said table beneath said bed-plate, racks carried on the under side of said bed-plate, and pinions on said shaft, which engage said racks, in combination with a tool-holder mounted crosswise of and above said reciprocating table, and a series of cutting-tools carried by said holder, which act simultaneously upon the stone on said bed-plate.

387,343. DYNAMO-ELECTRIC MACHINE AND ELECTRIC MOTOR. Rodney H. B. Croswell, London, England. Filed Feb. 23, 1887. Serial No. 228,517. (No model.) Patented in England Mar. 3, 1886, No. 4,262, and in Belgium Feb. 19, 1885, No. 67,989.

Claim.—1. In an armature for a dynamo-electric machine, the combination, with a removable axle, of radial bars *d* and wrought-iron disks held by such bars, substantially as and for the purpose set forth.

2. In an armature for a dynamo-electric machine, the combination, with iron disks having dovetailed notches, of radial bars having dovetailed edges to fit said notches, all substantially as set forth.

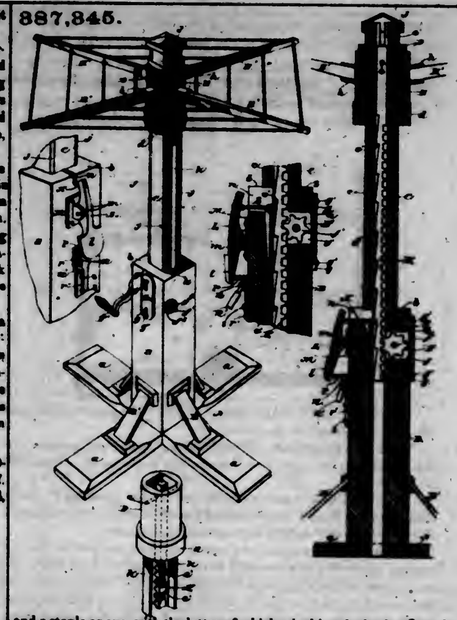
3. In an armature for a dynamo-electric machine, the combination of a detachable spindle with radial bars and iron disks arranged with spacing-pieces and radial ventilating-passages, substantially as set forth.

4. In an armature for a dynamo-electric machine, the winding consisting of loops or stirrups of copper strip arranged so as to lie flat on the outside of the armature and so as to be on edge on the inside, substantially as shown and described.

387,344. ARTIFICIAL STONE. Andrew G. Dederick, New York, N. Y. Filed June 13, 1888. Serial No. 276,869. (No specimens.)

Claim.—A composition of matter to form an artificial stone, consisting of cement, alkali in solution, silica, crushed stone or gravel, muriate of soda, caoutchouc or resin, and glue and gallic acid, substantially as set forth.

387,345. CLOTHES-DRIER. David A. Dodge, Duluth, Minn. Filed July 2, 1888. Renewed Dec. 16, 1887. Serial No. 258,142. (No model.)



Claim.—1. In a clothes-drier, the combination of a hollow standard, a rack-bar working therein and having a series of notches on one side and carrying the radial arms at its upper end, a shaft carrying a pinion, a spring-controlled latch housed within a recess in the standard and normally projected toward the rack-bar, and a pivoted lever located on the outside of the standard and connected with the latch, as and for the purpose described.

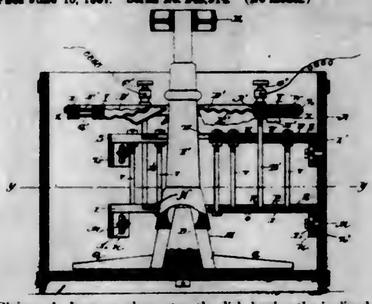
2. In a clothes-drier, the combination of the standard, the rack-bar carrying a sleeve and the radial arm and inclosed within the standard, a spring-pressed latch normally projected into the path of the teeth on the rack-bar, a pivoted lever connected with the latch for withdrawing it from engagement with the bar, and a vertically-adjustable stop-plate adapted to be moved into the path of the free end of the pivoted lever, substantially as described, for the purpose set forth.

3. The combination of the standard, the rack-bar having the notches or teeth and carrying the sleeve and the radial arms, the spring-pressed latch adapted to enter one of the notches of the rack-bar, a pivoted lever connected with the latch, a plate in which the lever is pivoted, and a stop-plate having the extended flange or leg, and the longitudinal slots through which are passed the guide-pins and a staple or eye, with the latter of which a locking device is adapted to be connected to prevent retrograde movement of the stop-plate, substantially as described, for the purpose set forth.

4. In a clothes-drier, the combination of the main and auxiliary standards or uprights of different diameters with the intermediate shoulder or flange, and provided with the central channel and the slots *c'*, the wear-strips at the corners of the auxiliary upright, the cap surmounting the said auxiliary standard, the rack-bar inclosed within the standards and having the notches, the sleeve fitted over the auxiliary standard and connected with the rack-bar, the collar carrying the radial arms and loosely fitted on the sleeve, a pinion for moving the rack-bar vertically, a spring-pressed latch normally projected into the path of the teeth of the rack-bar, and a pivoted lever connected with the latch, substantially as described, for the purpose set forth.

387,845.

387,346. PAINTING-MACHINE. Hugh P. Dugan, Mound City, Kans. Filed Feb. 1, 1888. Serial No. 262,694. (No model.)



Claim.—1. The combination of the casing containing the paint well or chamber and having a vertically-extended back provided with slots C, the lower brushes having fixed bearings in the casing and arranged within the paint-well, the upper brushes having their journals extending through the slots C, and the vertically-adjustable bars mounted on the back of the casing and secured to the journals of the upper rollers, as set forth.

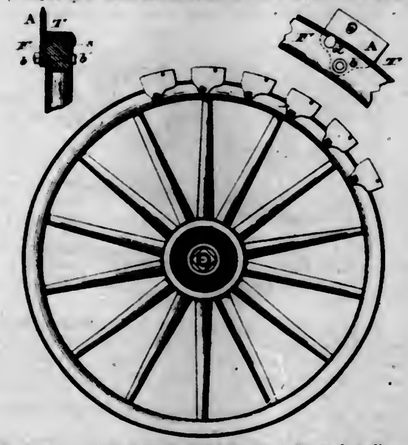
2. The painting-machine comprising the casing having a paint-well and an extended back having vertical slots C, and provided on its front side at its upper edge with an outwardly-curved longitudinal guard, *b*, the lower brushes arranged in the paint-well, the upper brushes having their journals extending through the slots C, and the

vertically-adjustable bars mounted on the back of the casing and having their upper ends secured to the journals of the upper brushes, as specified.

387,347. AMALGAMATOR. Adam H. Strahan, Dayton, Nev. Filed June 10, 1887. Serial No. 240,914. (No model.)

Claim.—1. In an amalgamator, the disk having the inclined paddles D, substantially as described.

2. In an amalgamator, the disk having the inclined paddles provided with series of transverse corrugations or plates E', substantially as described.



3. In an amalgamator, the disk having the openings F', the inclined paddles D, and the depending lips H', inclined in the opposite direction from the paddles, substantially as described.

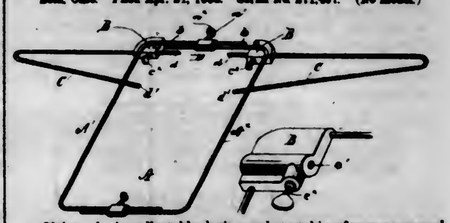
4. In an amalgamator, the combination of the settler, the converging conducting-arms secured to and insulated from the settler, the conducting-disk having the paddles and supported upon the arms, and the battery or other source of electricity having one pole connected to the settler and the other pole connected to the disk, substantially as described.

5. The annular conducting-disk W, having the series of inclined paddles E' extending inward from the disk to the center thereof, all the paddles converging to a common center, in combination with the settler, in which the disk is arranged, and the battery or other source of electricity having one pole connected to the disk and the other pole connected to the settler, substantially as described.

6. In an amalgamator, the settler, the series of arms I, secured to, but insulated therefrom, the series of arms S above the arms I, and also insulated from the settler, and the conducting-disk W, supported by the arms I, but insulated therefrom, and the battery or other source of electricity having one pole connected to the settler and the opposite pole connected to the disk, substantially as specified.

387,348. ROAD-GRADING MACHINE. William Fleming, Fort Wayne, Ind. Filed June 21, 1888. Serial No. 205,816. (No model.)

Claim.—1. In combination with the wheel of a road-grading machine, a reversible flange-piece adapted to be set on as a projecting flange by means of a fixed stem and a bolt, both passing through the felly, and to be set in position to clear the ground by turning it on its stem and bolting it in that position, substantially as described and set forth.



2. In combination with the wheel of a road-grading machine, a flange-piece turning by a stem passing through the felly and secured by a flattened head, and fastened by the same bolt in either of two positions at will—viz., as a projecting flange or turned inwardly to clear the ground.

3. In combination with the wheel of a road-grading machine, a flange-piece with a headed stem extending through the felly by a gain under the tire, and two bolt-holes, through one of which it may be bolted to the felly in position to stand as a projecting flange and lock the tire upon the felly, and through the other of which it may be bolted in position to clear the ground, substantially as described and set forth.

4. In combination with the wheel of a road-grading machine, the fixed stem *a* and flange-piece A, as described and set forth.

5. In combination with the wheel of a road-grading machine, the flange-piece A, the headed stem *a*, and the bolt-holes *b* and *c*, substantially as described and set forth.

387,349. GARMENT-STRETCHER. Harry S. Fuller, Springfield, Ohio. Filed Apr. 21, 1888. Serial No. 271,467. (No model.)

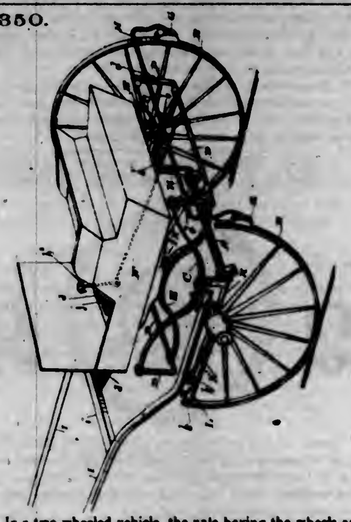
Claim.—1. An adjustable drying and stretching frame composed of two U-shaped pieces of resilient metal, connecting-couplers adapted to slip over the ends of the respective pieces, and a clamping-screw in each of said couplers for holding said pieces in different positions of adjustment, a V-shaped spring-arm connected to each of said U-shaped pieces, and means, substantially as described, for holding said arms in different positions of adjustment, substantially as set forth.

2. An adjustable drying and stretching frame provided with corner-pieces having longitudinal openings therein and adjustable spring-arms adapted to be inserted in said openings, substantially as specified.

3. The adjustable stretching-frame composed of the two U-shaped pieces, the free ends of which are connected together by couplings, as described, the corner-pieces having the longitudinal openings, a clamping-screw, and the independent spring-arms adapted to be secured to said corner-pieces and adjusted therein, substantially as specified.

4. The adjustable stretching and drying frame composed of the U-shaped pieces, the free ends of which are connected together by connecting-couplers, so as to be adjustable, as described, the corner-pieces grooved on one side to receive the said wire, which is secured therein, and provided on the other with an opening to receive one end of the V-shaped spring-arm, means for holding said spring-arms in different positions of adjustment in said corner-pieces, and a suspension-ring on said connecting-coupler, substantially as specified.

387,350. TWO-WHEELED VEHICLE. Peter Glaser, Redding, Cal. Filed Apr. 14, 1888. Serial No. 270,648. (No model.)



Claim.—1. In a two-wheeled vehicle, the axle and the body, in combination with the spring-connection between them, consisting of the springs clipped solidly to the axle and curving upwardly to each end, the springs supporting the body and curving upwardly to the center, and the pivoted hangers connecting the ends of the body-supporting springs with the ends of the axle-springs, substantially as herein described.

2. In a two-wheeled vehicle, the axle, the shafts rigidly clipped thereto, and the body, in combination with the half-springs clipped solidly to the axle and curving upwardly to each end, the half-springs supporting the body and curving upwardly to the center, and the depending hanger-frames connecting the ends of the body-springs with the ends of the axle-springs, substantially as herein described.

3. In a two-wheeled vehicle, the axle, the wheels, the body, and a swinging connection between the axle and body, whereby the body may have a movement forward and back, in combination with brakes operating against the rear of the wheels, whereby on a downgrade the weight on the horse's back may be relieved, substantially as herein described.

4. In a two-wheeled vehicle, the axle having the wheels and the body, in combination with the half-springs clipped to the axle, the half-springs supporting the body, and the pivoted hangers connecting the ends of the springs, whereby the body may have a movement forward and back, and the brakes operating against the rear of the wheels, whereby on a downgrade the weight on the horse's back may be relieved, substantially as herein described.

387,350.

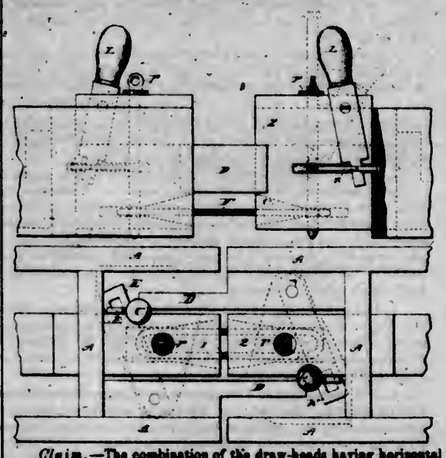
5. In a two-wheeled vehicle, the axle having the wheels and the body, in combination with the half-springs clipped to the axle, the half-springs supporting the body, and the pivoted hangers connecting the ends of the springs, whereby the body may have a movement forward and back, the rock crank-shaft carried by the rear hangers, the brake-blocks carried by the shaft, and operating against the rear of the wheels, the operating-lever in the body, and the rod connecting it with the rock crank-shaft, whereby the brakes are actuated, substantially as and for the purpose herein described.

6. In a two-wheeled vehicle, the axle, the body, and a swinging connection between them, whereby the body may have a movement forward and back, and the shafts clipped to the axle, in combination with an adjustable connection between the body and the shafts, whereby said body may be pulled forward on an upgrade to impose the weight on the horse's back, substantially as herein described.

7. In a two-wheeled vehicle, the axle, the body, and a swinging connection between them, whereby the body may have a movement forward and back, and the shafts clipped to the axle and having a cross-bar, in combination with the adjustable strap connecting the body with the cross-bar of the shafts, whereby the body may be pulled forward on an upgrade to impose the weight on the horse's back, substantially as herein described.

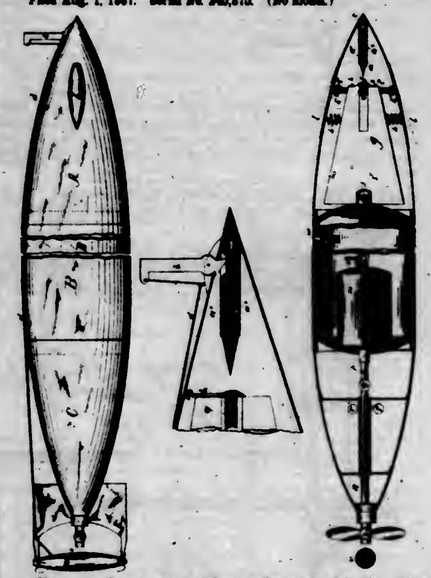
8. In a two-wheeled vehicle, the axle, the shafts clipped thereto and having a cross-bar, and the body, in combination with the half-springs clipped to the axle, the half-springs supporting the body, and the pivoted hangers connecting the ends of the springs, whereby the body may have a movement forward and back, and the adjustable strap connecting the body with the cross-bar of the shafts, whereby said body may be pulled forward on an upgrade to impose the weight on the horse's back, substantially as herein described.

9. In a two-wheeled vehicle, the crank-axle and the shafts solidly clipped thereto, in combination with the rod or link journaled or pivoted on the crank portion of the axle and fitted through a socket on the shaft, and nuts for adjusting the rod or link as to length between connections, whereby the height of the shafts may be regulated to suit the horse, substantially as herein described.



387,351. TROUSERS. Bernard Goodman, Cincinnati, Ohio. Filed Feb. 20, 1888. Serial No. 264,576. (No model.)

Claim.—1. A pair of pantaloons having side pieces extending rearward from the opening in front to a point in the rear of the hip-pockets and downward to the pocket-openings, and having extensions to serve as the inner walls of the pockets, substantially as for the purpose specified.



2. A pair of pantaloons comprising fore pieces, A, back pieces, B, and side pieces, C, forming the waistband and the body of the garment rearward from the opening in front and downward to the hip-pockets, and having extensions *c*, substantially as specified.

387,352. CAR-COUPLING. Freeman Hallmore, Mayfield, Ky. Filed Sept. 22, 1887. Serial No. 250,441. (No model.)

Claim.—The combination of the draw-heads having horizontal slots made through them, the extensions D, having their front ends projecting beyond the draw-heads, the pivoted supports extending through the slots in the draw-heads, the operating-levers pivoted on the draw-heads, the pins, and the link, substantially as shown and described.

387,353. AUTO-MOBILE TORPEDO. Martin H. Hall, U. S. Navy. Filed Aug. 1, 1887. Serial No. 245,575. (No model.)

Claim.—1. In an auto-mobile torpedo, the combination, with a shell, of a movable magazine located in said shell, a firing-pin in position to discharge this magazine, and a trigger located in position to liberate the firing-pin, substantially as set forth.

2. In an auto-mobile torpedo, the combination, with a shell and a movable magazine located in the shell or casing, of a set of pectoral fins connected with such shell, adapted to be outwardly extended by the movement of the magazine, substantially as set forth

3. In an auto-mobile torpedo, the combination, with a shell and a magazine yieldingly supported therein, of a set of pectoral fins connected with the shell and adapted to be outwardly extended by the lateral movement of the magazine, and mechanism for discharging the magazine.

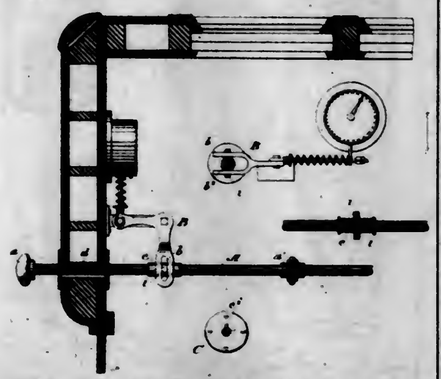
4. The combination, with a shell or casing and a magazine yieldingly supported in said casing, said magazine having a primer located therein, of a spring-actuated firing-pin in position, when released, to discharge the primer, and a trigger for liberating this pin, substantially as set forth.

5. The combination, with a shell, a magazine yieldingly supported in said shell by springs and hangers, and a primer located in one end of the magazine, of a pair of pectoral fins connected with the shell and in position to be alternately outwardly extended by the lateral movement of the magazine, a spring-actuated firing-pin adapted to strike the primer when liberated, and a pivoted trigger for engaging or disengaging the firing-pin, substantially as set forth.

6. In an auto-mobile torpedo, a shell provided with a magazine yieldingly suspended therein and suitable means for discharging the same, an immersion-chamber having unobstructed holes in its bottom, and a separate compartment of the air-chamber containing a suitable number of removable weights, whereby a proportionately less or greater quantity of water in the air-chamber will produce an equilibrium of the torpedo and control its submersion to a less or greater depth, substantially as described.

7. In a torpedo, the combination, with a pivoted trigger, a magazine, and a firing-pin normally held by said trigger, of a buoyant grapnel and a line connecting this grapnel to the trigger for the purpose of discharging the magazine when the grapnel is caught or obstructed, substantially as set forth.

8. The combination of a torpedo having a trigger thereon and a buoyant grapnel connected by a tow-line or cable to the trigger of the magazine for the purpose of discharging the same when the grapnel is caught or obstructed, substantially as set forth.



9. In a torpedo, the combination, with a shell, a magazine therein, and a firing device, of a buoyant grapnel connected to the firing device and adapted, when engaged, to discharge the magazine, substantially as set forth.

387,354. WASH-BOARD. Ephraim Hamboer, Detroit, Mich. Filed Dec. 3, 1887. Serial No. 256,762. (No model.)

Claim.—The combination, with the wash-board, of a spatter board or guard slidingly secured between the side rails of the wash-board, and the buttons F, pivoted to the top rail of the wash-board upon opposite sides thereof, substantially as and for the purpose specified.

387,355. DEVICE FOR RINGING FARE-REGISTERS. Jacob M. Hahn, Pittsburg, Pa. Filed Mar. 1, 1888. Serial No. 265,847. (No model.)

Claim.—1. In a device for ringing the register of a street-car, the combination, with a rod running lengthwise through the car, of a bell-crank having a slotted divided arm engaging the rod and connecting with the register, which it rings, by means of the other arm, substantially as and for the purposes set forth.

2. In a device for ringing the register of a street-car, the bell-crank B, having one arm connected with the register, which it rings, and the other arm divided into two parts, b' and b^2, each slotted to engage with pins above and below the rod A by which it is actuated, substantially as set forth and described.

3. In a device for ringing the register of a street-car, the rod A, having mounted thereon the sleeve e, provided with pins i, engaging corresponding slots in the arms of a bell-crank connected with the register, which it rings, substantially as specified.

387,356. ROLLER-BEARING. Reuben W. Hunt, San Francisco, Cal. Filed Apr. 16, 1887. Serial No. 235,040. (No model.)

Claim.—1. In a roller-bearing, a ring bearing at its periphery on journals of a series of rollers bearing directly on the shaft and casing and at its inner side on journals of a series of rollers bearing neither on the shaft nor casing, but on the rollers of the other series, all said parts combined substantially as set forth.

2. In a roller-bearing of the class herein described, the ring E, adapted to bear at its periphery on the journals B^2 of the bearing-rollers B, consisting each of a journal, B^2, and of two journals, B', bearing directly on the shaft A and casing D, and to bear at its inner side on the journals C^2 of the separating-rollers C, consisting each of a journal, C^2, and of two journals, C', bearing only on the journals B', all said parts combined substantially as shown and described, and for the purposes set forth.

3. In a roller-bearing, the combination of a series of rollers bearing directly on the shaft and casing and having journals adapted to rotate in contact with the periphery of a ring coaxial with the shaft, and a series of rollers bearing neither on the shaft nor casing, but on the rollers of the other series, and having journals adapted to rotate in contact with the inner side of said ring, all constructed and arranged substantially as set forth.

4. In a roller-bearing of the class herein described, the combination of the series of bearing-rollers B, each consisting of a journal, B^2, adapted to rotate in contact with the periphery of the ring E, coaxial with the shaft A, and of two journals, B', bearing directly on the shaft and casing, and the series of separating-rollers C, each consisting of a journal, C^2, adapted to rotate in contact with the inner side of said ring, and of two journals, C', bearing only on the journals B', all constructed and arranged substantially as shown and described, and for the purposes set forth.

5. In a roller-bearing, the combination, with a ring coaxial with the shaft, of a series of rollers bearing directly on the shaft and casing and having journals adapted to rotate in contact with the periphery of said ring, and a series of rollers bearing neither on the shaft nor casing, but on the rollers of the other series, keeping the latter separate from each other, and having journals adapted to rotate in contact with the inner side of said ring, all constructed and arranged substantially as and for the purposes set forth.

6. In a roller-bearing of the class herein described, the combination, with the ring E, coaxial with the shaft A, of the series of bearing-rollers B, consisting each of two journals, B', bearing directly on the shaft and casing, and of a journal, B^2, located between the journals B' and adapted to rotate in contact with the periphery of said ring, and the series of separating-rollers C, keeping the rollers B separate from each other, and consisting each of two journals, C', bearing only on the journals B', each journal C' on and between two journals B', and of a journal, C^2, located between the journals C' and adapted to rotate in contact with the inner side of said ring, all constructed and arranged substantially as shown and described, and for the purposes set forth.

7. In a roller-bearing, the combination, within the casing, of the shaft, a ring coaxial with the shaft, a series of rollers bearing directly on the shaft and casing and having journals adapted to rotate in contact with the periphery of said ring, and a series of rollers bearing neither on the shaft nor casing, but on the rollers of the other series, and keeping the latter separate from each other, and by such bearing kept from contact with the shaft, and having journals adapted to rotate in contact with the inner side of said ring, all constructed, arranged, and operating substantially as and for the purposes set forth

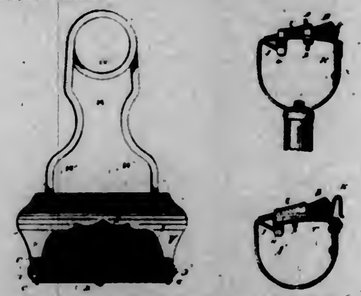
8. In a roller-bearing of the class herein described, the combination, within the casing D, of the shaft A, the series of bearing-rollers B, consisting each of two journals, B', bearing directly on the shaft and casing, and of a journal, B^2, located between the journals B' and adapted to rotate in contact with the periphery of the ring E, coaxial with the shaft, the series of separating-rollers C, keeping the rollers B separate from each other, and kept by their bearing on the latter from contact with the shaft, and consisting each of two journals, C', bearing only on the journals B', each journal C' on and between two journals B', and of a journal, C^2, located between the journals C' and adapted to rotate in contact with the inner side of said ring, and the said ring E adapted to bear at its periphery on the journals B^2 and at its inner side on the journals C^2, all constructed, arranged, and operating substantially as shown and described, and for the purposes set forth.

9. A roller-bearing comprising the shaft A, the casing D, the series of bearing-rollers B, consisting each of two journals, B', bearing directly on the shaft and casing, and of a journal, B^2, located between the journals B' and rotating in contact with the periphery of the ring E, coaxial with the shaft, the series of separating-rollers C, consisting each of two journals, C', bearing only on the journals B', each journal C' on and between two journals B', and of a journal, C^2, located between the journals C' and rotating in contact with the inner side of said ring, and the said ring bearing at its periphery on the journals B^2 and at its inner side on the journals C^2, all constructed, arranged, combined, and adapted to operate substantially as shown and described and for the purposes set forth.

387,357. ASPHALTUM COMPOUNDED AND PROCESS OF MAKING THE SAME. Moses S. Hoges, South Amboy, N. J., and Albert W. Duckemeyer, Brooklyn, N. Y. Filed Dec. 17, 1887. Serial No. 258,210. (Specimens.)

Claim.—1. The process herein described of refining asphaltum, which consists in adding it in small quantities from time to time to a bath of melted paraffine-wax and mineral oil and subjecting it to heat sufficient to melt it and to volatilize certain impurities therein contained, substantially as specified.

2. The process herein described of refining asphaltum, which consists in subjecting it to a bath of boiling paraffine-wax and mineral oil, and subjecting it to heat sufficient to melt it and to volatilize certain impurities therein contained, as specified.



3. The compound of paraffine-wax, mineral oil, and asphaltum melted together and freed from volatile impurities, as specified.

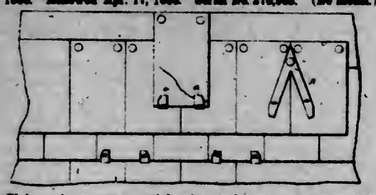
387,358. BITUMEN COMPOUNDED AND PROCESS OF MAKING THE SAME. Moses S. Hoges, South Amboy, N. J., and Albert W. Duckemeyer, Brooklyn, N. Y. Filed Dec. 17, 1887. Serial No. 258,211. (Specimens.)

Claim.—1. The process herein described of hardening bitumen, consisting in melting it with paraffine-wax and subjecting the same to heat to remove the volatile impurities, as specified.

2. The compound consisting of bitumen and paraffine-wax from which the volatile impurities have been removed, as specified and set forth.

387,359. SAFETY-RAZOR. Friedrich Kampfe, Richard Kampfe, and Otto Kampfe, Brooklyn, N. Y. Filed Feb. 6, 1888. Serial No. 263,136. (Model.)

Claim.—1. A safety-razor having angular blade-retaining clips on the top of the holder at the end of said top, and screws in said clips, substantially as herein shown and described, and for the purpose of adjusting the blade in relation to the guard, as set forth.



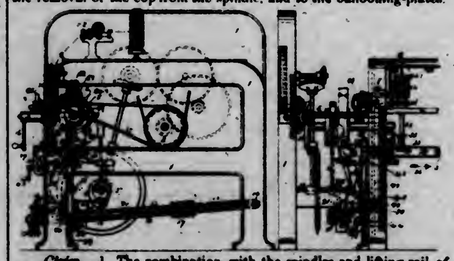
2. In a safety-razor, the combination, with a blade-holder, of movable angle-clips on said holder at the ends of the top of the holder, screws in said clips, and a spring pressing on the blade toward the guard, substantially as herein shown and described, and for the purpose of adjusting the blade in relation to the guard, as set forth.

3. In a safety-razor, the combination, with a blade-holder, of movable angle-clips at the ends of the top of the holder, which clips have flanges projecting over the top and bottom surfaces of the top of the holder, a screw in each flange of each clip, and a spring pressing the blade toward the guard, substantially as herein shown and described.

4. In a safety-razor, a guard composed of a rod and a series of U-shaped wire teeth secured in and projecting upward and outward from said rod, the closed ends of the U-shaped teeth being at the outside, substantially as shown and described.

5. In a safety-razor, the combination, with a holder having two apertures in its bottom, of the U-shaped spring-handle M, provided with the coil or loop M', the ends of the shanks of the handle being passed into the apertures in the bottom of the holder, substantially as herein shown and described.

387,360. DEVICE FOR SECURING ROOFING-SLATE. John H. Kemp, West Alexandria, assignor of two-thirds to William Clayton, New Lebanon, and Joseph Baumgardner, Dayton, Ohio. Filed July 17, 1886. Renewed Apr. 17, 1888. Serial No. 270,962. (No model.)



Claim.—1. As a new article of manufacture, an improved fastening device for roofing-slates formed of a single piece of sheet metal and comprising two arms arranged at an inclined position with relation to each other, one end of said arms being adapted to be bent over the lower edge of a shingle and the opposite ends of the arms meeting and joining each other and lying in the plane of the arms, and having a transverse opening therethrough for the passage of a securing nail or screw, substantially as set forth.

2. The combination, with the overlapping slates, of a V-shaped piece of metal whose angle portion is in the same plane as the arms thereof, secured upon the slates by a nail or similar device driven through its angular end and between the meeting edges of the under slates, the diverging arms of the piece of metal protruding below the edge of the upper slate and being bent round the same, substantially as set forth.

387,361. SPINNING-MACHINE. William Leach, Accrington, County of Lancaster, England. Filed Oct. 6, 1886. Serial No. 215,666. (No model.) Patented in England Apr. 9, 1884, No. 6,145.

Brief.—The invention relates to the copping-motion, to means for putting the drag on the spindle, to means for rotating the whirl-tube which rotates upon the spindle, to the flier, to means for facilitating the removal of the cop from the spindle, and to the ballooning-plates.

Claim.—1. The combination, with the spindles and lifting-rail, of a copping-motion consisting of a vibrating lifting-lever and mechanical connections between said lever and the lifting-rail for imparting reciprocating motion from the former to the latter, and including as part of said connections a chain, a chain take-up adapted to pay out a portion of said chain at each vibration of the lever, and an eccentric-pulley arranged relatively to said chain, substantially as described, so that as the chain is paid out at each reciprocation it will wind each time more on the eccentric-pulley, whereby a given reciprocation of the chain produces each time a decreased oscillation of the pulley, which, being communicated to the lifting-rail, results not only in lowering the latter at each reciprocation to a lower level, but also successively shortens its reciprocating movement, and thereby builds up the cop with chases which are successively more obtusely conical.

2. The combination, with the spindles and lifting-rail, of a copping-motion consisting of a lifting-shaft geared to the lifting-rail, an eccentric-pulley on said shaft, a chain connected to and adapted to

wind on said pulley, a vibrating lifting-lever to which said chain is connected, whereby on the vibration of said lever it alternately pulls and releases the chain, and thereby causes the oscillation of said pulley, and a chain take-up carried by said lever and adapted to pay out a portion of said chain at each vibration of the lever, substantially as set forth.

3. The combination, with the spindles and lifting-rail, of a copping-motion consisting of lifting-shaft 5, geared to the lifting-rail, an eccentric-pulley, 6, on said shaft, an arm, 7, fixed to said shaft, a chain, 11, connected to said arm and adapted to wind on said pulley, a lifting-lever, 13, to which the opposite end of said chain is connected, and a chain take-up carried by said lever and adapted to pay out a portion of said chain at each vibration of the lever, substantially as set forth.

4. The combination, with the lifting-rail and the spindles carried thereby, of tension-levers bearing against said spindles in order to apply a drag thereto, shifting weights applied to said levers and adapted by moving toward or from their fulcra to vary said drag, and a reciprocatory sliding bar arranged parallel with the series of levers and connected to said weights, whereby the reciprocation of said bar simultaneously shifts all of said weights and varies the drag equally on all the spindles.

5. The combination, with a spindle, of a tension-lever bearing against said spindle in order to apply a drag thereto, a shifting weight consisting of a weighted arm having a roller rolling on one arm of said lever, a reciprocatory bar to which said weighted arm is pivoted, and mechanism, substantially as set forth, for reciprocating said bar.

6. The combination, with a spindle, of a tension-lever bearing against said spindle to apply a drag thereto, a shifting weight bearing against one arm of said lever, a lifting-rail for lifting the spindles, a reciprocatory bar borne by said lifting-rail and rising and falling with it, and connected to said shifting weight and adapted to shift the same, and mechanism, substantially as set forth, for reciprocating said bar.

7. The combination, with a spindle, of a tension-lever, a shifting weight bearing against one arm of said lever, a lifting-rail for lifting the spindles, a reciprocatory bar borne by said lifting-rail, connected to said shifting weight to shift the same, a cam-shaft, mechanism driven from said shaft for lifting and lowering said lifting-rail, and mechanism, substantially as set forth, driven from the same shaft for reciprocating said bar.

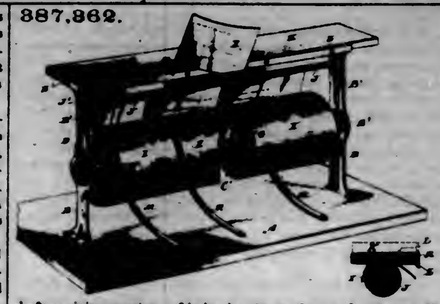
8. The combination, with a spindle, of a tube inclosing it, the lifting-rail for raising and lowering the spindle, the stationary rail through which the spindle and tube pass, an oil-cup in said rail, a screw-bushing beneath said oil-cup and embracing said tube, and the whirl and its tube, with the latter projecting into the oil-cup, substantially as set forth.

9. The combination of the spindle, the mechanism for raising and lowering it, the rotary cage inclosing the spindle having an outwardly-projecting flange at its top, and eyelets for guiding the yarn and applying a tension thereto, and the whirl attached to said cage, substantially as set forth.

10. The combination of the spindle, the mechanism for raising and lowering it, a rotary cage arranged to inclose the spindle and cop, constructed of cylindrical form, with an outwardly-projecting flange, 54, at its top, and having eyelets 23 for guiding the yarn around the cage beneath said flange to apply a tension thereto, and eyelets 53 for guiding the yarn to the cop, and the whirl attached to said cage, substantially as set forth.

11. The combination of the spindle, mechanism for lowering it, a tube inclosing it, the rotary cage inclosing the spindle, and a loose washer at the top of said tube, whereby on lowering the spindle said washer is arrested by the bottom of the cage and holds the cop while the spindle is lowered within it to loosen the cop, substantially as set forth.

12. The combination, with the spindles, of the ballooning-plate, a vertically-moving frame by which said plate is carried, and a lifting-gear for raising said frame in order to lift the ballooning-plate sufficiently to facilitate doffing, substantially as set forth.



387,862. PAPER HOLDER AND CUTTER. SYLVANUS D. LOCKE, Hoosick Falls, N. Y. Filed Mar. 24, 1888. Serial No. 268,389. (No model.)

Claim.—1. A roll-holder having sectional standards provided with friction faces or bearings and with means for clamping the same, and a rigidly-secured bar connecting the ends of the sections, substantially as specified.

2. A roll-holder having sectional standards, one section of each of which is provided with a shaft-receiving socket, a friction-face, and a hub, and the other of which is provided with a friction-face and adapted to swing or pivot upon the hub, and means, substantially as described, for clamping the sections together, substantially as specified.

3. A roll-holder provided with sectional standards, one section of each standard having an inwardly-projecting socket provided with a

387,862.

shaft-receiving opening, a friction bearing or face, and an outwardly-projecting hub, a square aperture therethrough, and each of the other sections of the standards having friction bearings or faces, a cross-bar carrying a cutter, and means for clamping the sections of the standards together, substantially as specified.

4. In a roll-holder, the combination of a base, standards adapted to support a roll-shaft, a rigidly-mounted cross-bar, and a knife fixed to the cross-bar and extending from standard to standard, substantially as specified.

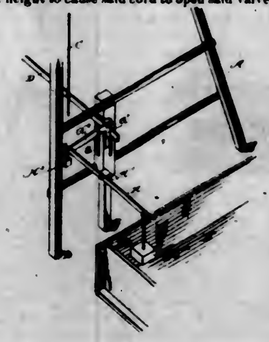
5. In a roll-holder, the combination of a base, sectional standards adapted to receive a roll-supporting shaft, a rigidly-mounted cross-bar, a knife rigidly secured to the cross-bar, and means for clamping the sections, substantially as specified.

6. In a roll holder and cutter, a base, standards adapted to receive a roll-supporting shaft, a cross-bar provided with a knife, and a guide, the surfaces of the guide and of the cross-bar being arranged to direct the leading end of the paper away from knife after each cut, substantially as specified.

7. In a roll-holder, a base, standards adapted to receive a roll-supporting shaft and to adjustably support a cross-bar, a knife fixed to the cross-bar, and a spring-pressed paper-guiding roller, substantially as specified.

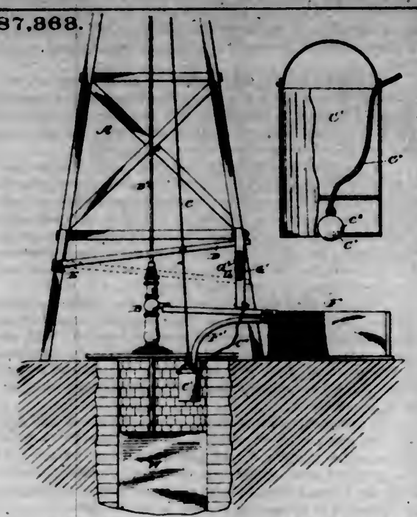
8. In a roll-holder, a base, sectional standards adapted to receive a roll-supporting shaft, a rigidly-mounted cross-bar, a knife fixed to the cross-bar, and a paper-guide arranged adjacent to the cross-bar, substantially as specified.

9. In a roll-holder, a base, standards terminating at their upper ends in longitudinal slotted sockets, bearing-blocks and springs arranged in the sockets, and a guide-roller mounted in the bearing-blocks, substantially as specified.



10. In a roll-holder, the combination of a recessed cross-bar and a spring-seated guide-roller, substantially as specified.

11. In a roll-holder, a base, standards provided with shaft-receiving sockets having openings, and a spring arranged to bear against the roll at a point substantially opposite the openings in the shaft-receiving sockets, substantially as specified.



12. The section B, provided with a shaft-receiving socket, B^2, having the opening B^3, and the guiding-rib B^{11}, substantially as specified.

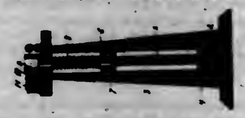
387,863. WINDMILL-REGULATOR. JOHN R. MILLER, Sterling, Ill. Filed Dec. 2, 1887. Serial No. 256,760. (No model.)

Claim.—1. The combination, with the windmill, of a bucket suspended from the wire or chain by which the mill may be drawn out of the wind, a passage for the delivery of overflow-water into said bucket, a valve in said bucket controlled by a cord secured to a support above at proper height to cause said cord to open said valve when the bucket

387,863.

has descended to its lower limit, an automatic locking device, substantially as described, for holding said bucket when it has reached its lowest limit, and a float for controlling said locking device, substantially as shown, and for the purposes specified.

2. The combination, with a windmill, of a wire, C, the drawing of which wire downwardly throws the wheel out of the wind, the bucket C', suspended from said wire, valve C^2, located in said bucket, cord C^3, arranged to open said valve when said bucket reaches its lower limit, bar D, secured to the wire C, bell-crank G, arranged to engage said bar when the latter has reached its lower limit, lever H, connected with said bell-crank, tank F, to receive water from the pump, the float H^2, suspended from the lever H into the tank F, and overflow-pipe F', leading to the bucket, substantially as shown, and for the purposes specified.



387,864. BOOK-CLIP. JOHN W. HOLAN, Chicago, Ill. Filed Jan. 26, 1888. Serial No. 261,914. (No model.)

Claim.—1. A book-clip consisting of a single wire bent so as to form a coil at each side of the book, a cross-rod and a cross-piece, U-shaped, which together clasp the cover of the book, and a cross-piece, U-shaped, which clamps the leaves of the book.

2. A book-clip consisting of a wire coil on each side of the book, with a cross-rod and two cross-pieces, U-shaped, of varying length, one of which clasps the outside of the back of the book, and the other with the rod engages the inside of the back of the book, as and for the purpose set forth.

387,865. ELECTRIC SWITCH-LOCK. EDWARD L. CROUTT, Somerville, Mass. Filed Feb. 9, 1887. Serial No. 227,041. (No model.)

Claim.—1. The combination, with a rail and a bar and a bolt for securing the same, of a lock for the bolt, a magnet for operating the lock to secure the bolt, a separate magnet to release the bolt, and a circuit-changer connected with and automatically operated by the lock, and a signal for the train controlled by the circuit-changer, substantially as described.

2. In a switch-lock, the combination, with the locking-bolt, of the releasing-magnet, the armature of which is provided with the locking-dog engaging the bolt, a locking-magnet the armature of which controls the locking-armature, a circuit-controller connected to the locking-armature, and a signal for the train controlled by the circuit-changer, substantially as described.

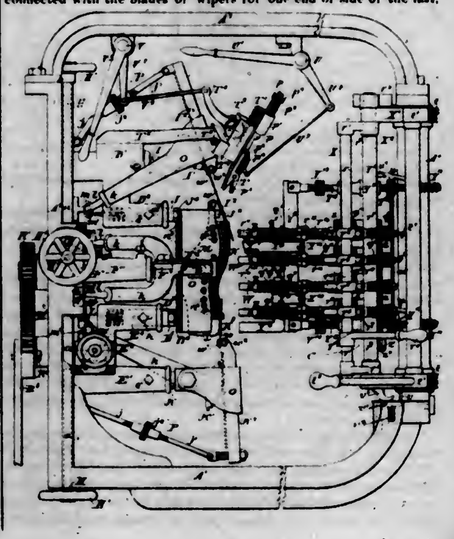
3. The combination, with the main conductors, of a series of locking devices in a single circuit, each of which is provided with a locking-magnet, a releasing-magnet, and a circuit-changer which switches the current past the lock after the same has operated, whereby the locks may be successively operated, substantially as described.

4. The combination, with the switch-rail, of a slide-bar, a sliding bolt, 5, which locks the slide-bar, a pivoted lever, 6, connected with the bolt 5 to move it, a lock securing the bolt, and electric means for controlling the lock from a distance, substantially as described.

5. The combination of a series of switches in a railroad-section, a lock for each switch, a locking-magnet for each lock, and a single circuit which operates all the locks in the section, substantially as described.

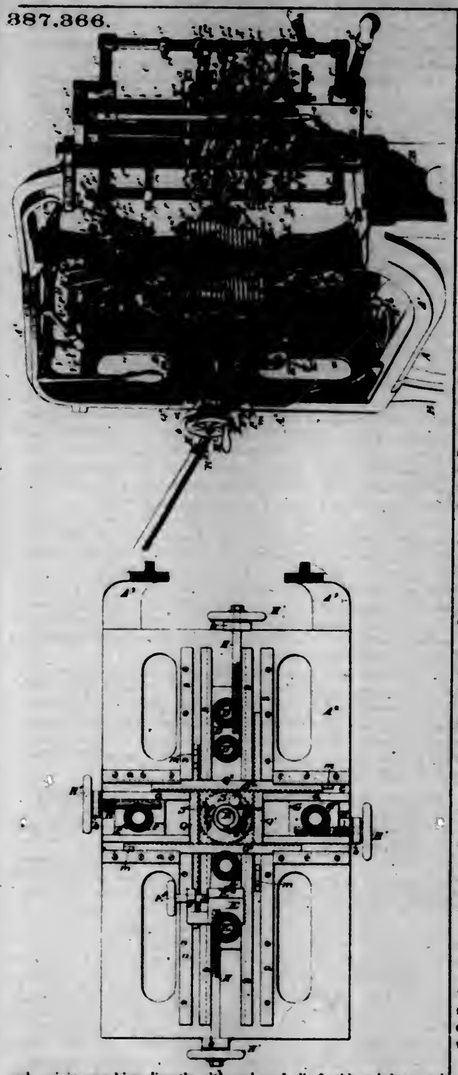
6. The combination of a series of switches in a railroad-section, a lock for each switch, a locking-magnet for each lock, a circuit which operates all the locks in the section, and a signal device operated by said current should any lock fail to operate, substantially as described.

7. The combination, with the conductors 12 and 13, one being broken at each switch, a switch-operating mechanism, a locking-magnet in a circuit including both said conductors on one side of the switch, and a locking-lever released by the locking-magnet and included in its circuit, and arranged, when moved, to break the circuit and to make electrical union of the parts of the conductor on opposite sides of the break at the switch, substantially as described.



8. The combination, with the conductors 12 and 13, broken at a switch, and a switch-operating mechanism, of a switch-lock-locking magnet, a circuit uniting conductors 12 and 13 and including the locking-magnet, a circuit uniting the parts of conductor 13 on opposite sides of the break, passing around the locking-magnet, and a circuit-controller carried by the switch-lock for shifting the circuit past the break as the lock operates, substantially as described.

9. The combination, with the conductors 12 and 13, broken at the switch, and a switch-operating mechanism, of a lock carried by the armature of a releasing-magnet, an insulated conducting-extension, 17, carried by said section, a connection between said extension and conductor 13 on one side of the break, contacts 19 and 25, between which extension 17 works as the lock is worked, a connection including a locking-magnet between contact 19 and conductor 12, and another connection between contact 25 and conductor 13 beyond the break, substantially as described.



10. In an electric railway-signal system, the combination of a series of switches in a railroad-section, a lock for each switch, a locking-magnet for each lock, a circuit which operates all the locks in the section in succession, a circuit-controller carried by the switch-locks to shift the current past the switches when they are locked, and releasing-magnets operated successively as the train passes the switches, substantially as described.

387,866. LASTING-MACHINE. SETH W. PAINE, Rochester, N. Y., HIRAM A. GRAY, New Haven, Conn., and CHARLES E. PINTER, Ilion, N. Y., assignors to William S. King, Minneapolis, Minn. Filed Nov. 12, 1887. Serial No. 254,907. (No model.)

Claim.—1. In a lasting-machine, the combination of a last, heel, toe, and side folding-blades or wipers, independent rack-bars each connected with the blades or wipers for one end or side of the last,

387,366.

and a pinion meshing directly with each and all of said rack-bars and serving to move them simultaneously and equally.

2. In combination with a last, heel, toe, and side folding-blades or wipers, toothed rack-bars for advancing and receding said blades or wipers, a pinion meshing with the several racks, a shaft carrying said pinion and provided with a second independent pinion, a pivoted sector meshing with said second pinion, and a hand-lever adjustably secured to the sector, whereby it may be set to suit different operators.

3. In a lasting-machine, the combination, with plate A^3, having ribs n, of rack-bars Q, Q', Q^2, and Q^3, mounted in or between said ribs and adapted to move longitudinally, the bars Q^2 and Q^3 being placed in a different plane from bars Q Q', and thus adapted to move across the same, heel, toe, and side folding-blades or wipers actuated by said rack-bars, and a last to support the work while being operated upon by the blades or wipers.

4. In a lasting-machine, the combination, with a last and supports therefor, of side, heel, and toe wipers or folding-blades, independent rack-bars for actuating the wipers or blades, the rack-bars being in different planes, and a pinion divided at right angles to its axis into parts or sections corresponding to the planes of the rack-bars and capable of rotation one independently of another, whereby movement or adjustment of the bar or bars meshing with a given section, and consequently of the wipers or folders actuated thereby, is permitted.

5. In a lasting-machine, the combination, with rack-bars, as Q and Q^2, placed in different planes, of an actuating-pinion therefor composed of sections S' S, meshing, respectively, with said bars, and a locking pin or device, substantially such as shown, whereby the sections of the pinion may be locked together or disconnected at will.

6. In combination with last-supports and a last, side, heel, and toe wipers or folders movable toward and from said last, toothed rack-bars carrying said wipers or folders, toothed sectors meshing with and serving to actuate said bars, a second set of toothed rack-bars, a pinion meshing with the several bars of the second series, and telescopic rods connecting the racks of the second series and the toothed sectors, whereby a rotation of the pinion is caused to move the two series of racks and to advance or recede the wipers.

7. In combination with a last and its support, a folder or wiper, a rack-bar carrying said folder or wiper, a toothed sector meshing with said rack-bar and serving to advance and recede the same, and a cap or guard pivoted concentrically with the sector and extending over the outer face of the rack-bar, whereby it is adapted to hold the rack and sector in engagement and yet to permit a rocking or tipping motion of the rack.

8. In combination with side jaws provided with wipers or folding-blades, end wipers or blades extending beneath guides carried by the side jaws, a bar carrying the end wipers, and a joint connecting the end wipers with their carrying-bar, constructed substantially as described and shown, whereby the end wipers are enabled to accommodate themselves to the varying positions of the side jaws.

9. In a lasting-machine, the combination, with a work-holder, of a longitudinally-movable bar, wipers or folding-blades w, pivotally attached to said bar and of varying width between their pivoted and free ends, and guides or supports against which the outer faces of the blades bear as the bar moves forward or backward, whereby the blades are caused to approach each other at a variable rate as different portions of their edges come into contact with the guides or supports.

10. In a lasting-machine, folding blades or wipers having their inner edges formed with closely-adjoining notches or serrations, substantially as described and shown, whereby they are adapted to gather the leather of the upper and to distribute the fullness evenly.

11. In combination with a last, folding-blades or wipers movable inward over the face of the last and provided on their inner edges and their lower faces with serrations, whereby they are adapted to take firm hold upon the upper and to fold it over upon the last or upon an insole thereon.

12. The combination, in a lasting-machine, of side jaws provided with folding-blades or wipers and with guides, as n^{10}, heel and toe wipers or folding-blades w, extending into said guides and having their outer edges made of cam shape or out of parallel with their inner edges, and reciprocating bars carrying the heel, toe, and side wipers or folders, whereby the closing together of the side jaws and the approach of the heel and toe jaws are caused to act conjointly to close the end wipers together.

13. In a lasting-machine, the combination, with guides, as n^{10}, of folding-blades or wipers w, and a spring acting upon said blades and tending to spread them apart.

14. In combination with a work-support and a wiper or folder movable to and from the same, a bar carrying said wiper or folder, a sector serving to support and move said bar, and a link pivoted at one end to a fixed support and at its other end to the bar, whereby the wiper is sustained and caused to move in a prescribed path.

15. In combination with a work support or last, a wiper or folder movable toward and from the same, a bar carrying said folder, and a link, P, pivoted at one end to a fixed support and at the other end to the wiper-carrying bar, said link being made in two parts capable of adjustment one toward or from the other, whereby the link may be shortened or lengthened and the plane or line of travel of the bar and wiper varied.

16. In a lasting-machine, in combination with a rack-bar, a sector serving to support and reciprocate the same, a link pivoted at one end to a fixed support, a bolt pivotally connected at the other end of said link and having a shifting connection with the rack-bar, and a spring interposed between the shoulder of the bolt and the rack-bar, whereby the latter is permitted to yield independently of the link.

17. In a lasting-machine, in combination with a rack-bar and a sector serving to support and reciprocate the same, a link having one end pivoted to a fixed support and the other end attached to the rack-bar by a yielding connection.

18. In a lasting-machine, the combination of a supporting-frame provided with guides, blocks mounted and movable in said guides, a supplemental block mounted upon one of said main blocks and movable transversely across the same, and posts provided, respectively, with heel and toe supports for a last, one of said posts being carried by one of the main blocks and the other by the supplemental block mounted upon the other main block.

19. In a lasting-machine, the combination, with a stationary bed or frame, a last, and folders or stretchers movable toward and from said last, of a last-support movable transversely to the length of the last, a block carrying said support, and an adjusting-screw for moving said support, whereby the last may be brought into proper relation to the folders or stretchers.

20. In a lasting-machine, the combination of a last, folding or stretching devices movable toward and from the last, a downhold to bear upon the last or upon the insole carried thereby, and a yielding support for the last, consisting of a tubular post, a spring placed within said post, a rod or stem movable within said post and bearing at its inner end upon the spring, and a stop-pin or screw to limit the longitudinal movement of the rod or stem.

21. In a lasting-machine, the combination of a downhold and a last-support consisting of a post, a two-part rod or stem movable longitudinally in said post and one part longitudinally movable in relation to the other, a spring bearing against the inner end of the two-part stem, and a stop-pin or screw serving to limit the movement of the two-part stem.

22. In a lasting-machine, a last-support consisting of a tubular post, an internally-threaded sleeve movable within said support, a stop to limit the movement of said sleeve, a spring bearing against the inner end of the sleeve and tending to force the same outward, and a threaded stem screwed into the sleeve, substantially as described and shown, whereby the threaded stem may be screwed in or out to vary its projection without affecting the compression of the spring or the play of the sleeve.

23. In combination with a last and supports therefor adapted to hold the last with its sole in a vertical plane, a frame provided with stretching devices to act upon an upper carried by the last, said frame being arranged to swing in a horizontal plane into and out of alignment with the last.

24. In a lasting-machine, the combination of a last, a frame adapted to swing laterally in reference thereto, and a sash or sliding frame movable within the swinging frame and carrying pinchers or stretching devices to act upon an upper carried by the last.

25. In combination with a last or work support, a laterally-swinging frame in front thereof, a sash or frame mounted in said swinging frame and movable toward and from the last, a catch or locking bolt adapted to lock the swinging frame against lateral movement, and a toe or trip carried by the sliding sash and serving to force back the catch and unlock the swinging frame when the sash moves back to a prescribed point.

26. In a lasting-machine, the combination of a stem or stock, g^2, two lever-jaws, g g, independently pivoted thereto and each provided with a stud or pin, g^3, and double yoke or lever g^4, pivoted to stock g^2 and provided with slots g^5, the pins g^3 being extended into said slots.

27. In combination with a stock or stem and jaws independently pivoted thereto and provided with studs or pins, a yoke or lever pivoted to the stock and having slots on opposite sides of the pivot, the slots being concentric at their inner ends with the pivot of the lever or yoke and eccentric thereto elsewhere in their length, and the pins of the lever-jaws being extended into said slots, substantially as set forth.

28. In combination with a supporting block or sleeve, an internally-threaded pinchers-stock free to slide but held against rotation therein, a threaded stem passing through the rear end of the block or sleeve, screwed into the rear end of the pinchers-stock, and having a shoulder or enlargement bearing against a shoulder therein, a spring encircling the stem in rear of the sleeve or block, and a nut screwed upon the rod in rear of the spring.

29. In combination with sleeve g^{12}, a stock, g^2, arranged to slide longitudinally therein, shouldered rod g^9, extending through the sleeve, screwing into the stock g^2, and projecting through the rear end of the sleeve, spring g^{11}, encircling said rod, and nut g^{10}, applied to the rear end of the rod and adjustable thereon.

30. The combination, in a lasting-machine, of a series of pinchers provided with yokes or levers for opening and closing them, a bar or frame movable toward and from said pinchers, and connecting-rods extending from said bar or frame to the yokes or levers, whereby all the pinchers may be opened or closed in unison by a single movement of the bar or frame.

31. In a lasting-machine, the combination, with two groups of pinchers arranged at opposite sides of the last, each pincher being furnished with a yoke or lever for opening and closing its jaws, two swinging frames connected by toothed sectors or gearing and adapted to move in unison toward or from an intermediate point, and rods extending from each yoke or lever to the swinging frame at its side, whereby all the pinchers are simultaneously opened or closed by the application of force to one of said frames.

32. In combination with pinchers, as W, provided with yoke or lever g^4, rod or bar r, movable toward and from said pinchers, sleeve r^4, encircling said rod, a spring carried by the collar and bearing upon the rod, and a link or rod extending from collar r^5 to the lever g^4, the spring serving to hold the collar at any desired adjustment upon rod r.

33. In combination with pinchers W and their yoke or lever g^4, swinging frame X, provided with collar r^5, and rod r^6, extending from a pivoted block carried by the yoke or lever to the collar and adapted to be screwed into or out of either or both to shorten or lengthen the distance between the two.

34. In combination with a last or work support, a sliding sash or frame in front thereof, pinchers carried by said frame, a downhold-carrier mounted in said sash or frame and capable of motion toward and from the last independently of the sash, and a locking dog or catch adapted to engage with the downhold-carrier when it is advanced to bear upon the last or insole and to hold it against recession with the sash.

35. In combination with a last or work support, a sliding sash in front thereof provided with a series of pinchers and movable toward and from the last, a downhold-carrier mounted and arranged to slide a limited distance in and independently of the sash, adjustable stops to limit the independent movement of the downhold-carrier, and a dog or catch to hold said carrier in its forward position while the pinchers are receded.

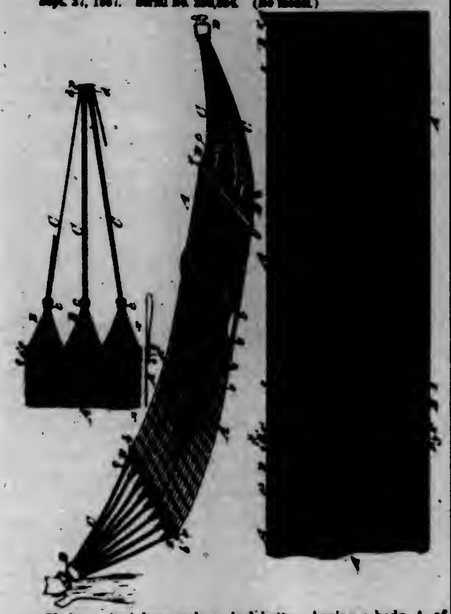
36. In combination with a last or work support, sliding sash X^1, provided with toothed rack-bars, toothed sectors meshing with said bars and serving to advance and recede the sash, rods Y^4 and Y^5, carrying a downhold-bar and movable back and forth in the sash, nuts Y^{13} and Y^{14}, applied to said rods and serving to control their movements forward and backward, springs Y^{15}, applied to said rods and tending to recede the downhold-bar, and locking-dogs u, adapted to engage the nuts Y^{14} when the downhold is advanced and to hold the same forward against the force of the springs.

37. In combination with sliding sash X^1, provided with finger u^2, downhold-bar Y^3, and its carrying-rods Y^4 Y^5, movable within or relatively to said sash and provided with retracting-springs, pivoted dog u, adapted to engage against a rest or shoulder upon one of said rods, the finger u^2 and dog u being arranged to ride one beneath the other, substantially as explained, whereby the dog is automatically lifted and the springs permitted to retract the downhold when the sash is moved back a given distance.

38. In combination with a last or work support, a guide-bar in front thereof, a series of cross-arms movable in said guide-bar, pinchers carried by said cross-arms, a system of crossed levers connected at their points of crossing with the cross-arms and at their ends with each other, and a screw or equivalent device for drawing the free ends of one pair of levers together or moving them apart, whereby the entire series of levers may be caused to move in unison and to move the cross-arms and their pinchers toward or from each other.

39. In combination with slotted bar T' and cross-arms s, carrying pinchers, crossed levers Z, connected at their points of crossing with the shanks of the cross-arms s and pivotally connected at their ends, and screw rod or stem Z^9, extending from one lever to another and serving to draw them together or force them apart.

40. In a lasting-machine, a side jaw comprising a head, M, a slotted plate, M', a series of wipers or folders, N, each consisting of a shank, n', and a blade, n^2, adjusting-screws n^3, swiveled in the slots of plate M' and screwing into the shanks of the wipers, a yielding plate, M^3, overlying the shanks of the wipers, and screws n^4, bearing against the shanks of the outer wipers of the series.



41. In a lasting-machine, a side jaw having a series of independently-adjustable wiper-blades or folders, and a flexible rod or wire passing through the shanks of the several wipers or folders, substantially as and for the purpose specified.

42. In combination with head M and slotted plate M', wipers or folding-blades N, resting with their backs against the face of head M, adjusting-screws n^3, swiveled in plate M and screwing into the shanks of the wipers or folders, plate M^3, extending over the front faces of the blade or wiper-shanks, bolts n^4, passing through said plate and the head M, and springs encircling the bolts and tending to hold the plate M^3 against the shanks of the wipers.

43. In a lasting-machine, the combination of a toothed rack carrying a wiper or folder, a toothed sector meshing with and serving to actuate said rack, a second rack for imparting motion to said sector, provided with a slotted lug, as m, and a bolt passing through said slot and into the lever-arm of the sector, whereby the sector and the rack which it operates may be adjusted without moving the actuating-rack.

44. In a lasting-machine, the combination of a last, heel and toe jaws or wipers, and side jaws or wipers, the side wipers being made up of independently-yielding blades or sections in immediate contact with each other, and the heel and toe jaws being extended across the side wipers, whereby an unbroken but yielding line of folders or wipers is formed entirely around the last.

387,367. HAMMOCK. Isaac B. Palmer, Middletown, Conn. Filed Sept. 27, 1887. Serial No. 250,254. (No model.)

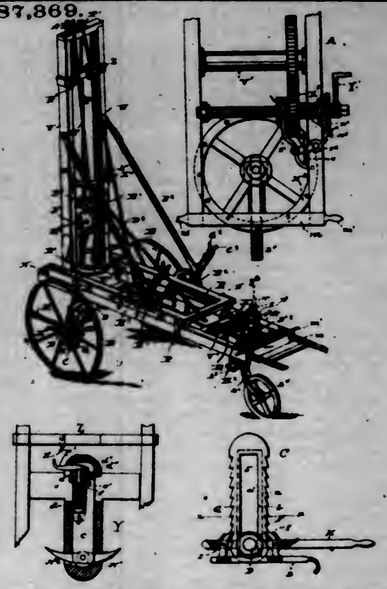
Claim.—1. A hammock or bed bottom having a body, A, of woven fabric, a strip, A', unconnected to the body by weaving, but secured across the end of the body by sewing or the like, and warp-threads extending in the form of suspension-loops between the strip and body, substantially as specified.

2. The combination, with the hammock, of a back or seat support, as E, extending across the hammock about midway between its head and foot and secured thereto, substantially as herein described.

387,368. ASBESTOS-FACED FELT. James L. Reed, Brooklyn, assignor of five-sixths to De Long & French, New York, N. Y. Filed Feb. 21, 1888. Serial No. 264,748. (No specimens.)

Claim.—1. As a new article of manufacture, boiler-covering consisting of hair-felt having a face of asbestus pressed therein and forming a part thereof, substantially as shown and described.

2. Hair-felt having a face of asbestus pressed therein, the said asbestus face being corrugated, ribbed, or scored, substantially as shown and described.



3. The combination, with hair-felt, of a fire-proof flexible face worked into the felt, and corrugated, ribbed, or scored, substantially as and for the uses and purpose shown and described.

387,369. POST-DRIVING MACHINE. Hiram F. Sharp, Mineral Point, Wis. Filed Mar. 1, 1888. Serial No. 265,966. (No model.)

Claim.—1. The combination, with the bolster, of the hangers secured thereto, consisting of the block slotted longitudinally, the longitudinal recess, and the detent-teeth on the opposite edges, the lever, the pawls, and the spindle having the rectangular head and the shouldered portion, substantially as specified.

2. The trip-head adapted to slide on the ways, having the slide bifurcated at its lower end, the levers pivoted therein and adapted to project laterally through slots, the short side *d*, pivoted to the offset *d'* and extending upwardly, the laterally-projecting slotted head *d'*, the pawl pivoted to the extended portion of the short side, the spring-controlled block, the transverse notches, and the pin, substantially as specified.

387,369.

3. The cross-head having the pawl R' pivoted near its heel therein, the said pawl having the rounded side and the point to engage the hook end of the pawl P', substantially as specified.

4. The combination, with the vertical pivoted frame having the projecting guideways, of the semicircular post-holder adapted to slide on said ways, the pivoted retaining-bar, the locking-pin, the extension *c'*, having lugs D', the depending bracket, the upright having the flanged edges, the braces securing said upright to the vertical frame, the counter-weight, the connecting-cord, and the pulley, substantially as specified.

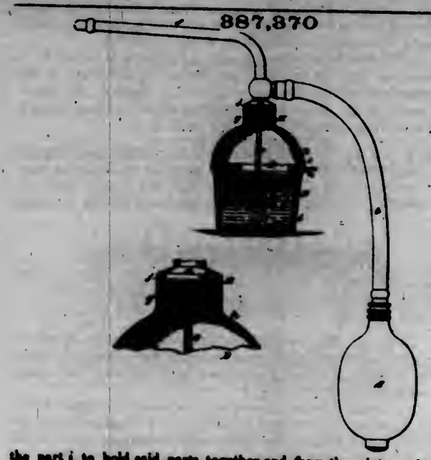
5. The combination, with the rectangular frame A, of the windlass having the gear-wheel, the loose gear adapted to engage said gear-wheel, the gear-wheel shaft having the crank and the ratchet-wheel on its outer end, the arm having the collar-connection with the gear X', pivoted to the frame and having the curved projecting end, the pivoted hand-lever, and the spring bearing upon the gear X', substantially as specified.

6. The combination, with the frame A, of the wheel H^3, secured thereto, the wheel L^2, turning on the wheel H^3, the pivot-arm *y*, the standard fulcrumed on the pivot-arm, the integral bifurcated segment, the adjusting-pins, and the bearing-wheel, substantially as specified.

7. The combination, with the rectangular frame A and the bearing-wheel, of the pivot-arm *y*, the curved standard, the bifurcated segment thereon provided with adjusting-apertures, and the holding-pins, substantially as specified.

8. The combination of the hammer having the opposite longitudinal recesses and the diverging slotted arms secured to the upper end of said hammer, substantially as specified.

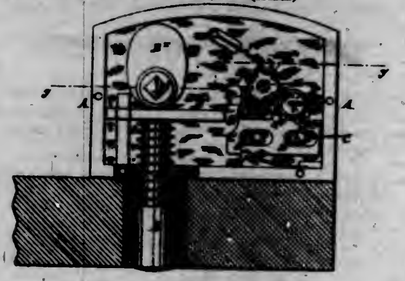
387,370. ATOMIZER. Augustus D. Shelmerdine, College Point, assignor to the India Rubber Comb Company, New York, N. Y. Filed Jan. 31, 1888. Serial No. 262,862. (Model.)



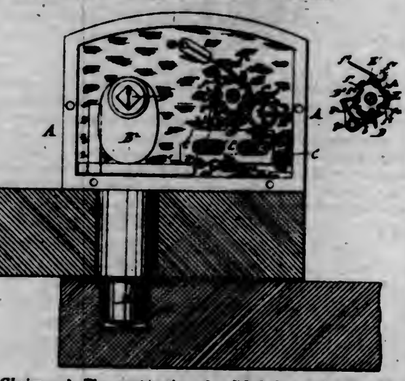
Claim.—1. The liquid-reservoir D, consisting of the expansible top *h*, having a single neck, *g*, for the ingress and egress of liquid to the reservoir, and the rigid base *i*, for containing the liquid, and to which the expansible top *h* is immovably secured, combined with the rigid ring E in said neck *g*, substantially as herein shown and described.

2. In an atomizer, the rigid base *i* and expansible top *h*, immovably secured thereto, said parts forming a liquid-reservoir, said expansible top *h* having a single neck, *g*, for the ingress and egress of liquid to the reservoir, and a rigid ring, E, in said neck *g*, combined with the pipe *f*, having the enlargement *d*, that fits the ring E securely, pipe *b*, and bulb A, all arranged substantially as herein shown and described.

3. The soft-rubber neck or pipe *g*, having inwardly-extending flange *j*, combined and intimately united into a substantially homogeneous mass with the hard-rubber socket E, substantially as described.



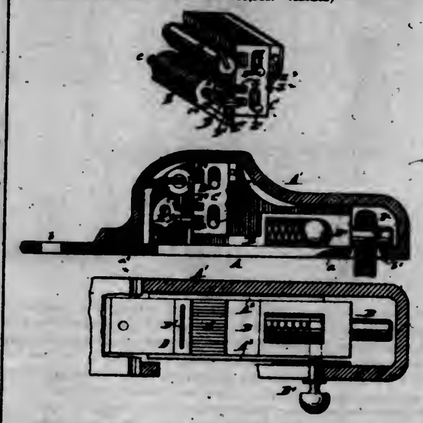
4. In an expansible liquid-reservoir, the rigid vessel *i*, combined with the expansive top *h* and hard-rubber ring *n*, that is shrunk upon



387,370

the part *i*, to hold said parts together and form them into a single vessel, substantially as herein shown and described.

387,371. LOCK FOR FREIGHT-CARS. Reuben C. Smith, New York, N. Y., assignor of one-fifth to Charles F. Frothingham, same place. Filed Feb. 3, 1888. Serial No. 262,878. (Model.)



Claim.—1. The combination of a slide-bolt, a series of guided and spring-locked tumblers, a series of recessed and centrally-pivoted cams, a recessed and centrally-pivoted auxiliary cam, oscillating and spring-actuated locking-bars applied to a common spindle, a pivoted and longitudinally-recessed key-cylinder, and a key having projecting wards adapted to engage the tumblers and cams, substantially as set forth.

2. The combination of a series of guided and spring-locked tumblers having recesses and projections, a series of recessed and centrally-pivoted cams, a recessed auxiliary cam pivoted to the same spindle as the series of cams, spring-actuated locking-bars applied to a common spindle and adapted to engage the recesses of the cams, a pivoted and longitudinally-recessed key-cylinder, and a key having projecting wards adapted to engage the tumblers and cams for actuating some of the same, substantially as set forth.

3. The combination of a series of guided and spring-locked tumblers having projections, a series of centrally-pivoted cams having two sets of recesses, a centrally-pivoted auxiliary cam having recesses, and two oscillating and spring-actuated locking-bars applied to a common spindle, one of said locking-bars being adapted to engage the recesses of all the cams, while the second T-shaped locking-bar is adapted to engage the series of cams and the projections of the tumblers, substantially as set forth.

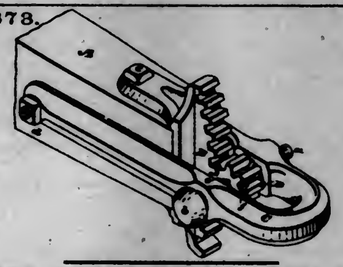
4. The combination of a series of recessed and centrally-pivoted cams, a recessed auxiliary cam applied to the pivot-pin of said cam, a spring-actuated locking-bar engaging the recesses of the auxiliary and other cams, and a second spring-actuated locking-bar engaging the recesses of the series of cams, substantially as set forth.

387,372. LOCK. Reuben C. Smith, New York, N. Y., assignor of one-fifth to C. F. Frothingham, same place. Filed July 6, 1887. Renewed Feb. 9, 1888. Serial No. 263,605. (Model.)

Claim.—1. The combination of a slide-bolt, a series of guided and spring-locked tumblers back of the same, a spring-actuated locking-bar engaging recesses of the tumblers, a series of pivoted cams for actuating the locking-bar, a pivoted and longitudinally-recessed key-cylinder, and a key having projecting wards, said wards being adapted to engage the tumblers and cams for actuating some of the same, substantially as set forth.

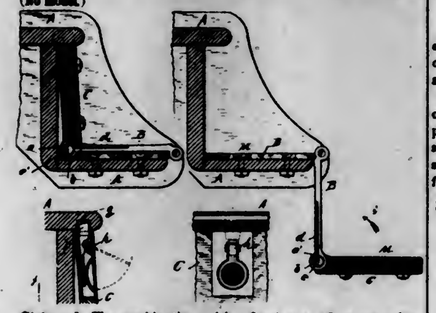
2. The combination of a slide-bolt, a series of guided and spring-locked tumblers back of the same, a spring-actuated locking-bar engaging recesses of said tumblers, a series of pivoted cams provided with projections and eccentric portions and concave portions, a pivoted and longitudinally-recessed key-cylinder, and a key having wards projecting from said key-cylinder and adapted to engage recesses of the tumblers, and the projections of the cams for moving some of the tumblers and setting the locking-bar into recesses of the same, substantially as set forth.

3. The combination of an inclosing-casing, a base-plate having side plates attached to said casing, a slide-bolt guided by said side plates, a series of guided and spring-locked tumblers at the inner end of the slide-bolt, a spring-actuated locking-plate engaging recesses of the tumblers, a series of pivoted cams having projections, eccentric portions, and concave portions, a pivoted and longitudinally-recessed key-cylinder, and a key having wards projecting beyond the key-cylinder and engaging recesses of the tumblers and the projections of the cams, substantially as set forth.



4. The combination of a slide-bolt, a series of guided and spring-locked tumblers, a spring-actuated locking-bar engaging recesses of said tumblers, and a series of cams having eccentric and concave portions, said cams moving the locking-bar into recesses of the tumblers, so as to lock the latter in position, substantially as set forth.

387,373. PLOW-CLEVIS. Henry M. Smith, Canton, Ohio. Filed Jan. 24, 1888. Serial No. 261,797. (No model.)



Claim.—1. The combination of the beam A, provided with the crown-head B, the draft-link C carrying the cross-bolt *a*, the pinions D and E, and the spring *c*, and means for locking said pinions, substantially as and for the purpose specified.

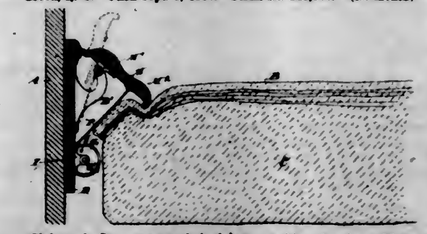
2. The beam A, provided with the crown-head B, the draft-link C, pivotally attached to said beam and carrying the cross-bolt *a*, and the pinions D and E, substantially as and for the purpose specified.

387,373.

387,374. EXTENSION-STEP FOR RAILWAY-CARS. Joseph Sellathow, Paterson, N. J. Filed May 26, 1888. Serial No. 275,315. (No model.)

Claim.—1. The combination, with a fixed step, of an extension-step, hinged straps applied to the fixed step and pivoted to the extension-step, and locking devices for retaining the extension-step at right angles to the hinged straps, substantially as set forth.

2. The combination, with a fixed step, of supporting-straps hinged to the fixed step, an extension-step in socket-bearings of the supporting-straps, so as to swing axially between said straps, and a locking device for retaining the extension-step when folded up against the riser of the fixed step, substantially as set forth.



3. The combination, with a fixed step, of supporting-straps hinged to the fixed step, an extension-step pivoted in socket-bearings of said straps, and a slide-bolt applied to the extension-step and provided with an operating-lever having a handle, which handle also serves for taking hold of and swinging the extension-step into folded or lowered position, substantially as set forth.

4. The combination, with a fixed step, of an extension-step, hinged straps applied to the fixed step and pivoted to the extension-step, and locking-springs secured on the hinged straps and adapted to engage notches or recesses on the pivots of the extension-step, substantially as shown and described.

387,375. PRESERVING WOOD. George Speil, Dutch Kills, N. Y. Filed Apr. 14, 1883. Serial No. 270,602. (No specimens.)

Claim.—The herein-described process of preserving wood—that is to say, subjecting the same to a hot bath consisting of water, sulphur, and mercury, in about the proportions specified, and as set forth.

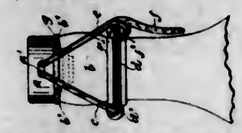
387,376. BEDCLOTHES-HOLDER. Hiram W. Stetson, Black Brook, N. Y. Filed Sept. 3, 1887. Serial No. 248,677. (No model.)

Claim.—1. In an automatic bedclothes-holder, the clamp M, turning on centers M' at the proper height above the bed, in combination with the band P, connected at one end to said clamp, and a spring, K, connected to the other end of said band and exerting a tension on one side or the other of the axis M', according as the clamp is elevated or depressed, so as to hold the clamp forcibly downward and also forcibly upward, as required, all substantially as herein specified.

2. In a bedclothes-holder, the clamp M, turning on centers M', in combination with the band P, pulley G, shaft G', and helical spring K, adapted to hold the clamp either elevated or depressed, and adjusting means, as the slots *d* and screws E, to adjust the clamp upward and downward, substantially as herein specified.

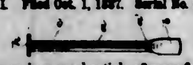
387,377. TOOTHED ROLLER FOR MACHINERY FOR OPENING, &c., FIBROUS SUBSTANCES. Ella Stubs and Eli Wilkinson, Huddersfield, County of York, England. Filed July 5, 1887. Serial No. 243,232. (No model.) Patented in England Sept. 28, 1886, No. 12,602.

Claim.—1. The combination of a roller having a grooved periphery with a series of serrated troughs entering said groove, and a strip of metal entering said troughs and fastened to the roller, substantially as set forth.



2. The combination of a roller having a grooved periphery, a strip of metal wound in the grooves thereof and projecting beyond the periphery of said roller, a serrated trough inserted between said metal strips, and a strip of metal placed within said trough and holding the same in position on the periphery of the roller, substantially as set forth.

387,378. PEN-HOLDER. William A. Taylor, Brooklyn, N. Y. Filed June 10, 1886. Renewed May 25, 1888. Serial No. 275,077. (No model.)

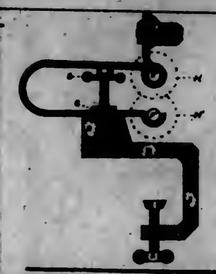


Claim.—In a pen-holder provided with a soft-rubber casing, a rigid core having at one end a socket, in combination with an elastic plug in said socket and adapted to form with said core a support for a pen, substantially described.

387,379. BOTTLE-STOPPER. Thomas Terrell, New Court Temple, County of Middlesex, England. Filed Oct. 22, 1887. Serial No. 252,867. (No model.)

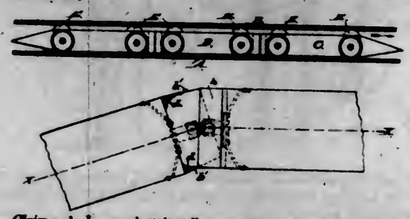
Claim.—The combination of a bottle-neck having a recess or channel at one side thereof, a collar surrounding the neck, a stopper, a connecting-link hinged to said stopper and collar at its opposite ends, a loop hinged at its upper end to said stopper at a point opposite the hinge of the link, and a lever-arm hinged at one end to said collar and adapted to swing in said recess and engage said loop, said lever having a nook on its inner face when in its normal closed position, substantially as described.

387,380. FLAT-POINTED NAIL OR TACK. James F. Thayer, Providence, R. I. Filed Oct. 1, 1887. Serial No. 251,162. (No model.)



Claim.—1. As an improved article of manufacture, a nail or tack having a flattened point or entering end portion somewhat wider than the normal size of the shank portion of the nail, the same extending rearwardly up to its intersection with the shank and being substantially uniform in thickness and width.

2. A nail of the class hereinbefore described, the same consisting of a head, a roughened shank portion adjacent to the head, and a flattened point portion substantially of a uniform thickness and whose width exceeds that of the unflattened portion of the nail's shank, substantially as shown and set forth.



387,381. HEAT-TENDERER. Henry R. Vollmar, Oswego, assignor of one-half to James Hallowell Lynch, Wichita, Kans. Filed July 12, 1887. Serial No. 244,117. (No model.)

Claim.—The combination, in a rotary meat-tenderer, of the diamond-toothed rollers H H', base-plate B, spring A, adjusting and clamping screw D, nuts C and E, overhanging arm T, swinging front bearing, Y, and slotted plate P, substantially as set forth.

387,381.

387,382. ELECTRIC-RAILWAY SYSTEM. David G. Weems, Baltimore, Md., assignor to the Electro-Automatic Transit Company of Baltimore City, same place. Filed Mar. 28, 1888. Serial No. 267,902. (No model.)

Claim.—1. In an electric-railway system for mail or parcels, a series of cars having ends adapted to telescope with each other, whereby the train presents a practically unbroken surface.

2. In an electric-railway system for transporting mail and packages, an electric motor and a series of cars connected therewith, said cars having open ends adapted to enter or telescope with the adjacent ends of contiguous front cars.

3. In an electric-railway system, a motor and a series of succeeding cars adapted for mail and small packages, said cars having one or both ends provided with compressible end wings, whereby the meeting end of one car may enter or telescope with the ends of contiguous front cars.

4. In an electric-railway system for mail and parcels, a car of approximately uniform diameter throughout provided at its end with pivoted wings, whereby said end may be compressed to enter the end of a contiguous car, and cushions behind the wings resisting their inward movement.

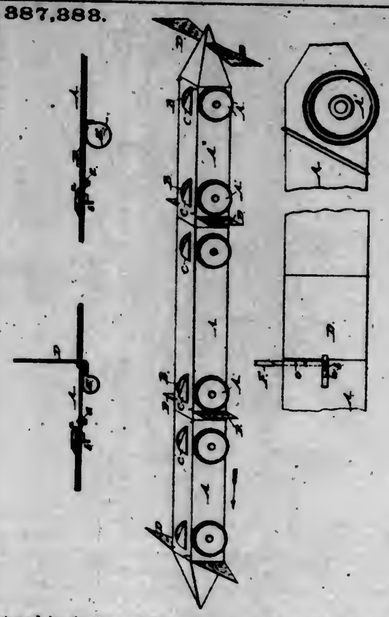
5. In an electric-railway system for mail and parcels, a locomotive having a pointed front end filled with non-heat-conducting packing.

6. In an electric-railway system for mail and parcels, a locomotive having a pointed front end and open rear end, in combination with cars having compressible ends adapted to telescope with the open end of the locomotive and with each other.

7. In an electric-railway system for mail and parcels, a locomotive, and telescoping cars having coupling devices, in combination with wings or doors by which access may be had to said devices.

8. In an electric-railway system for mail and parcels having an upper guide-rail and lower bearing-rails, a locomotive and succeeding cars having guide-wheels, and suitable housings inclosing the front faces of said wheels.

387,383. ELECTRIC-RAILWAY SYSTEM. David G. Weems, Baltimore, Md., assignor to the Electro-Automatic Transit Company of Baltimore City, same place. Filed Apr. 30, 1888. Serial No. 271,269. (No model.)



Claim.—1. In an electric-railway system for transporting mail, express-packages, &c., a train or series of cars provided with folding or collapsible wings adapted to be automatically thrown out laterally to resist the movement of the train.

2. In an electric-railway system, a series of cars provided with pivoted wings, automatic holding devices, and pivoted levers, in combination with fixed stops on the road adapted to engage said levers and release the holding devices, whereby the wings may be thrown outward by the action of the air.

3. In an electric-railway system, the combination, with fixed stops on the line of road, of one or more cars having pivoted wings and trip-levers, and plungers for automatically engaging the wings and holding them in a closed position.

4. In an electric-railway system, the combination, with fixed stops on the line of road, and a train of cars having wings adapted to be released by said stops and intermediate devices, and to be thrown

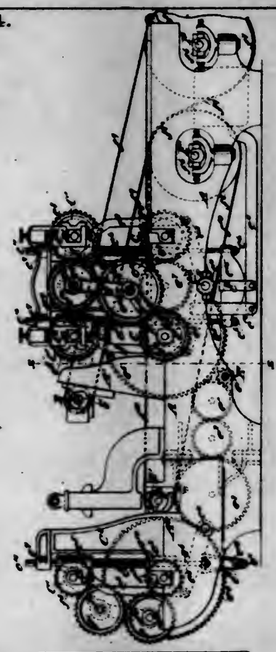
387,383.

outward by the force of the air, of a yielding cushion beneath the wings adapted to effect a preliminary outward movement of the wings.

5. The cars having the wings adapted to be automatically released and thrown outward, and a spring or device adapted to exert a pressure in opposition to the force of air and to automatically close the wings when the train lessens its speed.

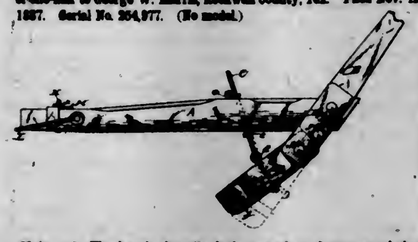
6. An improved electric-railway system, comprising fixed stops on the line of road, cars having wings adapted to be thrown outward by said stops and intermediate levers and plungers, yielding cushions adapted to effect a preliminary movement of the wings, and springs for automatically closing the wings when the train lessens its speed.

387,384. WOOD-PLANING MACHINE. James F. Wilde, Brooklyn, N. Y., assignor to the Glen Cove Machine Company, (Limited,) same place. Filed Jan. 27, 1888. Serial No. 262,169. (No model.)



Claim.—1. The combination, in a wood-planing machine, of a main frame supporting the upper cutter-head and feed-rolls, a lower cutter-head, and a supplemental frame carrying the lower cutter-head and hinged to the main frame at one side thereof, so that it may be swung laterally to expose the lower cutter-head, substantially as herein described.

2. The combination, with a main frame supporting an upper cutter-head and feed-rolls, of a lower cutter-head, a supplemental frame carrying the lower cutter-head and hinged to the main frame at one side thereof, a pair of delivery-rolls carried by the supplemental frame, and gear-wheels whereby they are driven from a shaft upon the main frame, the hinges of the supplemental frame being concentric or in line with the pitch-line of two of such wheels which are in engagement, whereby such wheels are not disengaged, even when the supplemental frame is swung laterally aside, substantially as herein described.



3. The combination, with a main frame supporting an upper cutter-head and feed-rolls, of a lower cutter-head, and a supplemental frame supporting the lower cutter-head and hinged to the main frame at one side thereof, so that it may be swung laterally to expose the lower cutter-head, a presser above the lower cutter-head, and a frame wherein the presser is adjustable vertically, and which is supported by the main frame, so that when the supplemental frame is swung laterally the lower cutter-head is carried from below its presser, substantially as herein described.

4. The combination, with a main frame and an upper cutter-head and feed-rolls supported thereby, of the supplemental frame A^2, hinged at *a'* to the main frame on one side thereof, and having a rest or support at A^3 upon the main frame on the other side thereof, and the lower cutter-head, B', supported in said supplemental frame, substantially as herein described.

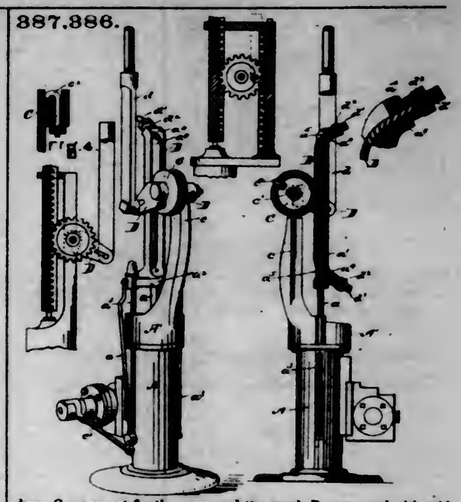
387,384.

387,385. PLOW. GEORGE W. WHATLEY, Dallas County, assignor of one-half to George W. Morris, Rockwall County, Tex. Filed Nov. 12, 1887. Serial No. 254,977. (No model.)

Claim.—1. The herein-described plow stock or frame, consisting of the beam A, having an oblique perforation formed therein, the standard B, the brace-plates E E, secured to the beam, standard, and foot, the adjustable foot D, hinged to said brace-plates, the eyebolt *d*, secured to said foot, the brace-rod C, passing obliquely through the beam and having its lower end linked or hinged to eyebolt *d*, and means, substantially as described, for securing said rod in its adjusted position, substantially as and for the purposes set forth.

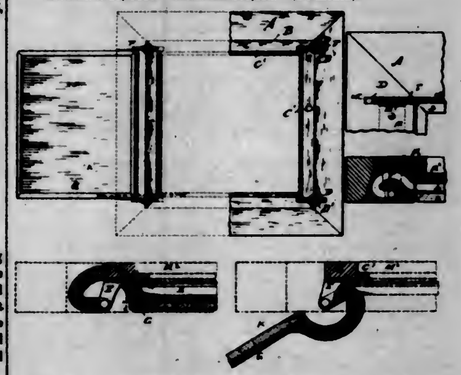
2. In combination with a clevis, the adjustable clevis-support adapted to be fitted to a plow-beam and consisting of the slotted saddle H, having stirrups *h' h'*, and bolt K and adjusting-nut *k*.

3. A detachable clevis-support consisting of a slotted saddle, H, provided with stirrups *h' h'*, adapted to be adjusted forward or backward upon a plow-beam and clamped in position by a bolt, K, and nut *k*, substantially as shown and described.



387,386. DEVICE FOR CONNECTING MOTORS TO ORGANS. FRANK R. WHITNEY, Melrose, Mass. Filed Sept. 6, 1887. Serial No. 249,099. (No model.)

Claim.—1. The combination, in an apparatus for operating organ-bellows, of a motor, a reciprocating head or bar operated by said motor, and a crank connected with said bar and operated thereby to travel from its lowest to its highest position and reverse coincidently with the upward and downward movements of the bar, and a rod or link connecting the crank to the device to be operated, substantially as described.

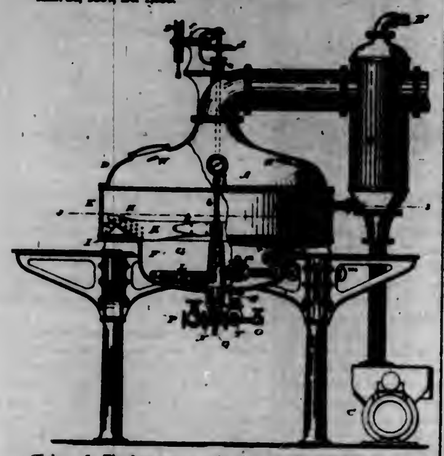


2. The combination, in devices for connecting motors to organs, of a water-motor, and a reciprocating bar attached to the water-motor to be reciprocated thereby, and having the rope or cord B, with the drum C, a support for the same, and the crank D, connected with said drum, and a link connecting said crank with the device to be operated, substantially as described.

3. The combination, in devices for connecting motors to organs, &c., of a bar, B, having a recess, *a*², and ends *a*', provided with holes *a*³, screw-threaded sleeves *d'*, to which the ends of the rope are secured, and the adjusting-nuts *d*², the drum C, crank D, and connecting rod or link *d*, substantially as described.

387,386.

387,387. FOLDING MIRROR. PETER WESSELMAN, Stapleton, N. Y. Filed Mar. 30, 1888. Serial No. 268,802. (No model.)



Claim.—1. In a triplicate mirror, the combination, with the central-mirror frame and the wing-mirror frames, of hinge-clips fastened on the central frame and curved hinge-clips secured to the inner ends of the wing-mirror frames and pivoted to the hinge-clips on the central-mirror frame, substantially as herein shown and described.

2. In a triplicate mirror, the combination, with a central frame, of cleats fastened to and forming part of the same, hinge-clips on said cleats, wing-mirror frames, and curved hinge-clips on said wing-mirror frames, which hinge-clips on the wing-mirror frames are pivoted to the hinge-clips on the cleats, substantially as herein shown and described.

3. In a triplicate mirror, the combination, with a central frame having rabbets, of cleats in said rabbets, hinge-clips fastened to said cleats, wing-mirror frames, and hinge-clips on said wing-mirror frames, the hinge-clips on the wing-mirror frames being pivoted to the hinge-clips on the cleats, substantially as herein shown and described.

4. In a triplicate mirror, the combination, with a central-mirror frame and two wing-mirror frames, of curved L-shaped hinge-clips secured to the wing-mirror frames, and detachable clips on the central-mirror frame, to which detachable clips the curved L-shaped hinge-clips are pivoted, substantially as herein shown and described.

387,388. PROCESS OF AND APPARATUS FOR CLEARING SACCHARINE LIQUIDS. ALEXANDER YOUNG, Honolulu, Hawaii. Filed Feb. 24, 1887. Serial No. 228,698. (No model.) Patented in Spain Mar. 30, 1887, No. 7,553.

Claim.—1. The improvement in the art of purifying saccharine liquids, which consists in boiling them in vacuum and simultaneously separating the resulting froth or scum.

2. The improvement in the art of purifying saccharine liquids, which consists in boiling them in vacuum and simultaneously separating the resulting froth or scum by skimming it from the surface of the liquid.

3. The improvement in the art of manufacturing sugar, which consists in purifying the saccharine liquid by boiling it in vacuum and simultaneously separating the resulting froth or scum, and subsequently concentrating the liquid.

4. The improved apparatus for purifying saccharine liquids, consisting of the closed vacuum pan or vessel, combined with the skimming device for removing the froth or scum from the surface of the liquid under treatment, substantially as described.

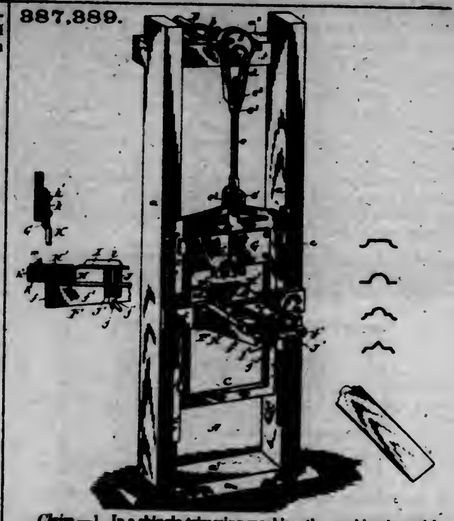
5. The improved apparatus for purifying saccharine liquids, consisting of the vacuum pan or vessel constructed with the heating device for boiling the liquid, and with the skimmings-receptacle, substantially as described.

6. The improved apparatus for purifying saccharine liquids, consisting of the vacuum pan or vessel, constructed with the receptacle for the liquid to be boiled, with the heating device for boiling the liquid therein, and with the skimmings-receptacle, in combination with the skimmer for removing the scum from the boiling liquid and transferring it to said skimmings-receptacle.

7. The improved apparatus for purifying saccharine liquids, consisting of a vacuum pan or vessel, constructed with a receptacle for the liquid to be boiled, with a heating device for boiling the liquid therein, with a skimmings-receptacle, and with an inclined surface extending up from said boiling-receptacle toward or over said skimmings-receptacle, whereby the scum rising from the boiling liquid is driven by the heat onto said inclined surface, in combination with a skimmer for removing the scum from said inclined surface and depositing it in said skimmings-receptacle.

8. The vacuum-pan, constructed with the central boiling-receptacle, and the annular skimmings-receptacle, substantially as described.

9. A vacuum-pan constructed with a central boiling-receptacle, with an annular skimmings-receptacle, and with an inclined rim extending outwardly from the margin of the boiling-receptacle.



10. A vacuum-pan constructed with a central boiling-receptacle and an annular inclined rim, combined with a rotary skimmer moving over said rim.

11. A vacuum-pan constructed with a central boiling-receptacle and with an inclined annular rim, in combination with a central vertical shaft and with a skimmer mounted on said shaft and moving over said rim.

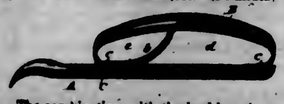
12. The improvement in the art of manufacturing sugar, which consists in defecating the saccharine liquid, then purifying it by boiling it in vacuum, and simultaneously separating the resulting froth or scum and subsequently concentrating the liquid.

387,389. SHINGLE-TRIMMING MACHINE. FRANK BATT, Tonawanda, N. Y. Filed Apr. 17, 1888. Serial No. 270,909. (No model.)

387,389.

Claim.—1. In a shingle-trimming machine, the combination, with the main frame, of a reciprocating frame, C, provided with a knife, K, a supporting-frame, F, secured to the main frame, a box, H, supported on the frame F and made adjustable thereon at right angles to the path of the knife, and the block H', seated in the box H, substantially as set forth.

2. The combination, with the main frame, of a reciprocating frame, C, provided with a knife, K, a supporting-frame, F, secured to the main frame and provided with forwardly-projecting arms *f f*, a box, H, provided with a forwardly-extending table, I, a block, H', seated in the box H, a supporting-bar, J, and a clamping-bar, J', applied to the upper and lower sides of the arms *f f* underneath the table I, and a bolt, *j*, passing through the table I and the bars J J', substantially as set forth.



3. In a shingle-trimming machine, the combination, with the reciprocating knife-frame C, of a main knife, G, secured to the knife-frame, and an ornamenting-knife, K, removably secured to the main knife and projecting beyond the edge thereof, substantially as set forth.

4. In a shingle-trimming machine, the combination, with the main frame and the shingle-supporting frame secured thereto, of a reciprocating knife-frame provided with a main knife, an ornamenting-knife removably secured to the main knife and projecting beyond the edge thereof, a driving-shaft and eccentric, and a length-wise-adjustable rod connecting the eccentric with the knife-frame, substantially as set forth.

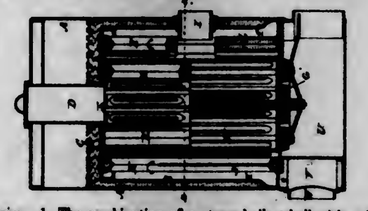
387,390. COMPOSITION FOR SIDEWALKS. LOUIS H. BRADSHER, Hancock, Mich. Filed Nov. 22, 1887. Serial No. 255,994. (No specimens.)

Claim.—The improved composition for sidewalks, consisting of the following ingredients in the proportions specified: coal-tar, eighteen gallons; black pitch, twenty pounds; resin, ten pounds; slab-tar, five gallons; pulverized limestone, fifteen pounds; copper-molding stampsand, four quarts; ashes, two quarts; yellow sand, six quarts.

387,391. CORN-HUSKER. HERBERT S. BLAIR, Bucyrus, Ohio. Filed Sept. 27, 1887. Serial No. 250,513. (No model.)

Claim.—The combination, with the husking pin or tool A, of the longitudinal loop-like strap B, having longitudinal incisions in the forward portion of its length arranged to form an inner flexing strip, *b*, essentially as shown and described, and for the purpose or purposes herein set forth.

387,392. CURTAIN-RING. WARREN L. BRADDOCK, Boston, Mass. Filed Aug. 20, 1887. Serial No. 247,488. (No model.)



Claim.—1. The hollow ring A, having the tongue-pieces 2 3 integrally connected with the ring, combined with a single roller-shaft, *c*, supported in the ring and passing through said tongue-pieces, and two anti-friction rollers set into the ring and journaled on said shaft, as set forth.

387,392.

2. A curtain-ring provided with a curtain-attaching device consisting of a strip of metal bent around the ring and having its ends provided with eyes twisted to the extent of a quarter-turn and riveted together with an eyelet, as set forth.

387,393. STEAM-BOILER. THEODORE R. BUTTON, Waterford, N. Y., assignor of one-half to Charles R. Button, same place. Filed Mar. 9, 1888. Serial No. 266,742. (No model.)

Claim.—1. The combination of a steam-boiler shell with a fuel-magazine formed in part by a series of loops depending from the crown-sheet within the fire-box and having longitudinal flanges, substantially as set forth.

2. The combination of a double-wall steam-boiler shell with a fire-box formed by a series of vertical loops depending from the crown-sheet and extending to the grate, and having longitudinal flanges, substantially as specified.

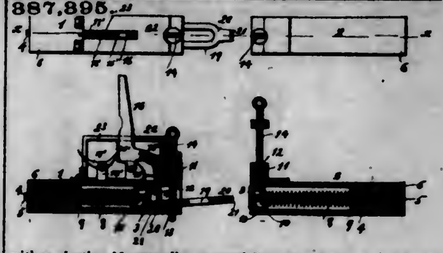
3. The combination, in a steam-boiler, of the magazine formed in part of a series of loops dependent from the crown-sheet, and the fire-box formed by a series of loops surrounding the magazine and also depending from the crown-sheet, substantially as set forth.

4. The combination of the fire-box, formed by a series of loops, with the short loops K, depending from the crown-sheet, and the section L, connected therewith by means of pipes M, to form an opening opposite the door of the boiler, substantially as and for the purpose set forth.

5. The combination of the shell and crown-sheet of a steam-boiler, with the series of dependent loops forming the magazine and the pendent loops constituting the fire-box thereof, the said loops having longitudinal lapping-flanges, substantially as specified.

6. The combination of the shell and crown-sheet, with loops depending therefrom and forming a magazine, and the pendent loops constituting the fire-box, the loops having webs partly closing the spaces in said loops, and longitudinal lapping-flanges on the sides thereof, whereby the products of combustion are carried up and deflected in their passage from the fire-box, substantially as set forth.

387,394. GATE-LATCH. GEORGE W. CHARLEVILLE, McKinney, Tex. Filed Feb. 20, 1888. Serial No. 264,894. (No model.)

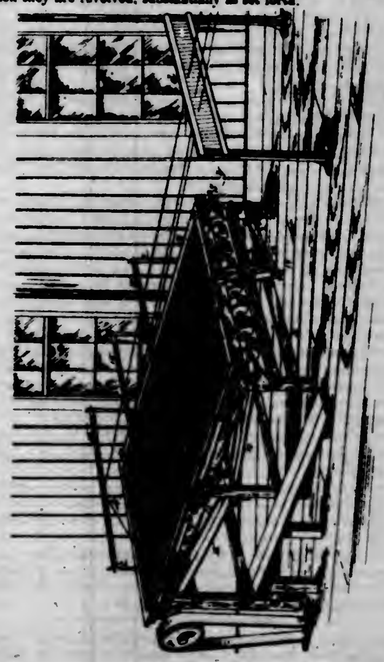


Claim.—1. In a latch, substantially as described, the combination of a case having an inwardly-projected ledge or flange, a loosely-suspended ring held and movable against said ledge or flange, and an operating-lever arranged above the said ledge and engaged with the ring, whereby to operate the same, substantially as set forth.

2. In a latch, the combination of a case having at its lower end a guide ledge or flange with its bearing-face arranged laterally in from the inner face of the side plate of the case, a loosely-suspended ring held and movable against the said ledge or flange, and means whereby the said ring may be operated, substantially as set forth.

387,395. CAR-COUPLING. JOHN M. CLARK, Hebron, N. Y. Filed Jan. 9, 1888. Serial No. 260,189. (No model.)

Claim.—1. In a car-coupling, the hollow draw-bar 1, formed



with projection 11, extending upward from its outer end and having hole 12 in line with hole 13 in casing 1, the slide 3, having friction-rollers 10 and guide-rod 4, and spring 8, located in said draw-bar, a bar, 17, adapted to move in slot 18 and connected by pivoted link 16' with lever 16, having teeth 15' and pivoted to bracket 15 on draw-bar 1, post 18', having pawl 17', engaging teeth 15', and the casing 22, having slot 23, through which projects lever 16, and hinged to draw-bar 1, substantially as described.

2. In a car-coupling, the combination of hollow draw-heads 1 2, with links 19, having projections 20 and coupling-pins 14, the draw-heads having upward projection 11, with hole 12 and coupling-pin hole 13, and containing slide 3, guide-rod 4, spring 8, and perforated end 6, containing the end of rod 4, and the draw-head 1, having slot 18 near its forward end, bar 17, adapted to slide in said slot, lever 16, pivoted to bracket 15 on draw-bar 1 and connected by link 16' with bar 17, and hinged casing 22, having slot 23, substantially as described.

387,396. MACHINE FOR WINDING YARNS FROM CHAINS UPON SPOOLS. ANDREW GARDNER, Fitchburg, Mass. Filed June 27, 1887. Serial No. 242,671. (No model.)

Brief.—The object of the invention is to provide apparatus for winding yarns directly from the chain upon spools.

Claim.—1. An organized mechanism for spooling thread directly from the chain, consisting of a rotatable chain-cup, a tension device, a suspended raddle, a splitting copper, and a frame supporting the spools and provided with a traversing board, with mechanism, substantially as described, for giving it a lateral reciprocating movement, and one or more endless belts, upon which the spools rest and by which they are revolved, substantially as set forth.

387,396.

2. The improved tension device hereinbefore shown and described, consisting of the bar B, having a series of pegs, the rolls 24 and 26, lying in substantially the same horizontal plane, the drum 45, resting upon said rolls and having its shaft journaled in vertical slots, and suitable means, substantially as shown and described, for applying pressure upon the periphery of said drum, substantially as set forth.

387,397. WAGON-POLE ATTACHMENT. GEORGE F. CRIST, Shelby, Iowa. Filed Mar. 7, 1888. Serial No. 266,491. (No model.)

Claim.—1. An attachment for wagon-poles for preventing the neck-yoke from coming off the pole, consisting of a longitudinally slotted and apertured tube, and a spring secured to said tube and provided at its free end with a pin engaging the aperture in the tube, substantially as described.

2. An attachment for wagon-poles for preventing the neck-yoke from coming off the pole, consisting of a longitudinally slotted and apertured tube provided with downwardly-projecting lugs at each end, and a spring secured to the tube and provided with a pin engaging the aperture of the tube, substantially as herein shown and described.

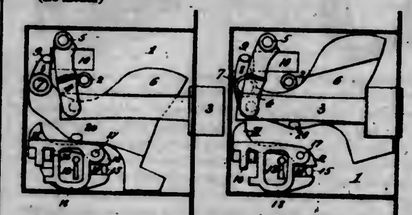
3. In an attachment for wagon-poles, the combination, with an apertured tube provided with a stop on its under side, of a spring secured to the tube and carrying at its free end a pin working in the aperture of the said tube, substantially as described.

4. In an attachment for wagon-poles, the combination, with a longitudinally slotted and apertured tube provided with lugs on its under side, of a spring secured to the tube, a plate secured to the spring and fitted to the end of the tube, and a pin on the under side of the plate, substantially as herein shown and described.

387,398. HOLDBACK. WILLIAM CHESEBRO, Copenhagen, N. Y. Filed Feb. 7, 1888. Serial No. 263,267. (No model.)

Claim.—1. As an improved article of manufacture, a holdback-iron comprising the attaching-plate provided with the housing E, open at both ends, and having a longitudinal slot, b^2, the tongue D, sliding freely in said housing, and formed with teeth d^2 at its inner end and with the projection d^3 at its outer end, and the screw d, passed through the housing-slot into the said tongue, substantially as set forth.

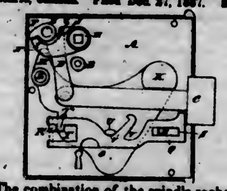
2. As an improved article of manufacture, the holdback-iron comprising the attaching-plate E, having a slotted housing, E', open at both ends, the inner surface of one wall of the housing being gradually inclined to contract the opening at its rear end, the angular tongue D, sliding in said housing and having the teeth d^2 on the inner face of its inner end, and the screw d, passed through the housing into the tongue, substantially as set forth.



387,399. RAILROAD-CHAIR. ALPHEUS COOK, Galway, N. Y. Filed Oct. 7, 1887. Serial No. 251,714. (No model.)

Claim.—1. A chair made of resilient metal, having its bottom arched from end to end and its sides of substantially the same contour as the web and foot of a rail and extending upwardly to the under side of the head of the rail, substantially as described.

2. A chair made of resilient metal and having a concave-convex bottom arching from end to end.

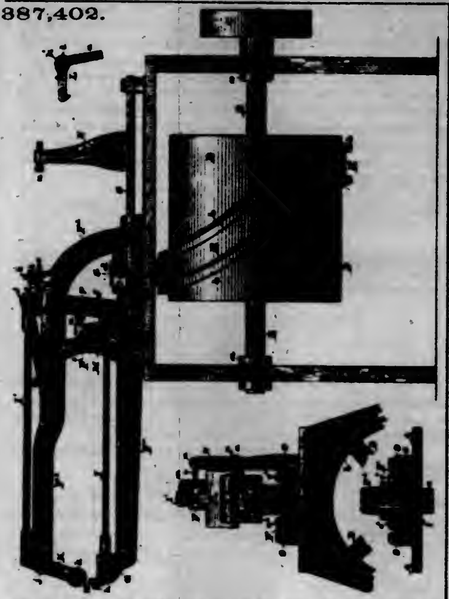


387,400. COMBINED LATCH AND LOCK. JOHN C. CRAIG, Perth Falls, Ontario, Canada. Filed Dec. 27, 1887. Serial No. 259,127. (No model.)

Claim.—1. The combination of the gravitating weight 6, pivoted to the lock-case and having an arm, 8, pendulum 4, pivoted to the lock-case, and bolt 3, pivoted to the pendulum, whereby the arm of the weight causes the pendulum to project the bolt after the latter has been retracted, substantially as set forth.

2. In a combined latch and lock, the combination, with the case 1, having stud 15, and post 16, of the slide 12, dog 11, bolt 3, pendulum 4, and gravitating weight 6, having an arm, 8, to engage the pendulum, as set forth.

387,401. COMBINED LATCH AND LOCK. JOHN C. CRAIG, Perth Falls, Ontario, Canada. Filed Dec. 27, 1887. Serial No. 259,172. (No model.)



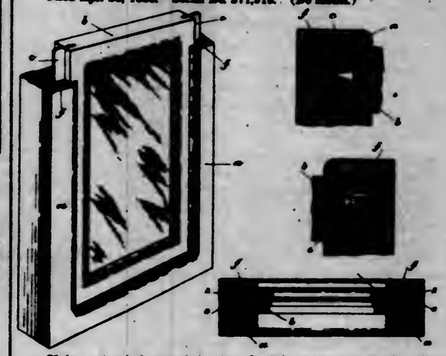
Claim.—1. The combination of the spindle-cock H, having an arm, I, and offset J, the pendulum D, having an arm, F, and offset G, and pivoted to the lock-case, gravitating weight K, having an arm, M, provided with a projection, N, and pivoted to the lock-case, and bolt C, pivoted to the pendulum, as set forth.

2. The combination, in a combined latch and lock, of the gravitating weight K, having post U, pendulum D, bolt C, and slide Q, having inclined notches V V', as set forth, for the purpose described.

387,402. MACHINE FOR STRETCHING HIDES. GEORGE R. DARFORTH, Lynn, Mass., assignor of one-half to Anton B. Hoffman, same place. Filed Apr. 21, 1888. Serial No. 271,261. (No model.)

Claim.—1. In the herein-described machine for rubbing and stretching hides or skins, the combination of a sliding frame, means having provision for reciprocating said frame toward and from the front of the machine, a knife or scraper holder pivoted to an arm of said sliding frame, a forked lever pivoted to another arm of said frame, a roller mounted in the forked end of said lever, a nearly-vertical

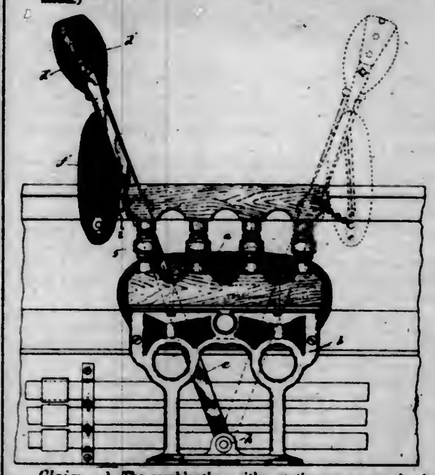
887,402.



lever pivoted to said sliding frame near its rear end, rods connecting said vertical lever with said roller-holding lever and said knife or scraper holder, a spring-operated latch-lever for locking said vertical lever in its rearmost position while said sliding frame is traveling toward the rear of the machine, a spring for moving said vertical lever toward the front of the machine, a stop secured to the frame of the machine in the path of an arm of said latch-lever to unlock said vertical lever when said sliding frame is at or near its rearmost position and allow it to move toward the front of the machine, thereby forcing said knife-holder and roller away from each other, an arm projecting from said vertical lever, and a stop secured to the frame of the machine in the path of said arm, so as to engage therewith when said sliding frame is near the front of the machine and move said vertical lever to its rearmost position, so that it may again be locked by said latch-lever and retained in that position while the sliding frame is moving to the rear.

2. In a machine for rubbing and stretching hides or skins, the combination of a sliding frame, means having provision for reciprocating said frame toward or from the front of the machine, a knife or scraper holder pivoted to an arm of said sliding frame, a forked lever pivoted to another arm of said frame, a roller mounted in the forked end of said lever, a nearly-vertical lever pivoted to said frame near its rear end, rods connecting said lever with said forked lever and said knife or scraper holder, means having provision for locking said vertical lever in its rearmost position when said frame is at or near the front end of the machine, a spring for moving the end of said vertical lever toward the front of the machine, and means having provision for unlocking said lever when the said sliding frame is at or near the rear end of the machine.

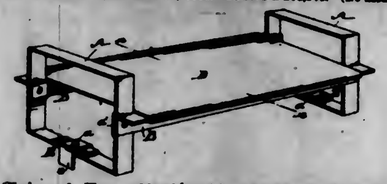
3. In a machine for rubbing and stretching hides or skins, the combination of a sliding frame, means having provision for reciprocating said frame toward or from the front of the machine, a knife or scraper holder pivoted to an arm of said sliding frame, a forked lever pivoted to another arm of said frame, a roller mounted in the forked end of said lever, means having provision for locking said lever and knife-holder in position with the edge of said knife in close proximity with the periphery of said roller during the rearward movement of said reciprocating frame, means having provision for unlocking said lever and said knife-holder when said frame is at or near its rearmost point and moving said knife farther to the front and said roller farther to the rear, thus making a more convenient space or opening between said roller and knife for the admission or removal of the material being operated upon, and means having provision for locking said lever and knife-holder in their original positions when said frame is at or near the front end of the machine preparatory to again moving to the rear and operating upon the material seized between said roller and said knife or scraper.



4. In a machine for rubbing and stretching hides or skins, the combination of a sliding frame, a knife-holder pivoted to an arm of said frame, a roller-holding lever pivoted to another arm of said frame, means having provision for locking said knife-holder and said roller-holding lever when said frame is at or near the front end of the machine, so that the edge of the knife will be in close proximity to the said roller during the rearward movement of said frame, means having provision for unlocking said lever and said knife-holder when said frame is near the rear end of the machine and moving said roller and knife away from each other, a truck or roll secured to said frame, and a cam-wheel so situated and constructed as to engage with said truck and reciprocate said frame toward and from the front of the machine.

887,408. CAR-WINDOW. William H. Dawes, Lowther, Minn. Filed Apr. 26, 1888. Serial No. 271,919. (No model.)

Claim.—A window-sash having flexible strips *e* projecting from its edges, combined with a casing having grooves of less depth than the width of the projecting portions of the strips and provided with narrow bottoms or seats 2 of the same width as the outer edges of the strips, and with inclined sides which converge from the outer ends or mouths of the grooves to the seats 2, said sides guiding the outer edges of the strips *e* to the seats 2 and keeping said edges in close contact with said seats, as set forth.

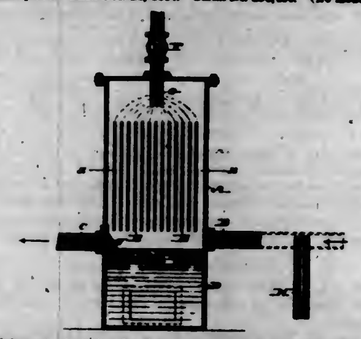


887,404. REVERSIBLE BACK FOR CAR-SEATS. James P. Doyle, Boston, Mass. Filed Feb. 15, 1888. Serial No. 264,130. (No model.)

Claim.—1. The combination, with a stationary car-seat having fixed arm-rests at the ends thereof, and the frame-pieces *b*, having centrally-apertured ears, of the levers pivotally secured at their lower ends to said ears and projected up between the said seat and arms, and having sockets 6 secured to their inner sides, the frame *d*, having the parallel arms secured to the upper ends of said levers and having their lower ends in said sockets, the lower frame, *f*, the hinges *g*, connecting said frames, and the chains *i i*, connected to said levers and lower frame, substantially as shown and described.

2. The combination, with the fixed seat and the fixed arm-rests at the ends thereof, of the levers *c c*, pivoted to fixed supports below the seat and arranged to swing between the ends of the seat and the fixed arm-rests, the upper back-section composed of an upholstered frame having downwardly-projecting side pieces, 2, rigidly attached to the upper ends of said levers, the lower back-section connected by hinges *g* to the upper back-section and adapted to swing backwardly in either direction, the covering-strips *h h*, whereby said hinges are concealed, and the chains *i*, connecting the levers and the lower back-section, whereby the backward movement of the same in each direction is limited, as set forth.

887,405. PALLET FOR DRYING BRICK. Charles T. Fish, Elizabeth, N. J. Filed Mar. 30, 1888. Serial No. 269,079. (No model.)



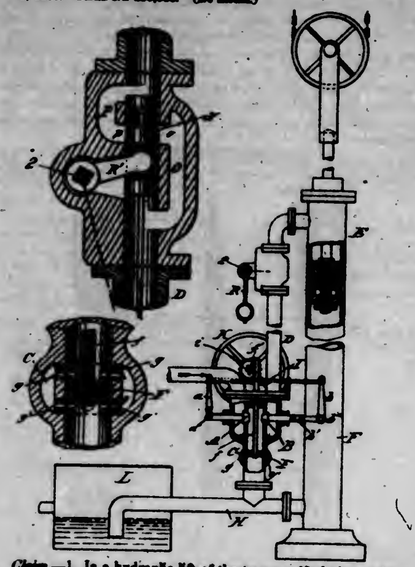
Claim.—1. The combination, with rectangular head pieces, of angular side pieces connecting said head pieces and a horizontal bench resting upon said side pieces and secured thereto, substantially as herein shown and described.

2. The combination, with rectangular head pieces, and side pieces connecting said head pieces formed as angle-irons, and a bench horizontally supported upon the horizontal members of the said angle-irons, the longitudinal edges of the bench being turned over the longitudinal edges of the horizontal members of the angle-irons, substantially as and for the purpose herein set forth.

3. The combination, with head pieces provided with central side depressions upon their outer face, of angle-irons connecting the said heads and attached in said recesses, a bench supported upon the horizontal member of said angle-irons between the heads, the longitudinal edges of the said bench being bent over the longitudinal edges of the horizontal members of the angle-irons, substantially as and for the purpose specified.

4. The combination, with head pieces each provided with a central recess or depression in its outer face, and angle-irons connecting said head pieces, of a bench supported horizontally upon the said angle-irons between the heads, the longitudinal edges of which bench are bent over the longitudinal edges of the angle-irons, and a locking-lip secured to the base of the head, adapted to project vertically downward outside of the said head pieces, as and for the purposes specified.

887,406. APPARATUS FOR PURIFYING WATER. Thomas Foley, Philadelphia, Pa., assignor, by mesne assignments, to Warren Webster, same place. Filed Dec. 20, 1887. Serial No. 258,469. (No model.)

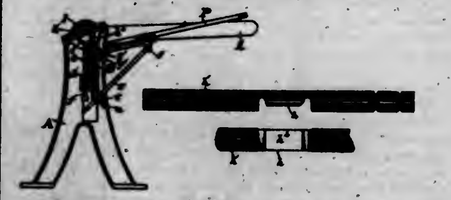


Claim.—1. A device for the purpose named, consisting of a tank having the steam-induction pipe B, the water-eduction pipe C, the water-inlet pipe F, with rose G, the vertical plates E, the shield J, and wall D, said parts being combined substantially as described.

2. The tank A, having the water-induction pipe B, the steam-eduction pipe C, the water-inlet pipe F, with rose G, the vertical plates E, connected to tank A, the shield J, between the lower end of said plates E and the pipe C, and the wall D in lower part of the tank A, below the said induction-pipe B and the eduction-pipe C, said parts being combined substantially as and for the purpose set forth.

3. A tank with a steam-induction pipe, a water-eduction pipe, a water-inlet pipe with a rose, a vertical series of plates secured within said tank and adapted to be heated by the said inlet-steam from said steam-induction pipe, a shield or hood covering the eduction water-pipe, and a water-pipe leading into said steam-pipe outside of said tank, said parts being combined substantially as and for the purpose set forth.

887,407. HYDRAULIC LIFT. Thomas P. Pugh, London, England, assignor to the American Elevator Company, same place. Filed Jan. 6, 1888. Serial No. 259,933. (No model.)

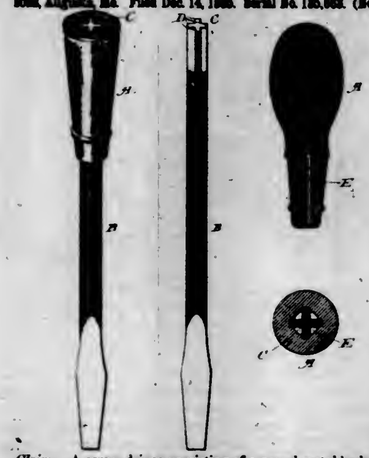


Claim.—1. In a hydraulic lift of the type specified, the combination, with water supply and circulation valves A B of the plug or sliding type, and the chamber C, connected with the main cylinder, as described, of a cup-leather piston-valve, F, controlling the passage from chamber C to the lower end of the main cylinder and acting in conjunction with the valves A B as a second seal to prevent leakage, both sets of valves being operated by the same gear, substantially as specified.

2. The combination, with the valves A, B, and F, of the rack-and-pinion gear and levers for operating such valves, and consisting of the piston rack-rod *f*, pinions *f'* and *i*, rack-rod I, and levers *a b*, connected to rack-rod I and to the stems of valves A B, substantially as shown and described.

3. In a hydraulic lift, a double-acting regulator for checking both the supply and circulation of the water, and consisting of a plunger-valve, N, working in a cylinder interposed in line axially of the column of water and provided with by-pass passages and ports O *o* P *p*, across which the valve works, said valve being combined with a weighted elbow-lever, R R', whereby the valve is held against the momentum of the water.

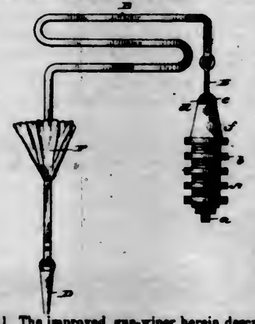
887,408. MACHINE FOR CUTTING THE METAL OF SHOW-CASE MOULDINGS. Frances X. Divine, Baltimore, Md. Filed Jan. 17, 1888. Serial No. 261,017. (No model.)



Claim.—1. A machine for cutting metal show-case moldings, comprising a cutter-plate, *c*, having an edge shaped to fit a design of molding, and a shaft, *N*, mounted in suitable bearings, and intermediate of its ends having a portion of its rounded side removed, whereon is a surface, *N'*, whose edge bisects the said rounded side and serves as a cutter, *A*, to coact with the said cutter-plate.

2. A machine for cutting metal show-case moldings, comprising a cutter-plate, *c*, having an edge shaped to fit a design of molding, a shaft, *K*, provided intermediate of its ends with a cutter, A, which is the counterpart of the cutter-plate edge and which does not project beyond the plane of the rounded side of the shaft, and a box-bearing for said shaft, said box-bearing covering the shaft along its length where the cutter is.

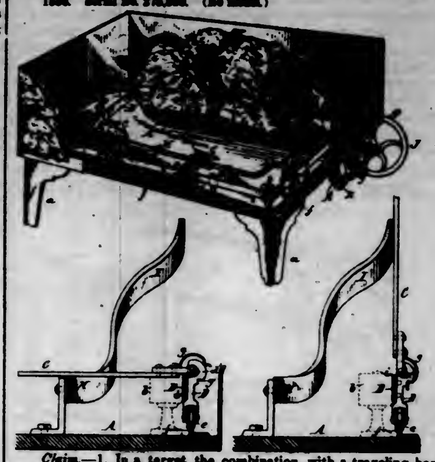
3. A machine for cutting metal show-case moldings, having in combination a cross-bar, B, provided with a recess, *d*, a cutter-plate, *c*, occupying the recess, a shaft, *K*, provided intermediate of its ends with a cutter, A, which is the counterpart of the edge of said cutter-plate, and a box-bearing covering the entire length of the cutter-shaft.



4. A machine for cutting metal show-case moldings, having in combination a stationary cutter-plate, *c*, a shaft, *K*, provided intermediate of its ends with a cutter, A, which is the counterpart of the edge on said cutter-plate, and a chute pivoted by one end adjacent to the cutter-plate.

387,409. SCREW-DRIVER. GEORGE R. GAY and JOHN H. PARSONS, Augusta, Me. Filed Dec. 14, 1888. Serial No. 135,663. (No model.)

Claim.—A screw-driver consisting of a round metal body, B, flattened at one end to adapt it to the neck of the screw, and having its other end reduced to a cross-shaped cross-section having the same external dimensions as the round body part, combined with and forcibly driven into a wooden handle, A, substantially as and for the purpose described.



387,410. GUN-CLEANER. CYRUS F. GILLETTE, Sparta, Wis. Filed Jan. 21, 1888. Serial No. 261,430. (Model.)

Claim.—1. The improved gun-wiper herein described, consisting, essentially, of the rod having a head at one end and threads at its opposite end, the removable tip *f* on the headed end, the rubber disks all of an equal diameter and arranged on the rod, the washers for spacing the said disks, the draw-cord attached to the rod, and the weighted point on the free end of the cord, and the rag on the said cord, substantially as specified.

2. In a gun-wiper, substantially as described, the combination, with the rod headed at one end and threaded at its opposite end, the tip on the headed end, the rubber disks of equal diameter, and the washers for spacing the disks on the rod, substantially as specified.

387,411. TARGET. JOHN GUNN, Buffalo, N. Y. Filed May 31, 1888. Serial No. 276,092. (No model.)

Claim.—1. In a target, the combination, with a traveling band and a plate hinged thereto and representing an animal or other object, of a guide whereby said plate is automatically returned to its normal position when overthrown, substantially as set forth.

2. In a target, the combination, with an endless traveling band and a plate hinged to said band and representing an animal or other object, of a cam or inclined guide arranged on the inner side of said endless band, whereby the hinged plate is automatically returned to its normal position when overthrown, substantially as set forth.

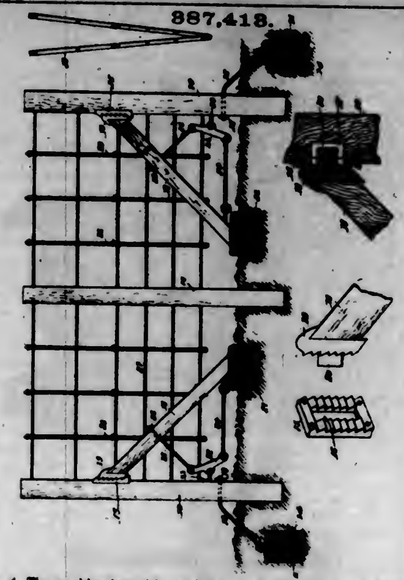
3. In a target, the combination, with the endless band B, running around suitable pulleys, of a plate, C, hinged with its lower end to said band and representing an animal or other object, and a guide, H, arranged in rear of the front portion of said band and provided at one end with a cam or incline, I, substantially as set forth.

4. In a target, the combination, with the endless band running around suitable pulleys, of a support or standard, D, secured thereto, and a plate, C, hinged to said support and provided with a spring, *g*, engaging with its end in a notch or recess formed in said support, substantially as set forth.

5. In a target, the combination, with the endless band running around suitable pulleys, of a support or standard, D, secured thereto and provided at its lower end with a roller, and a plate, C, hinged to said support and provided with a spring, *g*, engaging with its end in a notch or recess formed in said support, substantially as set forth.

387,412. HARROW. HENRY F. GRAETZEL and FREDERICK H. POWELL, Fullerton, Md. Filed May 21, 1888. Serial No. 274,503. (No model.)

Claim.—In a harrow, the combination, with the side beams, A, having upwardly-turned ends *b* and angular bearings *j*, and the revolving shaft E, having a series of prongs, k, of the bars I, with teeth *k* and adjustably mounted in the bearings *j*, whereby the said teeth *k* are adapted to be placed in a horizontal position projecting between the prongs *k*, or in a vertical position in contact with the ground, as set forth.



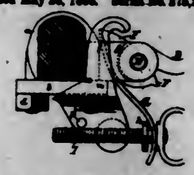
387,413. WIRE FENCE. THOMAS GRIFFIN and WILLIAM MITCHELL, Noblesville, Ind. Filed Apr. 20, 1888. Serial No. 271,268. (No model.)

Claim.—1. The combination, with a fence-post having a rack, of an inclined brace having a rack at its upper end engaging the rack on the post, substantially as set forth.

2. The combination, with the fence-post having a rack, of an inclined brace provided with a rack at its upper end, engaging the rack on the post, and adjustable connections between the post and brace below their racks, substantially as set forth.

3. The combination, with a fence-post provided with a recess in one face and a centrally-slotted rack-plate secured to the post adjacent to said recess, of an inclined brace provided with an engaging rack-plate, a lug integral with the brace-rack, adapted to enter the slot of the post-rack and the recess in said post, and a take-up device attached to said post and brace, as and for the purpose specified.

387,418.

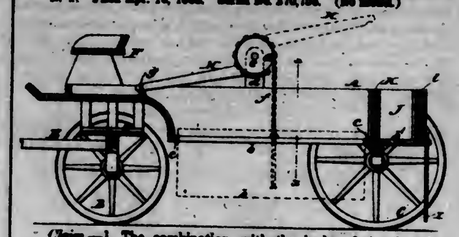


4. The combination, with a fence-post and a rack-plate, of a brace, a rack-plate attached to one end of said brace, adapted to engage the post-rack, a lever fulcrumed centrally upon the post, a link connecting the lower end of said lever to the lower end of said brace, and a threaded bar attached to the upper end of the lever and passing through the brace, and means for adjusting the said bar, substantially as and for the purpose specified.

5. The combination, with a fence-post provided with a recess in one face, and a rack-plate secured over said recess, provided with an aligning-slot, of a brace, a rack-plate attached to one end of said brace, adapted to engage the post-rack, a lug integral with the brace-rack, a lever fulcrumed centrally upon the post, a link connecting the lower end of said lever to the lower end of said brace, and a threaded bar attached to the upper end of the lever and passing through the brace, and a means for adjusting the said bar, substantially as and for the purpose specified.

6. The combination, with a post and a rack-plate provided with a central longitudinal slot, secured to said post, of a brace, a rack-plate secured to one end of said brace, adapted to engage the rack-plate, a lug integral with the brace-rack plate, adapted to enter the slot in the post-rack, and means, substantially as described, for adjusting the brace in relation to the post, as and for the purpose specified.

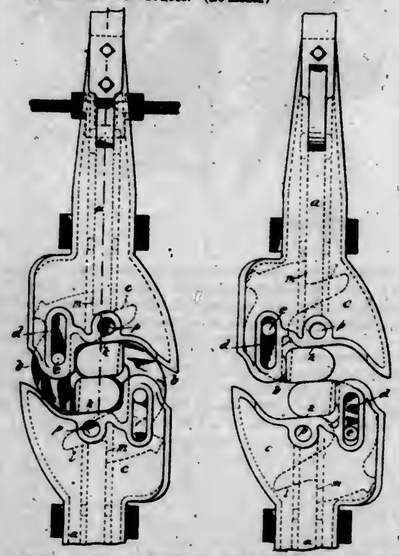
7. In a fence, a post and brace-rack consisting in the rack 15, having a longitudinal slot, 16, and the opposing rack 19, having a projection, 20, on its toothed face entering said slot, substantially as set forth.



387,414. THILL-COUPLING. WILLIAM H. HASKELL, Philadelphia, Pa., assignor to himself, George W. Haskell, and Henry J. Haskell, all of same place. Filed May 26, 1888. Serial No. 275,262. (No model.)

Claim.—1. The combination of the clip and its ears, the thill-iron and its pivot-pin, the friction-block having a projecting arm, the locking-plates engaging with the pivot-pin and having a bearing on the axle, and a screw-stem and nut for acting on the plates and on the arm of the friction-block, all substantially as specified.

2. The combination of the axle-clip having projecting ears, the thill-iron and its pivot-pin, the friction-block and its spring-arm, locking-plates fulcrumed on the axle and engaging with the pivot-pin, and a screw-stem and nut for operating the friction-block and locking-plates, all substantially as specified.



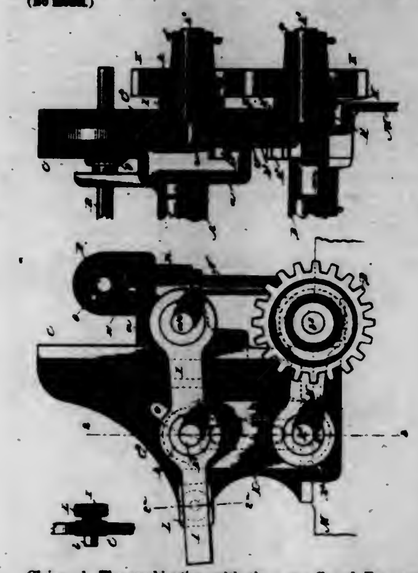
387,415. DUMPING-WAGON. WILLIAM H. HEWLETT, Merrick, N. Y. Filed Apr. 14, 1888. Serial No. 270,734. (No model.)

Claim.—1. The combination, with the body of the dumping-wagon, its front and rear wheels, and hinged centrally and longitudinally dumping bottom sections, of a scraper or leveler in rear of said body and adjustable up or down in relation thereto, substantially as and for the purpose specified.

2. In combination with the body A, having a tail-board, *l*, front and rear wheels, B C, and hinged centrally and longitudinally dumping bottom sections *b b*, the independent bottom section *b'* and the removable cross-board K, arranged in advance of the tail-board and at a suitable distance from it back of the bottom dumping sections *b b*, essentially as described.

387,416. CAR-COUPLING. OLIVER P. HIX, Rockland, Me., assignor to the HIX Automatic Car Coupler Company, same place. Filed Feb. 23, 1888. Serial No. 264,885. (No model.)

Claim.—1. In a car-coupler, a draw bar or head combined with a coupling hook or knuckle pivoted in a vertical plane to the head or bar, and having a limited sliding movement longitudinally of the same, the construction and arrangement of the hook and bar with respect to each other being such that the hook may be moved inward or rearward and bear or be seated against the end of the bar and become virtually one therewith, as set forth.



2. In a car-coupler, a draw bar or head, combined with a coupling hook or knuckle pivoted to the head and having a limited sliding movement longitudinally of the same, and a weighted bolt or bar for locking said hook against, and releasing it to permit of, action on its pivot, said weighted bolt being constructed and arranged to bear against the hook or knuckle and hold it normally pressed forward, as set forth.

3. In a car-coupler, a draw bar or head combined with a coupling hook or knuckle pivoted to the head and having a limited sliding movement longitudinally of the head, and a weighted bolt or bar having a movement vertically and longitudinally with respect to the head for locking said hook against, and releasing it to permit of, action on its pivot, substantially as set forth.

4. In a car-coupler, a draw bar or head combined with a coup-

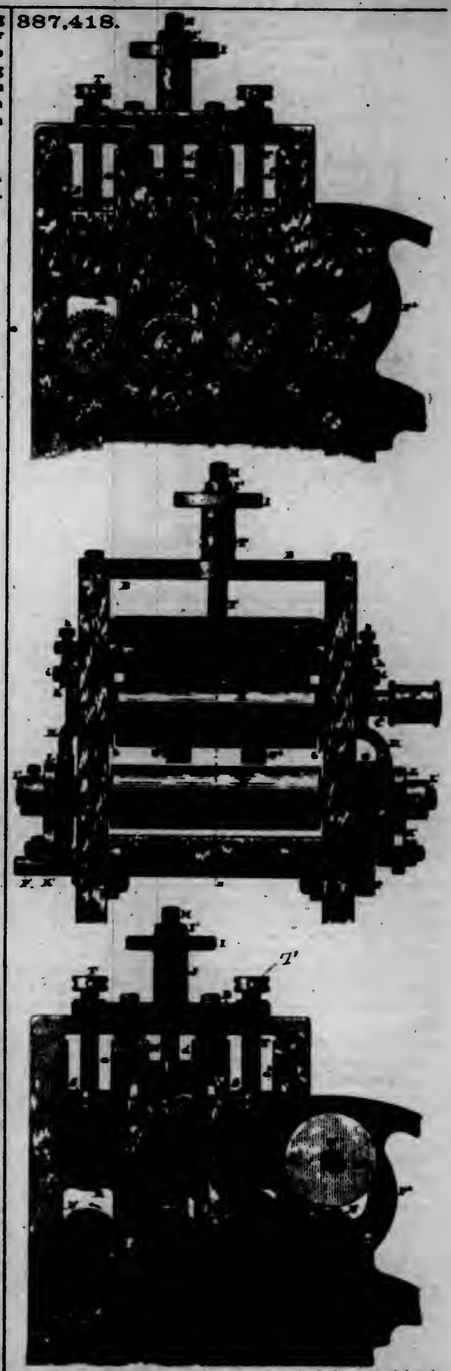
ing hook or knuckle pivoted to the head and having a limited sliding movement longitudinally of the head, and a weighted locking bolt or bar having a movement vertically and longitudinally with respect to the head, said bolt or bar being arranged to bear against the coupling hook or knuckle, whereby when the latter is pressed rearwardly in the draw bar or head and left free the weighted locking-bolt will push it forward again to its normal position and turn it on its axial pin when uncoupled or released, substantially as set forth.

387,417. EXPANSION-GEARING FOR PLANING-MACHINES. Louis P. Hoyt, Aurora, Ill. Filed Jan. 31, 1888. Serial No. 262,813. (No model.)

Claim.—1. The combination, with the gears G and F, respectively mounted upon separate adjustable bearings, of the lever pivotally connected with said bearings and having a sliding connection with a fulcral support, substantially as and for the purpose described.

2. The combination, with the gears D and G, of the intermediate gears mounted upon a shifting bearing, and the link H and lever I, arranged for maintaining the axes of the intermediate gears at respectively determinate distances with relation to the axes of the gears D and G, said lever being connected with a fulcral support by a sliding connection, substantially as and for the purpose set forth.

3. The combination, as hereinbefore set forth, of the driving-gear, the driven gear, the intermediate gears mounted upon a shifting bearing, and the lever I, pivotally attached to bearings for the driven gear and one of the intermediate gears, and having a sliding connection with a pivoted fulcral support, L, substantially as described.



4. The combination, with the gears G and D, of the intermediate gears mounted upon a shifting plate, K, providing a bearing common to both intermediate gears, the link H, hung at one end upon the stationary bearing for the gear D and at its opposite end hung upon a boss, *k'*, in the shifting bearing, and the link I, hung upon an adjustable bearing for the gear G and having a pivotal connection with said shifting bearing formed by the boss *k*, substantially as described.

387,418. WOOD-WORKING MACHINE. John P. Jamison, Cambridgeport, Mass. Filed Mar. 17, 1888. Serial No. 267,645. (No model.)

Claim.—1. In a wood-working machine, the combination of a rotating cutter, a reciprocating frame for carrying said cutter, one or more rolls or trucks mounted upon said frame, one or more rotating cams engaging with said trucks and moving said cutter toward the bed upon which the material is fed beneath the cutter, a spring for moving said cutter in the opposite direction, means for feeding beneath said cutter the material to be operated upon, one or more rolls located above the material to be operated upon and in contact therewith, one or more vertically-reciprocating frames carrying said rolls, and mechanism interposed between said roll-carrying frames and the frame of the machine, by which the pressure upon the material may be regulated.

2. In a wood-working machine, the combination of a rotating cutter, a reciprocating frame for carrying said cutter, a feed-roll

887,418.

located beneath said cutter and adapted to feed the material to be operated upon between the said cutter and said feed-roll, one or more rolls or trucks mounted upon said frame, one or more rotating cams engaging with said trucks and adapted to move said frame in one direction, and a spring to move said frame and cutter in the opposite direction.

3. In a wood-working machine, the combination of a rotating cutter, a reciprocating frame for carrying said cutter, brackets adjustably secured to said frame, so that the distance of said frame from the bed of the machine, when the parts are in their normal positions, may be varied in order to vary the depth of the carving, means for feeding beneath the cutter the material to be acted upon, rolls or trucks mounted upon said brackets, rotating cam-wheels engaging with said trucks and moving said frame and cutter in one direction, and a spring for moving the same in the opposite direction.

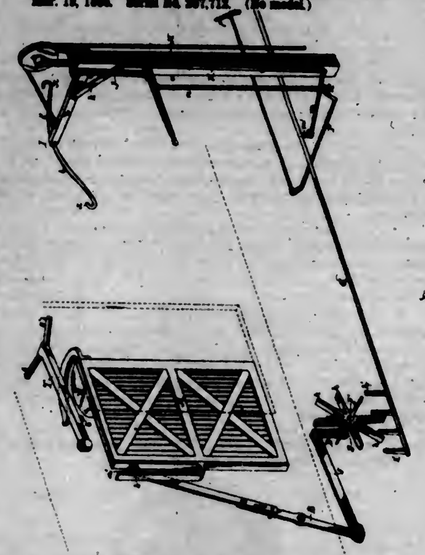
4. In a wood-working machine, the combination of a rotating cutter, a reciprocating frame for carrying said cutter, feed-rolls for feeding beneath said cutter the material to be operated upon, one or more rolls or trucks mounted upon said frame, one or more rotating cams engaging with said trucks and moving said frame and cutter toward the feed-rolls as the trucks pass over the projections of said cam, a screw-shank rigidly secured to said frame and passing through an opening in a stationary plate forming part of the frame of the machine, a nut mounted upon the outer end of said shank, and a spring interposed between said nut and said plate and adapted to retain said trucks in engagement with said cams.

5. In a wood-working machine, the combination of a rotating cutter, a reciprocating frame for carrying said cutter, a feed-roll located beneath said cutter and adapted to feed the material to be acted upon between said cutter and said feed-roll, brackets adjustably secured to said frame, so that the distance of said frame from said feed-roll, when the parts are in their normal positions, may be varied in order to vary the depth of the carving, rolls mounted upon said brackets, rotating cam-wheels engaging with said trucks and moving said frame and cutter in one direction, and a spring for moving said cutter and frame in the opposite direction.

6. In a wood-working machine, the combination of a rotary cutter, a reciprocating frame for carrying said cutter, and which is provided with two downwardly-projecting arms, rolls or trucks mounted upon the lower ends of said arms, rotating cams located above said rolls and engaging with the same to move said frame toward the bed upon which the material is fed beneath said cutter, and a spring to move said frame in the opposite direction.

7. In a wood-working machine, the combination of a rotating cutter, a reciprocating frame for carrying said cutter, a feed-roll located beneath said cutter and adapted to feed the material to be operated upon between said cutter and said feed-roll, one or more rolls or trucks mounted upon said frame, one or more rotating cams engaging with said trucks and moving said cutter toward said feed-roll, and a spring for moving said frame and cutter away from said feed-roll.

8. In a wood-working machine, the combination of a rotating cutter, a reciprocating frame for carrying said cutter, a series of feed-rolls located beneath said cutter and adapted to feed the material beneath said cutter, one or more rolls or trucks mounted upon said frame, one or more rotating cams engaging with said trucks and moving said cutter toward said feed-rolls, a spring for moving said cutter in the opposite direction, one or more rolls located above the material to be operated upon and in contact therewith, one or more vertically-reciprocating frames carrying said rolls, and mechanism interposed between said roll-carrying frames and the frame of the machine, by which the pressure upon the material may be regulated.



387,419. FURNACE-DOOR. Llewellyn H. Jordan, Buffalo, N. Y. Filed Nov. 3, 1887. Serial No. 254,147. (No model.)

Claim.—1. In a furnace-door, the combination, with the hollow frame E, having an open top and a closed bottom and forming a water-space, g^4, of hollow vertical end flanges, A, and a bottom flange, *k'*, projecting inwardly from the ends and bottom of the frame E and forming enlarged water-spaces at the ends and bottom of the central water-space, g^4, a lining of fire-brick secured to the inner wall of the frame E between the end flanges, A, and bottom flange, *k'*, and a water-pipe, *i*, entering the water-space g^4 through the open top of the frame E, substantially as set forth.

2. In a furnace-door, the combination, with the hollow frame E, having an open top and closed bottom and forming a hollow water-space, g^4, of hollow vertical end flanges, A, and a hollow bottom flange, *k'*, projecting inwardly from the ends and bottom of the frame E and forming enlarged water-spaces at the ends and bottom of the frame and continuations of the central water-space, g^4, vertical dovetail ribs *k K*, projecting inwardly from the inner wall of the frame E between the vertical flanges A, and a lining of fire-brick, F, having dovetailed grooves and secured to the inner wall of the frame E between the ribs *k K*, the edges and bottom of the lining being protected by the hollow flanges *k K*, substantially as set forth.

387,420. MAIL-BAG RECEIVING AND DELIVERY APPARATUS FOR RAILWAY-CARS. Edward Keenan, Philadelphia, Pa. Filed Mar. 19, 1888. Serial No. 267,712. (No model.)

Claim.—1. The combination of the sliding door of the car and the pivoted receiving and delivery arm with a cam, whereby said arm is projected and retracted as the door is opened and closed.

2. The combination of the pivoted receiving and delivery arm, the sliding door of the car, having an operating-cam for said arm, a lever connected to the door, a tappet-wheel hung to the car, means for transmitting the movement of said wheel to the lever, and tappets on the road-bed for actuating said tappet-wheel.

3. The combination of the pivoted receiving and delivery arm, the sliding door of the car, having an operating-cam for said arm, a lever connected to the door, a tappet-wheel hung to the car, means for transmitting the movement of said wheel to the door-operating lever, and tappets on the road-bed movable into and out of engagement with said tappet-wheel.

4. The combination of the car, having a pivoted bag receiving and delivery arm, a tappet-wheel hung to the car, mechanism whereby the movement of said tappet-wheel is transmitted to the bag receiving and delivery arm, a platform-post having a movable bag receiving and delivery arm, tappets for acting upon the tappet-wheel of the car, and means for connecting the said tappets to the arm of the platform-post, whereby the movement of the latter effects the movement of the tappets into and out of operative position, all substantially as described.

5. The combination of the platform-post and its bag receiving and delivery arm, a catch for retaining said arm, a car having a pivoted bag receiving and delivery arm, a projecting tappet-wheel hung to the car, mechanism whereby the movement of said tappet-wheel is transmitted to the pivoted arm on the car, tappets for operating the tappet-wheel, means for connecting said tappets to the arm of the platform-post, a tripper-arm connected to the catch-lever, and a projection on the car for operating said tripper, all substantially as described.

6. The combination of the platform-post with an arm having oppositely-projecting receiving and delivery fingers, one or both of which are bent downward and hooked at the outer end, as set forth.

7. The combination of the pivoted bag receiving and delivery arm, the door of the car having a cam for operating said arm, door-operating mechanism beneath the car, a lever made in two parts, one connected to the door and the other to the operating mechanism beneath the car, and means for locking together and unlocking the two parts of the lever.

387,421. SPRING-HINGE. Henry P. Kee, New York, N. Y. Filed Mar. 30, 1888. Serial No. 268,694. (No model.)

Claim.—1. In a spring butt-hinge, the combination, with the leaves and knuckles thereof, of a sectional tubular pintle, a spindle connecting said sections, and a spring surrounding the spindle within the sectional tubular pintle, substantially as herein shown and described.

2. In a spring butt-hinge, the combination, with the leaves provided with knuckles, of a sectional tubular pintle, a sectional and jointed spindle connecting the said sections, and a spring surrounding the spindle within the tubular pintle, substantially as herein shown and described.

3. In a butt-hinge, the combination, with the leaves and knuckles thereof, of a sectional tubular pin or pintle, a divided spindle having one section revolving upon the other, the outer ends of which spindle are held in the respective pintle-section, and a spring held upon said spindle and controlled thereby, substantially as shown and described.

4. In a spring butt-hinge, the combination, with the leaves and knuckles, of a sectional tubular pin or pintle, a divided spindle having one section revolving upon the other, the outer ends of which spindle are held in the respective pintle-sections, a spring held upon said spindle and controlled thereby, and means, substantially as shown and described, for retaining the spring in a contracted position, as and for the purpose specified.

387,422. GAME-COUNTER. Ferdinand King, New York, N. Y. Filed Jan. 26, 1888. Serial No. 261,961. (No model.)

Claim.—1. A game-keeper consisting of a disk divided into sections, provided with an annular projection or ring approximating the periphery, having a series of corresponding numbers produced thereon, one series for each section, and independent hands pivoted centrally upon the disk, to be below the outer face of the ring or projection, substantially as and for the purpose herein set forth.

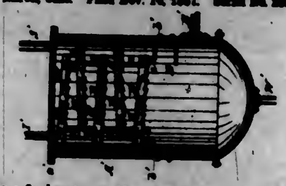
2. In a game-keeper, the combination, with a disk divided into equal sections and provided with an annular recessed projection or ring approximating the periphery, having a series of corresponding numbers produced thereon, one series for each section, of independent hands pivoted centrally upon the disk, the faces whereof are below the outer face of the ring or projection, substantially as and for the purpose specified.

3. In a game-keeper, the combination, with a disk divided into equal sections and provided with an annular recessed projection or ring approximating the periphery, having a series of corresponding numbers produced thereon, one series for each section, of independent hands pivoted centrally upon the disk, the faces whereof are below the outer face of the ring or projection, guide-lines produced upon the disk opposite each number, and auxiliary lines intervening said guide-lines, substantially as and for the purpose specified.

387,423. TETHER. Lewis J. King, Fair Play, S. C. Filed June 21, 1888. Serial No. 277,300. (No model.)

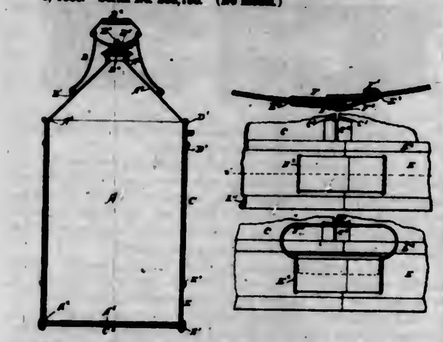
Claim.—1. In a grazing device, the combination, with the vertical post or standard having its lower end reduced or sharpened, and its upper end provided with the detachable head, of the revolving bracket carrying the lever mounted upon the said post or standard, a sliding collar or sleeve provided with a set-screw and adapted to raise or lower a plate loosely mounted upon the post or standard, and the said plate connected with the adjacent end of the lever by means of a coiled spring, substantially as specified.

2. In a cattle-grazing device, the combination, with a vertical post or standard adapted to be driven into the ground, of a revolvable bracket mounted on the said post, a lever pivoted to the bracket, a sliding sleeve on the post, carrying an adjustable fastening device, a loose plate on the post, and a spiral spring connecting one end of the lever with said plate, substantially as specified.



387,424. WINDMILL. Bernhard Kompff, Kearney, Nebr. Filed Mar. 19, 1888. Serial No. 267,657. (No model.)

Claim.—1. In a windmill, a casing inclosing the wind-wheel and composed of sides hold to swing and connected with each other by arms, in combination with two ropes connected at their ends with two of the said arms, a fixed arm carrying pulleys over which pass said ropes coming from opposite directions, and a lever fulcrumed in the said post and to which said ropes are connected at opposite ends, substantially as shown and described.



2. In a windmill, the combination, with a wind-wheel having angular wings, of a casing inclosing the wind-wheel and composed of sides hold to swing and connected with each other by arms, two ropes connected at their ends with two of the said arms, a fixed arm carrying pulleys over which pass the said ropes coming from opposite directions, and a lever fulcrumed in the said post and to which the said ropes are connected at opposite ends, substantially as shown and described.

387,425. FEED-WATER PURIFIER. J. Henry Kerns and Lewis A. Smith, Akron, Ohio. Filed Nov. 14, 1887. Serial No. 255,078. (No model.)

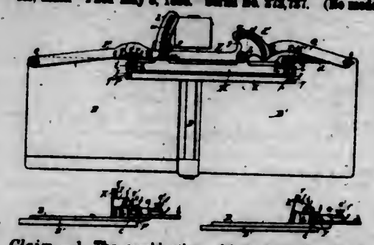
Claim.—In a feed-water purifier, the combination, with a closed vessel having pipes for the entrance of steam and feed-water and for the exit of purified water and sediment, of a series of troughs inclosed therein, each trough closed at one end and open at the other, and each having a cross-partition near the closed end lower than its sides, said troughs being placed one above another and each inclined from its closed end, the upper trough being arranged to receive the feed-water in its closed end above its cross-partition, and it and each succeeding trough, excepting the lowest, arranged to discharge the water into the closed end of the next lower trough above its cross-partition, substantially as and for the purpose hereinbefore set forth.

387,426. OIL-CAN. George W. Lane, Rockford, Ill. Filed Mar. 8, 1888. Serial No. 266,782. (No model.)

Claim.—1. In combination, the herein-described can-body provided with upper and lower outwardly-projecting annular retaining-flanges for retaining jacket-hoops on the can-body, the cylindrical can-jacket, and circular bottom, the upper jacket-hoop provided at the upper portion thereof with an annular groove of suitable size to admit and contain the upper retaining-flange of the can-body and furnished at the lower portion thereof with an outwardly-extending offset, open below, of proper dimensions to admit and securely retain therein an end of the can-jacket, and the lower jacket-hoop provided at the lower portion thereof with an annular groove of suitable size to admit and contain the lower retaining-flange of the can-body and peripheral portion of the jacket-bottom and furnished at the upper portion thereof with an outwardly-extending offset, open above, of proper dimensions to admit and securely retain therein an end of the can-jacket, substantially as described, and for the purpose specified.

2. In combination, the jacket-hoop having an annular groove, E', therein, and provided with an outwardly-extending offset, E², tie-slots E³, and hoop-tie F, consisting of a folded strip of metal having the hook F' in one of the slots E³ in said hoop, the long end F² of the tie arranged between the end portions of the hoop and in the remaining slot therein and the hoop-joint, the short end F³ of the hoop-tie being secured thereto by solder or other means, substantially as set forth.

387,427. SEA-GUIDING APPARATUS. Jens F. C. Larsen, Copenhagen, Denmark. Filed Sept. 20, 1887. Serial No. 250,155. (No model.)

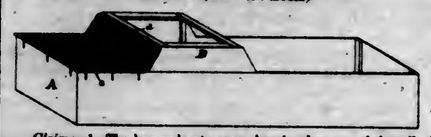


Claim.—1. A compressible oil-distributer comprising a flexible pervious bag open at both ends, a rigid apertured cover secured to said open ends and provided with devices for closing said apertures or openings, compressible oil-absorbent material filling the bag through-

out from side to side, and the suspending rope or cable, whereby interior cans and oil-vessels are dispensed with and a full compression of the bag by the force of the waves allowed to force the oil out through the apertures in the cover, substantially as hereinbefore shown and described.

2. An oil-distributer consisting in a bag, A, having covers C E secured to its opposite open ends provided with screw-caps D F, respectively, and opposite eyes, the compressible filling of oil-absorbent material B, and the rope or chains G, passing freely through the upper eyes and secured to the lower eyes, whereby the upper eyes may slide freely on said ropes or suspending devices during the longitudinal compression and expansion of the bag, substantially as set forth.

387,428. ADJUSTABLE GUIDE FOR RUNE-PLANERS AND OTHER WOOD-WORKING MACHINES. Benjamin C. Lovell, Worcester, Mass. Filed May 3, 1888. Serial No. 272,737. (No model.)



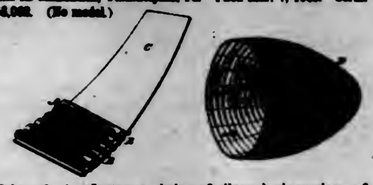
Claim.—1. The combination, with the lever F, pivoted to the table of a wood-working machine, of the lever G, pivoted to the lever F and having the lateral position of its outer end controlled in a guide, *d*, means for clamping the lever G to the lever F, the lever H, pivoted to the lever F and provided with the face-plate K, and means for clamping the lever H to the lever F, substantially as described.

2. The combination, with the lever F, pivoted to the table of a wood-working machine, of the lever G, pivoted to the lever F and having the lateral position of its outer end controlled by means of a guide, *d*, means for clamping the lever G to the lever F, the lever H, pivoted to the lever F, the opposite clamping-hooks I I, and the face-plate K, provided with locking-ribs, and means for tightening the hooks upon the locking-ribs to clamp the face-plate in various positions, substantially as described.

3. The combination, with the lever F, pivoted to the table of a wood-working machine, of the lever G, pivoted to the lever F and having the lateral position of its outer end controlled by means of a guide, *d*, means for clamping the lever G to the lever F, the lever H, pivoted to the lever F and provided with the perforated ears *h*, means for clamping the lever H to the lever F, the opposite clamping-hooks I I, provided with the perforations *s*, the face-plate K, and the pin *t*, for holding the face-plate K in a position at right angles to the surface of the table of the machine, substantially as described.

4. The combination, with the pivoted adjustable lever H, of the opposite clamping-hooks I I, the face-plate K, provided with locking-ribs, and means for tightening the clamp-hooks upon the locking-ribs to clamp the face-plate in various positions, substantially as described

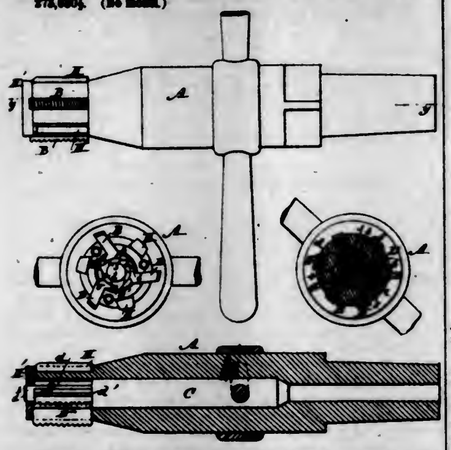
387,429. BUGGY-BOOT. James A. Mansfield, Waverly, Md. Filed May 31, 1888. Serial No. 274,492. (No model.)



Claim.—1. The buggy-boot cover herein shown and described, consisting of flexible material *g*, having border edges *h*, made stiff by the insertion of suitable stiffening material, *h'*, which is omitted at or near the middle of each edge, thereby to form a folding break, *j*, whereby the cover may be folded, as set forth.

2. The combination of the carriage-body walls provided in the edge with sockets *b*, the base-bar back of the seat, provided with turn-buttons *c*, and a flexible boot-cover, F, having slits *d'*, to take over

the tern-buttons, and provided with pins *i*, attached by their heads to the cover, said pins being adapted to enter the sockets, as set forth.



387,480. REFLECTOR AND REFLECTING-CHANDELIER. WILLIAM H. MARSHALL, Philadelphia, Pa. Filed Mar. 7, 1888. Serial No. 266,092. (No model.)

Claim.—1. A reflector consisting of silvered glass tubes, a foundation, and fastening-wires, all substantially as described.

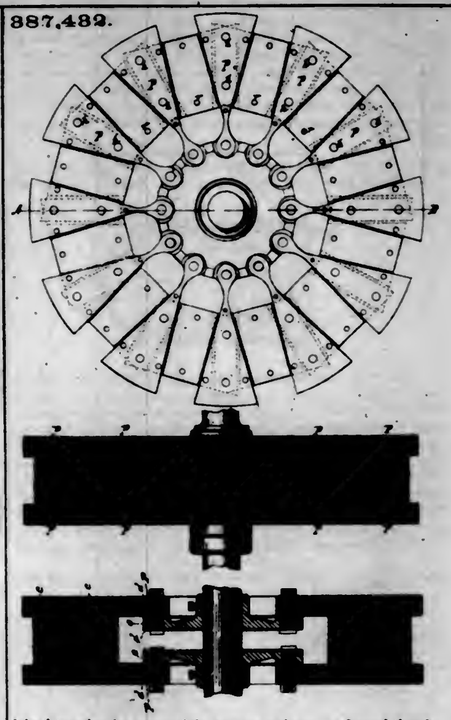
2. A reflector consisting of the silvered glass tubes A, the foundation C, and the wires B, securing said tubes together and to the foundation, substantially as described.

387,481. EXPANSIBLE AND COLLAPSIBLE SCREW-TAP. WILLIAM MATHER, New York, N. Y. Filed May 12, 1888. Serial No. 273,603. (No model.)

Claim.—1. The combination, with the lipped cutting-dies, of a winged cam for adjusting the said cutting-dies inwardly and outwardly, substantially as shown and described.

2. The combination, with a mandrel and a spindle rotating in the same provided with a winged cam at one end, of lipped cutting-dies held in said spindle, said dies being carried outward and inward by said cam, substantially as shown and described.

3. The combination, with a mandrel, a spindle rotating in the same, a winged cam integral with one end of said spindle, and a sectional handle passing through the spindle and mandrel, of lipped cutting-dies held in the mandrel in engagement with the cam, substantially as shown and described.



4. The combination, with a mandrel and a spindle held to rotate in the same provided with a series of longitudinal under-cuts in the cutting end forming the cam-shoulder 2, the re-entering inclined surface 3, the V-shaped recess 4, the inclined surface 5, and the wings *d*, of cutting-dies held in the mandrel provided with a longitudinal lip upon one side and having inclined and concaved inner edge, substantially as and for the purpose specified.

387,482. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. ALEXANDER W. MEEBER, St. Louis, Mo. Filed Dec. 7, 1887. Serial No. 257,240. (No model.)

Claim.—1. A flat ring-armature composed of laminated sections, having one or more coils of wire wound on each section, any of such sections being detachable, said sections composed of alternate long and short plates fitting and joined together by means of the tongues and recesses formed thereby, substantially as and for the purposes specified.

2. A flat ring-armature composed of laminated sections, the laminæ thereof being insulated from each other, having one or more coils of wire wound on each section, any of such sections being detachable, said sections composed of alternate long and short plates, fitting and

887,482.

joined together by means of the tongues and recesses formed thereby, substantially as and for the purposes specified.

3. A flat ring-armature composed of laminated sections, having one or more coils of wire wound on each section, any of such sections being detachable, said sections fitting together by means of tongues and recesses, in combination with a spider and detachable magnetic pole-pieces, by means of which the armature-ring is mounted on the spider, substantially as and for the purposes specified.

4. A flat ring-armature composed of laminated sections, the laminæ thereof being insulated from each other, having one or more coils of wire wound on each section, any of such sections being detachable, said sections fitting and joined together by tongues and recesses, in combination with a spider and detachable magnetic pole-pieces, substantially as and for the purposes specified.

5. A flat ring-armature composed of laminated sections, having one or more coils of wire wound on each section, any of the such sections being detachable, said sections fitting and joined together by tongues and recesses, in combination with a spider and detachable magnetic pole-pieces, said pole-pieces being insulated from the spider, substantially as and for the purposes specified.

6. A flat ring-armature composed of laminated sections, the laminæ thereof being insulated from each other, having one or more coils of wire wound on each section, any of such sections being detachable, said sections fitting and joined together by tongues and recesses, in combination with a spider and detachable magnetic pole-pieces, said pole-pieces being insulated from the spider, substantially as and for the purposes specified.

7. A flat ring-armature composed of laminated detachable sections having flanged outer plates, and having one or more coils of wire wound thereon, said sections fitting and joined together by tongues and recesses, substantially as and for the purposes specified.

8. A flat ring-armature composed of laminated detachable sections, the laminæ thereof insulated from each other, provided with flanged outer plates, having one or more coils of wire wound thereon, said sections fitting and joined together by tongues and recesses, substantially as and for the purposes specified.

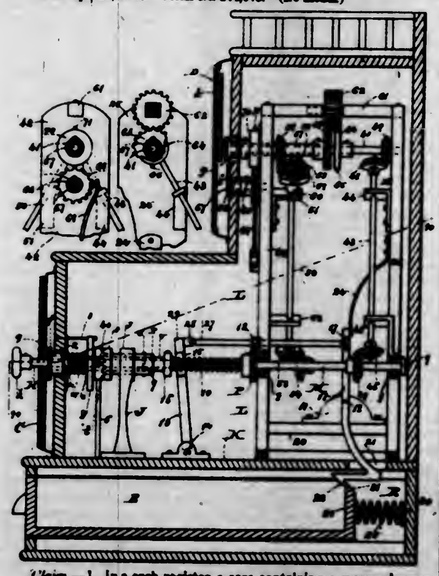
9. A flat ring-armature composed of laminated detachable sections, provided with flanged outer plates, and having one or more coils of wire wound thereon, said sections fitting and joined by tongues and recesses, in combination with a spider and detachable magnetic pole-pieces, by means of which the ring is mounted on the spider, substantially as and for the purposes specified.

10. A flat ring-armature composed of laminated detachable sections, the laminæ thereof insulated from each other and the outer plates flanged, said sections fitting and joined by tongues and recesses, and having one or more coils of wire wound thereon, in combination with a spider and detachable magnetic pole-pieces, by means of which the ring is mounted on the spider, substantially as and for the purposes specified.

11. A flat ring-armature composed of laminated detachable sections, fitting and joined together by tongues and recesses, having flanged outer plates, one or more coils of wire wound thereon, in combination with a spider and detachable magnetic pole-pieces, by means of which the ring is mounted on the spider, said pole-pieces being insulated from the spider, substantially as and for the purposes specified.

12. A flat ring-armature composed of laminated detachable sections, joined and fitted together by tongues and recesses, the laminæ thereof insulated from each other, the sections having flanged outer plates and having one or more coils of wire wound thereon, in combination with a spider and detachable magnetic pole-pieces, said pole-pieces being insulated from the spider, substantially as and for the purposes specified.

13. In a flat ring-armature, the combination of detachable laminated core-sections, a spider, and detachable laminated pole-pieces, by means of which the ring is mounted on the spider, substantially as and for the purposes specified.



14. A dynamo-armature section composed of laminæ, the outer plates of the laminæ being flanged, said shield-plates which are arranged between the flanged plates and cover the edges of the laminæ, substantially as and for the purposes specified.

15. A dynamo-armature section composed of laminæ, having its outer plates flanged for the coil, and flanged shields to cover the edges of the laminæ and complete the coil-flanges, substantially as and for the purposes specified.

16. The combination, in an armature, of a laminated core, two independent or separate spiders, and two independent sets of pole-pieces which connect the respective spiders with opposite sides of the laminated core, substantially as and for the purposes specified.

17. The combination in an armature, of laminated core-sections, two independent or separate spiders, and two independent sets of laminated pole-pieces which connect the opposite sides of the core-sections with their respective spiders, substantially as and for the purposes specified.

387,483. CASH-REGISTER. HARRIS A. MILES, Boston, Mass. Filed Apr. 26, 1886. Serial No. 271,973. (No model.)

Claim.—1. In a cash-register, a case containing a money-drawer, a dial on said case for indicating the amount of the sale in cents, an index-finger, a knob for turning said finger, adjunctive mechanism for releasing and forcing out said drawer when said knob is pressed inward, and a spring acting torsionally for returning said finger to the 0 when said knob is pulled outward, all being combined substantially as set forth.

2. In a cash-register, a case containing a money-drawer, a dial for indicating the amount of a single sale in dollars, a dial for indicating the amount of a single sale in cents, an index-finger on each dial, a knob for turning each finger, adjunctive mechanism for releasing and forcing out the money-drawer when either of said knobs is pressed inward, and means for automatically returning said fingers to the 0 point when the corresponding knob is pulled out, all being combined substantially as described.

3. In a cash-register, a case containing a money-drawer, a dial for indicating the amount of a single sale in cents, a dial for indicating the amount of a single sale in dollars, an index-finger for each of said dials, knobs for turning said fingers, a dial provided with three hands for registering the gross amount in dollars and cents of the total sales, adjunctive mechanism for correspondingly moving said hands when said knobs are turned, means for releasing and forcing said drawer outward when either of said knobs is forced inward, and means for automatically returning said fingers to the 0 point when the corresponding knob is pulled out, all being combined substantially as set forth.

4. In a cash-register, a case, a dial, a rod passing through the center of said dial and provided with a knob on its outer end, a sleeve inclosing said rod and having an index-finger on its outer end and a crown-gear on its inner end, a sleeve secured to the inner end of said rod and fitted to slide in a containing-sleeve journaled in a standard in said case, a crown-gear on said containing-sleeve intermeshing with the corresponding gear on said inclosing-sleeve, a coiled spring disposed between the case and the gear on said inclosing-sleeve to keep said gears engaged, and a spring secured to the case and to the gear on said inclosing-sleeve, said spring being adapted to revolve said sleeve when said gears are separated by withdrawing said rod, and a stop for preventing the inclosing-sleeve from being rotated too far, all being combined substantially as described.

5. In a cash-register, a case provided with a cash-drawer, a vertically-arranged lever pivoted in standards in said case and provided with a hook on its lower end for detachably locking said drawer in said case, a spring for holding said hook in engagement with said drawer, a spring for forcing said drawer out of the case when released from said hook, and adjunctive mechanism for moving said lever to release the drawer when a sale is registered, all being combined substantially as set forth.

6. In a cash-register, a case containing a cash-drawer, a vertically-arranged lever pivoted in a frame-work in said case and provided with a hook on its lower end for locking said drawer in the case, a spring for holding said hook in engagement with said drawer, a spring for opening the drawer when released, a horizontally-arranged bar pivoted to pivoted standards for engaging the top of the lever and overcoming the lever-spring to release the drawer, and adjunctive mechanism for forcing said horizontal rod into engagement with said lever, all being combined substantially as described.

7. In a cash-register, a case provided with a cash-drawer and indicating-dial, a rod provided with a knob and passing through the center of said dial; said rod being journaled by means of sleeves in a standard within said case, a collet secured to the outer end of one of said sleeves, a pivoted vertically-arranged lever within said case provided with a hook for securing said drawer, a spring for holding said hook in engagement with said drawer, a horizontally-arranged bar pivoted to pivoted standards, said standards being adapted to be forced forward by the collet on said rod when pushed inward and cause said bar to engage said lever and release said drawer, a horizontally-arranged pivoted lever having an arm projecting into the path of said vertical lever and a pivoted arm projecting into the path of said collet to prevent said collet from engaging said standards excepting at specified times, adjunctive mechanism for throwing said pivoted arm out of the path of said collet, and a spring for opening said drawer when released from said vertical lever, all being combined substantially as set forth.

8. In a cash-register, a case provided with a dial for indicating the amount of a single sale and with a dial for registering the gross sales, a horizontal shaft passing through the center of said registering-dial and journaled in a frame within said case, a hand secured to the outer end of said shaft for registering the amount in cents of the gross sales, a vertically-arranged inclined shaft journaled in said frame and provided with a beveled gear engaging a gear on said shaft, a horizontal rod journaled in said frame and provided with a beveled gear intermeshing with a gear on the lower end of said inclined shaft, adjunctive mechanism for connecting said rod with a rod passing through the center of said indicating-dial, a finger for said indicating-dial, and a knob for rotating the rod which passes through said indicating-dial, all being combined substantially as described.

9. In a cash-register, a case provided with a dial for indicating the amount of a single sale and a dial for registering the gross sales, a horizontal shaft passing through the center of said registering-dial, a hand on the outer end of said shaft, a sleeve adapted to rotate on said shaft, a hand on the outer end of said sleeve for registering the

amount in dollars of the gross sales, a gear-wheel journaled within the case above said shaft and intermeshing with a gear on the inner end of said sleeve, a wheel on said shaft provided with a stud adapted to engage a tooth in the upper gear, adjunctive mechanism for rotating said shaft, said mechanism being actuated by a rod passing through said indicating-dial, whereby the hand on the outer end of said sleeve is moved one space at each complete revolution of said rod, all being combined and arranged to operate substantially as set forth.

10. In a cash-register, a case provided with a dial for indicating the amount of a single sale and a dial for registering the gross sales, a horizontal shaft passing through the center of said registering-dial, a sleeve adapted to rotate on said shaft, a hand on the outer end of said sleeve for registering the amount in dollars of the gross sales, a beveled gear on said sleeve intermeshing with a gear on an inclined shaft, adjunctive mechanism for rotating said shaft, said mechanism being actuated by a rod provided with an index-finger and passing through the center of said indicating-dial, whereby said hand is moved a distance corresponding with the distance said finger is advanced, all being constructed, combined, and arranged to operate substantially as set forth.

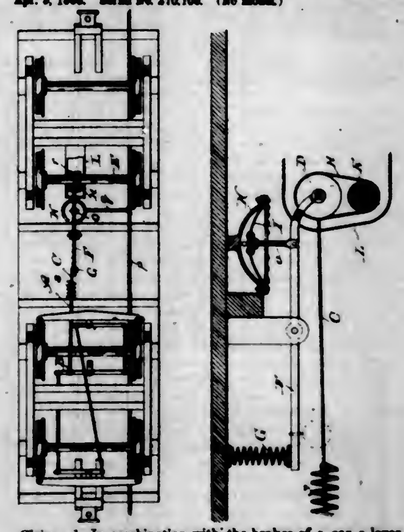
11. In a cash-register, a case provided with a dial for indicating the amount of a single sale, a dial for registering the gross sales, a horizontal shaft passing through the center of said registering-dial and provided with a hand for registering cents on said dial, a sleeve on said shaft provided with a hand for registering single dollars on said dial, a journaled stub-shaft passing through the center of a small circle on said registering-dial which records the amount by tens in dollars of the gross sales, a sleeve on said stub-shaft provided with a hand on its outer end for said small circle and a ratchet on its inner end, a spring-pawl engaging said ratchet to prevent it from turning in one direction, a wheel secured to the sleeve on said central shaft, said wheel being provided with a stud adapted to engage said ratchet and move it the distance of a tooth, and adjunctive mechanism for causing said sleeve to rotate, said mechanism being actuated by a rod passing through the center of said indicating-dial, all being combined and arranged to operate substantially as described.

12. In a cash-register, the case A, provided with the dial C, the rod H, provided with the knob *k*, the sleeve *m*, having the finger *f* and crown-gear *t*, the coiled spring *w*, disposed on said sleeve, the sleeve *r*, disposed in the standard J and provided with the gear *s*, intermeshing with the gear *t*, the sleeve *v*, pinned to said rod and fitted to slide in the sleeve *r*, and the spring *y*, secured to the gear *t*, and case A, whereby the sleeve *m* may be caused to rotate when the gears *t s* are disengaged by pulling outward on the knob, all being combined and arranged to operate substantially as set forth.

13. In a cash-register, the case A, having the drawer E, the sleeve *r*, disposed in the standard J, the sleeve *v*, fitted to slide in the sleeve *r* and provided with the slot 7, the rod H, secured in the sleeve *v* and provided with the knob *k*, the rod M, disposed in the sleeve *v* and secured to the sleeve *r*, the ratchet P, secured to the rod M, the pawl 12, engaging said ratchet, the spring 10, disposed on the rod M between the sleeve *v* and said ratchet, the vertical lever 17, pivoted in said case and provided with the hook 22 for locking said drawer, the spring 24 for keeping said hook in engagement with said drawer, adjunctive mechanism adapted to be actuated by the rod H when pressed inward for releasing the drawer from said hook, and the spring 26, for opening said drawer when released, all being combined to operate substantially as set forth.

14. In a cash-register, the case A, provided with the dials B C *b* and the drawer E, the frame-work L, disposed in said case, the lever 17, pivoted in said frame and having the hook 22, adapted to engage and lock said drawer, the spring 24, for holding said hook engaged with said drawer, the rod 27, pivoted to the bar 15, secured to pivoted standards 13, for disengaging the hook 22 from said drawer, rods passing through said dials B C and provided with collets adapted to engage the bar 15 and force the rod 27 against the lever 17 to release said drawer, and the spring 26, for opening the drawer when released, substantially as described.

15. In a cash-register, the case A, provided with the dials B C and drawer E, the frame-work L, the pivoted lever 17 and spring 24, for securing said drawer, the pivoted bar 27, adapted to be forced against said lever and release the drawer, a rod passing through said dials and provided with a collet adapted to force the bar 27 against said lever 17, the pivoted lever 32, having an arm, 35, projecting into the path of the lever 17, and a pivoted arm, 37, projecting into the path of said collet, adjunctive mechanism connected with said rod for throwing the arm 37 out of the path of said collet and the arm 35 into the path of the lever 17 when said rod is rotated, and the spring 26, for opening said drawer when released, all being combined and arranged to operate substantially as set forth.



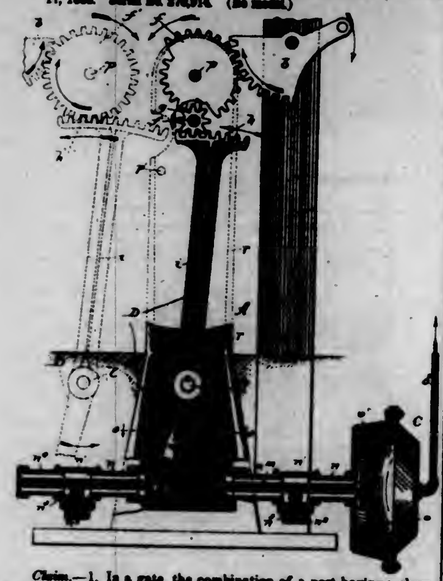
16. In a cash-register, the combination of the case A, provided with the dials C D, the frame L, disposed in said case, the shaft 41, journaled in said frame and provided with the hand *h* and gear 49, the inclined shaft 43, journaled in said frame and carrying the gears 48 and 46, the rod M, provided with the gear 47, the rod H, having the knob *k* and connecting mechanism for causing the rod M to rotate when the knob *k* is turned, whereby the hand *h* may be moved, substantially as described.

17. In a cash-register, the combination of the case A, having the dials C D, the frame L, the shaft 41, journaled in said frame and provided with the hand A, the sleeve 57, disposed on said shaft and provided with the hand *g*, the gear 62, journaled in said frame, the gear 63 on said sleeve, the wheel 64, provided with the stud 65, secured to said shaft, and adjunctive mechanism connecting said shaft and a rod passing through the dial C, whereby said shaft and sleeve may be rotated when said rod is turned, substantially as set forth.

18. In a cash-register, the combination of the case A, provided with the dials C D, the frame L, the shaft 41, journaled in said frame and provided with the hand A, the sleeve 57, disposed on said shaft and provided with the hand *g*, and wheel 70, having the stud 71, the shaft 66, the sleeve 67, disposed on said shaft and provided with the hand *i*, the ratchet-wheel 68, secured to said sleeve, the spring-pawl 69, engaging said ratchet-wheel, the inclined shaft 50, journaled in said frame and provided with the gear 55, intermeshing with the gear 56 on the sleeve 57, the rod M, provided with the gear 54, intermeshing with a gear on the shaft 50, the rod G, passing through the dial B, and connecting mechanism whereby the hands *g i* may be caused to turn when said rod G is rotated, substantially as described.

19. In a cash-register, the combination of the case A, having the dials C D, the frame L, the shaft 66, the sleeve 67, disposed on said shaft and provided with the hand *i* and ratchet 68, the pawl 69, the shaft 41, journaled in said frame and provided with the hand A, gear 49, and wheel 64, having the stud 65, the gear 62, journaled in said frame, the sleeve 57, disposed on the shaft 41 and provided with the hand *g*, and wheel 70, having the stud 71, the gear 63, disposed on the sleeve 57 and intermeshing with the gear 62, the rod H, passing through the dial C, and mechanism for connecting said rod and the gear 49, whereby the hands *g h i* may be caused to turn when said rod is rotated, substantially as set forth.

387,484. CAR-BRAKE. Mortimer B. Mills, Chicago, Ill. Filed Apr. 9, 1888. Serial No. 270,106. (No model.)



Claim.—1. In combination with the brake of a car, a lever, F, fulcrumed below the car, a rotatory drum, D, supported on the lever adjacent to and permanently out of contact with an axle of the rolling-gear, and connected by a cable or chain, C, with the brake-lever mechanism, a band or belt, H, surrounding the drum and axle, a spring, G, or weight on the lever near one end thereof, and a collapsible receiver supported on the car and having its movable portion connected with the lever near its opposite end and communicating with the air-pressure supply, substantially as described.

2. In combination with the brake of a car, a lever, F, fulcrumed below the car, a rotatory drum, D, having a grooved portion, *r*, supported on the lever adjacent to and permanently out of contact with an axle, E, of the rolling-gear, and connected by a cable or chain, C, with the brake-lever mechanism, a band or belt, H, surrounding the

drum and axle, a housing, L, for the band or belt, a spring, G, or weight on the lever near one end thereof, and a diaphragm device, I K, connected with the lever near its opposite end and communicating with the air-pressure supply, substantially as described.

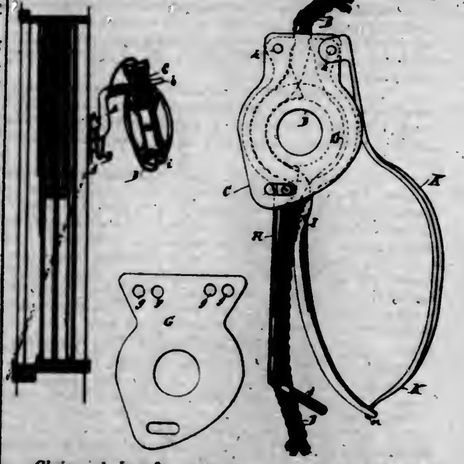
387,485. GATE. Mortimer B. Mills, Chicago, Ill. Filed Apr. 17, 1888. Serial No. 270,914. (No model.)

Claim.—1. In a gate, the combination of a post having a chamber in its base embedded in the ground and supporting a swinging arm having a cog-wheel upon its shaft, a horizontally-reciprocating rod extending through the chamber and inclosed against the access to it of water, and a bell-crank having one arm within the chamber engaging with the rod and its other arm without the chamber, and provided at its extremity with a rack engaging with the cog-wheel, substantially as described.

2. In a gate, the combination of a post formed of two bars, *r* and *r'*, embedded at their bases in the ground, a water-tight chamber, *q*, on the bar *r*, a swinging arm supported between the said bars on a shaft carrying a cog-wheel, a horizontally-reciprocating rod, *m*, extending through the chamber *q* and inclosed beyond the chamber in a water-tight conduit containing rollers n^2, and a bell-crank having one arm within the chamber engaging with the rod and its other arm without the chamber, and provided at its extremity with a rack engaging with the cog-wheel, substantially as described.

3. In a gate, the combination of a post formed of two bars, *r* and *r'*, embedded at their bases in the ground, a water-tight chamber, *q*, on the bar *r*, a swinging arm supported between the said bars on a shaft carrying a cog-wheel, a horizontally-reciprocating rod, *m*, extending through the chamber *q* and inclosed beyond the chamber in a water-tight conduit formed in sections connected by T-joints *n'*, having plugs n^2 in their bases supporting rollers n^3, and a bell-crank having one arm within the chamber engaging with the rod and its other arm without the chamber, and provided at its extremity with a rack engaging with the cog-wheel, substantially as described.

4. In a gate having posts supporting vertically-swinging arms tied together overhead to ensure the rise or fall of one arm to raise or lower simultaneously the other, the combination of posts A and A', having chambers *q* in their bases embedded in the ground and supporting swinging arms B and B', cog-wheels *f* and *f'* on the axes of the arms, a pinion, *g*, engaging with the cog-wheel *f*, horizontally-reciprocating rods *m*, extending through the chambers in the posts and inclosed against the access to them of water, bell-cranks D and D', having arms *k* in the chambers, engaging with the rods *m*, and having their other arms without the chambers and provided at their extremities with racks *h* and *h'*, respectively engaging with the pinion *g* and cog-wheel *f'*, collapsible receivers C, connected with the rods *m* and communicating with a suitable air-pump, posts E and E', respectively adjacent to the gate-posts, and racks *b*, pivotally supported on the posts E and E' and respectively engaging with the cog-wheels *f* and *f'*, and connected overhead to cause the rise or fall of one gate-arm to raise or lower the other, substantially as described.



5. In a gate having posts supporting vertically-swinging arms tied together overhead to ensure the rise or fall of one arm to raise or lower simultaneously the other, the combination of posts A and A', having chambers *q* in their bases embedded in the ground, and supporting swinging arms B and B', a cog-wheel, *f'*, on the axis of the arm, a cog-wheel, *f*, reduced in diameter throughout a portion of its periphery on the axis of the other gate-arm, a pinion, *g*, engaging with the cog-wheel *f*, horizontally-reciprocating rods *m*, extending through the chambers in the posts and inclosed against the access to them of water, bell-cranks D and D', having arms *k* in the chambers, engaging with the rods *m*, and having their other arms without the chambers and provided at their extremities with racks *h* and *h'*, respectively engaging with the pinion *g* and cog-wheel *f'*, and collapsible receivers C, connected with the rods *m* and communicating with a suitable air-pump, substantially as described.

6. In a gate having vertically-swinging arms on posts, the combination, with the arms and posts, of cog-wheels on the axes of the arms, posts E and E', respectively adjacent to the gate-posts, and racks *b*, pivotally supported on the posts E and E', and respectively engaging with the said cog-wheels and connected overhead to cause the rise or fall of one gate-arm to raise or lower the other, substantially as described.

7. In a gate having vertically-swinging arms on posts, the combination, with the arms and posts, of cog-wheels on the axes of the arms, posts E and E', respectively adjacent to the gate-posts, racks *b*, pivotally supported on the posts E and E' and respectively engaging with the said cog-wheels, double bell-cranks F and F', pivoted on the posts E and E', near their upper ends, and having their arms *c'* connected with the racks *b*, and cables *d* and *d'*, crossing each other and connecting opposite arms *c* and *c'* of the bell-cranks, substantially as described.

8. A gate comprising, in combination, posts A and A', having chambers *q* in their bases, embedded in the ground and supporting swinging arms B and B', cog-wheels *f* and *f'* on the axes of the arms, a pinion, *g*, engaging with the cog-wheel *f*, horizontally-reciprocating rods *m*, extending through the chambers in the posts and inclosed against the access to them of water, bell-cranks D and D', having arms *k* in the chambers, engaging with the rods *m*, and having their other arms without the chambers and provided at their extremities with racks *h* and *h'*, respectively engaging with the pinion *g* and cog-wheel *f'*, collapsible receivers C, connected with the rods *m* and communicating with a suitable air-pump, posts E and E', respectively adjacent to the gate-posts, and racks *b*, pivotally supported on the posts E and E' and respectively engaging with the cog-wheels *f* and *f'*, and connected overhead to cause the rise or fall of one gate-arm to raise or lower the other, substantially as described.

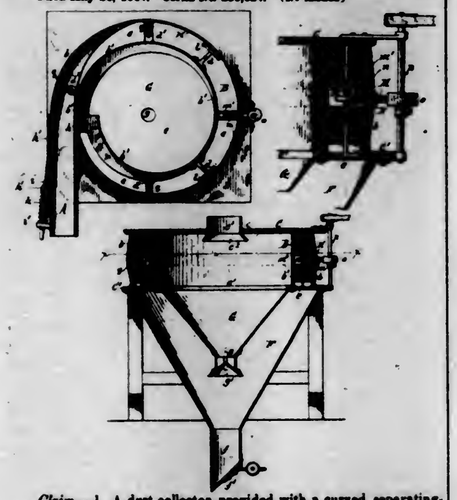
387,486. FIRE-ESCAPE. John K. O'Hern, Poughkeepsie, N. Y., assignor to Barney Neville, same place. Filed Nov. 21, 1887. Serial No. 255,752. (No model.)

Claim.—1. In a fire-escape, a suspending-hook, A, provided with a horn or extension, *b*, extending outward in a nearly horizontal direction from the outer extremity of the hook proper and adapted to support the clamp and whole coil of rope when the fire-escape is not in use, substantially as herein specified.

2. A suspending-hook for fire-escapes, having a triangular form in section, one flat side being horizontal at the top, substantially as and for the purpose herein specified.

3. In a fire-escape, a friction-clamp, C, having pressure-handles H I and pivots for the same adjustable toward and from the rope, substantially as and for the purpose herein specified.

4. The stationary handle having a central longitudinal rib on its inner bearing-surface, for the purpose herein specified.



5. The swinging handle having two oblique ribs on its inner bearing-surface, substantially as and for the purpose herein specified.

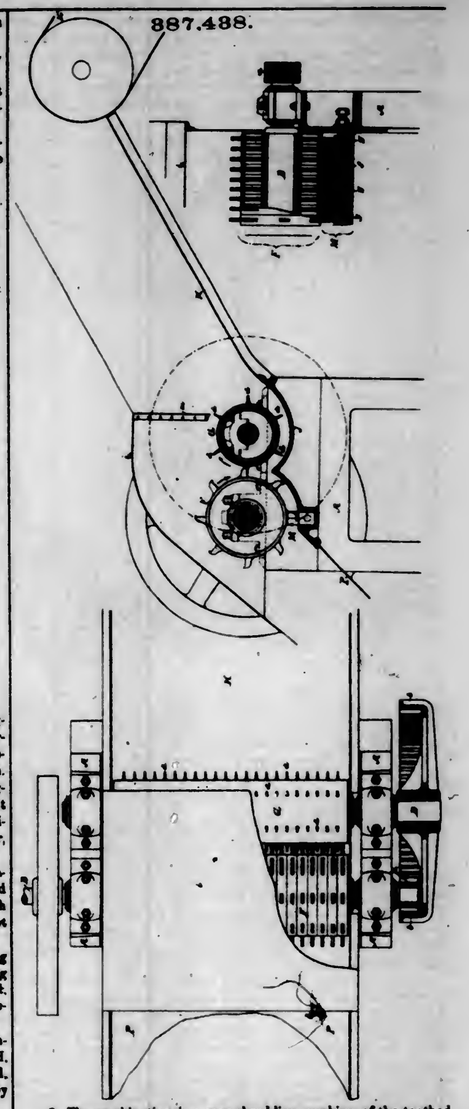
6. In combination with a friction-clamp, a shield, K, to protect the grasping hand, substantially as and for the purpose herein specified.

7. In a fire-escape friction-clamp, the combination, with the swinging handle, of a hand-shield, K, attached to and swinging with the handle, for the purpose herein specified.

387,437. DUST-COLLECTOR. Barnum F. Orthman, Buffalo, N. Y.

Filed May 23, 1887. Serial No. 239,037. (No model.)

Claim.—1. A dust-collector provided with a curved separating-case having an inner tight wall, an outer wall constructed of filter-cloth, and an air-exit through which the residue of the purified air escapes without passing through the filter-cloth, substantially as set forth.



2. In a dust-collector, the combination, with a curved separating-case having an outer wall constructed of filter-cloth and an inner tight wall, of a chamber surrounded by said separating-case and communicating therewith, and an air-exit formed in the top of said chamber, substantially as set forth.

3. In a dust-collector, the combination, with the curved separating-case having an outer wall constructed of filter-cloth, of a band bearing against the filter-cloth and an adjusting device connected with said band, whereby the filter-cloth is stretched, substantially as set forth.

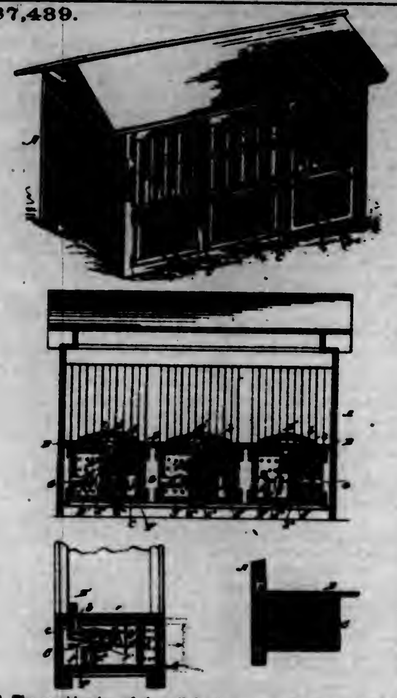
4. The combination, with the curved separating-case B, having its outer wall constructed of filter-cloth, of the band H, bearing against the cloth, a screw, *j*, connected with the band H, a spring, *k*, applied to said screw, and a fixed abutment, *i'*, and a screw-nut, *k'*, between which the spring is arranged, substantially as set forth.

5. The combination, with the curved separating-case B, constructed with an outer wall, *b*, of filter-cloth, of an elastic band, H, bearing against said cloth, a radial bolt, *m*, connected with said band, a cam, *o*, whereby said bolt is moved inwardly, and springs *q*, whereby the band is moved outwardly, substantially as set forth.

387,438. CANE-SHREDDING MACHINE. John Parker, Philadelphia, Pa. Filed Apr. 6, 1887. Serial No. 233,802. (No model.)

387,438.

Claim.—1. The combination, in a cane-shredding machine, of a toothed and rotating shredding-drum, a feed-cylinder having teeth overlapping those of the shredding-drum, means for rotating said cylinder so that its lower portion moves forward toward the drum, and a supply-chute directing the canes to the lower side of the toothed feed-cylinder and having a raised portion up which the canes must be carried by the teeth of the feed-cylinder before the teeth of the drum can act upon said canes, all substantially as specified.



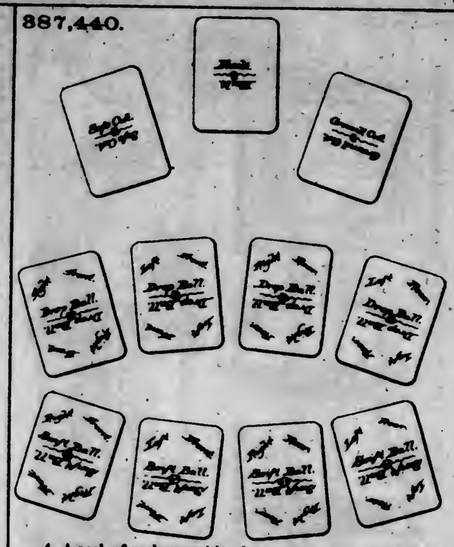
2. The combination, in a cane-shredding machine, of a toothed and rotating shredding-drum, a toothed shredder-bar, a feed-cylinder having pointed teeth projecting from the cylinder, point first, toward the canes, a feed-chute directing the canes to the under side of the feed-cylinder and forming a continuous support for the canes beneath said cylinder, and mechanism for so rotating the cylinder that the lower portion of the same moves forward toward the drum, all substantially as specified.

3. The combination, in a cane-shredding machine, of the toothed and rotating shredding-drum, the toothed shredder-bar, the toothed feed-cylinder, means for so rotating the latter that its lower portion moves forward toward the drum, and a feed-chute directing the canes to the under side of the feed-cylinder and having a raised portion up which the canes are carried before coming within range of the teeth of the shredder-drum, all substantially as specified.

387,439. CORN-CRIB RAT-TRAP. William R. Parker, Muddy Creek Forks, Pa. Filed Apr. 9, 1888. Serial No. 270,089. (No model.)

Claim.—1. The combination of the crib having a corn-chamber provided below the floor of said chamber with a way for the trap-box and having an opening leading from the corn-chamber and intersecting the way for the trap-box, such opening being adapted to permit the passage of the vermin, and the trap-box fitted to said way and movable therein into and out of position below the floor of the corn-chamber and having an inlet-opening movable into and out of register with the opening leading from the corn-chamber, substantially as and for the purposes specified.

387,439.



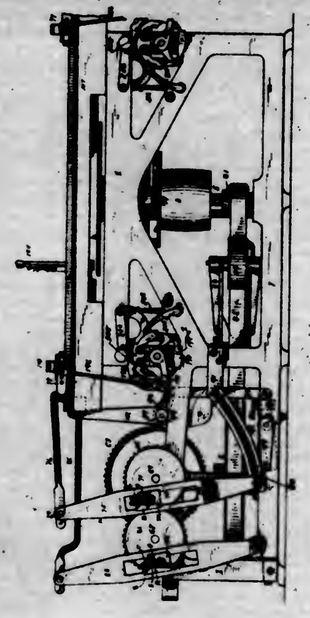
2. The combination of the crib having a corn-chamber provided below the same with a way for the trap-box and having an opening adapted to permit the passage of the vermin, such opening leading from the corn-chamber and intersecting the way for the trap-box, and the trap-box fitted to said way and movable into and out of position below the corn-chamber and provided with an inlet-opening movable into and out of register with the opening leading from the corn-chamber, and such trap-box also having a check-guarded inlet-opening leading into it from without the corn-chamber, substantially as and for the purposes set forth.

3. The combination of the corn-crib having a corn-chamber and provided below the same with a way for the trap-box, and having an opening leading from said corn-chamber and intersecting said way, and the trap-box movable in said way into and out of position below the corn-chamber and having in its top an inlet-opening which may be adjusted into register with the opening from the corn-chamber, and check-guarded inlet-openings being provided through the bottom and side of such box, substantially as set forth.

4. The combination of the crib having a corn-chamber provided with an opening leading from said chamber and having within said chamber a guard extended over the said opening, and the trap-box movable into and out of position below the corn-chamber and having an inlet-opening which may be adjusted into register with the opening leading from the corn-chamber, substantially as set forth.

5. The combination of the trap-box, the tube D, the pivoted drop-tube *d*, and the guard-plate E, arranged in front of the inner end of tube *d* and having stop projection *d'* on its side next the said tube *d* and a hook, *e*, on its opposite side, substantially as set forth.

387,440.

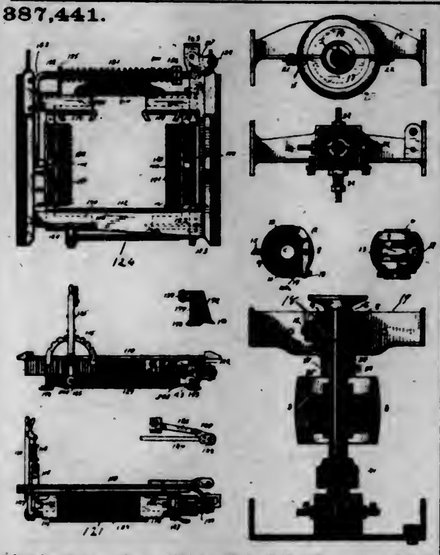


4. A pack of cards comprising five sets composed of four cards marked "Safe Cut," four marked "Ground Cut," eight marked "Fault," sixteen marked "Swift Ball," and sixteen marked "Drop Ball," and having each set of sixteen subdivided into four sets of four cards each, marked, respectively, "Right Front," "Left, Front," "Right Rear," and "Left Rear," substantially as and for the purpose set forth.

387,441. SHINGLE-SAWING MACHINE. Willis J. Pierce, Grand Rapids, Mich. Filed June 2, 1888. Serial No. 275,626. (No model.)

Claim.—1. In a shingle-sawing machine, the combination, with the saw-arbor, of a universally laterally-movable bearing near one end of said arbor and a universally rotarily-movable bearing near the other end of said arbor.

2. In a shingle-sawing machine, in combination with the saw-arbor,



387,440. GAME. Raymond A. Patterson, Evanston, Ill. Filed Oct. 24, 1887. Serial No. 253,193. (No model.)

Claim.—1. A pack of cards comprising sets marked, respectively, "Safe Cut," "Ground Cut," "Fault," "Swift Ball," and "Drop Ball," substantially as and for the purpose set forth.

2. A pack of cards comprising sets marked, respectively, "Safe Cut," "Ground Cut," "Fault," "Swift Ball," and "Drop Ball," and having each of the "Swift-Ball" and "Drop-Ball" sets divided into sets provided with representations indicating the court into which they are played, substantially as and for the purpose set forth.

3. A pack of cards comprising five sets composed of four cards marked "Safe Cut," four marked "Ground Cut," eight marked "Fault," sixteen marked "Swift Ball," and sixteen marked "Drop Ball," substantially as and for the purpose set forth.

387,441.

a bearing at one end movable laterally in all directions and a ball-and-socket bearing near the other end of said arbor.

3. In combination with the arbor of a shingle-sawing machine, a bearing near one end adjustable laterally in all directions, a bearing near the other end, a divided spherical shell surrounding said bearing, and a spherical seat in the frame for said shell.

4. In combination with a saw-arbor having a cap laterally adjustable, a segment of a sphere forming the other bearing, a spherical segment outside the cap, and a bar lying in a recess in the segment and bearing on said cap.

5. In combination with a saw-arbor, a cap on said arbor, a spherical shell within which the cap is movable, a pivoted bar lying in a recess in said shell and bearing on the cap, and an adjusting-screw by which the position of the bar may be regulated.

6. In a sawing-machine, the combination, with the arbor horizontally adjustable in all directions at one end and adjustable in a ball at the other end, of a divided matrix on the frame of the machine to receive said ball.

7. The combination, with the tilt-table and the rolling bearing, said table being vertically adjustable relatively to said bearing, of the adjustable side supports for said table, substantially as described.

8. The tilt-table having inverted cups at its under surface to prevent the entrance of sawdust, combined with the butt-supports which enter and fit said cups, and the point-actuating risers which pass through the butt-supports and enter the cups, substantially as described.

9. In a shingle-sawing machine, the combination, with the frame having a pair of reciprocating carriages thereon, of two pairs of crank-arms at the outer sides of one end of the frame, each pair of arms being connected to one of the carriages, and cranks engaging said arms, as set forth.

10. In a shingle-sawing machine, the frame, the reciprocating carriage, the driving mechanism connected to said carriage, and a movable catch in position to engage or disengage the driving mechanism, whereby the driving mechanism may be permitted to move without moving the carriage, substantially as described.

11. In a shingle-sawing machine, the combination, with a sliding carriage, an oscillating crank-arm connected to the same, and the stop which serves as a fulcrum to said arm, of the lever-shifting mechanism in the line of movement of the carriage, by which the stop may be withdrawn.

12. In combination with the sliding carriage of a shingle-machine, its driving crank-arms, and connections from the arms to said carriage, a stop serving as fulcrums for said crank-arms, a rock-shaft by which said stop is operated, and a train of levers, substantially such as described, having a bearing which is shiftable into or out of the line of movement of the carriage, by which said stop may be withdrawn when the carriage completes its backward movement.

13. In a shingle-sawing machine, the sliding carriage, crank-arms and connections therefrom to the carriage, stops serving as fulcrums to said crank-arms, a rock-shaft by which said stops are operated, an arm and connections to said rock-shaft, and a lever by which said arm may be shifted into or out of the path of movement of the carriage, as set forth.

14. In a shingle-sawing machine, the combination, with the sliding carriage, its crank-arm, and the driving mechanism and connections, of a projection from one end of said crank-arms, a curved slot into which said projection enters, and a removable stop in said curved slot, which when in the slot serves as a fulcrum on which the crank-arm rocks.

15. In a shingle-sawing machine, the carriage-driving shaft having crank-pin, a slotted crank-arm, and an expansible slide-piece in the slot in said arm which the crank-pin enters.

16. In a shingle-sawing machine, the combination, with the sliding carriage, the slotted crank-arms and connections, and the driving crank-pins, of an expansible slide-piece in the slot of the crank-arms, which is the seat for said crank-pins, said slide-piece composed of a plurality of wedge-shaped sections and a screw which adjusts these sections relatively to each other.

17. A shingle-saw carriage consisting of a single rectangular casting having integral side guides, a flat top, and depending sides, which sides have integral guideways for the holding-dogs running in a direction crosswise of the machine-frame, substantially as described.

18. A shingle-saw carriage consisting of a single rectangular casting having integral side guides beveled on one face, a flat top, and depending sides having ribs running crosswise of the machine, in combination with the guideways on the frame, having inclined bearing-faces, said guideways being adjustable toward each other, substantially as described.

19. In combination with the saw-carriage, a metallic guard depending below the dogs, having a surface toward the saw of a width greater than the distance between saw-teeth.

20. In combination with the carriage and its holding-dog, a guard depending below the dog and teeth attached to the dog and extending in opposite directions from the holding-teeth.

21. The combination, with a shingle-bolt carriage, of a holding-dog, an arm attached to said dog and bent at a right angle to extend alongside the carriage, a spring on said arm by which the dog is actuated, and a nut engaging the arm and bearing on the spring to regulate the tension thereof, a bell-crank lever pivoted to the arm and to the carriage, and a bearing for said lever on the main frame, substantially as described.

22. The combination, with the pivoted tilt-table, of the oscillating beam having risers secured thereto at each side of the pivotal support of said table and adapted to support the table, substantially as described.

23. The combination of the tilt-table, the supports on the frame, and an intermediate movable piece bearing on said supports and table, by the movement of which the height of the table may be adjusted, substantially as described.

24. In combination with the carriage of a shingle-sawing machine, a sliding dog, a cross-shaft parallel with the dog and bearing against the same, rigid arms on the cross-shaft pivotally connected to the carriage, and a draw-rod and lever for actuating said shaft, substantially as described.

25. In a shingle-sawing machine, the combination, with a pivotal tilt-table, of a walking-beam, a riser at each side of the pivot of the walking-beam, the riser at the elevated end of the walking-beam serving as a support for the elevated end of the tilt-table, and an adjustable support on the frame at each side of the tilt-table, one of these supports sustaining the depressed end of the table, substantially as described.

26. In a shingle-sawing machine, a tilt-table having a rolling and vertically-sliding movement on a ball-bearing, in combination with the frame having a socket for said ball.

27. In a shingle-sawing machine, the combination of a tilt-table, its supporting-post secured to said table and extending below the bearing, a ball-bearing on said post, and an adjusting-screw operating laterally against the post below the bearing.

28. In combination with an overhanging tilt-table mounted on a yoke, one arm of which forms a post secured to the table and having a ball-bearing thereon, said arm extending below the bearing, an adjusting device operating against the side of the post opposite the overhang.

29. The combination, with the frame, of a tilt-table supported thereon in a universal bearing, and having a pendent part below the bearing by which the tilt may be effected, end supports for the table, and a sliding piece between the end supports and the table by which the height of the table may be regulated.

30. A saw-carriage, a spring-actuated dog at one end of said carriage, an adjustable dog at the opposite end of said carriage, said adjustable dog having side wings engaging with the carriage, and a shaft in rear of and parallel with said dog, the shaft having rigid arms pivotally connected to the frame of the carriage and being operatively connected at one end with a dog-moving lever, the parts being relatively arranged and combined substantially as stated.

31. The combination, with the tilt-table having an inclined under surface and a bearing-piece with upper inclined surface, and the table-supports, of an adjusting-screw whereby the position of the bearing-piece is regulated, substantially as described.

32. The combination, with the tilt-table and its containing-post extending below but balanced on ball-bearing, of an oscillating beam and risers therefrom which support the tilt-table.

33. The combination, with the tilt-table balanced on a ball-bearing, of an oscillating beam and adjustable risers therefrom, which bear against the under surface of the tilt-table, and separate risers on the frame independently adjustable, substantially as described.

34. In combination with the tilt-table contained on a universally-movable standard, an adjustable support at each side of said standard, and also a separate alternately rising and falling support at each side of the standard.

35. The tilt-table, its ball-and-socket support, and a post extending below said socket, an oscillating beam pivoted under the table, and risers from said oscillating beam which support the sides of the table, all combined substantially as described.

36. The tilt-table and its oscillating beam, the cam actuated from the carriage to move said beam, and a stop engaging said cam to overcome its momentum.

37. The combination of the tilt-table and its oscillating beam, the ratchet-cam engaging said beam, the pawl actuating the cam, and a pivoted catch engaging the cam when the pawl is stepped, but lifted by the pawl in its forward movement to free the cam, as set forth.

38. The tilt-table and its oscillating beam, the ratchet-cam engaging said beam and having depressions in its faces into which the bearing of the beam falls in addition to its cam-surfaces, the locking-catch engaging the cam, the pawl, and the connection from pawl to shingle-carriage, as set forth.

39. The combination, with the carriage-moving shaft of a shingle-sawing machine, of a bearing-box surmounting the same, and a lever pivotally connected to the frame bearing on the cap of said box.

40. The combination, with the carriage-moving shaft of a shingle-sawing machine, of a box surmounting said shaft, a lever pivotally connected to the frame bearing on said box, and a screw and set-nuts by which said lever may be held in adjusted position, as set forth.

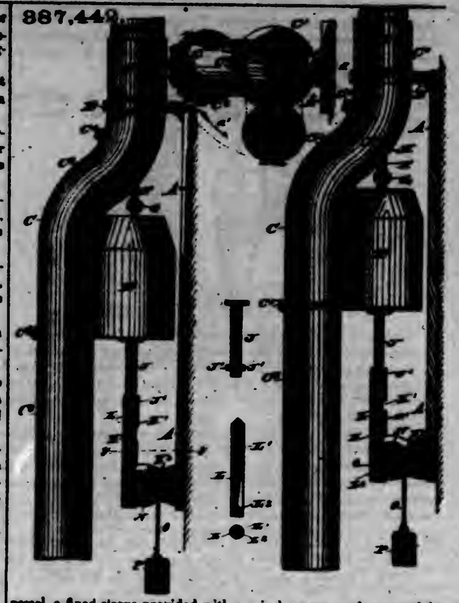
41. The combination of the frame and carriage sliding thereon, the tilt-table, its oscillating beam, and a ratchet-and-cam mechanism engaging the oscillating beam, and a connecting-piece between the carriage and the ratchet mechanism, such piece being attached to the carriage and the ratchet mechanism in position to arrive at a perpendicular just before the completion of the backward movement of the carriage, substantially as stated.

42. The combination, with the tilt-table and supports beneath the same, of an interposed adjustable piece whereby the height of the table above its supports may be regulated, as set forth.

387,442. AUTOMATIC WATER-TRAP FOR CISTERNS AND OTHER RECEPTACLES. Charles H. Pierrend, Houston, Tex., assignor to himself and John H. B. Hoare, same place. Filed Dec. 3, 1887. Serial No. 256,982. (No model.)

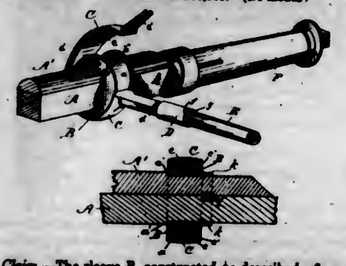
Claim.—1. In a water-trap, the combination, with a bent main pipe connected at its upper end with the leader and connected at its lower end alternately with a waste-pipe and a cistern, of a vessel secured on the said main pipe and connected with the same, a pin held on the under side of the said vessel, and a fixed sleeve provided with a spiral groove engaging said pin, so that when the said vessel and the main pipe descend they are turned, substantially as shown and described.

2. In a water-trap, the combination, with a support, of a bent pipe fitted to turn and slide in the said support, a vessel secured to and communicating with the bent pipe, a counter-balance for the said vessel and pipe, and a cam-connection between the said vessel and support, substantially as described, whereby the pipe will be automatically lowered and turned when the weight of the pipe, the vessel, and the water contained therein overbalances the counter-balance, as set forth.



3. In a water-trap, the combination, with a bent pipe fitted to slide and turn in its support, of a vessel secured to the pipe, a pipe connecting the top of the vessel with the bent pipe, a ring having an inclined top edge held on the inside of the bent pipe and surrounding the opening, a screw on the top of the said inclined ring, and means for turning the vessel and bent pipe as they descend, substantially as herein shown and described.

4. In a water-trap, the combination, with a bent main pipe, of a vessel secured on the said main pipe and connected with the same, a pin held on the under side of the said vessel, a fixed sleeve provided with a spiral groove engaged by the said pin, and a counter-balance connected with the said pin, substantially as shown and described.



5. In a water-trap, the combination, with a bent main pipe, of a vessel secured on the said main pipe and connected at its top with the interior of the said main pipe, a pin held on the bottom of the said vessel, a fixed sleeve provided with a spiral groove and engaged by said pin, a grooved pin held in the said fixed sleeve and resting at its top end on the bottom of the said pin, a rope connected with the said grooved pin, and a weight held on the said rope to counterbalance the said main pipe and vessel, substantially as shown and described.

6. In a water-trap, a bent main pipe, a vessel secured on the said main pipe and connected at its top with the interior of the said main pipe, and a pin secured to the bottom of the said vessel and provided at its lower end with lugs or pins, in combination with a fixed sleeve provided with spiral grooves engaged by the said lugs on the pin, a grooved pin held in the said sleeve and resting at its top on the bottom of said pin, a rope connected with the said grooved pin, a pulley held to rotate in the said fixed sleeve and over which said rope passes, and a weight secured to the lower end of said rope, substantially as shown and described.

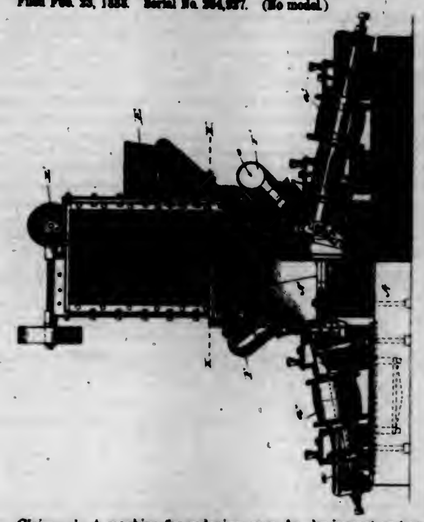
387,449.

387,443. THILL-COUPLING. Andrew Poulsen, St. Louis, Mo. Filed Mar. 6, 1888. Serial No. 266,266. (No model.)

Claim.—The sleeve B, constructed, as described, of one piece and and secured to the axle and cap by a washer and key, and having a recess in its periphery, in combination with the collar C, having the rabbets to cover the flanges of the sleeve, as set forth.

387,444. CONDUCTING-BOX. Andrew Poulsen, St. Louis, Mo. Filed Apr. 30, 1888. Serial No. 271,902. (No model.)

Claim.—The wrist or crank pin of a locomotive or other engine wheel, of square form transversely, in combination with a cylindrical collar covered with soft metal and a hinged coupling, constructed substantially as described.

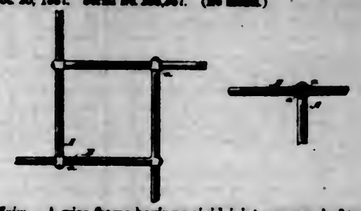


387,445. DEVICE FOR SECURING SHAFTS IN BEARINGS. GEORGE W. PROUTY, Boston, Mass. Filed Oct. 26, 1887. Serial No. 253,504. (No model.)

Claim.—1. A saddle or open-sided bearing, in combination with a securing device mounted permanently in an aperture in said saddle, and consisting of a piece of metal having one end bent at right angles to the bearing to bridge the opening in the saddle or bearing and its other end bent to form a curved spring adapted to retain the right-angled portion in position.

2. The saddle or open-sided bearing C, provided with a longitudinal aperture through the short arm of its fork, and with the detent-notch *b*, in combination with the securing device E, consisting of a wire provided with the right-angled arm *c* at one end and the curved portion *d* at the other end, constructed and arranged to engage with the detent-notch *b*, substantially as and for the purposes described.

387,446. MACHINE FOR REDUCING ORES, &c. GEORGE RAYMOND and ALBERT RAYMOND, Chicago, Ill., assignors to the Cyclone Pulverizer Company of the United States of America, New York, N. Y. Filed Feb. 23, 1888. Serial No. 264,927. (No model.)



Claim.—1. A machine for reducing ores, &c., by impact and attrition between the fragments, comprising a reducing-chamber, two oppositely-rotatable heads or beaters mounted opposite each other within said chamber in planes having upwardly-receding inclinations with relation one to the other, and suitable means for rotating said heads, whereby the fragments are caused to move vortically, substantially as described.

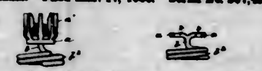
2. In a machine for reducing ores, &c., by impact and attrition between the fragments, comprising a reducing-chamber, two oppositely-rotatable heads or beaters mounted opposite each other within said chamber in planes having upwardly-receding inclinations with relation one to the other, and having radial curved ribs, and suitable means for rotating said heads, whereby the fragments are caused to move vortically, substantially as described.

3. In a machine for reducing ores, &c., by impact and attrition between the fragments, comprising a reducing-chamber, two oppositely-rotatable heads or beaters having concave adjacent surfaces and curved radial ribs mounted opposite each other within said chamber in planes having upwardly-receding inclinations with relation one to the other, and suitable means for rotating said heads, whereby the fragments are caused to move vortically, substantially as described.

387,447. WIRE-JOINT. WILLIAM A. RINGOEN, Niles, Mich. Filed Oct. 20, 1887. Serial No. 252,267. (No model.)

Claim.—A wire frame having a rigid joint composed of two sections of wire, one having its end bisected longitudinally and the flat side thereof bent adjacent to and around the other section, and a connecting coat of molten metal applied over the whole, substantially as and for the purpose described.

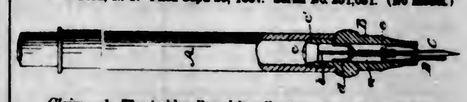
387,448. AUGER. HARRY W. RICHARDS, Bunn, Fla. Filed Dec. 29, 1887. Serial No. 259,312. (No model.)



Claim.—1. An auger provided with one or more cutters extending from the edge of the spiral parallel with the axis of the auger and in the same vertical plane with the outer edge of the spiral, substantially as described.

2. An auger provided with one or more detachable cutters extending from the edge of the spiral parallel with the axis of the auger and in the same plane with the outer edge of the spiral, substantially as described.

3. An auger provided with one or more cutters extending from the edge of the spiral adjacent to the pod of the auger to the edge of the spiral next above, the cutter or cutters being parallel with the axis of the auger and in the same plane with the outer edge of the spiral, substantially as described.



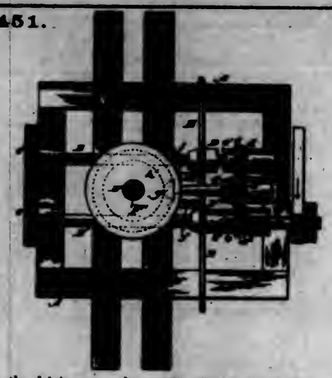
387,449. CROWN-SETTING FOR JEWELRY. NATHANIEL L. RIPLEY, Newton, assignor to the Ripley Rowland Manufacturing Company, Boston, Mass. Filed Mar. 17, 1888. Serial No. 267,402. (No model.)

Claim.—1. In an article of jewelry, a wire split at its end and bent to form a cross-bar integral with the wire, combined with a crown-setting attached to the said cross-bar, substantially as described.

2. The wire *b*, bent to form a spiral shank, *b*², and split at its end to form a cross-bar, 2 2, integral with the wire, substantially as described.

387,450. FOUNTAIN-PEN. FRED A. ROBINSON and AMY I. SMITH, New York, N. Y. Filed Sept. 28, 1887. Serial No. 251,031. (No model.)

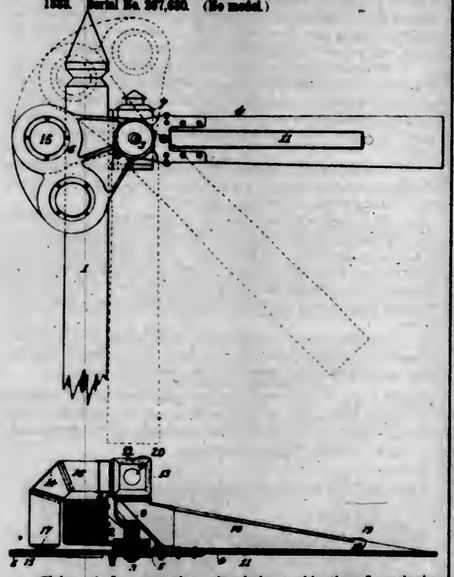
Claim.—1. The holder B and handle A, and the feeder D, fitted in the holder, the nib-pen C, having rod *b* and valve *c*, in combination with the cross-piece *d* and spring *a*, the rod *b* free to move longitudinally by pressure upon the point of the pen, substantially as described.



2. The nib-pen C, formed integral with a valve, *c*, and spring *a*, substantially as and for the purpose set forth.

387,451. GEAR-POWER FOR PRESSES. PETER D. ROSENBERGER, De Berry, Tex. Filed Feb. 6, 1888. Serial No. 263,182. (No model.)

Claim.—1. The driving-gear comprising shafts geared together at one end, and having loose pinions at or near the other ends, and an intermediate fixed pinion upon a third power-transmitting shaft, substantially as set forth.

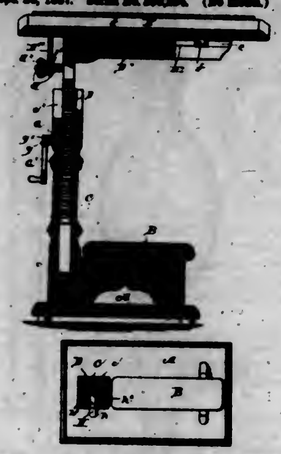


2. In a driving-gear, the combination of the shafts geared together at one end, and having at the other ends loose or sleeved pinions geared to a fixed pinion on an intermediate or third shaft carrying a second pinion, and clutch-sleeves sliding upon the first-named shafts and adapted to engage with the sleeves of the first-named pinions, substantially as set forth.

387,451.

3. In the driving-gear, the combination of the shafts geared together at one end, and having at the other ends sleeved or loose pinions geared to a fixed pinion upon a third shaft having a second pinion, and the sleeve or tap carrying a gear-wheel meshing with the said second pinion, together with the clutch-sleeves upon the first-named shafts and the clutch-sleeve-shipping mechanism, substantially as set forth.

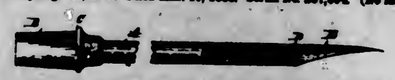
387,452. SEMAPHORE-SIGNAL. JESSE G. SCHROYER, Pittsburg, Pa., assignor to George Westinghouse, Jr., same place. Filed Mar. 19, 1888. Serial No. 267,620. (No model.)



Claim.—1. In a semaphore-signal, the combination of a swinging blade, a spectacle or frame carrying a colored glass and attached to said blade, and a lamp for illuminating both the blade and the glass carried by the frame, substantially as set forth.

2. In a semaphore-signal, the combination of a swinging blade, a spectacle or frame carrying one or more colored glasses and operated by the blade, a lantern, and suitably-arranged reflectors for throwing the light from said lantern upon the blade and the glasses in the frame or spectacle, substantially as set forth.

3. In a semaphore-signal, the combination of a swinging blade, a spectacle or frame carrying one or more colored glasses and operated by the blade, a lantern, a tube leading from the lantern to a point adjacent to the plane of movement of the frame, and suitably-arranged reflectors for directing the light upon the blade and the colored glass or glasses in the frame, substantially as set forth.



4. In a semaphore-signal, the combination of a swinging blade, a lamp for illuminating said blade, and illuminated indices on the rear sides of the blade and lantern, whereby the position of the blade may be determined, substantially as set forth.

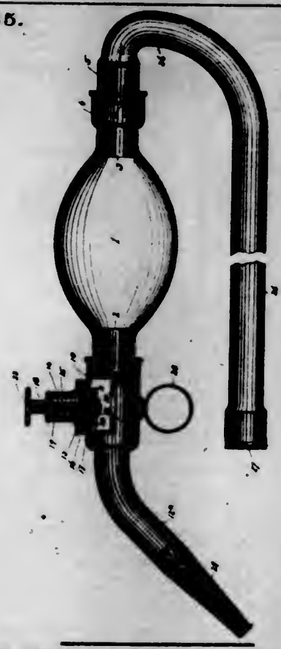
387,453. TABLE. CHRISTIAN W. H. SCHNEIDER, Rock Island, Ill. Filed Sept. 30, 1887. Serial No. 250,934. (No model.)

Claim.—The herein-described table, comprising the base-rest A, the foot-rest B, the hollow standard C, rising from the base-rest adjacent to the foot-rest, provided with the central vertical slot, *c*, and having the oppositely-beveled resting-surfaces *c*² at its upper end on each side of said slot, the rack-bar D, having a laterally-extended arm, D', the rest-arm E, seated upon the arm D' and having its upper side beveled to continue the beveled surfaces *c*² when aligned therewith, the table F, connected by the hinge *f* to the rest-arm, the semi-circular slotted bracket F', the stud *d* in the slot thereof and engaged by the thumb-nut *d*', the cog-wheel G, mounted on the spindle *g*, which has its outer end squared to engage a crank-handle, and the spring-controlled pivoted catch H, to hold the rack-bar up, substantially as specified.

387,454. EMBALMING-INSTRUMENT. HARVEY H. SCHOONHALSE, Springfield, Ohio. Filed Mar. 19, 1888. Serial No. 267,694. (No model.)

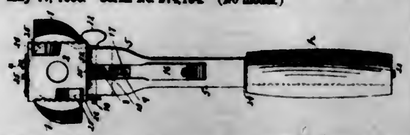
Claim.—1. As an improved article of manufacture, a trocar consisting of a vulcanized rubber tube reduced in size at one end, and of a metallic tip having a sharp keen point at one end and composed of a sleeve at the other end of substantially the same length as the reduced end of the tube and fitted over said end.

2. As an improved article of manufacture, a trocar consisting of a vulcanized rubber tube having one end reduced and exteriorly screw-threaded, and of a metallic tip having one end reduced to a keen sharp point and the other composed of a sleeve of substantially the same length as the reduced end of the tube and screw-threaded to receive said end, whereby the interior of the sleeve is protected by the material of the tube.



387,455. SIPHON. MICHAEL SCHROEDER, Louisville, Ky. Filed Oct. 6, 1887. Serial No. 251,631. (No model.)

Claim.—1. The combination, with the suction device, of two tubes having communication therewith, a valve in each of said tubes arranged with their openings in opposite directions, whereby one is constituted an outlet and the other an inlet, a cut-off in one of said tubes, and a spring for holding said cut-off normally in one position, and a strainer in one of said tubes, for the purpose described.

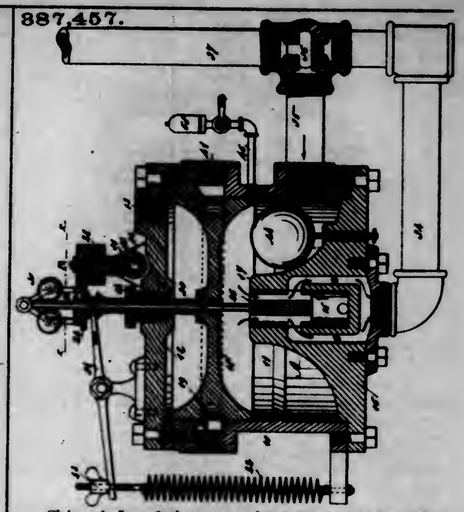


2. The combination, with the flexible bulb 1, of the tubes 2 3 in said bulb, the valves 6 9, for the purpose described, the spigot 12, secured to tube 2, a chamber, 11, in said spigot, having valve-seat 24 and opening 12, a cover, 13, having box 14, the valve-stem 16, having shoulder 18, the spiral spring 19, coiled in said box between the said shoulder and cover, and the finger-ring 26, substantially as shown and described.

3. The combination, with the bulb 1, of a spigot connected therewith, a valve in said spigot opening away from said bulb, a partition in said spigot forming a chamber, 11, and having an opening, 12, therein, a valve-seat surrounding said opening, the removable cover 13 in said chamber, a valve-stem projecting through said cover, a valve on said stem, and a spring for holding said valve normally open, substantially as set forth.

887,455.

887,456. WRENCH. Jonathan M. Silvis, Kittanning, Pa. Filed May 17, 1888. Serial No. 274,184. (No model.)



Claim.—1. In a ratchet-wrench, the shank 5, having its head formed with a chamber, 6, provided with slots 11 in its sides, the pawl 8, formed with alternating beveled sides 13 and notched sides 14 in said chamber, the rod 10, extending through slots 11 and having a handle, 12, and carrying said pawl, and the spring 9, mounted in chamber 6 and bearing on said pawl, in combination with the supports 2, having tubular shank 4 extending through chamber 6, the ratchet 7, with projections 15, alternating with ratchet-teeth and located in chamber 6 adjacent to pawl 8, and the spring-actuated sliding jaws 1 in said support 2, substantially as shown and described.

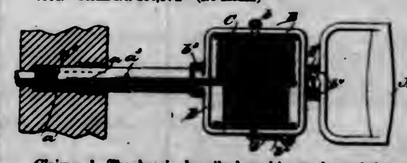
2. In a ratchet-wrench, the shank 5, having its head formed with a chamber, 6, provided with slots 11 in its sides, the pawl 8, formed with alternating beveled sides 13 and notched sides 14 in said chamber, the rod 10, extending through slots 11 and having a handle, 12, and carrying said pawl, and the spring 9, mounted in chamber 6 and bearing on said pawl, in combination with the supports 2, having tubular shank 4, extending through chamber 6, the ratchet 7, with projections 15, alternating with ratchet-teeth and located in chamber 6 adjacent to pawl 8, and the spring-actuated sliding jaw 1, having shanks 25, with teeth 34, located in sockets 26 in support 2, and springs 32, provided with pins 31 and having projections 35, the pins 31 engaging the teeth 34, substantially as described.

3. In a wrench, the combination, with the shank 5, provided with tubular openings 4 in its upper end, the supports 2, having tubular shanks 3, fitting in the openings 4, said supports having sockets 26, provided with stop-pins 27 and spring-actuated pins 31, of the adjustable sliding jaws 1, having shanks 25 adapted to slide in the sockets 26, said shanks provided with slots 28, engaging with the pins 27, whereby the outward movement of the jaws is limited, said shanks provided with teeth 34, engaged by the pins 31, and the spring 29, entered in the socket 26, and a socket, 30, formed in the end of the shank 25, all arranged substantially as and for the purposes described.

887,457. FEED-WATER REGULATOR. Frederick E. Smith, South Boston, Mass. Filed Dec. 6, 1887. Serial No. 257,102. (No model.)

887,457.

Claim.—1. In a feed-water regulator, the combination, with a cylinder, of a piston formed with a groove in its peripheral face, ports formed in the cylinder and communicating with said groove, a water-supply port arranged above the piston, a steam-chamber below the piston, and a steam-regulating valve, substantially as described.



2. In a feed-water regulator, the combination, with a cylinder, of a piston, 18, formed with a groove, 19, a lever by which the piston is normally upheld, a spring arranged in connection with said lever, ports communicating with the passage 19, a steam-chamber formed below the piston, and a steam-regulating valve, substantially as described.

3. In a feed-water regulator, the combination, with a cylinder, of a piston arranged therein and a steam-whistle arranged in connection with the piston, substantially as described.

4. In a feed-water regulator, the combination, with a cylinder, of a piston mounted therein and formed with an annular groove, ports arranged in connection with said groove, a means for supplying water to the chamber above the piston, a means for supplying steam to the chamber below the piston, a steam-valve, 26, a governor, and connections between said governor and the engine, substantially as described.

5. In a feed-water regulator, the combination, with a cylinder formed with a steam-chamber, of a float-valve arranged in connection with said cylinder, substantially as described.

887,458. TOOL FOR PACKING STUFFING-BOXES. Peter J. Smith, Philadelphia, Pa., assignor to himself and Joseph R. C. Smith, same place, and William B. Smith, Washington, D. C. Filed Mar. 20, 1888. Serial No. 267,574. (No model.)

Claim.—1. The herein-described packing-tool, consisting, essentially, of a tubular packer-rod adapted to fit upon the part to be packed, and provided with a longitudinal guide-slot extending along the tubular portion of the rod for the reception and guidance of the packing-strand, whereby, when said rod is placed upon the part to be packed and revolved, said strand will be wound around such part, substantially as and for the purposes specified.

2. The herein-described packing-tool, consisting of a tubular packer-rod adapted to fit upon the part to be packed, and provided with a longitudinal slot extending along the tubular portion of the rod for the reception and guidance of the packing-strand, in combination with a revolvable carrier for the packing, substantially as and for the purposes specified.

3. The herein-described packing-tool, consisting of a tubular packer-rod adapted to fit upon the part to be packed, and provided with a longitudinal slot formed in the tubular portion thereof, said slot curving from right to left at the open end of the said tubular portion of the rod, substantially as and for the purposes specified.

4. The herein-described packing-tool, consisting of a tubular packer-rod adapted to fit upon the part to be packed, and provided with a longitudinal slot formed in the tubular portion thereof, one of the walls of said slot having its outer end formed into or provided with a cutting-lip, whereby the rod is made to perform the function of an auger when revolved in a given direction, substantially as and for the purposes specified.

5. The herein-described packing-tool, consisting of a tubular packer-rod provided with a guide-slot for the packing-strand, in combination with a revolvable packing-carrier and a friction-brake for said carrier, substantially as and for the purposes specified.

6. A tool of the class described, comprising a tubular packer-rod adapted to fit upon the part to be packed, and provided with a guide groove or slot for the reception and guidance of the packing, a handle for said rod, and a revolvable carrier for the packing, said parts being detachably connected together, substantially as and for the purposes specified.

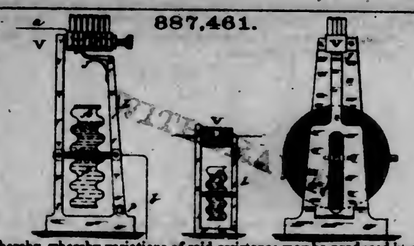
7. The herein-described packing-tool, consisting of a tubular packer-rod, A, provided with a slot, *c*, and a cutting-lip, c^1, in combination with the spool B, and the spring-plate b^1, provided with the cone-pin b', that constitutes one of the journals for the spool and operates as a friction-brake, substantially as and for the purposes specified.

887,459. WHEEL-FASTENING DEVICE FOR CAR-AXLES. Andrew J. Speer, Portland, Oreg., assignor to himself and James R. Hamilton, same place. Filed Feb. 25, 1888. Serial No. 265,941. (No model.)

Claim.—1. The combination, with an axle having an annular groove in its spindle, of a wheel having an annular groove in the inner surface of its hub, registering with the groove in the axle, and a passage leading from the groove through the hub, and a metallic locking-key inserted in the registering groove and provided with a stem projecting into the passage-way and locking the key to the hub of the wheel, substantially as described.

2. The combination, with an axle having a groove, 2, in the peripheral face of one of its wheel-seats, of a wheel in the hub of which there is formed a groove arranged to register with the groove 2, a passage, 4, leading from said groove in the wheel-hub, and a metallic locking-key placed in the registering grooves and formed with a centrally-apertured neck extending within the passage 4, substantially as described.

887,460. THILL-COUPLING. William H. Speer, Wellsville, N. Y., assignor of one-half to William Bruce, same place. Filed Mar. 16, 1888. Serial No. 267,906. (No model.)



Claim.—1. The combination, with a clip provided with apertured ears, of a pin fitting in said apertured ears and provided with a stud, and a spring adapted to have one end secured to the axle and provided with an aperture in its free end to receive the stud of the pin, substantially as described.

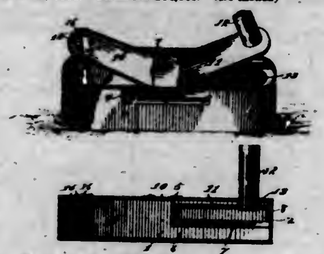
2. The combination, with the clip A, provided with the apertured ears B, of the pin C, having the stud D, the spring E, provided with the eye *a*, adapted to receive the stud D, and the clip G, substantially as described.

887,461. THERMAL DEVICE FOR VARYING ELECTRIC RESISTANCES OR CURRENTS. Elihu Thomson, Lynn, Mass. Filed Dec. 31, 1887. Serial No. 259,447. (No model.)

Claim.—1. The combination, with a thermo-dynamic actuator responsive to and varying in accordance with the changes in the medium surrounding it, of a variable resistance actuated or controlled thereby, whereby variations of said resistance may be produced in accordance with variations in the temperature of a surrounding medium.

887,461.

2. The combination, with an electro-thermo-dynamic device, of a thermo-dynamic actuator or controller responsive to variations of temperature of the surrounding atmosphere and an electric regulator or controller adjustable thereby for governing the flow of current to the electro-thermo-dynamic device.



3. The combination, with an electro-thermo-dynamic device, of a variable or adjustable resistance for governing the flow of current to the same and a thermo-dynamic actuator or adjuster responsive to variations of external temperature and operating upon said variable resistance, as and for the purpose described.

4. The combination, with an electro-thermo responsive device, of a variable resistance connected to the circuit of the same and a thermo-dynamic actuator or adjuster for said variable resistance.

5. The combination, with an electro-thermic meter, of an adjustable current-regulator governing the flow of current to said meter and a thermo-dynamic actuator or adjuster for said regulator, as and for the purpose described.

6. The combination, with a chamber having a diaphragm or wall expansible or movable under the variations of internal pressure due to variations of temperature, of an adjustable or variable resistance governed by said wall or diaphragm.

887,462. TANK-HEATER. Andrew J. Upham, Sycamore, Ill. Filed Feb. 21, 1888. Serial No. 264,819. (No model.)

Claim.—The water or liquid heater, consisting of a chamber provided with a grate and a removable fire-pot resting thereon, said fire-pot being provided with an opening in its top, a hinged cover and a smoke-pipe attached thereto, said pipe being adapted to rest in the opening in the top of the fire-pot when the cover is in a closed position.

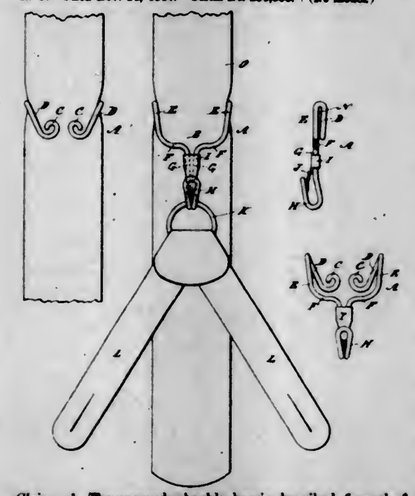
887,463. ELECTRIC REGULATOR. Joseph A. Vassart and Frank S. Anderson, Boston, Mass. Filed Sept. 6, 1887. Serial No. 248,853. (No model.)

Claim.—1. A current-regulator consisting of a receptacle containing a powdered substance having a certain degree of conductivity, a circuit-breaker inclosed in said receptacle, and a compressor for varying the pressure upon and the resulting density of said substance, as and for the purposes specified.

2. The improved regulator consisting of the large non-conducting cylinder 1, the circuit-breaker formed of the non-conducting cylinder 2, the electrical contact 5, an adjustable circuit-connector, 3, the powdered material 6, a piston for compressing the latter, and a rod for adjusting the piston, substantially as described.

3. In an electric regulator, the combination, with the conducting-wire C, divided, as specified, of the non-conducting cylinder 1, the metal rod 5, and the small non-conducting cylinder 2, the surrounding powdered composite material 6, the piston 7, the screw-threaded rod 3, working in a nut at the lower end of said cylinder and provided with a suitable head for use in turning it, as specified.

387,464. REGULATOR FOR ELECTRIC CURRENTS. JOSEPH A. VAILHANT and FRANK S. ANDERSON, Boston, Mass. Filed Jan. 31, 1888. Serial No. 261,477. (No model.)



Claim.—1. The electrical-current regulator proper, consisting of a cell or receptacle, a powdered material which is composed of conductive and non-conductive substances, which are in the form of dry powders intimately mixed together and contained in said receptacle, a movable plunger by whose adjustment the said material may be compressed more or less for the purpose of securing the desired degree of conductivity, and metallic circuit-connections which are in contact with the powdered material, substantially as shown and described.

2. The electrical-current regulator proper, consisting of a cell or receptacle, a powdered material consisting of carbon and mineral wool and contained in such receptacle, a movable plunger by whose adjustment the said material may be compressed more or less for the purpose of securing the desired degree of conductivity, and metallic circuit-connections which are in contact with the powdered material, substantially as shown and described.

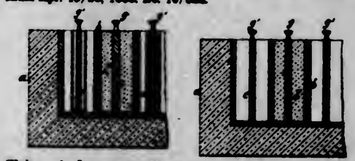
3. The multiple-cell regulator proper, consisting of a series of cells or receptacles filled with powdered carbon and mineral wool, a metal plate forming the top of the said cells, a movable plunger for each cell, and circuit-wires which connect with said plate and the powdered material, as shown and described.

4. The combination, with the regulator proper, consisting of a series of cells containing a powdered conductive and non-conductive material and a plunger for compressing it, of cells and the circuit-breaker formed of a series of metal fingers and a rotatable cylinder whose periphery is divided into conducting portions, and a series of insulated circuit-wires which connect the said cells and fingers, and a disconnected return-wire, all substantially as shown and described, whereby the rotary adjustment of the cylinder graduates the strength of the current in the circuit or cuts off the current altogether, as specified.

387,465. SUSPENDER-BUCKLE. CHARLES F. WALTERS, Prospect, N. Y. Filed Nov. 28, 1887. Serial No. 256,336. (No model.)

Claim.—1. The suspender-buckle herein described, formed of a single piece of wire bent upon itself, forming back and front members and having the ends forming the one member inclined toward each other and toward the other member, substantially as shown and described.

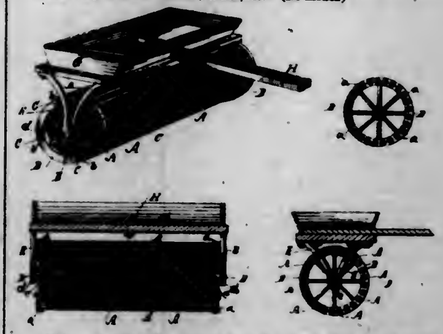
2. A suspender-buckle made of a single piece of wire having its ends outwardly inclined and doubled up to form a recess for the reception of the web of the suspenders, said doubled-up part extending inward and downward and forming at its lower end a loop for attaching the suspender-strap ring, in combination with a collar held on the said loop and provided with a spring-tongue engaging the front end of the said loop and serving to prevent a displacement of the suspender-strap ring, substantially as shown and described.



387,466. COMBINED ARTIFICIAL FLOWER AND PERFUME-RECEPTACLE. CHRISTOPHER WARNER, New York, N. Y. Filed Nov. 18, 1887. Serial No. 256,502. (No model.)

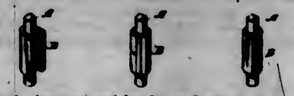
Claim.—1. As a new article of manufacture, the combined artificial flower and perfume-receptacle hereinbefore described, the same consisting of the bottle A, having a stopper, B, the petals *a*, glued to the body of said bottle, the wrapping *b*, secured around the lower portion of the latter, and the moss-like fiber *d*, applied over such wrapping, as shown and described.

2. The combination, with the bottle A, of the wire stem *c*, which is wrapped around it, as shown, the petals *a*, and the wrapping *b* and moss-like fiber *d*, secured around both the wire and petals, as and for the purpose specified.



387,467. APPARATUS FOR PURIFYING WATER. WILLIAM WHEATER, Jr., Lee Park, Lee, County of Kent, England. Filed Dec. 28, 1887. Serial No. 258,726. (No model.) Patented in England Jan. 27, 1887, No. 1,338; in France Dec. 9, 1887, No. 187,496; in Cape of Good Hope Jan. 23, 1888, No. 436; in Natal Feb. 2, 1888; in New South Wales Feb. 10, 1888, No. 488; in Tasmania Feb. 12, 1888, No. 642/10, and in India Apr. 13/26, 1888, No. 16/262.

Claim.—1. In a water-filtering apparatus, a carbon filtering medium connected to the positive pole of an electric battery or other electrical generator whose negative pole is connected to the water in the filter, so that on the passage of the water through the filtering medium it is brought into intimate contact with nascent oxygen generated therein by the electric current, substantially as herein described.



2. Electrolytic filtering apparatus in which a filtering medium through which the water is passed either itself constitutes the positive electrode or has a positive electrode embedded in it, while the negative electrode is either also embedded in a filtering medium or is otherwise in electrical contact with the water to be filtered, substantially as herein described, with reference to the accompanying drawings.

387,468. FIELD-ROLLER. JOHN S. WISEMAN, Canton, Ohio. Filed July 2, 1887. Serial No. 243,946. (No model.)

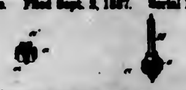
Claim.—A field-roller constructed of a series of pipes arranged in the general form of a cylinder, with spaces between one another, heads provided with depressions to receive the ends of the pipes, and rods passed longitudinally through some of the pipes, through the heads, and secured outside of the heads, substantially as and for the purpose herein specified.

387,469. ARBOR FOR CLOCKS, WATCHES, &c. WILLIAM H. WHEDON, New Bedford, Mass., assignor to the Weston Manufacturing Company, same place. Filed Aug. 13, 1887. Serial No. 247,203. (No model.)

Claim.—1. As a new article of manufacture, an arbor which is composed of a straight round core or center and a superimposed body made of sheet metal, substantially as and for the purpose specified.

2. As a new article of manufacture, an arbor which has its center and pivots formed by a straight round piece of metal and its body formed by a plate of sheet metal that is bent around and caused to closely embrace said center, substantially as and for the purpose shown.

387,470. MEANS FOR MAKING PINIONS FOR CLOCKS AND WATCHES. WILLIAM H. WHEDON, New Bedford, Mass., assignor to the Weston Manufacturing Company, same place. Filed Sept. 2, 1887. Serial No. 248,082. (No model.)



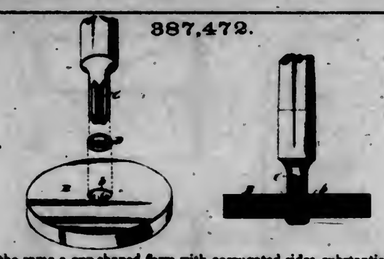
Claim.—1. As a means for forming pinions from sheet metal, a female drawing-die which is provided with a central opening that corresponds in shape to the toothed periphery of a pinion, in combination with a male die which corresponds to and is adapted to enter said opening, substantially as and for the purpose specified.

2. As a means for forming pinions from sheet metal, a male drawing-die and a female drawing-die which by their joint action are adapted to give to a cupped sheet-metal blank the external form of a toothed pinion, in combination with drawing-dies that are adapted to give a cupped form to a sheet-metal disk, substantially as and for the purpose shown.

3. As a means for forming pinions from blanks, the combination of drawing-dies which are adapted to give a cup form to a sheet-metal disk, drawing-dies that are adapted to give to the cup-shaped blank the external form of a toothed pinion, and punching-dies which are adapted to form within the closed end of said blank an opening for the reception of an arbor, substantially as and for the purpose set forth.

387,471. PINION FOR CLOCKS, WATCHES, &c. WILLIAM H. WHEDON, New Bedford, Mass., assignor to the Weston Manufacturing Company, same place. Filed Sept. 2, 1887. Serial No. 248,081. (No model.)

Claim.—1. As a new article of manufacture, a spur-pinion which is composed of a shell or corrugated metal that interiorly corresponds in shape to its exterior, substantially as and for the purpose specified.

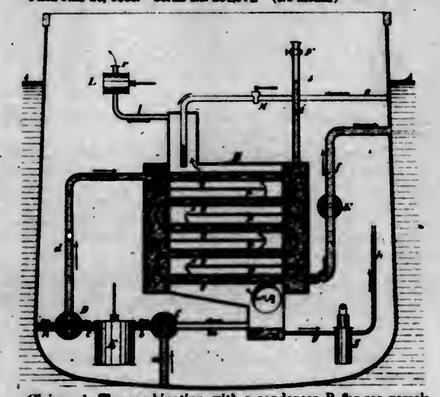


2. The combination of a shell-pinion with an arbor which passes axially through and is secured within the same, substantially as and for the purpose shown.

3. The combination of a shell-pinion with an arbor which passes axially through the same and fills the space between the points of the internal teeth, substantially as and for the purpose shown.

4. The described pinion, constructed from sheet metal and having one end open and its other end partly closed and provided with a central opening which is concentric with the periphery of said pinion, substantially as and for the purpose shown and described.

387,472. METHOD OF MAKING PINIONS FOR CLOCKS AND WATCHES. WILLIAM H. WHEDON, New Bedford, Mass., assignor to the Weston Manufacturing Company, same place. Original application filed Sept. 2, 1887, Serial No. 248,082. Divided and this application filed Feb. 28, 1888. Serial No. 265,949. (No model.)



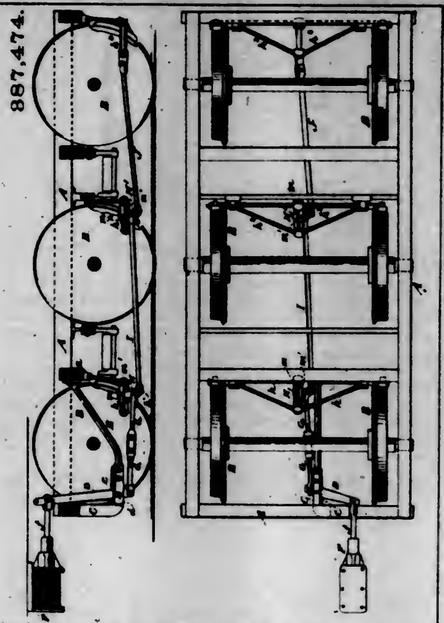
Claim.—1. The method employed in the forming of pinions, which consists in forcing a disk of sheet metal through dies and giving to the same a cup-shaped form with corrugated sides, substantially as and for the purpose shown and described.

2. The method employed in the forming of pinions, which consists in giving a cup shape to a disk of sheet metal and then passing such blank through drawing-dies until its sides are corrugated and it corresponds externally in size and shape to the exterior of a toothed pinion, substantially as and for the purpose specified.

3. The method employed in the forming of pinions, which consists, first, in cutting a round blank from a sheet of metal; next, in giving to such blank a cup shape; next, in corrugating the sides of said blank, and, lastly, in forming within the closed end an opening for the reception of an arbor, substantially as and for the purpose shown.

387,473. SURFACE-CONDENSER. FRANZ J. WEHR, Basle, Switzerland, assignor of three-tenths to August Burckhardt, same place. Filed Jan. 26, 1888. Serial No. 261,971. (No model.)

Claim.—1. The combination, with a condenser, B, for sea-vessels, of the cold-water pump K, the pipes *a b m*, connected, respectively, with the outside of the vessel, the pump, and the steam-space of the condenser, the three-way valve or cock C at the junction of said pipes, and the pipes *c d n*, containing the three-way cock or valve D, and connected, respectively, with the pump, the water-space of the condenser, and the outside of the vessel, substantially as described.

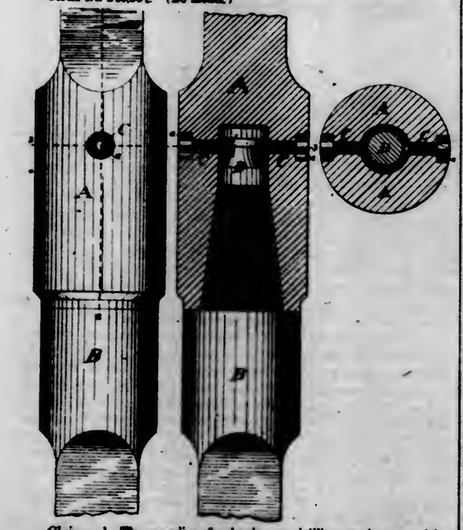


2. The combination, with a condenser, B, for sea-vessels, of the cold-water pump K, the pipes *a b m*, containing the three-way cock or valve C, and connected, respectively, with the outside of the vessel, the pump, and the steam-space of the condenser, the pipes *c d n*, containing the three-way cock or valve D, and connected, respectively, with the pump, the water-space of the condenser, and the outside of the vessel, and the fresh-sea-water pipe *e*, containing the cock or valve H and entering the top of the condenser, substantially as described.

3. In surface-condensers on sea-going vessels, the combination of the condenser B, the pump K, the system of pipes *a b m*, having the three-way cock or valve C, arranged between the condenser, the pump, and the outside board, the system of pipes *c n d*, having the three-way cock or valve D, arranged between the pump, the condenser, and the outside board, and the pipe *f*, having the cock or valve E, arranged between the condenser and outside board, the air-discharge cock or valve F, and the injection cock or valve H, arranged between condenser and outside board, substantially as and for the purpose specified.

387,474. CAR-BRAKE. JOHN WIRT, Burlington, Iowa. Filed Dec. 5, 1887. Serial No. 257,090. (No model.)

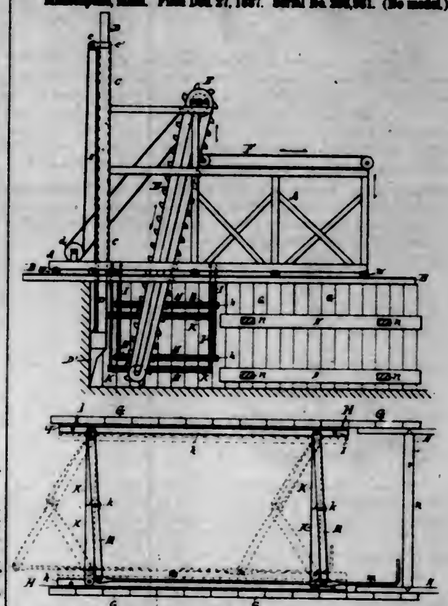
Claim.—1. A truck and the brake-beams thereof, a lever having a fixed fulcrum in the truck, and a series of rods and equalizers operated by said lever, each equalizer being pivoted in the strut of a brake-beam, combined with an air or steam cylinder and suitable



887,474.

connections between said cylinder and the operating-lever, substantially as set forth.

2. The wheels, brakes, and brake-beams of two or more trucks, the brake-beams of two or more pairs of wheels of each truck being connected by means of a single set of rods and equalizers, combined with the hand brake-wheels K, chains *k*, rods L, pulleys *l*, chains *l'*, and rod M, whereby the brakes may be applied to all the wheels of the several trucks with equal force, whichever hand brake-wheel is used, substantially as set forth.



887,475. MODE OF SECURING THE FASTENINGS OF DRILLING-TOOLS. John H. Whaling, Kingman, Kans. Filed Aug. 9, 1887. Serial No. 246,551. (No model.)

Claim.—1. The coupling for boring or drilling tools, comprising the bevel ended or headed screw and the additional bevel-ended screws intersecting the bevel end or head of the aforesaid screw, substantially as set forth.

2. The coupling for boring or drilling tools, comprising the tool-connecting screw having a plain or unthreaded portion or extension provided with a beveled surface extending from the inner edge of the head of the screw, the rod or shaft receiving said screw with its plain or unthreaded portion, and the screws also inserted into said rod or shaft and having beveled ends engaging with the beveled surface of the tool-connecting screw, substantially as specified.

887,476. EXCAVATING APPARATUS. Joseph S. Wheeler, Minneapolis, Minn. Filed Dec. 27, 1887. Serial No. 258,961. (No model.)

Claim.—1. In excavating apparatus, the combination, with sheathing for supporting the sides of a trench, of horizontal supports for the sheathing and toggle devices for pressing the same to engagement, substantially as set forth.

2. The combination, with the frame of an excavating apparatus and sheathing for the sides of a trench, of supporting-bars for the sheathing suspended from said frame, toggles connected to the bars, and levers for operating the toggles, substantially as set forth.

3. The combination, with the sheathing-supports, of the toggle-bars pivoted thereto, the levers pivoted at one side and connected to the joints, and the operating-rods connected to said levers, substantially as set forth.

887,477. LOGGING-CAR. Manly Wilson, Seattle, Wash. Filed Apr. 19, 1888. Serial No. 271,156. (No model.)

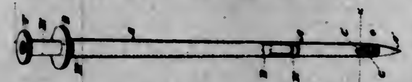
Claim.—1. In combination with the beam A and serrated bar C, provided with adjustable sliding blocks, links pivoted to the beam and connected to each other to be operated simultaneously for elevating the serrated bar, and adjustable block carried thereby, substantially as shown, and for the purpose set forth.

2. In combination with the beam A, guide-strips B B B' B', vertical moving bars held by said guide-strips and provided with suitable sliding blocks, D D, links E, pivotally secured to the beam A and to connecting-bars F, and the trip-rods G, pivotally secured to the ends of the bars H, the parts being organized substantially as shown, and for the purpose set forth.

3. In combination with a beam, A, a vertically-movable serrated bar carrying sliding blocks D, links E, having the upper portions thereof bifurcated and one of the sides recessed, a connecting-bar pivotally secured to said links, and a trip-rod for operating the same, substantially as shown, and for the purpose set forth.

4. In combination with a compound trip-rod, G, for the purpose set forth, a wrench or lever for moving one of the sections thereof, having a bifurcated head, one member extending beyond the other and curved at its end to operate or depress a spring-catch employed for holding the trip-rod, substantially as shown, and for the purpose set forth.

887,478. STRAP OR BELT FASTENER. Charles H. Bell, Orange, Ohio. Filed Nov. 28, 1887. Serial No. 256,691. (No model.)

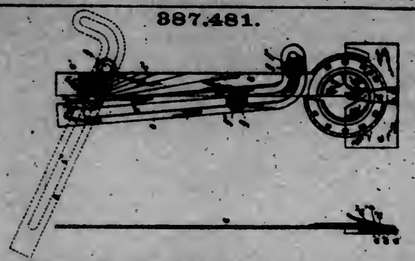


Claim.—The fastening device for blanking-straps herein described, consisting of a plate having a longitudinal slot the upper longitudinal edges of which are squared off to form right angles, and a tongue extended from one end of this slot along over the top of the same, having its free end curved outward, the lower side or edges of the tongue being flush with the plate and squared off to form right angles.

887,479. SEWING-MACHINE. Rufus H. Ackerman, Quincy, assignor of one-half to William H. Coffey, Cambridge, Mass. Filed June 16, 1887. Serial No. 241,735. (No model.)

Claim.—In combination with the cloth-plate of a sewing-machine and with the looper, a semicircular shield secured to the under side of said cloth-plate, having an interior diameter corresponding to the looper, arranged to cover the upper and front sides of the looper, and extending axially beyond the looper, the said shield being open on its rear and bottom, whereby the lint and ravelings are dislodged and the thread prevented from winding on the looper, substantially as described.

887,480. BLOATING-NEEDLE. Joseph J. Allshar, Union Springs, N. Y. Filed Aug. 26, 1886. Serial No. 211,867. (No model.)



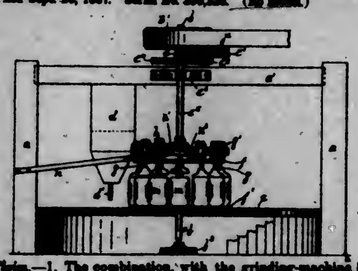
Claim.—1. In a bloating-needle, in combination with the hollow shank closed at its lower end provided with a puncturing-point and having an opening in its side, the tube within such shank having an opening adapted to be brought into and out of coincidence with the opening in the shank side by turning the tube, substantially as and for the purpose set forth.

2. In a bloating-needle, in combination with the tubular shank having the puncturing-point and the opening in its side, the tube within the shank having the opening in its side, and means, substantially as described, for limiting the rotation of the tube within the shank, substantially as and for the purpose described.

3. In combination with the tubular shank having the puncturing-point, the opening C, and the slot A, extending in a plane at right angles to the axis of the shank, the tube within the shank having the opening G, and the pin on the tube engaging the slot in the shank, so as to prevent longitudinal movement of the tube within the shank, as well as limit its rotation in the latter, substantially as and for the purpose specified.

887,481. PROTRACTOR. Gurdat Allshorn, Waltham, Mass., assignor of one-half to John Stark, same place. Filed May 4, 1888. Serial No. 272,897. (No model.)

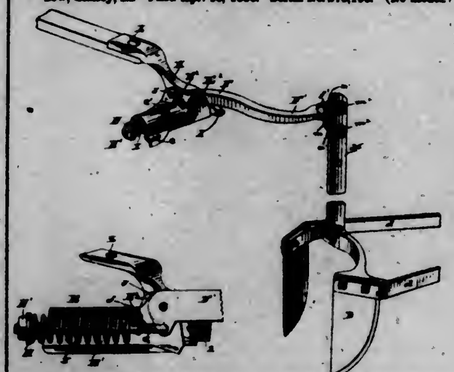
887,481.



Claim.—1. The rectangular bed-plate *a*, having the semicircular recess *a'*, combined with the open graduated and beveled ring *b*, its rule *c*, and the spring locking device *d d'*, as and for the purpose set forth.

2. The graduated beveled ring *b* and the graduated rule *c c'*, secured to it, in combination with the detachable and adjustable slotted blade *e f f'* and its fastening bolts and nuts *f' f' f'*, as and for the purpose set forth.

3. The rectangular bed-plate *a*, having the semicircular recess *a'* and side recesses or depressions, *a'' a''*, combined with the open graduated and beveled ring *b*, its rule *c*, and spring locking device *d d'*, as and for the purpose set forth.



887,482. GRINDING-MACHINE. Rudolph B. Ball, Buffalo, N. Y. Filed Sept. 20, 1887. Serial No. 250,324. (No model.)

Claim.—1. The combination, with the grinding-machine having the revolving grinding-disk *c*, the revolving rack *f'* for the jars, and the revolving rack *f*, having seats *f''* and carrying the series of movable weights *h*, and holders *k*, of the rod *n*, having the long curved incline *n'* and the curved end *n²*, substantially as and for the purpose stated.

2. In a grinding-machine for glass jars, &c., the combination, with the inclines *n' n²*, of the rack *f*, on which are the seats *f''*, the weights *h*, and holders *k*, the weights *h* being provided with grooves *f'* to receive the ribs *f''* of the seats *f''*, substantially as and for the purpose stated.

887,488. COVERING-SHOVEL FOR PLANTERS. Joseph C. Barlow, Quincy, Ill. Filed Apr. 10, 1888. Serial No. 270,168. (No model.)

Claim.—1. The combination, with a planter and a cover-shovel, of a spring interposed in the connection between them, and a lever operating to raise the shovel against the tension of the spring, substantially as described.

2. In a planter, the combination, with a cover-shovel, of a spring operating to force the shovel toward the ground, and a lever operating as a stop to limit the motion of the shovel and arranged to be operated to raise the shovel against the spring, substantially as described.

3. In a planter, the combination, with the cover-shovel, of a supporting-link for the latter, a lever to which the link is connected, a spring operating upon said lever, a lever for acting upon the lever connected to the link and arranged to be operated to cause the lifting of the shovel against the spring, substantially as described.

4. In a planter, the combination, with the shovel, of a supporting-link for the same, a lever connected to the link, and a spring operating to depress the shovel, a stop to limit the downward movement, and a lever projecting beneath the lever connected to the link and arranged to be operated to cause the raising of the shovel against the spring, whereby the shovel can be raised independently of the last-mentioned lever or by means of it, substantially as described.

5. In a planter, the combination, with the cover-shovel, of a supporting-link, a lever, a spring operating upon the same, means for adjusting the tension of the spring, a stop, and a slotted loose connection between said link and lever, substantially as described.

6. In a planter, the combination, with the cover-shovel and a link connected therewith having an elongated eye thereon, of a lever for adjusting the link engaging said eye, substantially as described.

7. In a planter, the combination, with the cover-shovel, of a link connecting thereto, a lever, a spring operating upon said lever, a stop for the lever, and a slotted loose connection between said lever and link, substantially as described.

8. In a planter, the combination, with the cover-shovel, and a link connected therewith having the adjustable elongated staple or eye secured thereto, of a lever for operating upon the link engaging said eye, substantially as described.

9. In a planter, the combination, with the cover-shovel, of a supporting-link connected to the same, the pivoted bell-crank lever, one arm engaging the link and the other operated upon by the spring, said spring, and a stop for limiting the movement of the lever, arranged to hold the shovel with a yielding pressure, substantially as described.

10. In a planter, the combination, with the cover-shovel, of a link connected to the same, the pivoted bell-crank lever, one arm engaging the link and the other operated upon by the spring, said spring, and a pivoted lever engaging said bell-crank lever to raise the shovel, substantially as described.

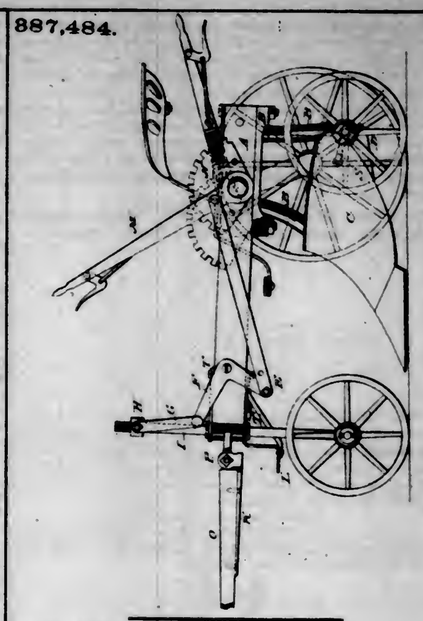
11. In a planter, the combination, with the cover-shovel, of a link connected thereto, the base-casting, the bell-crank lever pivoted thereon, one arm connected with the shovel-link and the other with a draft-link having a projection thereon, a spring between the projection and the casting, and a lever arranged to operate upon the bell-crank to raise the shovel against the spring, substantially as described.

12. The improved attachment for planters for adjusting the cover-shovels, consisting of a base-casting having mounted upon it a spring-operated lever adapted to be connected to the shovel, and a lever independent of the first-mentioned one arranged to engage the same and operate it, substantially as described.

387,484. SULKY-PLOW. Jacob H. Barr, Mansfield, Ohio. Filed Jan. 13, 1888. Serial No. 260,652. (No model.)

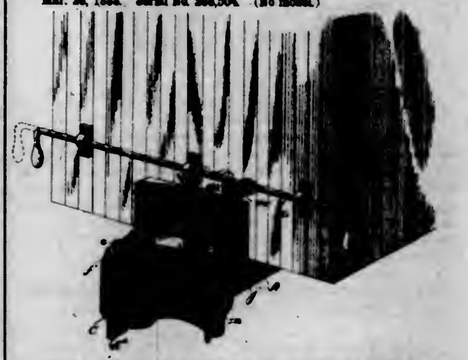
Claim.—1. In a sulky-plow, the combination, with the axle, plow-beam, and standard, of the lever M, connecting-links E G, bell-crank F, nut H, and adjustable wheel shank or bar I, substantially as shown and described.

2. In a sulky-plow, the combination, with the beam A and tongue O, of the hinge-block J, plates T T, adjustable bar I, and nut H, as and for the purpose set forth.



3. In a sulky-plow, the combination, with the beam A and tongue O, of the hinge-block J, plates T T, adjustable bar I, nut H, link G, crooked lever F, connecting-bar E, lever M, and segmental rack N, substantially as described.

4. In combination with the plow-beam and tongue, the double hinge-block J, having a square aperture, and the squared wheel shank or bar I, substantially as shown and described.



5. In a sulky-plow, the combination, with the beam A and tongue O, of the plate K, having lugs P P, hinge-block J, and plates T T, as and for the purpose set forth.

387,484.

387,485. CAR-COUPLING. Nicholas Barr, Cayuta, N. Y. Filed Mar. 26, 1888. Serial No. 268,504. (No model.)

Claim.—1. In a twin-jaw coupler, the combination of the coupling-head, a movable jaw provided with a heel pivoted in said head, said heel having a notch or projection on the front side of its rear end, and said coupling-head having a vertical passage through the same provided with a shoulder at its lower portion, a locking-pin confined in said passage and provided with a tongue longitudinally located on the same, said tongue being beveled on its lower edge and adapted to engage the notched end of the pivoted jaw and said shoulder, and an uncoupling-pin extending through said head and provided with a laterally-extending arm engaging the lower end of the locking-pin, as set forth.

2. In a twin-jaw car-coupler, the combination of the coupling-head provided with a downwardly-extending hollow or chambered portion, the movable jaw pivoted in said head, the vertically-operating locking-pin confined in a chamber or passage in the head and extending into said downwardly-extended portion when said jaw is locked, an uncoupling-pin operating vertically through the head and provided with a lateral arm located in said hollow extension and adapted to engage the lower end of the locking-pin, when the same is extended into said hollow extension below its passage.

3. The combination, with the coupling-head provided with a downwardly-extending chamber or hollow portion, of the pivoted jaw, locking-pin, uncoupling-pin, and mechanism for operating the uncoupling-pin, said hollow extension forming a guide and protecting the locking-pin, uncoupling-pin, and their attachments from injury, in the manner set forth.

4. In a twin-jaw car-coupling, the combination, with the coupling-head and the rigid jaw, of the movable jaw pivoted to the coupling-head, and a rod extending beneath said coupling-head and engaging the movable jaw; whereby, when said jaw is uncoupled, it can be thrown open or closed, substantially as described.

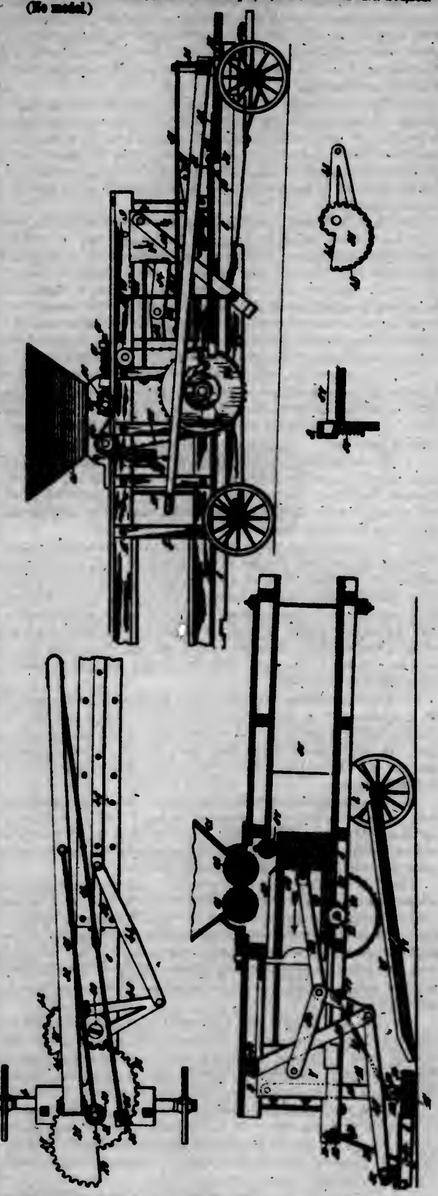
5. The combination, in a twin-jaw car-coupler, of the coupling-head provided with a substantially circular recess or chamber, a movable jaw provided with a laterally-extending heel pivoted in the head, a block located in said circular chamber and provided with an opening in which the end of said heel normally extends, and a locking-pin vertically operating in the head and extending through said circular chamber and forming the pivot upon which the block turns when operated by the end of the movable jaw, for the purpose and in the manner substantially as described.

6. The combination, with the coupling-head, the movable or coupling jaw, and a locking-pin, of a rotatory block operated by the movable jaw, and whereby the locking-pin is held suspended when the jaw is swung out, but when the jaw is swung inwardly it operates the block to automatically drop the locking-pin into position, locking said jaw, substantially as described.

7. In a twin car-coupler, the combination of the coupling-head provided on one side with the rigid jaw, the movable jaw pivoted in the opposite side of the head, a downwardly-extending lug on the under side of the movable jaw, a rod extending beneath the head and engaging said lug, whereby the movable jaw can be thrown open or closed when uncoupled, and a locking-pin to engage the rear end of the movable jaw and lock the same, substantially as described.

8. In a twin-jaw car-coupler, the combination of the coupling-head, the movable jaw provided with a heel pivoted in the coupling-head, a passage extending vertically through said head, a locking-pin loosely confined in said passage and engaging the end of said heel, a chambered or hollow extension at the lower side of the head and into which said vertical passage opens and the end of the locking-pin extends when the coupling-jaw is locked, a vertically-movable uncoupling-pin extending loosely through the head and provided with a lateral arm in the hollow extension and engaging the end of the locking-pin, and a transverse rock-shaft journaled at the end of the car and connected with the uncoupling-pin, whereby, when the shaft is turned, the uncoupling-pin is raised and its lateral arm lifts the locking-pin from engagement with the movable jaw, substantially as described.

9. In a twin-jaw car-coupling, the combination of the coupling-head provided with the rigid jaw and a movable jaw, the movable jaw being provided with a heel pivoted and normally resting in the coupling-head, a vertically-operating locking pin or key, a vertically-operating uncoupling-pin confined loosely in the coupling-head and provided with a laterally-extending arm engaging the lower end of the locking key, a longitudinally-movable rock-shaft journaled at the end of the car, an upwardly-inclined toe on the rock-shaft, and a chain or link loosely connecting the uncoupling-pin and said toe, substantially as described.



10. In a twin-jaw car-coupler, the combination of the draw-head, the coupling-jaw, the coupling-pin provided with a locking-tongue to engage the coupling-jaw heel and lock the jaw, said coupling-pin operating vertically and loosely confined in a passage extending through the head and projecting below the lower end of said passage when its locking-tongue is holding the coupling-jaw, an uncoupling-pin extending loosely through the head, and an arm secured to the lower end of said pin and extending laterally from the same beneath the lower end of said passage for the locking-pin, and upon which the end of said locking-pin rests when the jaw is coupled, and whereby the jaw is uncoupled by raising the lateral arm until the lower end of the locking-pin is withdrawn into its passage and its tongue lifted from engagement with said jaw.

11. The combination, in a twin-jaw car-coupler, of a movable jaw pivoted, as shown, and provided with a heel or lateral projection, a locking-pin, and a cylindrical rotary block having a flange arranged in such manner that said flange will hold the locking-pin in a suspended position when the car is uncoupled, substantially as described.

12. The combination, with the coupling-head provided with a socket or recess, a movable jaw provided with a heel pivoted in said recess, and a locking-pin, of the herein-described block pivoted in said head and provided with a recess into which the end of said heel is adapted to extend, whereby, when the jaw is uncoupled and the heel swung outwardly, it turns said pivoted block to allow the heel to pass out and to hold the locking-pin from dropping, and when the jaw is swung inwardly the block is turned to drop the locking-pin and close the opening into said socket or recess, in the manner and for the purpose as set forth.

13. In a twin-jaw car-coupler, the combination of the draw or coupling head, the movable or coupling jaw pivoted to the same, the locking-pin operating vertically in a passage extending through the draw-head and adapted to extend below the lower open end of the passage when in locked position, an uncoupling-pin operating vertically through the draw-head, and a lateral arm carried by the lower end of the uncoupling-pin and extending beneath the lower end of the locking-pin and adapted to engage the same and raise it from the locking position, for the purpose substantially as described.

387,486. BALING-PRESS. Henry P. Blank and Henry W. Shumaberger, Quincy, Ill. Filed Apr. 11, 1888. Serial No. 270,332. (No model.)

Claim.—1. The combination, in a press having a horizontally-movable plunger and the plunger-actuating levers, of a slide-bar supported in a horse-power sill and pivotally connected to the main plunger-lever, a vibratory toggle-arm pivoted to said slide-bar, a variable

scroll-gear pivoted to the horse-power sill and having a toggle-arm pivoted to the vibratory toggle-arm, an S-shaped variable gear also pivoted to the power-sill and meshing with the scroll-gear, and a sweep having a pull-rod connected with the S-shaped variable gear, substantially as described.

2. The combination, with a press-body supported on wheeled axles and having a horizontally-movable plunger, of a horse-power sill connected with the forward axle and adapted to be moved back beneath the press for transportation and to be disconnected from the press-frame and moved forward with the front axle in advance of the press, a horse-power mechanism mounted on said sill and connected with the plunger-levers, and a movable frame for supporting the forward end of the press-body when the front axle and horse-power are disconnected from the press and moved forward for operation, substantially as described.

3. The combination, in a press having a horizontally-movable plunger and the plunger-actuating levers, of a horse-power sill arranged in line with the press at its forward end, a frame attached to the press to support its forward end and form an abutment for the horse-power sill, and a bail suspended from the press-frame and extended beneath and on each side of the horse-power sill to brace the same, substantially as described.

4. The combination, with a press supported on wheeled axles and a horse-power mechanism for actuating the press-plunger, of a sill to support said horse-power mechanism, said horse-power sill being attached to the forward axle and capable of being moved in front of the press for operation and beneath the press for transportation, and an inclined plane hinged to the rear axle and extended forward beneath the press-frame to receive the horse-power sill, and a frame for supporting the forward end of the inclined plane when the power-sill is moved back beneath the press, substantially as described.

5. The combination, with the press-chamber of a press having a horizontally-movable plunger, of a yielding roller journaled above the entrance to the baling-chamber for the purpose of rolling the loose part of the material inward as it enters the baling-chamber, substantially as described.

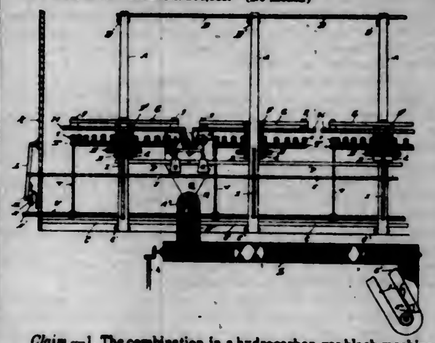
6. The combination, with a baling-chamber, a feed-chamber, and a horizontally-movable plunger, of a hopper located above the feed-chamber, feed-rollers located in said hopper, and gearing for actuating said rollers from the plunger only while the plunger is being moved away from the baling-chamber, substantially as described.

7. The combination, with a baling-chamber, a feed-chamber, and a horizontally-movable plunger having a cogged rack, of a hopper located above the feed-chamber, a horizontally-yielding feed-roller and a non-yielding feed-roller journaled in said hopper, said feed-rollers being provided with sprocket-gears, a shaft having a pinion meshing with said rack, a ratchet-wheel secured to the pinion-shaft, a sprocket-wheel loosely mounted on the pinion-shaft and carrying a pawl to engage the ratchet-wheel, and a chain to connect the sprocket-gears, substantially as described.

8. The combination, with the baling-chamber 55, feed-chamber 59, and hopper 61, of the plunger 53, having a cogged rack, 69, the shaft 71, having a pinion, 70, and ratchet-wheel 72, the loose sprocket-wheel 74, having pawl 73, the feed-rollers 62 and 63, provided with sprocket-gears 64 and 65, the idler 76, and the chain 75, substantially as described.

9. The combination, with the horizontally-movable plunger 53, of the plunger-levers 48 and 52, connected by bars 51, the pivoted hangers 49 and 54, for suspending said levers, the slide-bar 45, pivotally connected with the lever 48, and a horse-power mechanism for actuating said slide-bar, substantially as described.

10. The combination, with a portable press-frame mounted on wheels and a horse-power sill, 6, attached to the forward axle and adapted to be moved from beneath the press-frame, of a swinging frame, 12, pivoted to the press-frame and having a cross-bar, 14, to support the rear end of the extended horse-power sill, said swinging frame being also adapted to support the forward end of the press when the front axle is moved forward to extend the horse-power sill, substantially as described.



11. The combination, with a portable press-frame mounted on wheels and a horse-power sill, 6, attached to the forward axle, of the inclined plane 77, hinged to the rear axle and projecting forward beneath the press, the swinging frame 12, having a cross-bar, 14, and the brace-rods 16, substantially as described.

12. The combination, with the press-frame and the horse-power sill 6, of the swinging frame 12, having a cross-bar, 14, and braces 15 and 16, and the bail 21, attached to the bolster 22 of the press-frame and engaging legs or pins 24 on the sides of the power-sill, substantially as described.

13. The combination, with a portable press-frame adapted to be supported and transported on wheeled axles, of a horse-power sill attached to the forward axle, which is detachable from the press-frame, whereby said axle can be moved forward to extend the horse-power sill and be moved back to push the horse-power sill beneath the press-frame, a swinging frame attached to the forward end of the press to support said press when the horse-power is extended or moved forward, said swinging frame being also adapted to assist in supporting the horse-power, a horizontally-movable plunger mounted in the press-frame, and a horse-power mechanism mounted on the movable lower-sill to actuate said plunger, substantially as described.

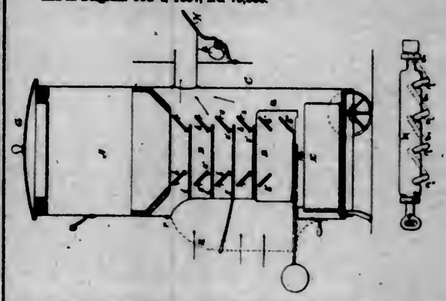
387,487. APPARATUS FOR MANUFACTURE OF LAMP-BLACK.

ARTHUR B. BLOOD, WESTON, BRYANT H. BLOOD, Ludlow, and EMERSON B. BLOOD, Ludlow, administrator of HENRY B. BLOOD, deceased, late of Ludlow, Pa.; said BRYANT H. BLOOD assignor to said ARTHUR B. BLOOD. Filed Mar. 30, 1888. Serial No. 268,812. (No model.)

Claim.—1. The combination, in a hydrocarbon-gas black machine, of a horizontal rotating deposit-ring, with an annular row of gas-burners arranged centrally under said deposit-ring, and scrapers operating to automatically remove the black from the rotating deposit-ring, substantially as and for the purpose set forth.

2. The combination, in a hydrocarbon-gas black manufacturing and handling apparatus, of horizontal rotating deposit-rings, gas-burners and scrapers arranged under said deposit-rings, with boxes for receiving the black removed from the deposit-rings, and conveyors for conveying the black from the boxes to a conveyor outside of the building, substantially as and for the purpose set forth.

3. The combination, in a hydrocarbon-gas black machine, of a series of upright posts, A, supporting rotating deposit-rings H, and ratchet-wheels E secured thereto, with ratchet-arms I, horizontal reciprocating bars J, pivoted to the ratchet-arms I, levers L, and cam mechanism M N, substantially as and for the purpose set forth.



4. The combination, in a hydrocarbon-gas black machine, of a series of horizontal rotating deposit-rings, H, and gas-burners *t* under said deposit-rings, with black-receiving boxes O, scrapers *h*, and screw-conveyers R, for conveying the contents of the boxes O away, substantially as and for the purpose set forth.

387,488. PAINT-VEHICLE. HANS BOSSHARD, New York, N. Y.

Filed July 28, 1887. Serial No. 245,547. (No specimens.)

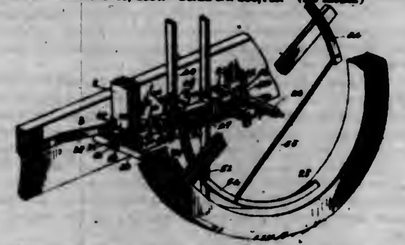
Claim.—A binding material for water-color, consisting of alkali, water, casein, and an oleaginous body, substantially in the proportions specified.

387,489. GRATE FOR STOVES OR OTHER HEATING APPARATUS. HENRY CARR, Paris, France. Filed Jan. 19, 1888. Serial No. 261,270. (No model.) Patented in France July 27, 1887, No. 185,098, and in Belgium Oct. 4, 1887, No. 79,060.

Claim.—1. The combination, with the side frames of the fire-box, of the grate-bars disposed in two vertical series and pivoted in the side frames of the fire-box, and the means for rocking said bars on their pivots, substantially as described.

2. The combination, with the grate-bars in the upper part of the fire-box, of the removable carriage constituting the lower part of the fire-box, said carriage being provided with grate-bars, forming continuations of the series in the upper part of the fire-box, substantially as described.

3. The fire-box provided with a movable carriage at the bottom and composed of removable bars between side walls, the latter being provided with grooves and the said carriage having a dumping-bottom, in combination with the separator and the hopper, substantially as described.



4. The combination, with the side walls of the fire-box, of the grate-bars arranged one above the other in two series, the side walls of the fire-box being provided with horizontal grooves between the several bars of each series, and the separator-plate adapted to be inserted in said grooves, substantially as described.

387,490. HELIOGRAPHIC ENGRAVING. GEORGE W. CAHLBAR, Washington, D. C. Filed Sept. 17, 1887. Serial No. 250,058. (No specimens.)

Claim.—1. The method of producing a heliographic-printing plate, which consists in covering the plate with an acid resist, cutting a series of lines or dots through said resist, then etching to this resist, as a substratum, a previously exposed and developed picture-bearing film, and finally etching the same, substantially as set forth.

2. The method of producing a heliographic-printing plate, which consists in covering the plate with an acid resist, cutting a series of lines or dots through said resist, flowing with a sensitive solution, and then, after drying, exposing under a positive and developing the same, submitting the plate to the action of the etching-acid, substantially as set forth.

387,491. HORSE-POWER. ORRIN A. CHAPMAN, Shawneetown Point, Iowa. Filed Oct. 20, 1887. Serial No. 252,762. (No model.)

Claim.—1. In a horse-power, the combination of the confining-box, the sides of which diverge toward the rear end, and an endless bridge.

2. In a horse-power, the combination, with the confining-box having an endless traveling bridge, of a band-wheel upon the side of the box, two curved arms pivotally secured upon diametrically-opposite spokes of the wheel, a rod connecting the short end of one of the arms with the long end of the other arm, a bell-crank upon one of the spokes of the wheel, a rod connecting the short end of the second curved arm with the bell-crank, a sleeve upon the hub of the wheel engaging with the other arm of the bell-crank, and a brake connected with the sleeve.

3. In a horse-power, the combination, with the confining-box having an endless traveling bridge, of a band-wheel upon the side of the box, a block secured to the side of the box near the periphery of the wheel, a flat bar adjustably attached to the block, the outer end of which is bent forwardly upon the outer side of the periphery of the wheel, and a movable brake attached to the block, the outer end of which is bent and adapted to be forced against the inner side of the periphery of the wheel.

4. In a horse-power, the combination, with the confining-box having an endless traveling bridge and a band-wheel upon the side of the box, of a slotted bar adjustably secured to the side of the box, the outer end of which is bent upon the outer side of the wheel, and a spring-actuated brake also secured to the side of the box, the outer end of which is bent and adapted to be forced against the inner side of the wheel.

5. In a horse-power, the combination, with the confining-box having an endless traveling bridge and a band-wheel upon the outer side of the box, of a brake-lever pivotally secured to the side of the box, a brake-shoe connected with the outer end of the lever, and an automatic regulating device adjustably connected with the other end of the lever.

6. In a horse-power, the combination, with the confining-box having an endless traveling bridge and a band-wheel upon the side of the box, of two arms or levers pivotally secured to the side of the box near the periphery of the wheel, a brake-shoe attached to the outer end of one of the levers, and a sleeve upon the hub of the wheel adapted to engage with the opposite end of the other lever, the inner ends of said levers being adjustably connected with each other.

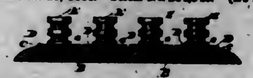
7. In a horse-power, the combination, with the confining-box having an endless traveling bridge and a hand-wheel upon the side of the box, of two levers pivotally secured upon the side of the box, a brake-shoe secured to the outer end of one of the levers, and an adjusting-screw secured to the inner end of the same lever, a spring secured to the inner end of the other lever near its pivotal point, a handle upon the side of the box, and a rod near its lower end, the outer end of which engages with the spring.

8. In a horse-power, the combination, with the confining-box having an endless traveling bridge and a wheel upon the side of the box, of a sleeve upon the hub of the wheel, two levers pivotally secured to the side of the box, the inner end of one of which is bifurcated and engages with the sleeve, a lip upon the under side of the lever, a brake-shoe upon the outer end of the other lever, the inner end of said second lever engaging with the lip of the first-mentioned lever, a handle or lever upon the side of the box, and a hook pivotally secured to the handle and adapted to engage with the first-mentioned lever.

387,492. PROCESS OF EXTRACTING GOLD AND SILVER. RUSSELL D. CLARK, Cortez, Nev. Filed Dec. 19, 1887. Serial No. 258,494. (No specimens.)

Claim.—The improvement in chloridizing gold or gold and silver in ores, consisting in mixing protosulphide of iron or of copper, also known as "matte," with the ore and salt, and roasting the same together preparatory to the subsequent leaching and amalgamating processes, substantially as herein described.

387,493. CARTRIDGE. ALFRED W. CORNELIUS, Washington, D. C. Filed June 6, 1888. Serial No. 276,102. (No model.)



Claim.—1. As an improved article of manufacture, a cartridge-shell provided with an opening or slot in its wall near its mouth, said opening being adapted to receive and seat the periphery or edge of a wad and to hold said wad in place.

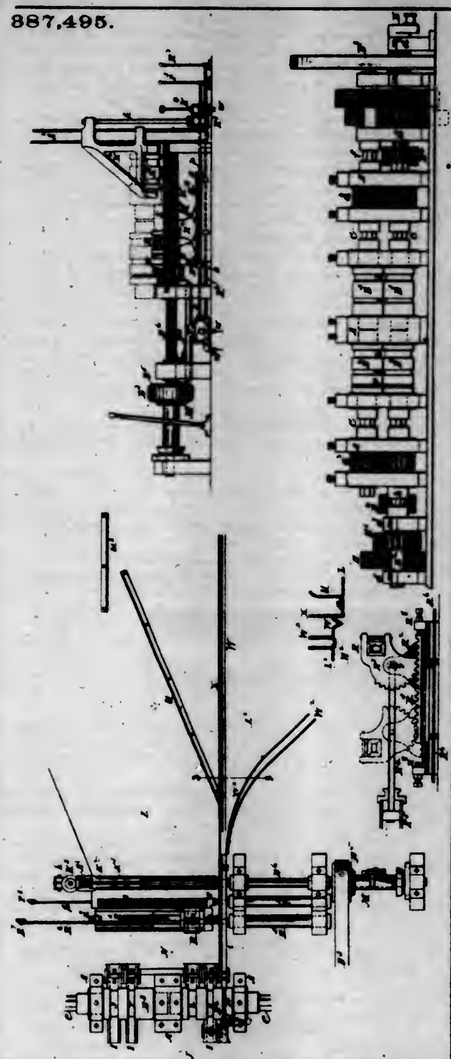
2. In combination with a shell provided with an opening or slot (one or more) in its wall, a wad provided with a projection on its periphery to fit the opening on the shell.

3. In combination with a shell, A, provided with angular openings B B in its walls, a wad, C, provided with tongues or projections D D, adapted to fit into the openings B B.

4. A cartridge-shell provided with an angular opening or slot in its wall near its mouth, said opening being adapted to receive and seat the periphery or edge of the wad and hold the latter in place.

387,494. VIOLIN TAIL-PIECE. JEAN B. DANDELIN, Fall River, Mass. Filed Feb. 20, 1888. Serial No. 264,542. (No model.)

Claim.—1. A tail-piece for violins, provided with a screw-actuated pressure-plate, substantially as described.



2. A tail-piece for violins, provided with a screw-threaded plate on the under side of the same and on its upper side with packing, pressure-plate, and screw, substantially as described.

387,495. ROLLING-MILL. FRED H. DANIELS, Worcester, Mass. Filed Jan. 31, 1887. Serial No. 226,026. (No model.)

Claim.—1. A rolling-mill having a plurality of sets of rolls, each set composed of two pairs of rolls, with driving mechanism for rotating the pairs in opposite direction, said sets of rolls being disposed with their passes in line for advancing the bar in either direction through the several sets in duplex or continuous order, substantially as described, whereby each introduction of the product backward or forward gives a plurality of passes for reduction.

2. A rolling-mill having a plurality of sets of two-high rolls arranged in double pairs with their reducing-passes in substantially the same horizontal plane, disposed one set in front of the other for operating in duplex order, and the respective pairs of rolls at the right and left in each set rotating in opposite directions for giving backward and forward passes of the bar, and means, substantially as described, for directing the bar across the space between the rolls, and mechanism for imparting motion to said rolls, substantially as set forth.

387,495.

herein described, for giving double backward and forward passes, the rolls combined with a system of guides for conducting the bar across the space between the sets of rolls, and a shifting device for carrying the bar laterally from the position of its exit to a position for its entrance into the roll-passes, substantially as set forth.

7. In a rolling-mill, the combination of a plurality of sets of rolls arranged in double pairs, end to end, rotating in opposite directions, with the bite of the rolls substantially in the same plane, the product to be carried through the duplex passes in one direction in one series of pairs of rolls and back through another series, and a laterally-movable oscillating carrier-guide for shifting and turning the end of the bar when reversing the feed thereof, substantially as set forth.

8. The combination, with the reducing-rolls, and the feeding-roll K, disposed in relation thereto as described, of the presser-roll K', having a groove for the reception of the bar and mounted on the overhanging vertically-reciprocating bracket K^3, substantially as and for the purpose set forth.

9. The combination, substantially as hereinbefore described, of the reducing-rolls disposed in oppositely-rotating pairs, the feed-roll K, with driving mechanism for rotating the same, the presser-roll K', the upwardly and downwardly movable bracket K^3, overhanging one end of said feed-roll and supporting the journals of said presser-roll, the guiding-standard A', the hydraulic cylinder K^4, piston-rod *k*, connected with said bracket, and the valve K^5, for the purposes set forth.

10. In a rolling-mill adapted for reducing bars by forward and backward end and end feeding, the combination, with the reducing-rolls, of the fenders U U', arranged substantially as set forth, and for the purposes specified.

11. In a rolling-mill arranged for the back and forth feeding of the bar, the combination, with the reducing-rolls, of a feed-roll over which the bar is projected, a presser-roll, and means for raising and depressing the same, and a diagonally-disposed fender for deflecting the advancing end of the bar, and a hydraulic carrier for shifting the rear end of the bar laterally from the pass of one pair of rolls to the pass of the other pair of rolls, substantially as set forth.

12. The combination, with the reducing-rolls, of an entering-guide and guide-carrier adapted for partial rotation for turning the bar, and means for rotating said guide-carrier and guide, substantially as and for the purpose set forth.

13. The combination, with the reducing-rolls and rolls for feeding the bar to the pass of said reducing-rolls, of an entering-guide and guide-carrier adapted for partial rotation for turning the bar, a rack for rotating said guide-carrier and guide, and means for effecting movement of said rack, substantially as and for the purpose set forth.

14. The combination, with the reducing-rolls in a rolling-mill, of a twisting-guide adapted for turning the bar before entering the reducing-pass of said rolls, and a feeding-in mechanism for advancing the bar through said guide, substantially as and for the purpose set forth.

15. The combination, with reducing-rolls, of the guide-carrier R', the reciprocating supporter R^2, the rack R^3, mounted to slide on said supporter and engaging with said guide-carrier, stops for engaging said rack, and means for imparting reciprocative action to said supporter and carrier, substantially as and for the purpose set forth.

16. In a rolling-mill for reducing bars by forward and backward end and end passage, the combination, with the reducing-rolls, of a reciprocating guide or carrier for shifting the bar laterally, an operating cylinder, piston, and connections, and means for automatically closing the cylinder-valve when said shifting-carrier has reached its desired limit of action, substantially as set forth.

17. The combination, with the oscillating guide-carrier R', its shifting supporter R^2, provided with an engaging-lug, of the operating-cylinder R^5 and connecting-rod, and the valve-controlling rod R^6, provided with collars or lugs, substantially as and for the purpose set forth.

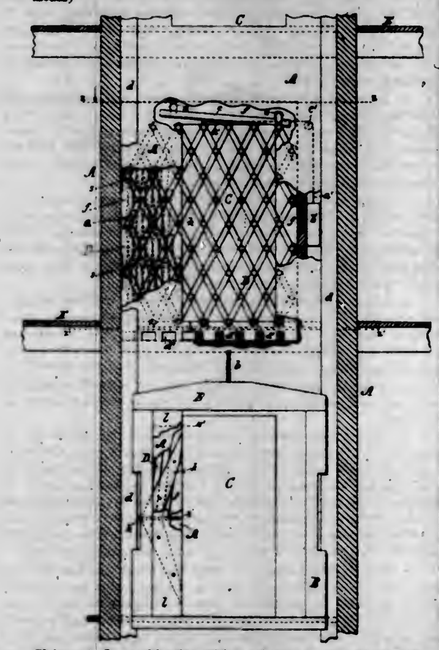
18. The combination, in a rolling-mill, of a plurality of sets of reducing-rolls disposed in oppositely-rotating pairs, with the bite or passes of said rolls in substantially the same plane, driving mechanism imparting motion thereto, an intermediate platform, and guides between the sets of rolls, a receiving-platform upon which the bar is projected as it runs from the rolls, a feed-roll arranged across said platform, a presser-roll in front of the entering-pass, and means for operating the same for forcing the bar down upon said feed-roll, a movable carrier for shifting the end of the bar laterally of said platform, an actuating cylinder and piston connected with said carrier, and valve-operating mechanism to control the pressure in said cylinder, substantially as hereinbefore set forth.

19. The combination, in a rolling-mill, of a plurality of sets of reducing-rolls disposed in oppositely-rotating pairs, with the bite or passes of said rolls in substantially the same plane, driving mechanism for imparting motion thereto, a support for the bar between the rolls, a receiving-platform upon which the bar is projected as it runs from the rolls, a diagonally-disposed fender, and a reversing-fender fixed upon said platform, a laterally-movable carrier for shifting the end of the bar laterally of said platform, an actuating cylinder and piston connected with said carrier, and valve-operating mechanism to control said cylinder, substantially as hereinbefore set forth.

20. The combination, in a rolling-mill, of a plurality of sets of reducing-rolls disposed in oppositely-rotating pairs, with the bite or passes of said rolls in substantially the same plane, means, such as described, for operating said rolls, a support, and guides for directing the bar between the several sets, a receiving-platform upon which the bar is projected as it runs from the rolls, a feed-roll arranged across said platform, a presser-roll in front of the entering-pass, and means for operating the same to force the bar down upon said feed-roll, a diagonally-disposed fender, and a reversing-fender fixed upon said platform, an actuating cylinder and piston connected with said presser-roll, and valve-operating mechanism to control the pressure in said cylinder, substantially as hereinbefore set forth.

21. In a rolling-mill, the combination of a plurality of sets of reducing-rolls severally comprising a plurality of oppositely-rotating pairs of rolls, with intermediate guides disposed for operation upon the bar in duplex order, a pair of feed-rolls at either side of said mill, a driving-shaft, as D, provided with gearing F H, and pulleys D^4, auxiliary gear-shafts F^5 H^5, coupled with the respective roll-shafts, belts D^5, pulleys D, and clutch mechanism M, substantially as and for the purpose set forth.

22. The reciprocating carrier P, the cylinder P', and piston connecting-rod, the valve V, valve-rod *p*, provided with collars S, engaging-lug P^4, and actuating-lever P^5, in combination with the feed-rolls K K' and reducing-rolls in a rolling-mill, substantially as and for the purpose set forth.



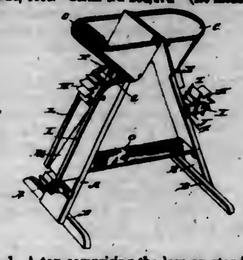
3. A rolling having a series of pairs of rolls, as B^7 B^8, for giving forward passes, and a series of pairs of oppositely-rotating rolls, as B^2 B^4, arranged end to end, with operating-gearing for the several pairs at the right and left, respectively, and a main driving-shaft, D, provided with gearing for simultaneously operating all of the respective pairs of rolls at the requisite speeds for reducing the bars in their back-and-forth passes, substantially as described.

4. A rolling-mill having a plurality of sets of rolls arranged one in front of the others to work in duplex or continuous order, in combination with a bar-supporting platform arranged parallel with the axial plane and extending across the space between the respective sets of rolls adjacent to the plane of their reduction-passes, substantially as and for the purpose set forth.

5. A rolling-mill having a plurality of sets of rolls, each set composed of two oppositely-rotating pairs of rolls disposed with the pairs of rolls in one set in front of correspondingly-rotating pairs in the other sets to work in continuous or duplex order, in combination with guides leading across the space between the sets in alignment with the passes of the rolls, and means for rotating said rolls for effecting backward and forward passage of the bar, substantially as set forth.

6. A rolling-mill the rolls in which are arranged, in the manner

387,496. DOOR-GUARD FOR ELEVATOR-WELLS. ORION L. DAVIS, Rochester, N. Y. Filed Dec. 5, 1887. Serial No. 257,003. (No model.)



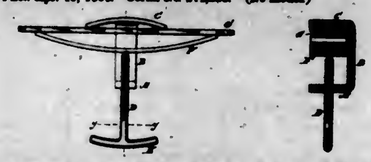
Claim.—1. In combination with an elevator-car provided with a vertical cam, a movable gate for a doorway of the well hinged or pivoted at one side of said doorway and provided with a projecting pin to be acted upon by said cam to move said gate toward one side, and a spring or springs bearing upon said gate, so as to move the latter in the opposite direction, substantially as shown and described.

2. A laterally-operating gate of the lazy-tongs form for an elevator-well, consisting of slats crossing each other and joined by pivot-pins at the points of intersection, said gate being provided with a projecting pin, in combination with a lever pivoted to the wall of the well in position to bear upon said pin, and an elevator-car provided with a cam to act upon said lever, said wall of the well being formed with a slit, *i*, and a rest for said pin, substantially as shown and described.

3. In combination with an elevator-car provided with a vertical cam, a laterally-expansible gate for a doorway of the well hinged or pivoted at one side of said doorway and provided with a projecting pin to be acted upon by said cam, an inclined track, and a supporting-roller for the gate resting upon said track, substantially as shown.

4. A gate for the doorway of an elevator-well, consisting of oppositely-inclined slats crossing each other and joined by pivot-pins at the points of intersection, said gate being held at one side of said doorway and provided with a projecting pin, in combination with a car having a vertical cam to act upon said projecting pin, and springs connecting said adjacent pivot-pins in vertical lines, so as to draw said connected pivot-pins toward each other to close the gate, substantially as described.

387,497. SAND-MILL. JAMES T. DEBARDT, Englewood, N. J. Filed Mar. 26, 1888. Serial No. 268,474. (No model.)



Claim.—1. A toy comprising the legs or standards hinged together at their upper ends and provided with transverse bars or feet at their lower ends, the hopper secured to the upper ends of the legs, and the wheels mounted thereon below the hoppers, as set forth.

2. The combination of the inclined standard, the hopper secured to the upper end of the same, the grooved guide-plate secured to the standard below and adjacent to the lower end of the hopper, the parallel plates secured to the standard below said guide-plate, the wheel journaled between the upper ends of said plates, the deflecting-plate secured between said parallel plates below the wheel, and the wheel mounted on the standard below and adjacent to the lower ends of the parallel plates and the deflecting-plate, substantially as specified.

3. A toy comprising the legs or standards hinged together at their upper ends and carrying the hoppers, and the wheels below the hoppers, and the feet at the lower ends of the legs, and the straps O, connecting the legs, as set forth.

387,498. BENDING-TOOL. DANIEL DEBLIEBRE, Brooklyn, N. Y. Filed Apr. 19, 1888. Serial No. 271,262. (No model.)

Claim.—1. The combination of the bar B, having the jaw C and arm A, the jaw F, of a length greater than the jaw on the bar, and an actuator, D, for advancing one jaw toward the other, substantially as described.

2. The combination of a frame open at one side and comprising a jaw, C, and actuator D, and a longitudinally-curved jaw, F, of greater length than the jaw on the frame, substantially as described.

3. The combination, with a frame open at one side and comprising a jaw, C, of an actuator, D, and a removable and replaceable concavo-convex jaw F, substantially as described.

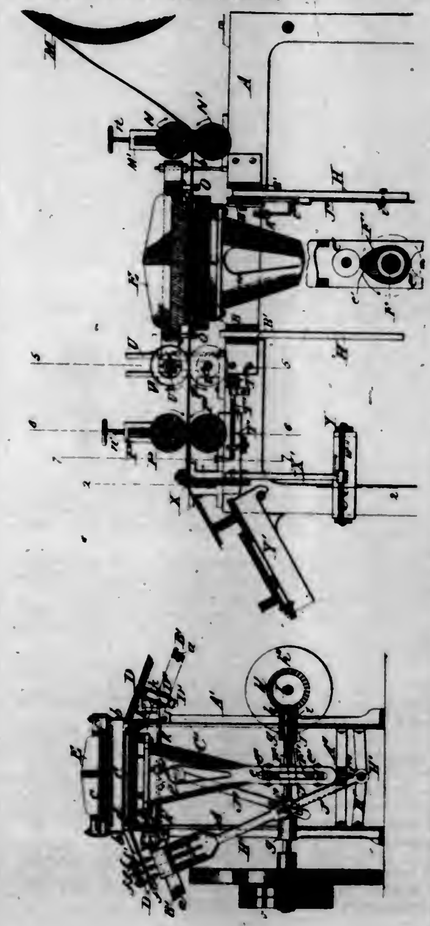
4. The combination of a frame open at one side and comprising a jaw, C, and arm A, having a screw-threaded orifice, the screw D, engaging said orifice, and the jaw F, one of said jaws being of length greater than the other, substantially as described.

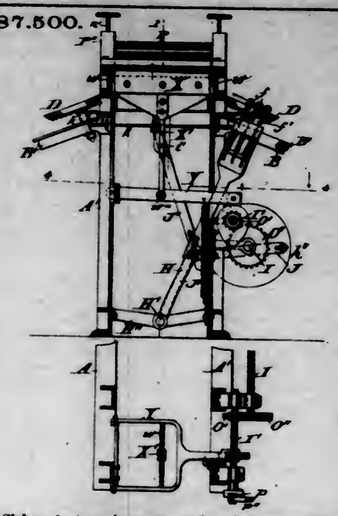
5. The combination of a frame having a jaw, C, an actuator, D, and a jaw, F, one of said jaws being of a length greater than the other jaw, to extend beyond the ends thereof, substantially as described.

6. The combination of a frame having a longitudinally-curved jaw, C, an actuator, D, and a longitudinally-curved jaw, F, one of said jaws being of a length greater than the other, to extend beyond the ends thereof, substantially as described.

7. The combination of the bar B, having a jaw, C, an actuator, D, and a reversible concavo-convex jaw, F, one of said jaws being of a length greater than the length of the other jaw, to extend beyond the ends thereof, substantially as described.

387,499. CORD-HOLDER FOR VENETIAN BLINDS, &c. JOHN R. HADDAW, Manchester, County of Lancaster, England. Filed July 20, 1887. Serial No. 244,813. (No model.) Patented in England Mar. 19, 1887, No. 4,171.





Claim.—1. A cord-holder having a socket constructed with upwardly-converging side walls and a correspondingly-tapering wedge which travels freely up and down within said socket, in combination with a pair of cords interposed between said wedge and the respective side walls, substantially as herein specified.

2. In a cord-holder, a socket constructed with upwardly-converging side walls and provided at its lower end with a stop and a pair of inclines, in combination with an upwardly-tapering wedge which travels freely up and down within said socket, and a pair of cords interposed between said wedge and the respective side walls, substantially as herein specified.

3. The combination, in a cord-holder, of a socket having upwardly-converging side walls and parallel front and back walls, an upwardly-tapering wedge which travels up and down within said socket, and an attaching-screw which passes through said front wall and beneath said wedge at the lower end of the socket, substantially as herein specified, for the purpose set forth.

387,500. PRINTING-MACHINE. DAVID I. ECKERSON, Worcester, N. Y., assignor of one-half to George B. Wright, same place. Filed June 30, 1887. Serial No. 243,003. (No model.)

Claim.—1. As an improvement in printing-machines, a horizontally-placed adjustable platen provided upon its under side at each end with the rollers O O, supporting the paper, and a yielding layer of material, *c*, covered by a cloth, *c'*, passing under said yielding material and secured to the sides of the platen by screws *a' a'*, to support the paper while it receives the impression from the upwardly-moving type-bed, as set forth.

2. As an improvement in printing-machines, the vertically-reciprocating type-bed C, provided with guides *d'*, and the secondary frame B, having guide slots or recesses *d''* to receive said guides, in combination with the cone-shaped slotted support *C'* for said bed and the cam and shaft, arranged substantially as shown and described, to produce the reciprocation of said type-bed, as set forth.

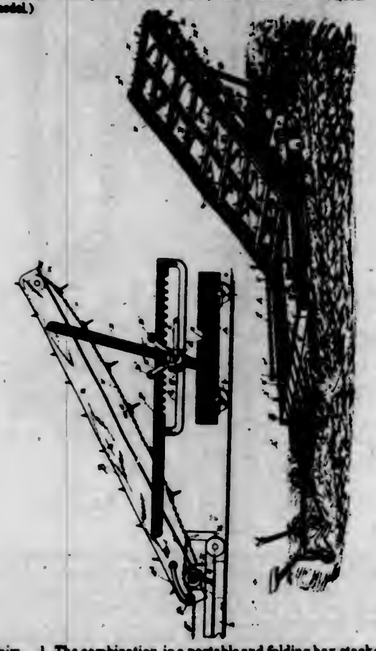
3. As an improvement in printing-machines, the transverse secondary frame B, in combination with vertically-reciprocating type-bed C, supported upon an inverted hollow cone-shaped standard, *C'*, said standard being diametrically slotted below the apex of the cone in two directions at right angles to each other for the reception of the cam-shaft, cam, and friction-wheels, as specified.

4. As an improvement in printing-machines, the vertically-reciprocating type-bed C, supported upon the downwardly-projecting cone-shaped standard *C'*, carrying the friction-wheels *c'* and provided at its lower end with guide-pin *C''*, moving in a guide-orifice in a cross-bar of the frame, in combination with the cam F' and its shaft F, revolving in one of the slots of said standard and adapted to impart a vertically-reciprocating movement to said standard and type-bed, as set forth.

5. As an improvement in printing-machines, the main frame A, carrying an adjustable platen, the secondary frame B, vertically-reciprocating type-bed, and its cone-shaped slotted supporting-standard, said type-bed and standard sustained in their vertical movements by suitable guides, in said secondary and main frames, in combination with the cam F', carried by shaft F and adapted to impart a vertical reciprocating movement to said type-bed by contact in their revolutions with the friction-rolls *c' c'* above and below said cam, as specified.

6. In a printing-machine, the main frame A of said machine and the transverse driving-shaft F, carrying the cam F', for giving motion to the type-bed, in combination with the longitudinal shaft I and bevel-gears *h h'*, arranged to give one revolution of the shaft I to two of the shaft F, the disk *h'*, provided with an adjustable crank-pin, *i*, connecting-rod I', and slotted swinging arm H, all operating, as shown and described, for imparting motion to the inking-rolls.

7. In a printing-machine, the combination, with the main frame A, of the inside transverse secondary frame, B, provided with inclined ends for the reception of the inclined inking-plates and guide-recesses to receive the guides of the vertically-reciprocating type-bed, as set forth.



8. In an inking apparatus for printing-machines, the combination, with the swinging lever carrying the inking-rolls and a lever connected with said roll-carrying lever by an adjustable rod or connection, of the pawl-rod, pawl, and inking-disks, all arranged, as shown and described, to give a rotary motion to said disks, as specified.

9. As an improvement in means for imparting motion to a system of inking-rolls in printing-machines, the combination, with the main driving-shaft placed transversely to the main frame of the machine, of a crank-shaft placed at right angles to said driving-shaft and connected therewith by bevel-gears adapted to give one revolution of the crank-shaft to two of the driving-shaft, a pitman, and swinging lever carrying upon its free end the inking-rolls, all arranged and operated as set forth.

10. In a printing-machine, the combination, with the stationary rolls, of the adjustable feed-rolls P P', the rack-pinion and ratchet mechanism by which an intermittent and adjustable length of rotating movement is imparted thereto, the screws upon opposite sides of the frame, and their connecting shaft and gear for adjusting the position of the rolls P P' longitudinally of the frame, as set forth.

11. In printing-machines, the vertically-reciprocating and longitudinally-adjustable cutter X, in combination with the pitman X', cross-bar *w''*, bifurcated lever Y, and the shaft and cam arranged to give a swinging movement to said lever, as specified.

387,501. HAY OR STRAW STACKER. JOSEPH A. EDWARDS and EDWARD WALTON, Chariton, Iowa, assignors of one-third to David Wormley, same place. Filed Nov. 2, 1887. Serial No. 254,112. (No model.)

Claim.—1. The combination, in a portable and folding hay-stacker, of the truck A, the bars D, pivoted to said truck and to the carrier-frame B, the shaft C, having bearings on said bars and provided with the pinions *d* and crank-handles *e*, the carrier-frame B, pivotally supported at one end, the toothed or rack bars F, pivotally secured at one end to said carrier-frame and having the guards or guides G, the endless carrier, and means for operating the same, substantially as described.

2. The combination, in a portable and folding hay-stacker, of the truck A, the bars D, pivoted to said truck and to the carrier-frame B, the shaft C, having bearings on said bars and provided with pinions *d* and cranks *e*, the toothed bars F, pivoted to the carrier-frame B and having the guides or guards G, the carrier-frame B, the shafts H M, having bearings on said carrier-frame, the sprocket-wheels *m*, the endless carrier, the upright supports K, sprocket-wheels O, and means for operating the same, substantially as described.

3. The combination, in a hay-stacker, of the carrier-frame, the shafts H and M, journaled at its upper and lower ends, the sprocket-wheels secured on said shafts within the frame, the endless carrier running on said wheels, the hollow trunnions secured to said frame, the upright supports for said trunnions, the sprocket-wheels O, loosely mounted on said shaft H, the spring-clutch connection between said wheels and shaft, and means for operating said sprocket-wheels, substantially as described.

4. The combination, with a portable hay-stacker, of the carrier-frame B, pivotally and adjustably supported, the shaft H, the sprocket-wheels O, the spring having one end secured to said sprocket-wheels, the pawls loosely pivoted to said wheels, the ratchet-wheel rigidly secured to the shaft H, and the power-carriage carrying sprocket-chains, said chains engaging said sprocket-wheels and adapted to operate the endless carrier, substantially as described.

5. The combination, in a portable and folding hay-stacker, of the truck A, having the depressions *c*, the bars pivoted to said truck and to the carrier-frame, the shaft journaled on said bars and having the pinions *d*, the carrier-frame B, and the pivoted toothed or rack bars F, having guides or guards G, rigidly secured thereto, whereby said carrier-frame may be folded and its longitudinal movement on said truck prevented, substantially as described.

6. A power-carriage for hay-stackers, consisting of the longitudinal beams *d''*, having the uprights *r* and *r'* at opposite ends, the pins *t'*, the sprocket-chains *s'*, the cross-beams *s'*, the wheels *u*, and flanged wheels *u'*, in combination with the carrier-frame having the driving sprocket-wheels, substantially as described.

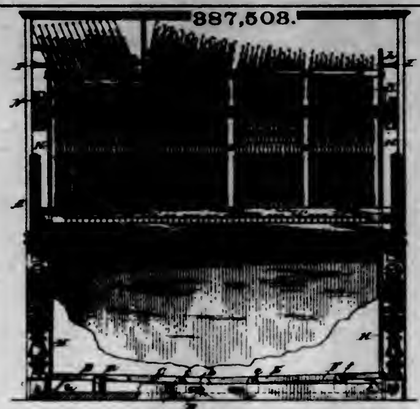
7. An endless carrier for hay-stackers, consisting of the side pieces *v* and bottom *v'*, shafts H M, the sprocket-wheels *m*, the sprocket-chains N, formed of the bridged links *w*, having side pieces *w'*, cross-pieces *w²* and hook *w³*, and the toothed slats *w⁴*, secured to said cross-pieces *w²*, substantially as described.

8. The hereinbefore-described hay-stacker, consisting of the truck A, the bars D, pivoted to said truck and the carrier-frame B, the shaft C, journaled on said bars and having the pinions *d* and cranks *e*, the toothed bars F, pivoted to the carrier-frame and having the guides or guards G, the carrier-frame B, the shaft H M, carrying the sprocket-wheels *m*, the endless carriers, the sprocket-chains N, the toothed bar R, the sprocket-wheels O, clutch hub or connection between the sprocket-wheels O and the shaft H, the hollow trunnions *d'*, uprights K, the power-carriage P, the track having inclined ends, and means for operating the power-carriage, substantially as described.

9. The combination, in a hay-stacker, with an adjustable frame carrying endless carriers, of a wheeled truck, bars pivoted to said truck and to the discharge end of the apron, a cross-shaft journaled to said bars and having pinions and cranks, and toothed or rack bars pivoted at one end to the carrier-frame and supported by the cross-shaft at their other end, substantially as described.

387,502. HORSE HAY-RAKE. JOSEPH A. EDWARDS and EDWARD WALTON, Chariton, Iowa, assignors of one-third to David Wormley, same place. Filed Nov. 2, 1887. Serial No. 254,112. (No model.)

Claim.—1. In a horse hay-rake, the combination of the axle, the shafts pivotally attached to said axle, the angle-irons having one end pivoted to the axle and the other rigidly attached to the shafts, the rake-teeth secured to said axle, the seat-supporting beam pivotally attached to the axle, the caster-wheel supporting said beam, and means for adjusting the inclination of the rake-teeth, substantially as described.



2. In a horse hay-rake, the combination of the axle A, shafts E, beam F, segmental ratchet H, secured to said beam, the lever K, pivoted to the beam, the link M, having one end pivoted to the lever K and the other to the elbow-lever N, the elbow-lever N, pivoted to the beam, the link O, pivoted at one end to the lever N and at its other to the cross-bar secured to the rear ends of the rake-teeth, and means for locking said levers in their adjusted position, substantially as described.

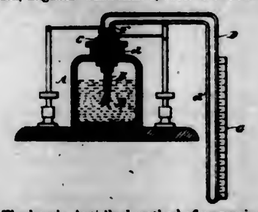
3. A horse hay-rake consisting of the axle A, the wheels B, the shafts E, the seat-supporting beams and braces loosely attached to said axle, the rake-teeth rigidly secured to the axle, the bar D, having the inclined teeth *b*, angle-irons *d*, rigidly secured at one end to the shafts and at the other loosely secured to the ends of the axle, caster-wheels G, the seat-bar *G'*, secured to the supporting-beams, the seat A, the lever K, pivoted to the beam and carrying thumb-lever L, the latter having the depending pin *m*, the segmental ratchet H on the beam, the link M, pivoted to the lever and to bell-crank N, the bell-crank N, pivoted to the beam and its lower arm pivoted to the link O, and the link O, pivoted to the cross-bar secured to the rear ends of the rake-teeth, substantially as described.

387,503. PIANOFORTE-PEDAL FOR PIANOS. FRANK FIELDS, Milwaukee, Wis. Filed Nov. 8, 1886. Serial No. 252,242. (No model.)

Claim.—In an upright piano, the combination, with a pedal having a vertical pin, *b*, of the lever C, adapted to engage said pin, levers

387,503.

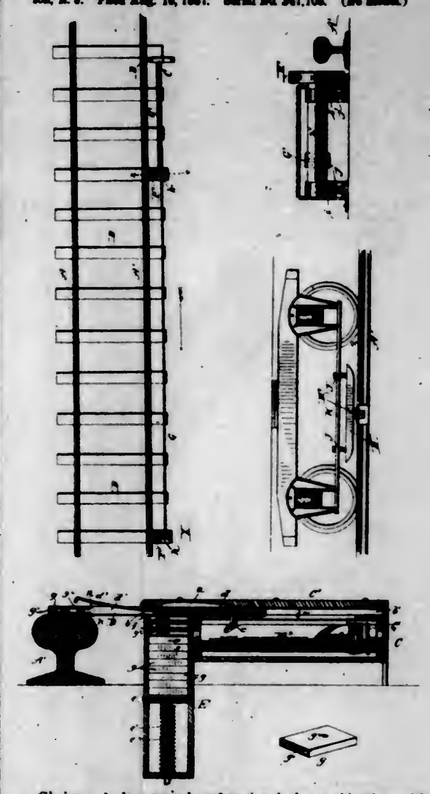
D E, flexibly joined to the one C, and another lever, F, similarly joined to the one E, two vertical sliding rods united at their lower ends to said levers D F, brackets I, secured to the interior of the piano-casing and provided with pins passing through slots in the upper part of the rods, a horizontal bar, L, fastened at its ends to said rods, a continuous strip of felting or other suitable material, *i*, and a series of strips, *i'*, of similar material, pendently secured to said horizontal bar, and the springs G, arranged to come in contact with the outer ends of the lever system at or near their points of juncture with the vertical rods, all arranged to operate substantially as and for the purpose set forth.



387,504. ATTACHMENT FOR PLOWS. William C. Perry, Fowler, Ind. Filed Feb. 7, 1888. Serial No. 263,243. (No model.)

Claim.—1. The combination, with the plow having the lower edge of its landside formed with a longitudinal recess, of the share attachment consisting of a vertical portion formed with a vertical open slot, and further formed with a horizontal triangular share portion, and bolts and tightening-nuts, substantially as set forth.

2. An attachment for plows, consisting of the vertical portion formed with the slot adapted to engage with a bolt and a tightening-nut in the side of the plow, and further formed with the triangular horizontal portion beveled upon its forward edge to form a cutting-surface, substantially as set forth.



387,505. METHOD OF MEASURING ELECTRICITY. George Forbes, London, England. Filed Mar. 3, 1888. Serial No. 266,554. (No model.)

Claim.—1. The herein-described method of measuring electricity, consisting in passing the current to be measured through a conductor and thereby heating the same, evaporating a liquid by the aid of the heat so generated, and finally noting the amount of evaporation which has taken place as a measure of the quantity of electricity which has been passed through the conductor, substantially as described.

2. The herein-described method of measuring electricity, consisting in passing an electric current through a conductor arranged in proximity to a quantity of liquid, thereby heating said conductor and evaporating the liquid, then condensing said vaporized liquid in a second vessel, and finally measuring the amount of liquid so condensed, substantially as described.

387,506. DETONATING RAILROAD-SIGNAL. James Fox, Trenton, N. J. Filed Aug. 16, 1887. Serial No. 247,103. (No model.)

Claim.—1. In a torpedo safety-signal, the combination, with a torpedo placer and retractor applied to a railway-track, of the rollers F F', their connections with said device, as described, and a spring-yielding shoe on a truck-frame adapted to actuate said devices, substantially as described.

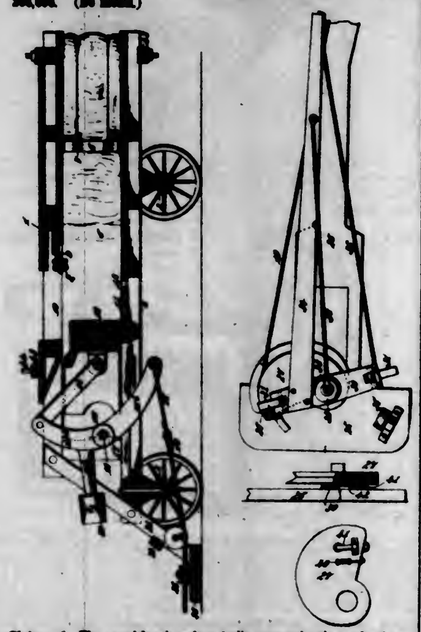
2. The combination, with a horizontal case, of a reciprocating torpedo placer and retractor, D, a spirally-grooved drum for moving said device, a vertical case for containing torpedoes in open-ended shells, and a spring-actuated follower for feeding the torpedoes to said device D, substantially as described.

3. The combination, with a suitable case, of a spirally-grooved drum, a sliding torpedo placer and retractor actuated by said drum, and having spring gripping-jaws, the lugs or rollers *p p*, for contracting said jaws, and a torpedo-feeder, substantially as described.

4. The combination of the case E and its spring-actuated follower, the case C, with its recessed cover, the spirally-grooved drum, the reciprocating device D, having spring gripping-jaws, and a hooked retracting-spring, d^3, between said jaws, substantially as described.

5. The combination, with a torpedo-button, of an open-ended shell, perforated as described.

6. The combination, with a suitable case having a vertical torpedo-cartridge chamber provided with a spring-actuated follower, of the reciprocating torpedo placer and retractor D, having spring-jaws, and a hooked retracting-tongue, d^3, adapted to engage with the shell *g*, and cover for the horizontal portion of said case, recessed at *a*, for the purpose described.



7. The combination, with a suitable case, of the reciprocating placer and retractor D, having spring-jaws, the closing projections *p p* therefor, and a hooked spring-tongue, d^3, substantially in the manner and for the purposes described.

387,507. KNITTING-MACHINE NEEDLE. Carl Pfenning, Milwaukee, Wis. Filed Jan. 16, 1888. Serial No. 260,894. (No model.)

Claim.—A knitting-machine needle constructed and adapted to reciprocate in the groove of a cylinder of a knitting-machine, such needle having a shank, G, a bit, H, and a spring, K, located above the bit and adapted to bear laterally against the side or sides of the groove of the cylinder in which the needle travels, said shank, bit, and spring being formed integrally of a single piece of metal, substantially as described.

387,508. BALING-PRESS. Franklin Pirt, Quincy, Ill., assignor, by mesne assignments, of two-thirds to John O. Hannaher and Charles H. Swain, both of same place. Filed Mar. 27, 1888. Serial No. 268,602. (No model.)

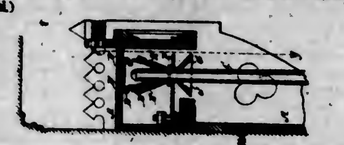
Claim.—1. The combination, in a baling-press having a horizontally-movable follower, of a three-armed lever fulcrumed back of said follower, a pitman for connecting the follower with the upper arm of said lever, a cable connecting the lower arm of the lever to a horse-power, and a weight on the rear arm of the lever, substantially as described.

2. The combination, in a baling-press having a horizontally-movable follower, of a horse-power located in a direct line with the press, a three-armed lever through which the follower is actuated, a pitman connecting one arm of the lever with the follower, a cable connecting another arm of the lever with the horse-power, and a weight on another arm of the lever to retract the follower when the horse-power cable is relieved, substantially as described.

3. The combination, in a baling-press having a horizontally-movable follower, of a horse-power comprising an eccentric pulley having a lug, a lever having a latch to engage said lug, a sweep to actuate said lever, a cable connecting the eccentric pulley to the follower-lever, and a cam to release the latch that engages the lug on the eccentric pulley, substantially as described.

4. The combination, in a baling-press having a horizontally-movable follower, of a lever connected with the follower, a horse-power comprising a cable attached to the follower, an eccentric pulley having a lug and connected with the cable, a lever having a latch to engage the lug on the pulley, a cam to release the latch, a sweep, and a brake mechanism to ease the recoil of the pulley, substantially as described.

5. The combination, with the horizontally-movable follower 13 and weighted lever 15, of the cable 19, the guide-pulleys 24 and 29, the eccentric pulley 27, having lug 28, the lever 30, having latches 31, the sweep 34, and the cam 38, substantially as described.

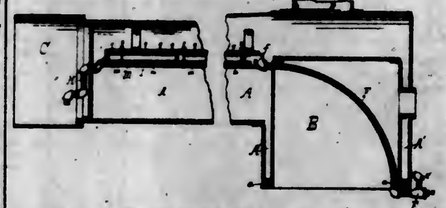


6. The combination, with the eccentric pulley 27, of the stop 39, spring-bolt 40, friction-way 42, and spring-brake 41, substantially as described.

387,509. SASH-HOLDER. William H. Fiehe and Wilbur H. Gessner, Dayton, Ohio. Filed Sept. 17, 1887. Serial No. 249,941. (No model.)

Claim.—The combination, with the sash moving up and down between retaining-strips secured to the jamb-posts, and the transversely-corrugated metal strip secured to the edge of said sash adjacent to the securing or holding devices, of the casing let into the jamb-posts on one side, the eccentric cams corrugated transversely on their outer surfaces, and provided, respectively, with the inwardly-standing fingers N N', pivoted within said casing, the actuating-springs *g g'*, and the hollow shaft K, provided with the arm L, and the opposite pins M M' on the end of said arm, substantially as specified.

387,510. HOLDER FOR CUES AND OTHER ARTICLES. Gustave W. Gray, Newark, N. J. Filed Sept. 1, 1887. Serial No. 248,883. (No model.)



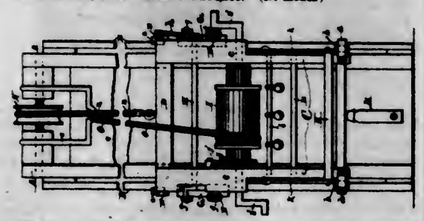
Claim.—1. A suspending device for cues and other articles, consisting of the base or support A, the movable jaws B, hinged at their upper ends to said base, and the spring F, secured to said base, and having free ends which surround said jaws and are adapted to press them together, substantially as described.

2. A suspending device for cues and other articles, consisting of the support A, the jaws B, hinged to said base and provided with lugs and notches forming guides E, and the spring F, surrounding said jaws and adapted to press them together, substantially as described.

3. The combination of the support A, having eyes D', the movable jaws B, provided at their upper ends with pivots D, engaging said eyes, and the spring F, surrounding the jaws, substantially as described.

387,511. STEAM-BOILER. Herbert Hackney, Topeka, Kans. Filed May 10, 1888. Serial No. 273,515. (No model.)

Claim.—1. The combination of the boiler with a submerged mud-drum isolated from the direct action of the fire, and an automatic circulation-pipe exposed to the direct action of the fire or the heated volatile products of combustion, and adapted to continuously circulate the water from the lower part of the boiler into the mud-drum and thence into the upper part of the boiler, substantially as described.



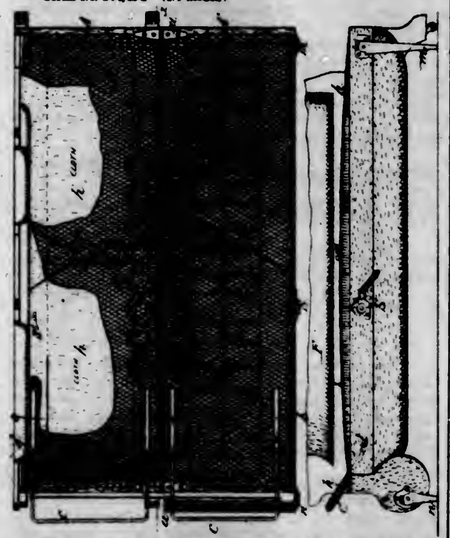
2. The combination of the boiler with a submerged mud-drum isolated from the direct action of the fire, and communicating along its upper edge with the water-space of the boiler, and the automatic circulation-pipe exposed to the direct action of the fire or the heated volatile products of combustion, and adapted to continuously circulate the water from the lower part of the boiler into the mud-drum and thence into the upper part of the boiler, substantially as described.

3. The combination of the boiler, the automatic circulation-pipe exposed to the direct action of the fire or the heated volatile products

of combustion, and the submerged and isolated mud-drum, divided into two compartments, M N, the former of which communicates with the circulation-pipe and the water-space and the latter with the discharge-pipe and the compartment M, substantially as described.

4. The combination of the boiler, the mud-drum and means for discharging the same, and the automatic circulation-pipe F, with the coupling E, provided with a removable cap to adapt the apparatus to the application of a hose for cleaning purposes, substantially as described.

387,512. PORTABLE ELEVATOR. Joseph T. Haines, Balbec, Ind. Filed Feb. 16, 1888. Serial No. 264,209. (No model.)



Claim.—1. The elevator comprising the vertical guide-rails, the carriage C, mounted on said rails and having a hinged platform, K, supporting-rods therefor, the rope, drum, and equipoising-weight on rope *n*, and pulley N, and the brake mechanism engaging the guide-rails and adapted to stop and hold the carriage, all constructed and arranged substantially in the manner and for the purpose described.

2. The combination of the guide-rails and the elevator-carriage with the cranked rod H, the arm A, the movable brake-blocks G G, and the links *g g*, respectively connecting said blocks with arm A and the cranked end of shaft H, all constructed and arranged substantially as and for the purpose described.

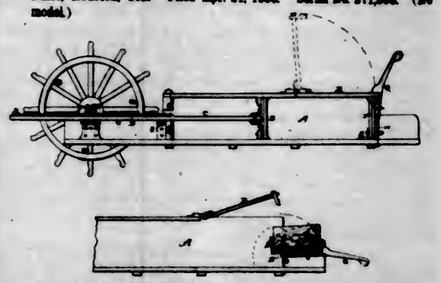
3. The herein-described elevator, comprising the guide track-rails, the carriage provided with friction-rollers, and clips mounted on said guides, the drum I, its cranked shaft, rope O, and the brake-blocks G G, cranked shaft H, arm A, and links *g g*, connecting blocks G respectively with the cranked end of shaft H and arm A, all constructed and arranged substantially in the manner and for the purpose described.

387,513. BED-LOUNGE. Frederick B. Hemingway, Clinton, Iowa, assignor to Hemingway & Kelly, same place. Filed May 19, 1888. Serial No. 274,494. (No model.)

Claim.—1. In a bed-lounge, the wire web B, provided with the elongated slots *b* and extended over the entire intermediate space between the outer sides and ends of the lounge-frames, and fastened in a tightly-stretched state to the lounge-frames, in combination with the two separate pillow-support frames *c*, having their legs inserted through the slots and pivotally connected with the lounge-frames below the wire web, substantially as and for the purposes described.

2. In a bed-lounge, the wire web B, provided with the elongated slots *b* and extended over the entire intermediate space between the outer sides and ends of the lounge-frames, and fastened in a tightly-stretched state to the frames, in combination with the two separate pillow-support frames *c*, having their legs inserted through the slots and pivotally connected with the frames below the wire web in position for their forward portions to extend beyond the lounge-frames, substantially as and for the purposes described.

387,514. STOP FOR THE CARRIAGES OF SCREW-CUTTING LATHES. Thomas Heslin, Watertown, N. Y. Filed Apr. 26, 1888. Serial No. 271,903. (No model.)

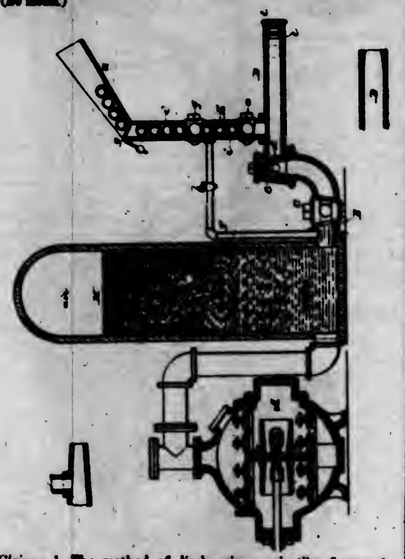


Claim.—On a screw-cutting lathe, the combination, with the lathe-bed, of a stop clamped rigidly thereon at a point to abut against that side of the tool-carriage from which the latter is to move in cutting the screw-threads, substantially as described and shown.

387,515. BUSTLE. John R. Emmett, Dayton, Ohio. Filed Apr. 19, 1888. Serial No. 271,167. (No model.)

Claim.—The combination, in a bustle, of the rectangular frame A, having a cross-wire, C, and eyes *a a'*, bails E and D, having central eyes, the ends of said bails being pivotally secured to the eyes *a a'*, longitudinal springs secured to the upper portion of the frame A and to the cross-wire C, and an adjusting strap or loop connected to the lower cross-wire of the frame and to the central longitudinal spring below the lower bail, and a covering for the springs and frame, substantially as shown, and for the purpose set forth.

387,516. BALING-PRESS. Frederick W. J. Hoge and Joseph Isaac, Houston, Tex. Filed Apr. 21, 1888. Serial No. 271,269. (No model.)



Claim.—1. The combination of the baling box or chamber with a tail-board provided with devices for catching under the bale and lifting it out of the box as the tail-board is turned backward, substantially as shown.

2. The combination of the baling box or chamber provided with a cover with the tail-board, which is hinged a suitable distance above the bottom of the baling-chamber, and which is provided with devices for catching under the bale and lifting it out of the chamber when the tail-board is turned back, substantially as described.

3. The combination of the baling box or chamber provided with a movable cover, the tail-board P, hinged above the bottom of the baling-chamber by means of the rod N, the angle-irons S, and the clamping-lever, substantially as set forth.

387,517. METHOD OF DISCHARGING PROJECTILES. Walter H. Jaques, New York, N. Y. Filed May 28, 1888. Serial No. 274,810. (No model.)

Claim.—1. The method of discharging projectiles from a hydraulic battery, consisting in dropping the projectiles into a jet of discharge-water under enormous pressure and forcing these projectiles through a choked orifice, substantially as set forth.

2. The method of discharging projectiles by forcing water against a column of air, permitting this water to pass out through a choked discharge-barrel, and dropping projectiles into said barrel, substantially as set forth.

3. The method of discharging projectiles by forcing water against a column of air, passing the water out through a choked discharge-barrel, and forcing projectiles from an ammunition-conduit into this discharge-barrel by means of water under equal pressure back of said projectiles, substantially as set forth.

387,518. PANTS-STRETCHER AND GARMENT-SUPPORTER. William H. Kauffman and William F. Hinson, Columbus, Ohio, assignors of one-third to Thomas W. Wright, same place. Filed Nov. 10, 1887. Serial No. 254,580. (No model.)

Claim.—1. The combination of the adjustable strap to surround the ankle or limb and having slides thereon, the metallic arms B, having loops formed therewith and carrying buckles at their lower ends, the elastic strip C, and the metallic strips D, carrying safety-pins at their lower ends, substantially as described.

2. The combination of the adjustable strap A, having a buckle and slides thereon, the arms B, the elastic strips C, the metallic strips D, carrying safety-pins at their lower ends, the semicircular band E, having a front central slide, and the depending arm F, substantially as described.

3. The combination, with the band A, having the attachments, as set forth, of the upwardly-projecting arm G, having a clasp, G', on the upper end thereof for engagement with and to support the stocking or drawers, substantially as described.

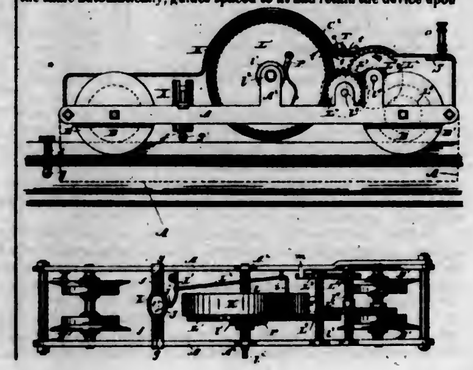
4. The combination of the adjustable strap A, having slides thereon, the arms B, secured to the slides on the strap A and having upper and lower loops and lower buckles, the elastic straps C, secured at one end to the buckles on the lower ends of the arms B and at their upper ends to the strap A, the metallic arms D, having safety-pins on their lower ends and loops at their upper ends, through which the elastic strap C passes, the semicircular band E, secured at its two ends to the upper loops of the arms B and provided with suitable adjusting-slides and a central vertical slide-plate, E', secured thereto, the depending arm F, supported and adjustable in the slide-plate E', and the upwardly-projecting stocking-supporting arm G, having a clasp on its upper end, secured to the band or strap A, substantially as described.

5. The combination, with the ankle-strap, of the two adjustable depending devices secured to each side thereof and adapted to be attached to the bottom of the pantaloons, the front semicircular band standing out from the ankle-strap, and the depending adjustable arm having a lower bend carried in the front central portion of the said band, substantially as described.

6. The combination, with the adjustable ankle-strap, of the two adjustable depending devices attached to the sides thereof and adapted to be secured at their lower ends to the bottom of the pantaloon, the front central support, and the stocking-supporter, substantially as described.

7. The ankle-strap carrying side and front pantaloons-adjusting devices, and the upwardly-projecting stocking-supporter, substantially as described.

8. The combination, with the ankle-strap, of the side devices supported directly thereagainst, and the front central depending arm supported some distance away from the said ankle-strap, substantially as described.



387,519. ARTIFICIAL STONE. James T. Key, Blackburn, Ia. Filed May 21, 1888. Serial No. 274,094. (No specimens.)

Claim.—An artificial stone composed of Portland cement, sand, plaster-of-paris, alum, table-salt, and rice, in or about in the proportions specified.

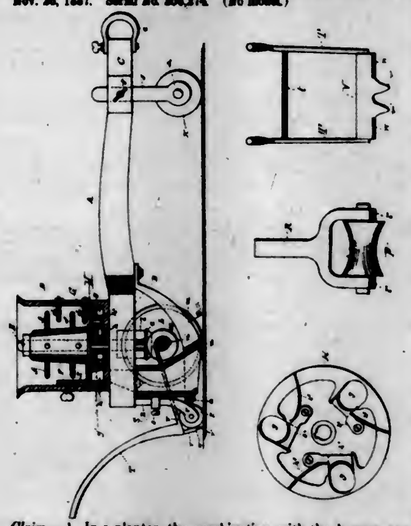
387,520. AUTOMATIC RAILWAY SIGNAL-CARRIER AND TOR-PEDO-PLACER. Hezekiah G. Kuhn and Frank Hanson, Greenville, S. C. Filed Sept. 10, 1887. Serial No. 249,266. (No model.)

Claim.—1. In a railway signaling device, the combination of the balanced frame, the supporting and driving wheels arranged for a single rail, a motor connected with the driving-wheels to rotate the same, guides spaced to fit the sides of a single rail and retain the device upon the same, and means for signaling, substantially as described.

2. The combination of the balanced frame, the supporting and driving wheels, a motor connected with the driving-wheels to rotate the same automatically, guides spaced to fit and retain the device upon

387,520.

a single rail, a signaling device carried with said frame, and a derailing-trip operating automatically at a predetermined time, substantially as set forth.



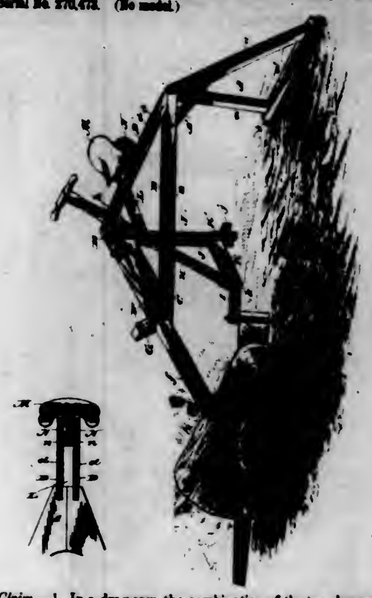
3. The combination of the balanced frame, four supporting and driving wheels flanged upon their outer margins, a motor carried with the frame and connected with the wheels to automatically rotate them, and a signaling device carried with the frame, said flanged wheels being spaced to fit and retain the machine upon a single rail, substantially as set forth.

4. The combination of the balanced frame, the supporting and driving wheels, a motor carried by the frame and connected with the wheels to automatically propel the machine, guides spaced to fit and retain the device upon a single rail, a torpedo-receptacle carried by the frame, and a torpedo-placer operated automatically by the motor, substantially as set forth.

5. The combination, with the frame, the motor, and the supporting and driving wheels, spaced as described, of a torpedo having an explosive portion of a width less than the space between the treads of the wheels and malleable lateral arms having downward bends at their extremities, substantially as set forth.

6 The torpedo having a central explosive portion, two lateral malleable arms, and weights carried by said arms, substantially as set forth.

387,521. WHEEL-PLANTER. Peter Klipe, Hayes, Tex. Filed Nov. 26, 1887. Serial No. 256,274. (No model.)



Claim.—1. In a planter, the combination, with the hopper provided with the stirrer-arms, the rotating shaft having the stirrer-arms, the disk H, having the discharge-openings, pivoted arms, and springs, the plate *g*, having the cam-pin and discharge-opening, and the shaft E, having the bevel-gear *e*, of the main axle adapted to engage the hooked ends of the handles and having the beveled gear M and the conveying-wheels thereon, substantially as specified.

2. The combination, with the main frame and main axle, of the handles provided with inwardly-extending arms having their inner ends hooked and engaged over the main axle, and the toothed harrow-plate secured across the junction of the handles with said arms, substantially as specified.

3. The combination, with the main frame, main axle, and covering-roller, of the handles having inwardly-extending arms hooked at the inner ends to engage over the main axle, and the bevel-edged scraper-plate secured across the junction of the handles and said arms, substantially as specified.

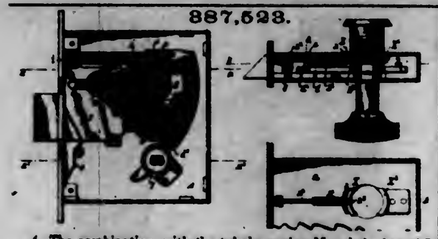
4. In a planter, the combination, with the main frame, main axle, and vertically-adjustable covering-roller, of the handles T, arms *v*, having their ends hooked to engage over the main axle, and the harrow and scraper-plate V, provided with the teeth *v'* and inwardly-beveled scraper-edges W, substantially as specified.

387,522. DRAG-SAW. John B. Lalonde, Portland, Oreg., assignor of one-half to Estevan G. Francis, same place. Filed Apr. 12, 1888. Serial No. 270,473. (No model.)

Claim.—1. In a drag-saw, the combination of the two downward rearwardly-inclined bars D, having tracks thereon and an intervening space between the same, a seat having rollers engaging with and moving on the tracks on said bars D, and an arm connected to and projecting forwardly from the under side thereof between said bars, and a hand-lever pivotally mounted in the frame, to which the forward end of the arm from the seat is attached, and having its lower end secured to levers connected to the rear end of the saw and to the frame of the machine, substantially as described.

2. In a drag-saw, the combination of the two downward rearwardly-inclined bars D, having tracks thereon and an intervening space between the same, a seat having rollers engaging with and moving on the tracks on said bars, and an arm connected to and projecting forwardly from the under side thereof between said bars, a hand-lever pivotally mounted in the frame to which the forward end of the arm from the seat is attached, the slotted block secured to the rear of the saw, to which the lower end of the hand-lever is secured link K, attached to the slotted block at its front end, and the swinging frame having foot-pieces, to which the rear end of the link K is attached, substantially as described.

3. In a drag-saw, the combination of a frame consisting of parallel bars B B and D D, having tracks thereon, beam C, and a rear support, A, the adjustable beam F, supporting the operating mechanism, consisting of a pivoted lever with a handle-bar, swinging bars J J, link K, the block I, connecting the same to the reciprocating saw, and a bar, L, pivoted to the main lever H, the rear end of said bar passing between beams D D, and being provided with a seat and with rollers bearing on the tracks on said beams D D, substantially as and for the purpose set forth.

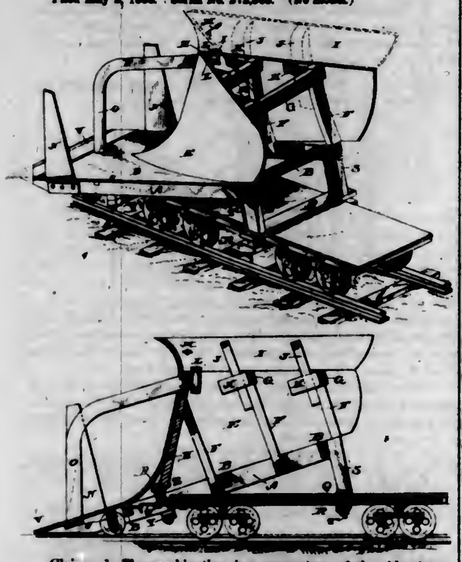


387,523. COMBINED LATCH AND LOCK. Joseph Loss, New York, N. Y. Filed Jan. 5, 1888. Serial No. 259,886. (Model.)

Claim.—1. The combination, with a bolt, of the pivoted tumbler D, a stop, H, thereon, and a movable detent, I, carried by the bolt and engaging with the stop, substantially as shown and described.

2. The combination, with a sliding bolt, of a pivoted tumbler, a stop, H, on the same, a detent, I, carried by the bolt and engaging with said stop, said detent containing a recess for the passage therethrough of the stop in the tumbler, and a yielding block or head, J', substantially as shown and described.

3. The combination, with the tubular casing M and the barrel L therein, of the lock N, connecting the casing and barrel, and the notched wards W, which, when formed, receive said lock and free the barrel, substantially as shown and described.

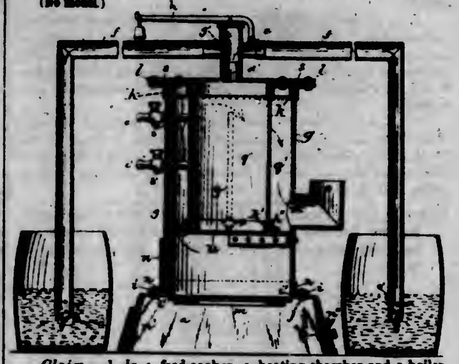


387,523.

4. The combination, with the tubular casing M and the barrel L therein, of the lock N, connecting the casing and barrel, the notched wards W, the head L' on the barrel, the stem *m*, extending through the barrel, and the stops 9 and 10 in the head for arresting the motion of the stem, substantially as shown and described.

5. The combination, with the tubular casing M, having a stop, *l*, and the barrel L therein, having a head containing stops 7 and 8, for engaging said stop *l*, of the notched wards W, the friction-plates W', engaging the barrel, the stem *m*, extending through the barrel, and stops 9 and 10 in the barrel-head, for arresting the motion of the stem, substantially as shown and described.

387,524. SNOW-PLOW. Joseph M. Mansfield, Manchester, Iowa. Filed May 2, 1883. Serial No. 272,803. (No model.)



Claim.—1. The combination, in a snow-plow, of the side pieces, the cross-pieces, vertical ribs secured to the side pieces, cross-pieces at the tops of the ribs, an apron on the side pieces, and cross-pieces at the bottom, rearwardly-diverging furrow-boards secured to the ribs, braces secured to the tops of the ribs and to the inner surface of the furrow-boards, standards at the front ends of the furrow-boards projecting above their upper edges, and side-boards having downwardly-projecting curved standards, substantially as and for the purpose set forth.

2. The combination, in a snow-plow, of the side pieces, the cross-pieces, one of which is cut away upon its under side, a support at the rear end, and a keeper at the front end just below and to the rear of the cut-away cross-piece, and means for securing the front end of a flat car to the plow, substantially as and for the purpose set forth.

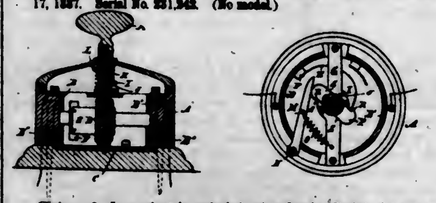
3. The combination, in a snow-plow, of the side pieces, supports at the rear end of the plow, a transverse bar secured to the lower end of the supports, two bolts secured to the side pieces and passing down through the transverse piece, and a second transverse piece having holes at its ends and adapted to be secured upon the ends of the bolts below a flat car, substantially as and for the purpose set forth.

4. The combination, with a snow-plow, of a pair of trucks at the front end, a clamp at the rear end, and a keeper between the trucks and the clamp, whereby the plow may be secured upon a flat car, substantially as and for the purpose set forth.

387,525. STEAM FEED-COOKER. James W. Marsh and Glass H. Ringolby, Manning, Iowa. Filed Jan. 26, 1888. Serial No. 261,937. (No model.)

Claim.—1. In a feed-cooker, a heating-chamber and a boiler therein having flanged ends provided with collars, in combination with a crown-plate and shelf attached to the boiler in such a manner as to form end plates and supports for the boiler, substantially as described.

2. In a feed-cooker, a boiler and a surrounding shell forming the heating-chamber, said boiler and shell being provided with flanges and flanged collars, in combination with a crown-plate to which said collars are attached, whereby said plate is made to close the upper end of the boiler and heating-chamber, for the purpose and in the manner substantially as described.



3. In a feed-cooker, a fire-chamber shell and boiler having the upper ends provided with flanges, in combination with a crown-plate having downwardly-extending flanges fitting within the ends of said shell and boiler, and collars provided with flanges, whereby the ends of the boiler and shell are closed, substantially as described.

4. In a feed-cooker, a boiler located in the upper part of the fire-chamber, and a shelf supporting said boiler, said shelf being arranged to form the bottom of the boiler, in combination with partitions located upon diametrically-opposite sides of the boiler, substantially as described.

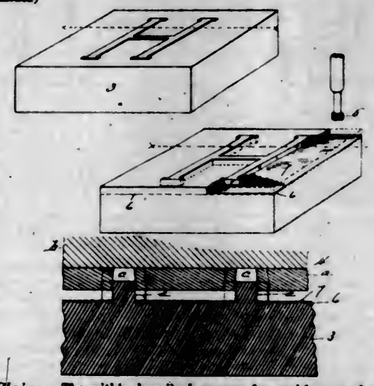
5. In a feed-cooker, a boiler located in the top of the heating-chamber and having its upper end plate arranged to close the top of said chamber, in combination with partitions located upon diametrically-opposite sides of the boiler, and a bracket or shelf arranged to form the lower end plate of the boiler and to close the space behind the same, substantially as described.

6. In a feed-cooker, a boiler located above the fire-chamber, the upper end of said boiler being arranged to close the top of said chamber, in combination with partitions at the sides and a shelf or bracket at the lower part of the boiler, substantially as described.

387,526. ELECTRIC SWITCH. James F. McElroy, Lansing, Mich., assignor of one-half to Lewis C. Butler, same place. Filed Mar. 17, 1887. Serial No. 231,342. (No model.)

Claim.—1. In an electric switch having fixed cylindrical contacts and a movable contact carried by a spindle, an actuating key or handle secured to said spindle and having a loose connection therewith, a ratchet secured to the spindle and provided with cogs and flat faces, and a spring-click operating in connection therewith to impel the spindle through the medium of the ratchet, substantially as described.

2. In an electric switch, the combination, with the fixed cylindrical contacts, of a spindle, a spring carrying the movable contact, a key secured to the spindle and having a loose connection therewith, a ratchet having cogs and flat faces, and a spring-click operating in connection with said ratchet to form an impelling and locking device for said spindle, substantially as described.



3. In an electric switch having fixed cylindrical contacts, a movable contact carried by a spindle, and a spring-actuated impelling device on said spindle, a key or handle secured to said spindle and hav-

ing a loose connection therewith, and a spring between said spindle and key arranged to take up such rotary play, substantially as described.

4. In an electric switch, the combination of the fixed cylindrical contacts B B' B'' B''', the spindle D, the movable contact F, carried by said spindle, the key or handle H, having a loose connection therewith, the ratchet P, secured to the spindle and having cogs R and flat faces S, and the spring-click M, all arranged to operate substantially as described.

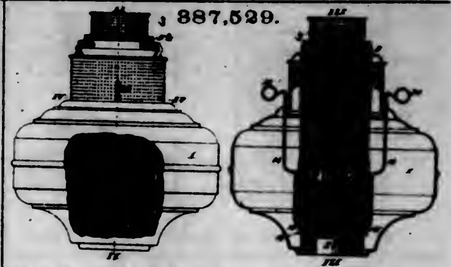
5. In an electric switch, the combination of the fixed contacts B B' B'' B''', the spindle D, the movable spring-contact F, the key or handle H, having a loose connection therewith, the spring K, arranged to take up said play, the ratchet P, having cogs R and flat faces S, and the spring-click M, all substantially as described.

387,527. PROCESS OF MAKING WOOD TYPE. Mortimer G. Merritt, Springfield, Mass., assignor to Alfred E. Hobbs and George B. Hobbs, New Milford, Conn. Filed Apr. 25, 1887. Serial No. 236,014. (No model.)

Claim.—The within-described process for making wood type, which consists in first delineating a letter on a block by suitable lines, substantially as described, then removing the surface of the latter which surrounds said outlined letter, and finally subjecting said block to pressure under a die, whereby the surface of the block and of the letter thereon are suitably compressed and finished, substantially as set forth.

387,528. SLEIGH. Peter W. Meyer, Louisville, Ky. Filed Apr. 11, 1888. Serial No. 270,315. (No model.)

Claim.—1. The combination, in a sleigh, of a pair of runners and upright standards secured thereto, with vertically-adjustable braces mounted on and connecting said standards by means of adjustable T-joints, all substantially as and for the purpose described.



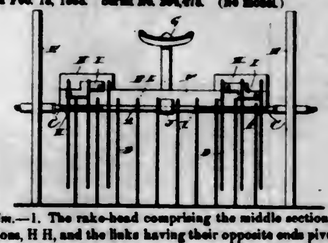
2. The combination of the runners and their standards, substantially as described, with the adjustable T-joints on said standards and the vertically-adjustable braces united to said joints, and each made in two parts united by a screw-coupling, substantially as described.

3. The combination of the continuous pipe-runners and their uprights with the vertically-adjustable sectional braces and the adjustable connections of said braces to the uprights, and the connecting bars or axles above said braces, all substantially as and for the purpose described.

4. The combination of the axles G with the continuous runners A A, their uprights C, and the vertically-adjustable braces D, composed of sections *d d*, screw-coupling F, and the sliding T-joint E on the ends of the braces, and their set-screws *e*, all constructed and arranged substantially as and for the purpose described.

387,529. WICK-RAISER. Ferdinand Meyer, St. Louis, Mo. Filed Aug. 12, 1887. Serial No. 246,788. (No model.)

Claim.—1. In combination with the reservoir having recessed openings in its top and air-tube, the wick-holder consisting of a cylinder, wires secured to the cylinder, and arms on the wires, the upper

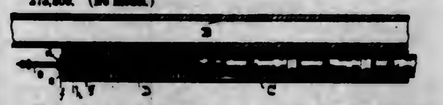


ends of the wires bearing in said recesses to hold the arms pressed against the wick, substantially as and for the purpose set forth.

2. The combination, with the reservoir having an opening for the reception of a burner, of a wick-holder consisting of tube 11, expansible at top, and wires 14, substantially as described, for holding the wick to the tube, said wires being confined between the mouth of the reservoir and upper expansible end of the tube, as explained.

3. In combination with the reservoir and air-tube, the wick-holder consisting of the flexible cylinder, hinged wires, and arms secured to the wires, the upper ends of the wires being adapted for prehension, substantially as and for the purpose set forth.

4. In combination with the reservoir and air-tube, the wick-holder consisting of a cylinder having a lap-joint, 12, connected by a rivet, 13, wires secured to the cylinder, and arms on the wires, substantially as and for the purpose set forth.



387,530. HORSE HAY-RAKE. Moses I. Milam, Caddo Mills, Tex. Filed Feb. 18, 1888. Serial No. 264,673. (No model.)

Claim.—1. The rake-head comprising the middle section, F, and end sections, H H, and the links having their opposite ends pivoted, respectively, to the front and rear side at the outer ends of the section F and the inner ends of the sections H H, as set forth.

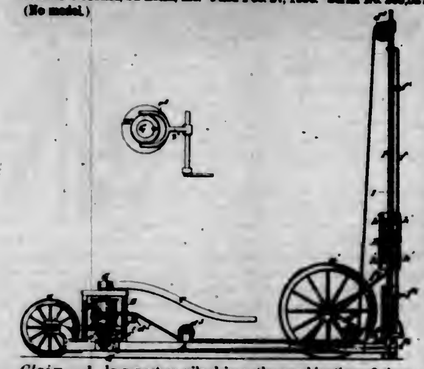
2. The rake-head consisting of the middle section, F, the end sections, H H, and the Z-shaped links pivoted, respectively, to the front and rear side at the inner ends of the sections H H and the outer ends of the section F, as set forth.

387,531. CHARGE-INDICATOR FOR MAGAZINES OF GUNS. William R. Miller, Baltimore, Md. Filed May 14, 1883. Serial No. 273,909. (No model.)

Claim.—1. In a repeating fire-arm, the head or end of the magazine perforated and combined with an indicating-stem which enters the magazine through the said perforation, is parallel to the magazine and within it, and is in contact with the contained magazine-spring or an attachment operated thereby, whereby the length of the exposed portion of the stem indicates the number of cartridges contained in the magazine, substantially as specified.

2. In a repeating fire-arm, the magazine thereof provided with a projecting stem which has a plate at its inner end, combined with a spring situated between the said plate and the head of the magazine, substantially as and for the purpose specified.

387,532. PLOW. Hans P. Nelson, Moorhead, Minn. Filed May 14, 1888. Serial No. 273,891. (No model.)



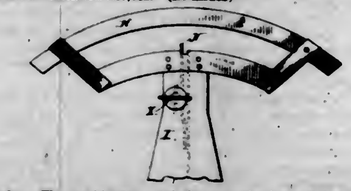
Claim.—The combination of the standard, the shovel-blade, a vertically-adjustable V-shaped shoe, one arm forming the horizontal rearwardly-extending heel and the other arm extending along the standard and having a longitudinal slot, a perforated projection extending rearwardly from the upper portion of the shoe, bolts passing through the shovel-blade, standard, and shoe, the cutting-wings hinged to the under side of said blade, and brace-rods pivoted to said wings

387,532.

and adjustably secured to said projection of the shoe, whereby the wings can be adjusted backward and forward, as set forth.

387,533. POST OR PILE DRIVER. George H. Oldham and William M. Rodgers, St. Louis, Mo. Filed Feb. 27, 1888. Serial No. 265,587. (No model.)

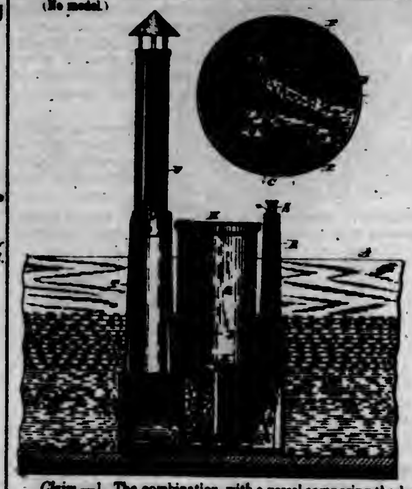
Claim.—1. In a post or pile driver, the combination of the uprights, the hammer, and the lifting-rope with the drum, the clutch engaging the same, and the crank-levers and connecting-rods for automatically releasing said clutch, all constructed and arranged substantially as and for the purpose described.



2. The combination of the uprights, the hammer, and the rope with the drum, the clutch engaging the same, the rod *f'*, the adjustable lug thereon, and the connections between said rod and clutch, all constructed and arranged substantially in the manner and for the purpose described.

3. The combination, in a post or pile driver, with the base and uprights, of the drum D, shaft G, clutch-ring E, and automatic stop, gearing together, operating the hammer H by means of the rope I, substantially as shown, and for the purposes specified.

4. The combination of the uprights, the hammer, rope, and drum, with the clutch engaging said drum, the vertical movable rod *f'*, its handle *f*⁵, adjustable lug *f*⁶, and the bell-crank levers and rods connecting rod *f''* with the clutch, all constructed and arranged substantially as and for the purpose described.



5. The combination of the carriage A, the hinged uprights thereon, the hammer, drum, and rope, with the clutch engaging said drum, the rod *f'*, and its lug *f*⁶, engaging the hammer, and the crank-levers and rods connecting the clutch with the rod *f'* and operating the same therefrom, all constructed and arranged substantially as and for the purpose described.

387,534. TYPE-WRITING MACHINE. Alvah P. Osborn, Trumansburg, N. Y., assignor to Fredric D. Barta, same place. Filed Nov. 23, 1886. Serial No. 219,612. (No model.)

Claim.—The combination, with the type-wheel, the dial-plate, and the operating-arm, of the indicator adjustable in a recess in the forward edge of the operating-arm, and the toothed rack M, engaged by the indicator, substantially as specified.

387,535. HEATER FOR ANIMAL DRINKING-TROUGHS. Allen M. Parmeter, Knoxville, Ill. Filed Feb. 16, 1888. Serial No. 263,686. (No model.)

Claim.—1. The combination, with a vessel composing the body of a heater, and a heating-chamber within it, with a dead-air space between the vessel and chamber, and having a suitable fire-crate within said chamber, of a draft-tube leading into said chamber, a smoke-pipe leading from said chamber, and a fuel-feeding cylinder also leading into said chamber.

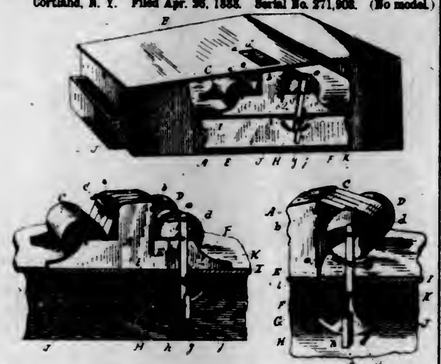
2. The combination, with a vessel composing the body of the heater, a fuel-feeding cylinder, a draft-tube, and a smoke-stack leading upward therefrom, of a hood composed of two side walls and a bottom fitted within said vessel and inclosing the lower ends of said tube, pipe, and cylinder, and a removable fire-crate located within said hood.

3. The combination, with the vessel composing the body of the heater, of a hood fitted therein constituting in its interior a heating-chamber and forming between its exterior and the said vessel one or more dead-air spaces, and a suitable fire-crate within said chamber.

4. The combination, with a vessel composing the body of the heater and a fuel-feeding cylinder mounted upon and discharging into it, of a heating-chamber within the vessel, with a dead-air space between it and the vessel and a removable fire-crate within said chamber and beneath said cylinder.

5. In a heater for animal drinking-troughs, the following instrumentalities: a metallic vessel composing the heater proper, a heating-chamber within said vessel with a dead-air space between the vessel and chamber, a fire-crate removably fitted within said chamber, a double-walled feeding-cylinder extending upward from the vessel and opening into said chamber, a double-walled draft-tube, and a double-walled smoke-pipe also extending upward from the vessel and opening into said chamber, an auxiliary vessel within which the heater proper is placed, with a space between them for the purpose of holding a supply of water about the vessel to protect the same against injury from the fire, and suitable posts and strips engaging with the vessel and adapted to be fastened to a water-trough, for the purpose set forth.

387,536. BARREL-HOOP. George W. Parrish, Salem, Va. Filed Apr. 12, 1888. Serial No. 270,493. (No model.)



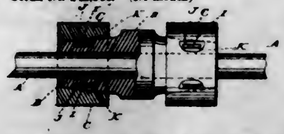
Claim.—1. A contractile hoop having at one end a curved rack-bar and at the other end a link capable of engaging the curved rack-bar, substantially as and for the purpose described.

2. A hoop having at one end a curved rack-bar and at the other end a link capable of engaging the curved rack-bar, and a hook secured to the end having the link, whereby the ends of the hoop may be drawn and held together, substantially as described.

3. A hoop having at one end a curved rack-bar and at the other end a link provided with another link, the former arranged to slide between the curved rack-bar and the hoop, and the latter capable of engaging the teeth of the curved rack-bar, and a hook secured to the end having the link, substantially as specified.

4. A hoop having at one end a curved rack-bar and at its other end a hook and a link having attached to it another link, and strips of metal passing over the head of the barrel and having hooked ends that engage the hoop, whereby the head is retained in place and the hoop may be contracted, substantially as specified.

387,537. **RECORDER FOR MONEY-DRAWERS.** Arthur R. Peck, Cortland, N. Y. Filed Apr. 26, 1888. Serial No. 271,908. (No model.)



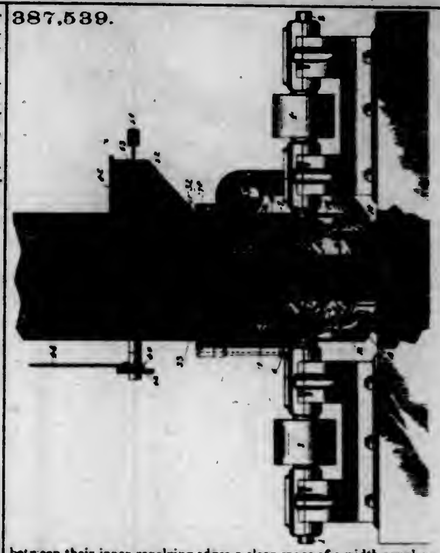
Claim.—1. The combination, with a lever having a pawl engaging with a reel-ratchet and a drawer having a projection thereon, of a trigger-bar adjustably pivoted to said lever and engaging with the drawer projection, as set forth.

2. The combination, with a lever having a pawl engaging with a reel-ratchet and a drawer provided with a projecting stud, of a vertically-adjustable trigger-bar connected to an eye in said lever and engaging with the projection on the drawer, as set forth.

3. The combination, with a lever having a pawl engaging with a ratchet on a reel and a guard-plate upon its lower end, and a drawer having a stud or projection, of a weighted trigger-bar having a pivoted and adjustable connection with said lever and engaging with the projection on said drawer, as set forth.

4. The combination, with a lever having a pawl engaging a ratchet on a reel, upon which is wound the paper or slip unwound from a roll and passing over an intermediate table, and a money-drawer having a stud or projection, of a weighted trigger-bar having a screw-threaded extension and fitted nuts, said extension passing through an eye-plate pivoted to said lever, said nuts being disposed one upon each side of said plate, said lever carrying at its extreme lower end a curved guide having a stop projection, and said weighted bar having engagement with the stud or projection on said money-drawer, as set forth.

387,538. **COMPRESSION-COUPLING.** John W. Ramsey, Beaver Falls, Pa., assignor of one-half to John Corbus, same place. Filed June 25, 1887. Serial No. 242,500. (No model.)



Claim.—The combination, with the aligned shafts, of the clamps having the slots J, the sleeves having the slots K, and the keys I I, as and for the purpose specified.

387,589. **REDUCING-MACHINE.** George Raymond and Albert Raymond, Chicago, Ill., assignors to the Cyclone Pulverizer Company of the United States of America, New York, N. Y. Filed Dec. 30, 1886. Serial No. 223,086. (No model.) Patented in England Jan. 26, 1887, No. 1,270.

Claim.—1. In a reducing-machine, the combination of a circular chamber, two sets of beaters placed one in each end of said chamber, and means for causing said beaters to revolve, the said beaters having

387,589.

between their inner revolving edges a clear space of a width equal approximately to one-third the length of the chamber, and the said chamber being provided with an upward discharge-opening substantially equal in length to the length of the chamber, substantially as described.

2. In a reducing-machine, the combination of a circular elongated pulverizing-chamber, two sets of beaters, one placed in each end, said beaters having a clear space between their revolving faces, means for causing said beaters to revolve, said chamber having an upward discharge-opening approximately equal in length to the chamber itself, and a separating-chamber forming an upward continuation of said discharge-opening, substantially as described.

3. In a reducing-machine, the combination of a circular elongated chamber, beaters placed therein, means for causing said beaters to revolve, said chamber being provided with an upward discharge-opening, a separating-chamber, a discharge-pipe therefrom, and a partial partition located in said separating-chamber between the said upward opening from the chamber containing the beaters and the entrance to the said discharge-pipe, substantially as described.

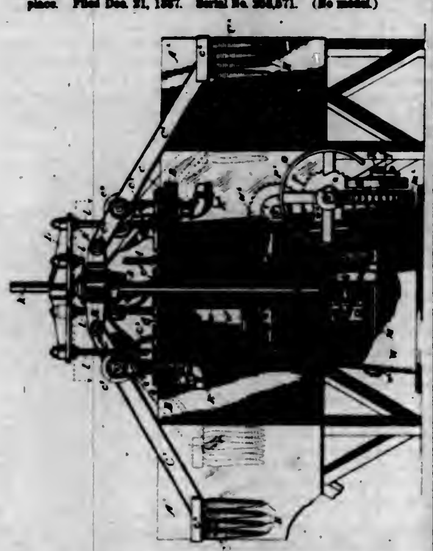
4. In a reducing-machine, the combination of a pulverizing-chamber, rotatable beaters mounted therein, a separating-chamber connected therewith and having a curved top and a discharge-pipe leading from a point below the top of said separating-chamber, and a partition located within the separating-chamber in front of the discharge-orifice and above the bottom of the separating-chamber, substantially as described.

5. In a reducing-machine, the combination of a circular chamber having a larger diameter at its center than at its ends, two sets of beaters arranged one in each end of said chamber, and means for causing said beaters to revolve, said circular chamber having an upward discharge-opening of approximately the length of the chamber itself and of a width approximately equal to two-thirds of its largest diameter, substantially as described.

6. In a reducing-machine, the combination of a circular chamber having a larger diameter at its center than at its ends and provided with an upward discharge-opening, two sets of oppositely-revolving beaters, one set placed in each end of said chamber, means for causing said beaters to revolve, and two air-pipes leading into said circular chamber at its base, one at each end thereof and on opposite sides of the axes of the shafts with respect to each other, substantially as described.

7. In a reducing-machine, the combination of a circular elongated pulverizing-chamber, two sets of beaters placed one in each end of said chamber, means for causing said beaters to revolve, and two air-pipes approaching the chamber from the same side and entering the chamber one at each end, with a downward turn and on opposite sides of the longitudinal axis thereof, substantially as described.

8. In a reducing-machine, the combination of a circular elongated chamber having a larger diameter at its center than at its ends, two sets of beaters, one placed in each end, means for causing said beaters to revolve, said circular chamber being provided with an upward discharge-opening substantially equal in length to the chamber itself, and guide-blocks attached one to each end wall of the said upward discharge-opening, extending upwardly and inclined outwardly, whereby partially-pulverized material, returning by gravity to the discharge-opening, is deflected toward the center of the same, substantially as described.



9. In a reducing-machine, the combination of an elongated circular chamber, 5, provided with central annular circumferential chamber, 34, removable grate-bars 25, placed between said chambers, and adjustable lining-plates 33 and 34, substantially as described.

10. In a reducing-machine, the combination of a pulverizing-chamber having a wide central upward discharge-opening and rotatable beaters mounted therein, with a separating-chamber placed over the discharge-opening and extending beyond the two lateral sides of the same, deflecting-plates extending each from one side of the discharge-opening to the corresponding side of the separating-chamber, and a discharge-pipe from the separating-chamber, substantially as described.

11. In a reducing-machine, the combination of a pulverizing-chamber having a central upward discharge-opening and rotatable beaters mounted therein, and a separating-chamber placed over the opening and extending beyond the two sides of the same, closed at its upper end by a curved top, with deflecting-plates extending from the lateral edges of the discharge-opening to the corresponding walls of the separating-chamber, a discharge-pipe communicating with one side of the separating-chamber, and a partition within the separating-chamber in front of the opening to the discharge-pipe, substantially as described.

12. In a reducing-machine, the combination of a pulverizing-chamber having a central upward discharge-opening, and a separating-chamber extending beyond the two sides of the opening, and rotatable beaters mounted therein placed upon the same, with a discharge-pipe extending from one side of the reducing-chamber, and a partition before the entrance of the discharge-pipe and to one side of the discharge-opening, leaving a free space above its upper edge for the passage of the reduced material to the discharge-pipe and a free space below its lower edge for the return of coarse particles to the discharge-opening, substantially as described.

387,540. **DYEING AND BLEACHING APPARATUS.** Howard Richmond, Providence, R. I., assignor to the Cop Dyeing Company, same place. Filed Dec. 21, 1887. Serial No. 258,571. (No model.)

Claim.—1. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier provided with cop-carrying arms adapted to be vibrated, oscillated, or rocked, a fixed carrier-body with reference to which the cop-carrier has movement, conduits in exterior communication with pumps, and the mouths of which are embodied in the carrier-body, and tanks circumferentially disposed with reference to the carrier-body, substantially as set forth.

2. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier provided with cop-carrying arms adapted to be vibrated, oscillated, or rocked, a fixed carrier-body with reference to which the cop-carrier has movement, and which is provided with a dead-face, conduits in exterior communication with pumps, and the mouths of which are embodied in the carrier-body, and tanks circumferentially disposed with reference to the carrier-body, substantially as set forth.

3. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier having perforations and hollow pivoted cop-carrying arms applied in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed carrier-body against the carrying-face of which the cop-carrier rotates, and which as to said face contains or embodies the mouths of conduits, with which mouths the perforations of the carrier are caused to register as the carrier rotates, and a series of tanks circumferentially disposed with reference to the carrier-body, substantially as set forth.

4. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier having perforations and hollow pivoted cop-carrying arms applied in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed carrier-body against the carrying-face of which the cop-carrier rotates, and which as to said face contains or embodies the mouths of conduits and a dead-face, with which mouths and with which dead-face the perforations of the carrier are caused to successively register as the carrier rotates, and a series of tanks circumferentially disposed with reference to the carrier-body, substantially as set forth.

5. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier having perforations and hollow cop-carrying arms applied in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed carrier-body against the carrying-face of which the cop-carrier rotates, charging-conduits in exterior communication each with a separate suction or pressure pump and the mouths of which are embodied in the carrier-body, liquid-exhausting conduits in exterior communication each with a suction or pressure pump and the mouths of which are likewise embodied in the carrier-body respectively beyond the respective mouths of the charging-conduits, gearing for rotating the cop-carrier and causing its perforations to register successively with the mouths of the respective conduits, and a series of tanks circumferentially disposed with reference to the carrier-body and the mouths of the charging-conduits, substantially as set forth.

6. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier having perforations and hollow cop-carrying arms applied in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed carrier-body against the carrying-face of which the cop-carrier rotates, charging-conduits in exterior communication each with a separate suction or pressure pump and the mouths of which are embodied in the carrier-body, liquid-exhausting conduits in exterior communication each with a suction or pressure pump and the mouths of which are likewise embodied in the carrier-body respectively beyond the respective mouths of the charging-conduits, gearing for rotating the cop-carrier and causing its perforations to register successively with the mouths of the respective conduits or with the dead-face, and a series of tanks circumferentially disposed with reference to the carrier-body and the mouths of the charging-conduits, substantially as set forth.

7. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier having perforations and hollow pivoted cop-carrying arms applied in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed carrier-body against the carrying-face of which the cop-carrier rotates, and which as to said face contains or embodies the mouths of conduits, with which mouths the perforations of the carrier are caused to register as the carrier rotates, a series of tanks circumferentially disposed with reference to the carrier-body, cop-carrier-rotating gearing, and carrier-arm-rocking gearing, substantially as set forth.

8. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier having perforations and hollow pivoted cop-carrying arms applied in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed carrier-body against the carrying-face of which the cop-carrier rotates, and which as to said carrying-face contains or embodies the mouths of conduits and a dead-face, with which mouths and with which dead-face the perforations of the carrier are caused to successively register as the carrier rotates, a series of tanks circumferentially disposed with reference to the carrier-body, cop-carrier-rotating gearing, and carrier-arm-rocking gearing, substantially as set forth.

9. In an apparatus of the class herein recited, the combination of a rotatable cop-carrier having perforations and a series of hollow pivoted cop-carrying arms applied in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed carrier-body against the carrying-face of which the cop-carrier rotates, which as to said face contains or embodies the alternately-disposed mouths of charging-conduits and of liquid-exhausting conduits, and which also contains or embodies a dead-face, with which mouths and with which

dead-face the perforations of the carrier are caused to successively register as the carrier rotates, a series of tanks circumferentially disposed with reference to the carrier-body and the mouths of the charging-conduits, intermittent cop-carrier-rotating gearing, and intermittent carrier-arm-rocking gearing, substantially as set forth.

10. In an apparatus of the class herein recited, the combination of a rotatable horizontally-disposed cop-carrier having a series of circumferentially-disposed equidistant perforations and a series of hollow radially-disposed pivoted cop-carrying arms applied as to their hollow interiors in communication with said perforations and adapted to be vibrated, oscillated, or rocked, a fixed horizontally-disposed carrier-body against the face of which the cop-carrier rotates, and which as to said face contains or embodies the equidistant circumferentially-disposed mouths of alternately-disposed charging-conduits and liquid-exhausting conduits, less, however, in aggregate number than the number of cop-carrying arms, and which also contains or embodies a dead-face, with which mouths and with which dead-face the perforations of the carrier are caused to successively register as the carrier rotates, a series of tanks circumferentially disposed with reference to the carrier-body and in such radial disposition with respect to the mouths of the charging-conduits as to present themselves to those cop-carrying arms the hollow interiors of which are, for the time being, in registry with the mouths of the charging-conduits, intermittent cop-carrier-rotating gearing, and intermittent carrier-arm-rocking gearing, substantially as set forth.

11. In a machine of the class above recited, a carrier-body the working-face of which is a plane containing or embodying, first, a series of separate mouths of charging-conduits each opening within a given radial compass from the center of said face; second, a corresponding series of mouths of liquid-exhausting conduits similarly opening within the same radial compass from said center, and which, considered with reference to circumferential distribution, alternate with the mouths of the charging-conduits, and, third, a dead-face intermediate between the mouth of the last liquid-exhausting conduit and that of the first charging-conduit of said respective series, substantially as set forth.

12. In a machine of the class above recited, a carrier-body the working-face of which is a plane containing or embodying, first, a series of separate mouths of charging-conduits; second, corresponding series of months of liquid-exhausting conduits, which, considered with reference to circumferential distribution, alternate with the mouths of the charging-conduits, and, third, a dead-face intermediate between the mouth of the last liquid-exhausting conduit and that of the first charging-conduit of said respective series, in combination with a cop-carrier the working-face of which is a plane corresponding with the face of the carrier-body, and which is provided with a series of perforations in excess of the number of conduit-mouths in said carrier-body, substantially as and for the purposes set forth.

13. In an apparatus of the class herein recited, the combination, to form a rotatable cop-carrier, of a carrier-disk having a series of equidistant radially and circumferentially disposed perforations, hollow tubular fulcra the hollow interiors of which register with the perforations aforesaid, and hollow cop-carrying arms applied to said fulcra and respectively as to their hollow interiors in communication with the hollow interiors of the fulcra aforesaid, substantially as and for the purposes set forth.

14. In a machine of the class herein recited, the combination of a rotatable flat or disk-like cop-carrier having perforations in communication with which are pivotally applied hollow cop-carrying arms adapted to be vibrated, oscillated, or rocked, a fixed correspondingly flat or disk-like carrier-body against the face of which the cop-carrier rotates, and which as to said face contains or embodies the mouths of fixed conduits and a dead-face, over which mouths and which dead-face the perforations of the carrier are caused to successively present as the carrier rotates, and a series of tanks circumferentially disposed with reference to the carrier-body and the mouths of the charging-conduits, substantially as and for the purposes set forth.

15. In an apparatus of the class herein recited, a series of tanks which partially circumscribe the carrier-body, a disk-like horizontally-disposed carrier-body erected within the partial circle formed by the circumscribing series of tanks, and embodying a sectoral face area constituting a dead-face and opposite an interspace between the tanks, conduits the mouths of which open independently of each other through the carrying-face of the carrier-body, and which are conveniently independent holes in said face, a disk-like cop-carrier provided with hollow radially-projecting cop-carrying arms adapted to be oscillated, vibrated, or rocked, having circumferentially-distributed perforations in communication with the hollow interiors of the cop-carrying arms, and adapted, in the rotation of the carrier, to register successively with the dead-face and with the conduit-mouths, cops applied to the outer extremities of the cop-carrying arms, and suitable means for both rotating the cop-carrier and raising and lowering the arms, substantially as set forth.

16. In a machine of the class above recited, in combination with a rotatable cop-carrier provided with arms adapted to be rocked, vibrated, or oscillated, a plunger-rod connected with the arms, a plunger-cam, and a cam-rocker, substantially as and for the purposes set forth.

17. In a machine of the class above recited, in combination with a rotatable cop-carrier provided with arms adapted to be rocked, vibrated, or oscillated, a plunger-rod connected with the arms, a plunger-cam and a cam-rocker, a worm-wheel connected with the cop-carrier, an intermittently-rotating counter-shaft provided with a worm engaging said worm-wheel, and gearing for intermittently operating said counter-shaft, substantially as and for the purposes set forth.

387,541. REEL FOR TAPE-MEASURES, FISHING-LINES, &c. James Rose, Patchogue, N. Y. Filed Mar. 14, 1888. Serial No. 267,178. (Model.)

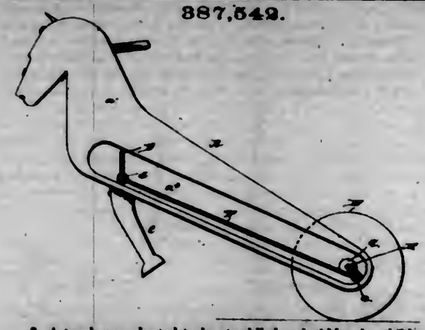
Claim.—1. In a reel, the combination of the central part having two disks flanged and shouldered at their circumference and having hand-holds, with a circumferential part formed of two annular plates having spacing-rods, seated upon the shoulders and between the flanges of said disks, and forming the spool or reel adapted to be revolved upon said central flanged part, substantially as described.

2. In a reel, the combination of a circular central portion having perforations for the insertion of the fingers of one hand, and having flanges with annular plates revolving with their central apertures upon the central portion between the flanges, and having spacing posts or rods at the inner edges, substantially as described.

3. A reel consisting of a central part of separable disks flanged and shouldered at their circumference, and an annular circumferential reel part mounted upon the shoulders of the said disks between their flanges, the said central part having means for holding it in one hand, and the said circumferential part having means for revolving it between the said flanges, substantially as described.

4. In a reel, the combination, with a circular central separable portion having flanges and forming a receptacle, of an annular revolving reel portion upon the central portion between the flanges, substantially as described.

5. In a reel, the combination of two separable and equal-flanged circular disks having respectively a screw-threaded and a screw-bored stud at the center, with an annular reel portion fitted to revolve upon the disks between the circumferential flanges, as shown and described.



6. In a reel, the combination, with a central circular portion having end flanges, of two annular plates fitted to revolve upon the central portion between the flanges and having posts for spacing them near the inner edges, a hook secured to the inner side of one plate near the inner edge, and a handle mounted in the outer edge of one of said plates adapted to be set inward over the tape when wound, substantially as described.

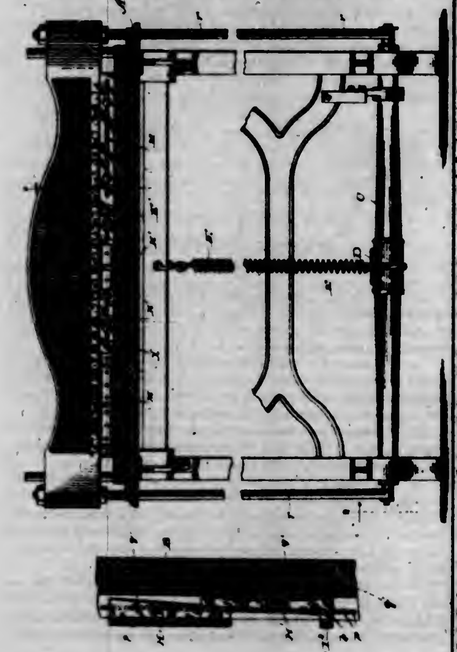
7. In a reel, the combination of the circular disks having the flanges and the central studs, respectively formed with a screw-threaded end and with a female-threaded bore and formed with the registering-apertures, the annular apertured plates having the spacing posts or rods, the hook having its bent end secured in one plate near the inner end, and the handle having a sliding adjustment over the tape, as shown, and for the purpose specified.

387,542. TOY. Otto H. Rocker, Mooresville, Ind. Filed Jan. 26, 1888. Serial No. 261,817. (No model.)

Claim.—1. A toy horse adapted to be straddled and ridden by children, comprising two portions having in their meeting faces coincavities which form an interior chamber that receives and protects the operative mechanism, a crank-axle mounted at the rear of the chamber and provided with wheels, a crank-shaft mounted at the front of the chamber and provided with legs, and a rod connecting the two, the loop in said crank-shaft being longer than the loop of the crank-axle, whereby the crank-shaft is caused to oscillate, substantially as described.

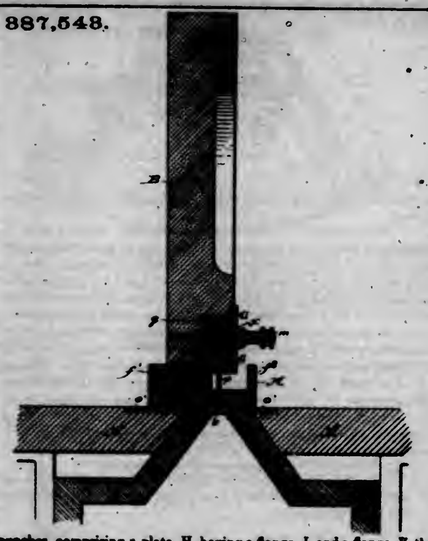
387,542.

2. A toy horse adapted to be straddled and ridden by children, comprising two similar portions having in their meeting faces concavities which form an interior chamber to receive and protect the operative mechanism, a crank-axle mounted at the rear of the chamber and provided with wheels, a crank-shaft mounted at the front of the chamber and provided with legs, a rod connecting the two, and washers placed at each side of the loop of said crank-axle, whereby the connecting-rod is prevented from slipping and the device becoming inoperative, substantially as described.



387,543. PERFORATING-MACHINE. Frederic P. Rossman, Chicago, Ill. Filed June 16, 1887. Serial No. 241,868. (No model.)

Claim.—1. In a perforating-machine, the combination, with the cross-head and punch-bar, of a sliding plate provided on its inner side with a flange confined over the line of punches, substantially as and for the purpose set forth.



2. In a perforating-machine, the combination, with the cross-head and punch-bar, of longitudinally-extensible sliding flanges confined over the line of punches, substantially as and for the purpose set forth.

3. In a perforating-machine, the combination, with the cross-head and punch-bar, of two sliding flanges confined over the line of punches and inclined on their adjacent surfaces in opposite directions to afford an extensible bearing for the punches, substantially as and for the purpose set forth.

4. In a perforating-machine, the combination, with the cross-head and punch-bar, of a longitudinally-extensible sliding bearing for the

387,548.

punches, comprising a plate, H, having a flange, I, and a flange, I', the said flanges being confined over the line of punches and having their adjacent surfaces inclined longitudinally in opposite directions, substantially as and for the purpose set forth.

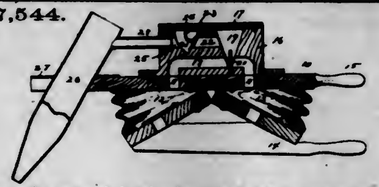
5. In a perforating-machine, the combination, with the cross-head and punch-bar, of a longitudinally-extensible sliding bearing for the punches, comprising a plate, H, having a flange, I, and a flange, I', hollowed out longitudinally on its rear side, the said flanges being confined over the line of punches and having their adjacent surfaces inclined longitudinally in opposite directions, substantially as and for the purpose set forth.

6. In a perforating-machine, the combination, with the cross-head and punch-bar, of a longitudinally-extensible sliding bearing for the punches, comprising a plate, H, having a flange, I, and a flange, I', hollowed out longitudinally on its rear side and provided with a plate, I', near one extremity, the said flanges being confined over the line of punches and having their adjacent surfaces inclined longitudinally in opposite directions, substantially as and for the purpose set forth.

7. In a perforating-machine, the combination, with the cross-head and punch-bar, of a longitudinally-slotted sliding plate, G, provided on its inner side with a flange, G', a set-screw, m, for confining the plate G in place with its flange over the line of punches, and a longitudinally-extensible sliding bearing for the punches, comprising a slotted plate, H, having a flange, I, a flange, I', the said flanges being confined over the line of punches and having their adjacent surfaces inclined longitudinally in opposite directions, and a set-screw, m, for the said extensible bearing, substantially as and for the purpose set forth.

8. In a perforating-machine, the combination, with the cross-head and punch-bar, of a sliding plate provided on its inner side with a flange confined over the line of punches, and a graduated scale, K, on the front face of the cross-head above the punch-bar, substantially as and for the purpose set forth.

9. In a perforating-machine, the combination, with the table A and cross-head, of an index-finger, L, substantially as and for the purpose set forth.



10. In a perforating-machine, the combination, with the table A and cross-head, of an adjustable index-finger, L, substantially as and for the purpose set forth.

11. In a perforating-machine, the combination, with the table A and cross-head B, of an index-finger, L, formed in adjustable sections, substantially as and for the purpose set forth.

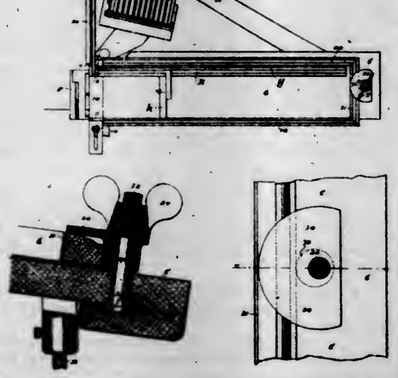
387,544. FUMIGATOR. Abbe Spitler, Moscow, Idaho. Filed June 2, 1888. Serial No. 275,726. (No model.)

Claim.—1. In an animal-exterminator, the combination, with a table containing spaced ports, bellows attached beneath the ports, and a fire-chamber secured in the forward end of the table, of a block containing an essentially U-shaped port connecting with the ports of the table, a forward and rear recess, the latter connecting with the U-shaped port and a second port uniting said recesses, a valve closing the forward end of the latter port, and a tubular connection between

387,544.

the forward recess and fire-chamber, substantially as shown and described.

2. In an animal-exterminator, the combination, with the table 10, containing spaced ports 11, bellows 12 and 13, communicating with said ports, and a forwardly-inclined fire-cylinder, of a block, 16, provided with the ports 18 and 22 and recesses 19 and 21, a spring-actuated valve, 23, closing the port 22, and a tube, 28, connecting the recess 21 and the fire-cylinder, substantially as shown and described.

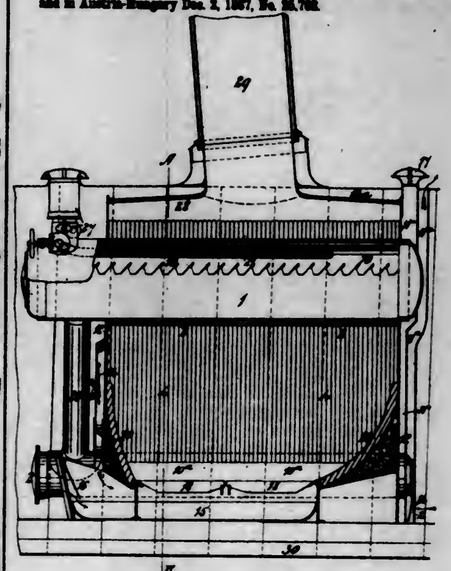


3. In an animal-exterminator, the combination, with the table 10, containing spaced ports 11, bellows 12 and 13, communicating with said ports, and a forwardly-inclined fire-cylinder having a tapering end, of a block, 16, provided with parallel ports 18 and 22, a rear vertical recess, 19, and a forward recess, 21, a spring-actuated valve, 23, closing the forward end of the port 22, a flexible valve, 20, located in the port 18 and recess 19, and a tube, 28, connecting the forward recess and cylinder, substantially as shown and described.

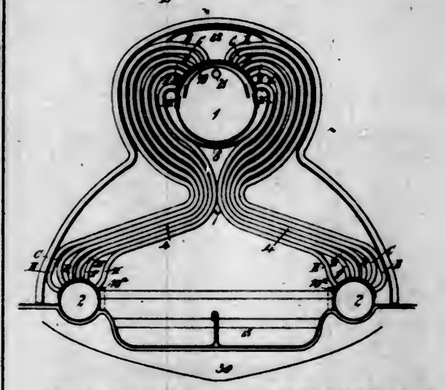
387,545. LINE-GUIDE FOR FISHING-RODS. James Strode and Ada M. Comstock, Waterbury, Conn. Filed Jan. 30, 1888. Serial No. 262,418. (No model.)

Claim.—The herein-described line-guide for fishing-rods, made from a single piece of sheet metal, the central portion punched to form eyes *a a*, and having shanks *d d* projecting therefrom, the said eye portions bent at an angle to said shanks, combined with bushings through the eyes closed down upon both sides and so as to form a rounded interior surface for the eyes, substantially as described.

387,546. JUSTIFYING APPARATUS. Joseph Thorne, Port Richmond, N. Y., assignor to the Thorne Machine Company, of New York. Filed June 4, 1885. Serial No. 167,600. (No model.)



Claim.—1. The combination, with the table C, its head 10, and the galley G, of the combined end and top clamp, 30, substantially as described.



2. The combination, with the galley G and table C, having the head 10, of the block 12, fixed upon the head, and having the lip 6, the side-stick having the slot 5 to engage with said lip, and having a lateral support, *g*, at its lower end, and the movable gage 11, substantially as described.

3. The combination, with the setting-stick having one side removed at its delivery end, of a frictional bearing, as the rubber 9, substantially as described.

4. The combination, with the table C, its head 10, and the galley G, of the clamp 30 and cam 70, substantially as described.

387,547. STEAM-GENERATOR. John I. Thornycroft, Chiswick, County of Middlesex, England. Filed July 6, 1887. Serial No. 243,573. (No model.) Patented in England Jan. 31, 1885, No. 1,464; in France June 26, 1887, No. 184,894; in Italy June 30, 1887, XLIII, 378; in New South Wales Aug. 2, 1887, No. 86; in Spain Aug. 20, 1887, No. 11,367, and in Austria-Hungary Dec. 2, 1887, No. 35,702.

Claim.—1. In a steam-generator, a combined collector and separator comprising a vessel, 1, baffle-plate 19, and perforated steam-pipe 21, said baffle-plate being arranged above said steam-pipe and partially inclosing the same, substantially as herein described.

2. In a steam-generator, a combined collector and separator comprising a cylindrical vessel, 1, with curved baffle-plate 19, extending lengthwise thereof and formed with notched or serrated edges, substantially as herein described, for the purpose specified.

3. In a steam-generator, a combined collector and separator comprising a vessel, 1, baffle-plate 19, having notched or serrated edges, and perforated steam-pipe 21, substantially as described.

4. In a steam-generator, the combination of a combined collector and separator comprising a cylindrical vessel, a curved baffle-plate with notched or serrated edges, and a perforated steam-pipe arranged lengthwise and below said baffle-plate, water vessels or chambers 2, and pipes connecting said combined collector and separator with said water vessels or chambers, substantially as described.

5. In a steam-generator, the combination of a combined collector and separator, water vessels or chambers 2, pipes 4, connecting said collector and separator with said water vessels or chambers, and a return-pipe, some of said pipes 4 being arranged close together for the greater part of their length to form inner and tubulous close walls of flues, within which other pipes 4 are separately placed, the pipes forming said inner walls being bent near their lower ends to form inlet-passages 5, and the pipes forming said outer walls being bent near their upper ends to form outlet-passages 6, substantially as described, for the purposes specified.

6. In a steam-generator, the combination of a combined collector and separator, water vessels or chambers 2, pipes 4, connecting said collector and separator with said water vessels or chambers, and a return-pipe, some of said pipes 4 being arranged close together for the greater part of their length to form inner and outer longitudinal tubulous close walls of flues, within which other of said pipes are separately arranged and bent at other parts to form inlet and outlet passages 5 and 6 to and from said flues, and others of said pipes 4 being arranged to form a partial wall or division, 7, at each end of the combustion-chamber, substantially as herein described, for the purposes specified.

7. In a steam-generator, the combination of a combined collector and separator comprising a cylindrical vessel, 1, curved baffle-plate 19, having notched or serrated edges, and a perforated steam-pipe, 21, arranged below said baffle-plate, water vessels or chambers 2, pipes 4, connecting said collector and separator with said water vessels or chambers, and return-pipes 26, some of said pipes 4 being arranged to form the inner and outer close tubulous walls of flues with inlet and outlet passages 5 and 6, and within which flues other pipes 4 are arranged, while other pipes 4 are arranged to form partial walls or divisions 7 at the ends of the combustion-chamber, substantially as described, for the purposes set forth.

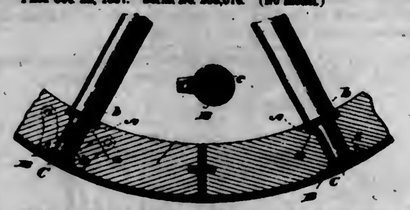
8. In a steam-generator, the combination of a combined collector and separator comprising a vessel, a baffle-plate, and a steam-pipe, water vessels or chambers 2, pipes 4, return-pipes 26, a combustion-chamber, an ash-pit with air-inlet valve 16, and an air-chamber provided with inlet-valve 14, for admission of air, said air-chamber being situate at, and adapted to cool one end of the combustion-chamber, substantially as described, for the purposes specified.

9. In a steam-generator, a combined collector and separator comprising a vessel, a baffle-plate, and a steam-pipe, water vessels or chambers 2, pipes 4, return-pipes 26, a combustion-chamber, an ash-pit with valve 16, and chambers 11 11°, with valves or doors 14 for admission of air, all substantially as described, for the purposes set forth.

10. In a steam-generator, a combined collector and separator comprising a vessel, a baffle-plate, and a steam-pipe, water vessels or chambers 2, pipes 4, return-pipes 26, a combustion-chamber, an ash-pit with valve 16, and chamber 11° in communication with the ash-pan and having an outlet closed by a loaded valve, 17, substantially as herein described, for the purposes specified.

11. In a steam-generator, a combined collector and separator, water vessels or chambers 2, pipes 4, return-pipes 26, a combustion-chamber, an ash-pit with valve 16, chamber 11 in communication with said ash-pit, chamber 11° in communication with the external atmosphere, valves 14 for admission of air to said chambers, and chamber 11°, with loaded valve 17, all substantially as herein described, for the purpose set forth.

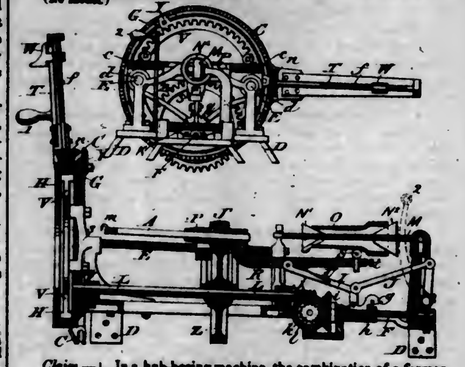
12. In a steam-generator, a combined collector and separator, comprising a vessel, 1, a baffle-plate, and a steam-pipe, water vessels or chambers 2, pipes 4, return-pipes 26, blocks or plates 10 and 10°, of refractory material, fire-grate 3, ash-pan 15, with valve 16, chambers 11 11°, with valves 14 for admission of air, and chamber 11°, with loaded valve 17 for exit of steam, all substantially as herein described, for the purposes set forth.



13. In a steam-boiler, a combined collector and separator comprising a vessel, 1, a baffle-plate, and a steam-pipe, water vessels or chambers 2, pipes 4, return-pipes 26, fire-grate 3, blocks or plates 10 and 10°, of refractory material, shield 8, of non-conducting material, ash-pan 15, with valves 16, chambers 11 and 11°, with valves 14 for admission of air, chamber 11°, with loaded valve 17 for exit of steam, flue 28, and uptake or chimney 29, all substantially as herein described, for the purposes specified.

387,548. METHOD OF MAKING ARBORS FOR CLOCKS AND WATCHES. William H. Wheeler, New Bedford, Mass., assignor to the Weeden Manufacturing Company, same place. Filed Aug. 18, 1887. Serial No. 247,297. (No model.)

Claim.—The method employed in manufacturing arbors, which consists in forming a core or center from a straight rod of metal, then forming thereon a body by bending a plate of sheet metal around the core, and, lastly, compressing the body closely upon said core by the action of a drawing-die, substantially as and for the purpose shown.



387,549. WHEEL. A. McIntosh Williamson, Philadelphia, Pa. Filed Oct. 22, 1887. Serial No. 253,076. (No model.)

Claim.—1. The combination, with the elastic cushion and the follies of a vehicle-wheel, of the corrugated plate, substantially as specified.

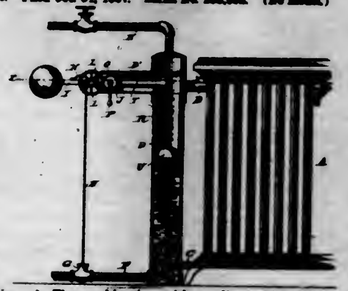
2. The combination, with the spokes and follies of a vehicle-wheel and the cushions C, of the clamping-plate interposed between the felly and tire, substantially as specified.

387,550. HUB-BORING MACHINE. Amos Wonser, Davenport, Iowa. Filed July 30, 1888. Renewed June 1, 1888. Serial No. 275,691. (No model.)

Claim.—1. In a hub-boring machine, the combination of a former having the shape of the exterior surface of an axle-box, a cutter-bar provided at one end with a cutter adapted to cut the bore in a hub and having the other end adapted to bear upon and be reciprocated over the former, the said cutter-bar being attached to a rocking cross-head mounted in reciprocating bearings, means to reciprocate the cutter-bar, and means to hold in place and revolve a hub in contact with the cutter, all of the said devices being constructed and arranged to cause the bore in the hub to be cut the size and shape of the axle-box, substantially as and for the purposes described.

2. In a hub-boring machine, the bar A, provided with a cutter, *m*, and rigidly attached to the cross-head P, pivotally mounted in movable bearings placed on fixed supports, guide-arm R, provided with friction-roller *s*, former O, adjustably secured on the shaft M, in combination with mechanism for holding and rotating the hub of a wheel in position to be bored by the cutter, and mechanism for reciprocating longitudinally the cross-head carrying the cutter-bar and guide-arm, substantially as set forth and described.

387,551. VEHICLE-WHEEL. Henry A. Arnold, Lake Geneva, Wis. Filed Apr. 3, 1888. Serial No. 269,462. (No model.)



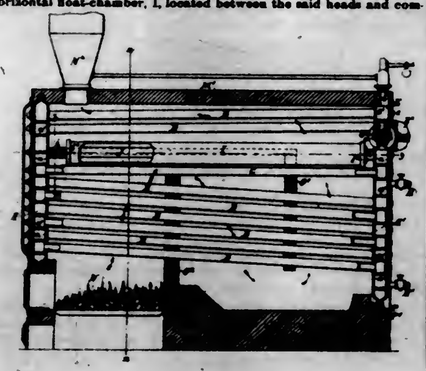
Claim.—1. The combination of the parallel beams, the inclined axle secured between the outer ends thereof, and the wheel mounted on said axle and having its upper portion passing between the parallel beams, as set forth.

2. The combination of the parallel beams, the upper one having a downwardly-turned end and the lower one having a beveled end, the inclined axle secured between said ends, and the wheel mounted on the axle, as set forth.

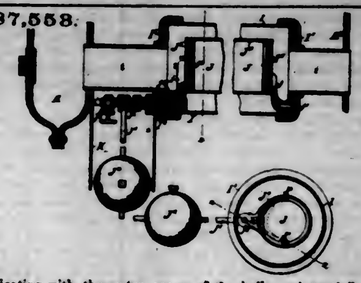
3. The combination of the parallel beams, the inclined axle mounted in the ends of the beams, the skein surrounding the axle between the ends of the beams, the thimble mounted on the skein, and the wheel secured to the thimble, as specified.

387,552. RADIATOR-REGULATOR. Peter W. Barry, Gunnison, Colo. Filed Oct. 31, 1887. Serial No. 253,982. (No model.)

Claim.—1. The combination, with a radiator, of a tank connected at top and bottom with the radiator and provided with an inlet and outlet pipe, a valve for opening and closing the outlet-pipe, a weighted lever connected to said valve, and a float in the tank and connected to the weighted lever, substantially as described.



2. The combination, with a radiator, of a tank connected at top and bottom with the radiator and provided with an inlet and outlet pipe, a valve in the outlet-pipe, a weighted lever provided with an arm projecting into the tank, a pulley on the said arm, a float in the tank, a chain secured to the float and passing over the pulley, and a connection between the valve and weighted lever, substantially as described.



3. The combination, with a tank constructed to be connected to the radiator at top and bottom and provided with a lateral extension and an inlet and outlet pipe, and a valve in the outlet-pipe, of a shaft journaled in the lateral extension and provided with a drum and a pinion, a weighted lever mounted on the shaft and provided with a pinion meshing the pinion on the said shaft, and with an inwardly-projecting arm carrying a pulley, a chain on the drum, a float on the end of the chain, and a connection between the valve in the outlet-pipe and the weighted lever, substantially as described.

4. The combination, with a tank constructed to be connected to a radiator provided with a lateral extension and inlet and outlet pipes, and a valve in the outlet-pipe, of a shaft journaled in the lateral extension and provided with a drum and pinion, a sleeve on the shaft provided with an inwardly-projecting arm carrying a pulley and a weighted lever carrying a pinion meshing with the pinion on the said shaft, a pawl engaging the pinion on the weighted lever, a chain on the drum and having a float at its end, and a rod connecting the valve in the outlet-pipe with the weighted lever, substantially as described.

387,553. STEAM-BOILER FURNACE. Gilbert A. Colby, Chicago, Ill., assignor, by mesne assignments, to M. Cochran Armour, same place. Filed June 27, 1887. Serial No. 242,582. (No model.)

Claim.—1. The combination, with the vertical water-heads A A', a series of inclined water-tubes, B B B, connected at their opposite ends with the said water-heads, and a second series of horizontal water-tubes, C C C, also connected with the said water-heads, of a horizontal float-chamber, I, located between the said heads and communicating with the water-space of the boiler, substantially as described.

2. The combination, with a boiler comprising vertical water-heads A A', and water-tubes connected at their opposite ends with said heads, and a furnace-casing surrounding said boiler, of a float-chamber, I, connected at its opposite ends with the said heads and located at a point adjacent to the side wall of the boiler-casing, a float within said chamber, and a pivotal support for the float provided with an arm, J', extending outwardly through an opening in the boiler-casing, substantially as described.

3. The combination, with a boiler-casing and boiler comprising a float-chamber, I, of a float located within said chamber, a pivotal support for the float extending through the wall of the float-chamber and provided with an arm, J', and a shell, K, inserted in the boiler-casing and extending inwardly to and around the pivotal support of the float at the point where it emerges from the float-chamber, substantially as described.

4. The combination, with the float-chamber of a boiler, of a float provided with a steam opening at its upper part, a pivotal support for the float extending through the wall of the float-chamber and provided with an arm rigidly attached to the float, said pivotal support and arm being provided with a passage communicating with the interior of the float at the bottom part thereof and with the open air, and a hand-valve located in said passage exterior to the float-chamber, whereby the said passage may be kept normally closed to prevent escape of steam from the boiler and may be opened at desired times to allow the escape of water from the float, substantially as described.

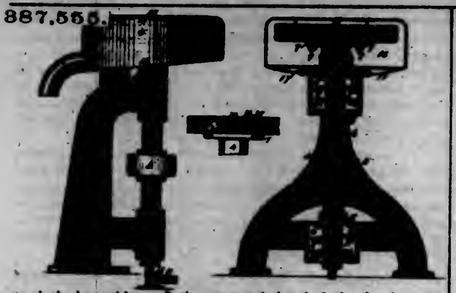
5. The combination, with a horizontally-arranged float-chamber, of a cylindric horizontally-arranged float extending through the greater part of the length of the said float-chamber, and a pivoted supporting arm or arms for the said float, substantially as described.

6. The combination, with a horizontally-arranged float-chamber, of a float and supporting-arms for the float attached to opposite ends of the latter and having separate pivotal connection with opposite end walls of the float-chamber, substantially as described.

7. The combination, with a horizontally-arranged float-chamber, of a cylindric float consisting of a hollow cylinder and metal disks or end walls secured in the end of said cylinder and provided with supporting-arms cast integral therewith, substantially as described.

387,554. PROCESS OF TREATING IRON ORE. Gerrit Cornelius, Glens Falls, N. Y. Filed May 26, 1887. Serial No. 239,493. (No model.)

Claim.—1. The process of treating iron ore containing phosphorus or titanium, or both, which consists in first crushing the ore, then concentrating the same by specific gravity, then separating the particles of the concentrated ore according to their fineness, and, finally, exposing the fine particles resulting from this separation to the action of magnets, substantially as described.



2. The process of treating iron ore containing phosphorus or titanium, or both, which consists in first crushing the ore, then concentrating the same by specific gravity, then passing the concentrated mass over a sieve or screen, then recrushing the particles which pass over the screen, and, finally, exposing the recrushed particles to the action of magnets.

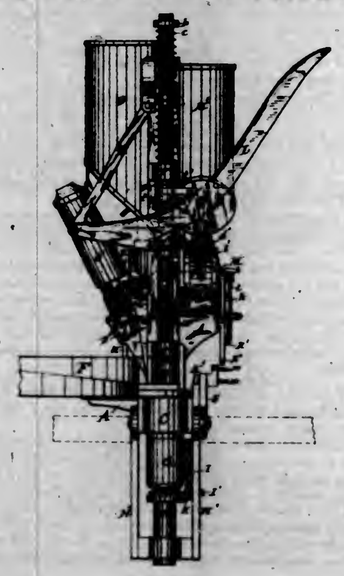
387,555. MACHINE FOR GRINDING THE MOUTHS OF GLASS BOTTLES, JARS, &c. John K. Cornelius, St. Louis, Mo. Filed Feb. 20, 1888. Serial No. 264,846. (No model.)

Claim.—1. In a glass-grinding device, the vertical tubular rotary shaft, the band-wheel that drives it, suitable means for supplying water within said shaft, the rotary grinding-wheel carried by said shaft, and the circular ridges on the face of said wheel, arranged to provide grooves between them in which to grind and bevel the mouths of glass vessels, &c., circumferentially, to avoid a lateral grind and production of sharp cutting-edges, substantially as and for the purpose set forth.

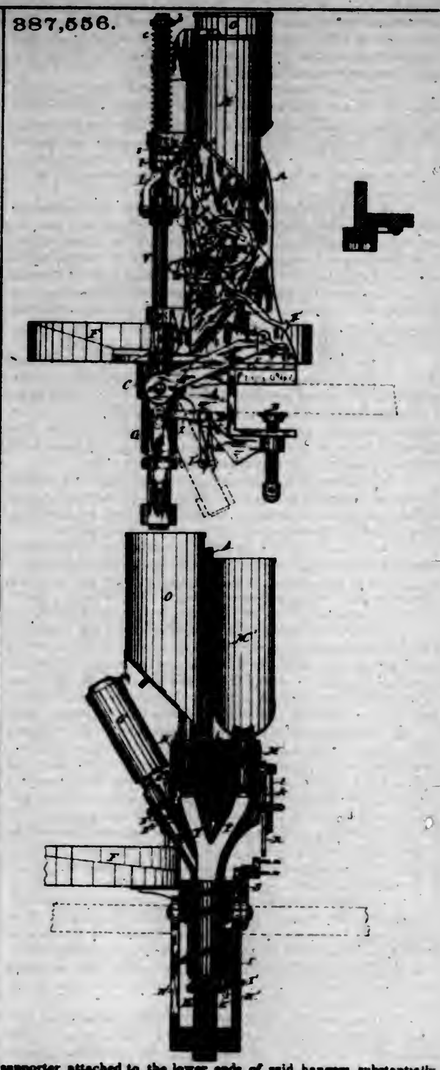
2. In a glass-grinding device, the combination of the supporting-

387,555.

stand, the journal-boxes 2, the rotary tubular shaft that has bearings in said boxes, the band-wheel that drives it, the flanged bed-plate that surmounts said shaft, the grinding-wheel secured on said bed-plate and to the screw-head of the tubular shaft, and the circular ridges on the face of said wheel, that provide circumferential grooves between them to guide, grind, and form smooth bevel edges to the mouths of glass vessels, substantially as and for the purpose set forth.



3. In a glass-grinding device, the combination of the stand, the rotary tubular shaft and band-wheel that drives it, the hydrant-pipe that ascends through said shaft, the bed-plate that surmounts it, the grinding-wheel secured on said bed-plate and to the screw-head of the tubular shaft, the circular ridges on the face of said wheel, that provide between them circumferential grooves to guide, grind, and bevel the mouths of glass vessels, &c., and the drip-chamber 16 and drainage-pipe 18, to receive and carry off the waste products from the wheel, substantially as and for the purpose set forth.



4. In a glass-grinding device, the combination of the stand, the rotary tubular shaft and the band-wheel that drives it, the water and sand conveyer within said rotary shaft, the grinding-wheel 8 and bed-plate 7, that surmount said shaft, and a drainage-tube, substantially as and for the purpose set forth.

5. In a glass-grinding device, the combination of the stand, the vertical tubular rotary shaft, the band-wheel that drives it, the hydrant-pipe within said shaft, the flat rotary grinding-wheel secured to the screw-head of the rotary shaft, the said hydrant-pipe arranged to throw a jet of water through and onto the grinding-wheel, and the drip-chamber 16 and its drainage-pipe that collect and discharge the overflow from the wheel, substantially as and for the purpose set forth.

387,556. CARTRIDGE-LOADER. Howard C. Dorchester, Geneva, N. Y. Filed Feb. 21, 1887. Serial No. 228,302. (Model.)

Claim.—1. In a cartridge-loader, the combination, with a stationary upright cartridge-receiver having its receiving end at the base, of hangers hinged to opposite sides of said receiver and a cartridge-

supporter attached to the lower ends of said hangers, substantially as described and shown.

2. In a cartridge-loader, the combination, with the stationary upright cartridge-receiver having its receiving end at the base and a cartridge-supporter arranged movably under the cartridge-receiver, of a cartridge-extractor sliding longitudinally on the said receiver, substantially as described and shown.

3. In a cartridge-loader, the combination of an upright cartridge-receiver having its receiving end at the base, a cartridge-extractor at said receiving end, a cartridge-supporter arranged removably under the receiver, and a lever for transmitting motion from the supporter to the extractor, as and for the purpose set forth.

4. The combination, with the upright cartridge-receiver having its receiving end at the base, of a cartridge-extractor sliding on said receiver, a cartridge-supporter suspended from the receiver and adapted to swing to and from the receiving end thereof, and a lever arranged to transmit motion from the supporter to the extractor, substantially as set forth.

5. The combination, with the upright cartridge-receiver having its receiving end at the base, of a cartridge-extractor sliding longitudinally on the receiver, a cartridge-supporter suspended from the receiver and adapted to swing to and from the receiving end thereof,

a bell-crank having one of its arms connected with the extractor and the other arm adapted to be encountered by the swinging cartridge-supporter, and a spring for sustaining the extractor in its normal position, substantially as and for the purpose set forth.

6. In combination with the cartridge-receiver having its receiving end at the base, an extractor sliding longitudinally on said receiver, a cartridge-supporter hinged on the receiver, a bell-crank having one of its arms connected with the extractor and the other arm adapted to be encountered by the swinging supporter, and a spring to partially lock said supporter at the extremes of its motion, substantially as described and shown.

7. In a cartridge-loader, the combination, with the cartridge-receiver, of a cartridge-supporter arranged movably to and from the receiving end of said receiver, a powder-duct leading to said receiver, a powder-charger arranged movably in and out of communication with said duct, a powder-receptacle communicating with the aforesaid charger, and levers transmitting motion from the cartridge-supporter to the powder-charger and throwing the latter in communication with the aforesaid duct simultaneously with the movement of the cartridge-supporter to the cartridge-receiver, substantially as set forth.

8. In a cartridge-loader, the combination, with the cartridge-receiver, of ducts leading to said receiver, a main powder-charger arranged movably in and out of communication with one of the ducts, a priming-charger arranged movably in and out of communication with the other duct, and a lever arranged to transmit motion from the main charger to the priming-charger and move the latter to its delivering position in advance of the former, as set forth.

9. In combination with the cartridge-receiver and ducts leading thereto, an oscillatory main powder-charger, a reciprocating priming-charger, and a lever arranged to transmit motion from the oscillatory charger to the reciprocating charger, as set forth and shown.

10. In combination with the cartridge-receiver and a duct leading thereto, a reciprocating charger having a diagonal ammunition-channel adapted to communicate at one end with the duct, and an ammunition-receptacle having a discharge-spout in the path of the opposite end of the channel of the charger, substantially as described and shown.

11. In combination with the cartridge-receiver and oscillatory ammunition-chargers communicating with said receiver, an oscillatory cartridge-supporter under the receiver, an arm projecting from the cartridge-supporter, a crank on the aforesaid charger, and an arm connected to the said crank and adapted to engage and release the arm of the cartridge-supporter, substantially as and for the purpose set forth.

12. In combination with the cartridge-receiver and oscillatory ammunition-chargers communicating with said receiver, an oscillatory cartridge-supporter under the receiver, an arm projecting from said supporter and provided with laterally-projecting pins at its free end, a crank attached to the chargers, an arm pivoted on said crank and provided at its pivoted end with a lateral extension and having its free end provided with a hook adapted to enter between the aforesaid pins of the cartridge-supporter arm, and a spring connecting the lateral extension of the pivoted arm with the axis of the chargers, substantially as described and shown.

13. In combination with the cartridge-receiver, ramrod, and oscillatory ammunition-charger, a hook hinged on the said charger, a guide parallel with the ramrod and guiding the free end of the aforesaid hook, and a cam hinged on the ramrod yielding upwardly, but restrained from yielding to downward pressure, and adapted to engage the aforesaid hook during the upward movement of the ramrod, substantially as described and shown.

14. In combination with the cartridge-receiver, ramrod, and oscillatory ammunition-charger, a hook hinged on said charger, a guide parallel with the ramrod and guiding the free end of the aforesaid hook and provided with a notch for the release of the hook, a spring pressing the hook toward the ramrod, and a cam hinged on the ramrod and restrained from yielding to downward pressure and adapted to engage the hook during the upward movement of the ramrod, substantially as described and shown.

15. In combination with the upright frame provided with the cartridge-receiver at its base and the ramrod sliding on said frame, the sleeve *a*, adapted to be clamped on the ramrod at different points in the length thereof, the toggle T, connected with the frame, and the lever L, pivoted on the aforesaid sleeve and connected with the toggle, substantially as described and shown.

16. The combination of the frame A, provided with the cartridge-receiver at its base and with guide-eyes above said receiver, the ramrod sliding in said eyes and provided with the collar *b*, the spring *c*, interposed between the said collar and one of the guide-eyes on the frame, a cushioned stop on the ramrod under the said guide-eye, the toggle T, connected to the frame, and the lever L, pivoted on the ramrod and connected with the toggle, substantially as described and shown.

17. In combination with the frame A, provided with the cartridge-receiver at its base and powder and shot ducts converging to said receiver, oscillatory powder and shot chargers arranged axially in line with each other and united to turn synchronously and having their delivering end in different positions in relation to each other, a reciprocating priming-charger communicating with the powder-duct, a lever pivoted at one end on the frame and connected intermediate its length with the priming-charger and slotted at its opposite end, and a stud-pin passing through the slotted end of said lever and secured to the end of the powder-charger eccentrically in relation to the axis of the latter, substantially as described and shown.

18. In combination with the annular charger-seat communicating with the ammunition-duct and the shot-receptacle communicating with said seat, the oscillatory shot-charger in the aforesaid seat and provided with the diametrical shot-chamber and with a groove extending from said shot-chamber part way around the periphery of the charger, and the lug *d*, projecting into said groove, substantially as and for the purpose set forth.

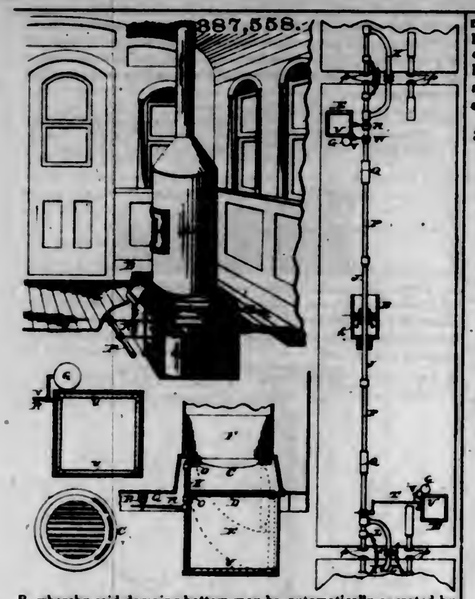
19. In combination with the annular charger-seat and communicating with the ammunition-duct and the shot-receptacle communicating with said seat, the oscillatory shot-charger in the aforesaid seat and provided with the diametrical shot-chamber and with a groove extending from said shot-chamber part way around the periphery of the charger, and the scraper *e*, projecting into the aforesaid groove, substantially as and for the purpose set forth.

20. In combination with the ammunition-charger having the chamber *f* extending through it, the gage *g*, seated movably in said chamber and provided with perforations at different points of its length, and the spring-plate A, secured to the end of the charger and having its free end adapted to enter the perforation of the gage, substantially as described and shown.

387,557. HUB. William H. Rehse, Berlin, Wis. Filed Apr. 5, 1888. Serial No. 269,710. (No model.)

Claim.—1. In a vehicle-hub, the combination, with the hollow shank A, having formed on a portion of its outer surface screw-threads, the stationary abutting disk B, formed integral with the said shank A and standing at right angles to the same, this disk B being provided upon its outer or bearing face with projections which enter the tenons of the spokes, the ring C, formed integral with the said shank and disk in the angle formed by the same, this ring being provided with longitudinal radial dovetail slots *c*, and the spokes provided with tapering or wedge-shaped tenons, each one of these tenons being provided on its extreme inner end with a smaller dovetail tenon, *c'*, which enter the dovetail slots *c* in the ring C, and the adjustable clamping-disk E, adapted to firmly clamp and hold the spokes in their proper place, as and for the purpose herein set forth.

2. The combination, with the hollow shank having formed integral with it the abutting disk B, the ring C, formed integral with the said shank and disk in the angle formed by them, the disk being of less width than the spoke-tenons and provided with radial dovetail slots *c*, and the spokes provided with dovetail tenons *c'*, which are adapted to enter the said slots *c* and serve to retain the spokes in the hub, of the clamping-disk, substantially as described.



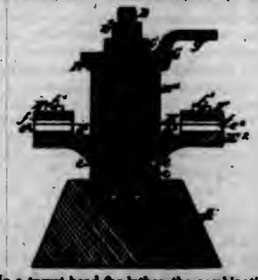
3. The combination of the hub provided on its inner end with a collar, *b*, and the axle provided with a spindle adapted to enter the said hub, of the clip G, consisting of the two parts *g g'*, clamped to the axle by means of the bolt H, these two parts forming when thus attached to the axle a complete cylinder, which embraces the said collar *b* upon the hub and permits the same to rotate freely, the interposed washers, and the sand-band extension I, formed upon the upper part of the clip and embracing the upper portion of the shank of the hub, the said bolt extending through the parts of the clip and axle, substantially as described.

387,558. Heater for Railway-Cars. Henry B. Perrine and Rodney J. McAnley, Cleveland, Ohio. Filed Mar. 7, 1887. Serial No. 229,664. (No model.)

Claim.—1. The combination, in a railroad-car stove or heater, of one or more downwardly opening or dumping bottoms, catches for holding the same raised or closed, and a cylinder and piston mechanism for releasing the catches, substantially as described.

2. In a railway stove or heater, the combination of a dumping-bottom, catches for holding the same raised or closed, a shaft, N, to which the said catches are connected, a lever, R, connected with said shaft, and a movable rod or pipe, P, connected directly with said lever

387,558.

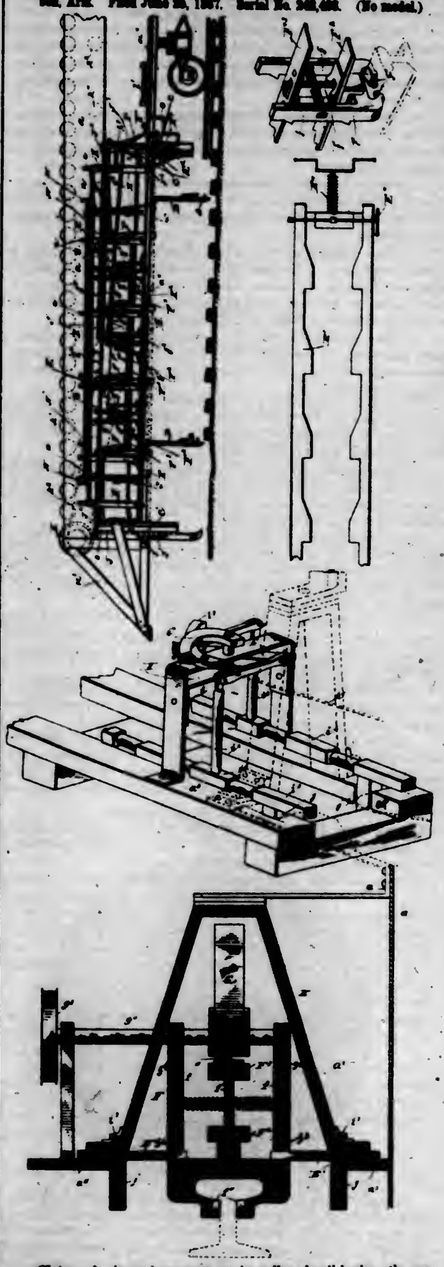


R, whereby said dumping-bottom may be automatically operated by the movement of said rod or pipe, substantially as described.

3. In stoves for railway-cars, the combination, with the fire-pot, of a base having a hinged grate, and a hinged trap-door in the bottom of said base, covering an opening through the car-floor, and a bottomless chamber beneath the said opening, the said grate and trap-door being held up by a latch mechanism, a coil of perforated pipe arranged in said bottomless chamber and connected with a chemical fire-extinguisher, substantially as described.

4. The combination, substantially as described, of a stove-base having a hinged grate, a hinged trap-door in the bottom of said base, covering an opening through the car-floor, a bottomless chamber beneath said opening, and a coil of perforated pipes in said bottomless chamber, connected with a chemical fire-extinguisher, and a latch and latch-operating mechanism for tripping the grate and trap-door, consisting of an air-cylinder secured to the under side of the car, provided with a piston having hollow piston-rods extending the full length of the car, and connected near each end with levers connected with and operating the latches of the grates and trap-doors, and the cocks of the extinguishers, all constructed and arranged to operate as and for the purposes specified.

5. The combination of the air-cylinder H, secured to the under side of the car and provided with a piston, I, having hollow piston-rods J J extending full length of the car, and provided with bumpers on each end, and hose with couplings K for connecting with adjacent cars, also connected, by cranks, levers R and W, and connecting-rod T, with the latches O O, and the valve V on extinguisher G, all constructed and operating substantially as and for the purpose specified.



387,559. Turret-Head for Lathes. Orramel G. Orr, Lima, Ohio. Filed Oct. 27, 1887. Serial No. 253,514. (No model.)

Claim.—In a turret-head for lathes, the combination of the tool-post block A, a center post, B, a cylinder surrounding the same, and a flange formed upon the bottom thereof, a lower extension having a

room, a thumb-lever, D, pivoted thereto, a lug pivoted to the said lever and projecting through a hole in the said flange, a coil-spring, *d'*, surrounding the said lug, a turret, E, surrounding the cylinder C having recesses *e* in the lower edge thereof for receiving the said lug, and a nut, G, having a handle, *g*, screwed upon the cylinder C, for securing the turret in position, as and for the purpose described.

387,560. Constructing Railroads. Charles H. Hosser, Tucson, Ariz. Filed June 25, 1887. Serial No. 242,402. (No model.)

Claim.—1. As an improvement in railroad-rail laying, the combination herein described, comprising the car and its extensions, hav-

ing endless chain belts carrying the ties, the rail-car, the rollers secured in the sills of said cars, and the tie-car having inclined roller-frames and the mechanism for lowering said rails, all constructed and arranged and designed to operate substantially as shown and described.

2. The combination, with the car having the forward and rearward extensions, of the sprocket-wheels secured at the ends of said extensions, the grooved pulleys, the endless chain belts, and the driving mechanism, substantially as shown and described.

3. The combination, with the car having the forward extension provided with side platforms, of the series of clutches, the spring-held guide-plates, the U-shaped bars and the pinions or cog-wheels, the friction-brakes, and the operating mechanism, substantially as shown and described.

4. The combination, with the car having the forward extension, of the vertically-disposed guides D D, having lower pivoted ends, substantially as shown and described, whereby the rails are guided into position, as set forth.

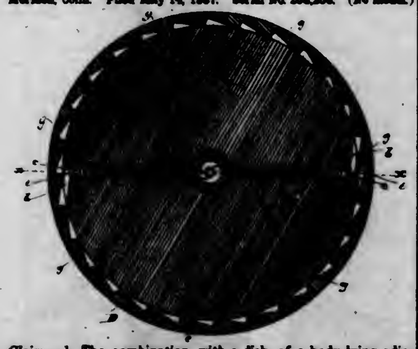
5. The combination, with the clutches, of the plates F^1 F^2, carrying rollers 2 3 at their ends, and the upright guideway-plates C and E^2, wherein said rollers are designed to slide, substantially as shown and described.

6. The combination, with the clutches and their lowering and raising mechanism, of the bars having projecting arms, the uprights connected thereto, the connecting-links, the pivoted cross-bar, the curved arm, the connecting-rod, and the operating-lever connected to said connecting-bar, substantially as shown and described.

7. The combination, with the clutches having two sets of rearward projections or notches, of the spring-held sliding plates having abutments and the foot-lever, arranged substantially as shown, and for the purpose stated.

8. The herein-described clutches, consisting of the levers having projecting portions, the rollers secured at the lower ends of said levers, the vertical bars having projecting arms, and the springs on said arms bearing against said levers, substantially as described.

9. The combination, with the clutches and the vertical bars, of the guide-plates pivoted to said bars, the U-shaped bars having teeth in one portion thereof, the cog-wheels, and the operating mechanism, substantially as shown and described.



10. The combination, with the clutches and guide-plates carrying rollers at their ends, of the guideway upright plates, wherein the ends of said guide-plates project, the pivoted levers secured in one of said upright plates, the connecting-rod, and the operating-lever, substantially as shown, and for the purpose set forth.

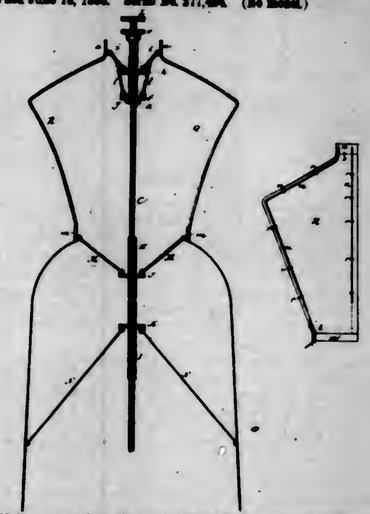
11. The herein-described tie-car, comprising the inclined roller-frames secured at their upper rear ends to posts or standards and the platforms at the lower ends of said inclined frames, arranged substantially as shown and described.

12. The combination, with the cars, of the rollers secured in pivoted posts on the upper surfaces of the outer sill of the cars for passing the curved rails, substantially as shown and described.

13. The combination, with the car having the forward extension, of the L-shaped bars or brackets having the outwardly-projecting portion and the double pulleys sliding on said bar and carrying hooks at their lower ends, arranged substantially as shown, and for the purpose stated.

387,561. EXPLOSIVE MOTOR OR ENGINE. William L. Rogers, Meriden, Conn. Filed May 14, 1887. Serial No. 238,238. (No model.)

Claim.—1. The combination, with a disk, of a body lying adjacent or in close proximity to the edge of the same, the said disk and body being the one provided with inclined notches or buckets and the other with an explosive-chamber having a discharge-opening tangential to the edge of the disk, and one of said parts being revoluble, substantially as described.

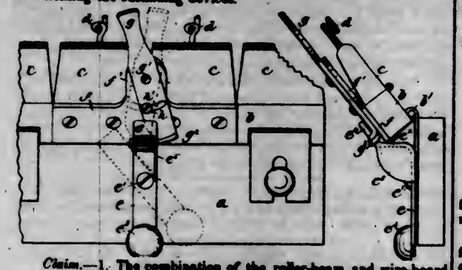


2. The combination, with a revolvable disk provided with an explosive-chamber in the periphery thereof having a tangential discharge, of a revolvable casing having a rim in close proximity to the periphery of the disk and provided with buckets, substantially as and for the purpose set forth.

387,562. PAPER-HANGER'S BRUSH AND ROLLER COMBINED. William H. Jaek, Grand Rapids, Mich., assignor to Orville H. Dunham, same place. Filed Dec. 16, 1887. Serial No. 258,126. (No model.)

Claim.—A combined paper-hanger's brush and roller comprising the handle having a rectangular slot or recess formed in one end, bristles secured along the longitudinal face of the handle, a screw-bolt, and the roller journaled thereon in the slot or recess of the handle, substantially as described.

387,563. DRESS-FORM. William H. Kraft, Brooklyn, N. Y. Filed June 18, 1888. Serial No. 277,494. (No model.)

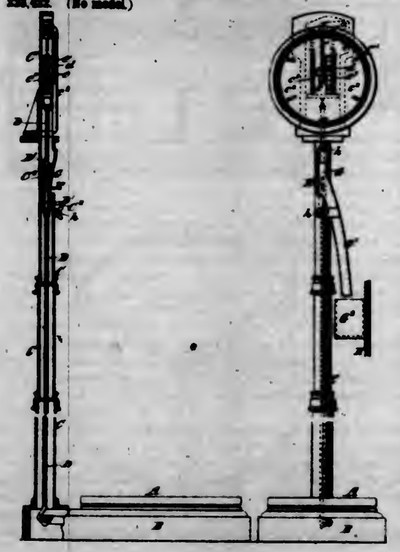


Claim.—1. A dress-form consisting of a central supporting-standard, B, a spindle, C, supported by said standard and so as to permit the free rotation of said spindle, the frame divided vertically into several sections and surrounding said spindle, the spindle provided with a screw-thread, H, near the waist-line, and also constructed with a screw-thread, I, below the said screw-thread H, the said two screw-threads being the one right hand and the other left hand, a corresponding screw-threaded collar, J, on said screw-thread H, braces M, hinged by their inner end to said collar J and extending obliquely upward therefrom, hinged to the frame at the waist-line, a corresponding screw-threaded collar, K, on the said thread I, braces N, hinged by their inner end to said collar K and extending therefrom obliquely downward, hinged by their outer end to the skirt portion of the form, the waist portion of the form extending above the waist-line and divided corresponding to the skirt portion, and mechanism, substantially such as described, to adjust the waist portion at the neck, the central spindle, C, extending above the said neck and terminating in a head by which the said spindle may be rotated, substantially as described.

2. In a dress-form, the combination of a standard, a vertical revolvable spindle, C, a frame divided vertically into several sections surrounding said spindle, the said spindle constructed with a screw-thread, H, near the waist-line and with a screw-thread, I, below said screw-thread H, the said screw-threads H and I being the one right hand and the other left hand, a corresponding screw-threaded collar, J, arranged upon the screw-thread H, and a collar, K, upon the screw-thread I, braces hinged by their inner ends to the respective collars, the said braces from the collars extending obliquely in opposite directions, those from one collar hinged to the frame at the waist-line and from the other collar to the skirt portion below, a screw-threaded sleeve, *h*, revolvable on said spindle C, but supported against vertical movement, braces *i*, hinged by their inner end to the said collar *h* and extending therefrom obliquely upward, hinged by their outer ends to the segments of the neck portion of the form, a collar, *f*, stationary on said sleeve as to vertical movement, struts *d*, hinged by their lower end to the said stationary collar *f* and by their upper end to the said braces *i* midway between their hinging-points, the said sleeve terminating above in a head, *e*, and the spindle terminating in a head, L, above said sleeve, substantially as described.

3. In a full-figure dress-form divided vertically into several sections made adjustable around a central spindle, metal segments *a* around the neck and similar metal segments, *m*, at the waist-line, the several sections of the waist made from molded material, with rods *s* made fast to the said segments and conforming to the interior vertical lines of the waist-sections, with clips *r* through said sections and upon said rods, substantially as described.

387,564. SUPPORT FOR WIRE-BOARDS OF SPINNING-FRAMES. Sherman Lyons, Lawrence, Mass. Filed May 14, 1888. Serial No. 273,881. (No model.)

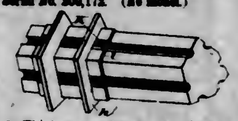


Brief.—The invention consists in the improved devices for sustaining the wire-board in its elevated position when raised for doffing and for releasing the sustaining devices.

Claim.—1. The combination of the roller-beam and wire-board of a spinning-frame with a wire-board-supporting lever pivoted on the front of said roller-beam and a handle co-operating with said lever, pivoted at the under side of the wire-board, substantially as described.

2. The wire-board-supporting lever pivoted on the front of the roller-beam below the wire-board, and provided at one end with a weight and at its other end with a wire-board-supporting seat and a projection beyond said seat, and a contact-plate, combined with a plate or bracket attached to the under side of the wire-board, and a handle pivoted on said bracket, with one end extending out between a pair of guide-wires and its other end co-operating with the projection and contact-plate of the weighted wire-board-supporting lever, substantially as described.

387,565. COIN-CONTROLLED WEIGHING-SCALE. Jonas Moss, Brooklyn, N. Y. Original application filed Sept. 26, 1886, Serial No. 214,747. Divided and this application filed Jan. 6, 1887. Serial No. 223,622. (No model.)

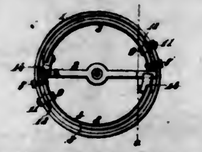


Claim.—1. The combination, with a scale-platform and indicator and a rod, D, connecting them, of the rest F, the swinging stop E, pivoted to said rod and overlying the rest, and the duct G, for guiding and confining a coin to make its weight available to move said stop, substantially as herein described.

2. The combination, with a scale-platform and a register and a connection through which the register is operated by weight on the platform, of a movable stop whereby the said connection is normally locked against weighing movement, a duct whereby a coin is guided and confined to make its weight available to move the stop and free the connection, and a keeper operated by the downward movement of the connection and which holds the coin in action upon the stop until the connection has moved to pass a locking position, substantially as herein described.

3. The combination, with a scale-platform and indicator and a rod connecting them, of the fixed rest F, the swinging stop E, pivoted to the rod and normally overlying the rest, the keeper J, whereby the coin is held upon the rest, a connection between said rod and keeper, whereby the keeper is retracted at the downward movement of the rod, the duct G, for conducting the coin to the swinging stop and rest, and the delivery-duct G', substantially as herein described.

387,566. GRATE. William J. Owens, Utica, N. Y. Filed Apr. 26, 1888. Serial No. 272,172. (No model.)



Claim.—1. The hexagonal bar *n*, formed with the longitudinal grooves or air-channels *d*, and suitable abutting stops, as *f*, in combination with tooth-rings, as *A*, for the purpose specified.

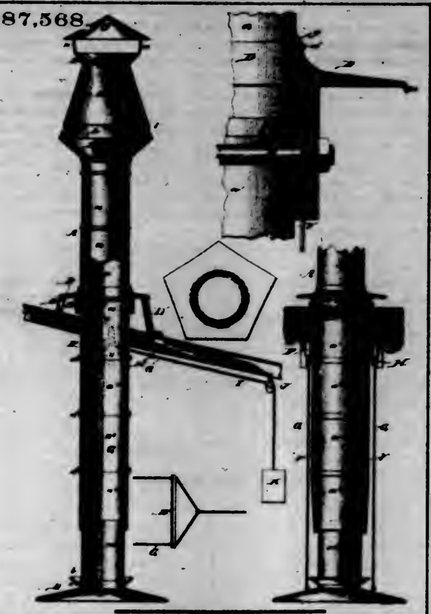
2. In a grate-bar, the hexagonal tooth-rings A, formed with the flanges *i* and air-spaces *k*, in combination with a rotatable bar, as *n*, formed with the air-channels *d*, the said air-spaces registering with each other, as set forth and specified.

3. In combination with the frame A, constructed as described, the hexagonal-shaped bars *n*, provided with the air-channels *d*, in combination with the hexagonal-shaped teeth containing air-spaces between them, as set forth, which register with the air-channels in the bars, the said bars *n* being provided with gear-wheels on their front ends, arranged to mesh with each other, whereby all the bars can be rotated simultaneously by the rotation of one of the bars *n*, as described.

387,567. COMPENSATION WATCH-BALANCE. Augustus F. Pressey, Atlanta, Ga. Filed Feb. 14, 1888. Serial No. 263,982. (No model.)

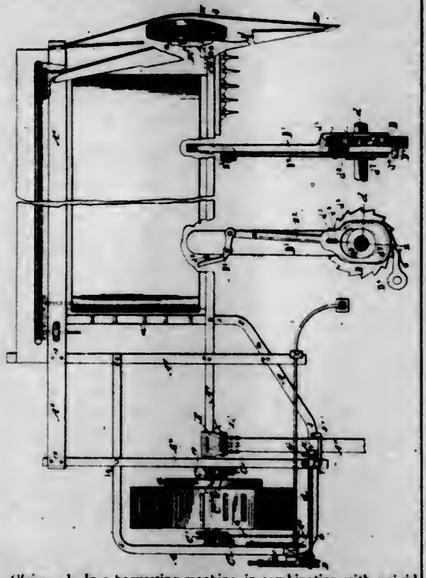
Claim.—1. The combination of the solid balance-wheel and the lengthwise-adjustable compensating bimetallic segments supported upon the inside of the wheel, substantially as described.

2. The combination, in a compensation-balance for time-pieces, of a slotted ring or wheel, slotted bimetallic segments, and adjustable pins or screws passing through the slots of the ring or wheel and the segments or sections, substantially as and for the purposes described.



3. The combination of a slotted ring or wheel having a cross-bar, slotted bimetallic segments secured at one end and loosely engaging the cross-bar at the other end, and adjustable pins or screws passing through the slots in the ring or wheel and the segments or sections, substantially as and for the purposes described.

4. A compensation-balance for time-pieces, consisting of a guard ring or band, I, weighted bimetallic segments or sections protected externally by the ring or guard and each adjustable thereupon in the direction of its length, and a cross-bar for the center bearing or balance-staff, substantially as described.



387,568. SMOKE-STACK. Charles S. Rue, Chicago, Ill. Filed Jan. 18, 1888. Serial No. 261,083. (No model.)

Claim.—In a smoke-stack, the combination of a roof-plate or collar, the fixed upper portion of the stack which rests thereon, and the swinging lower portion, which is pivoted to said roof-plate and is provided at the bottom with a telescopic drop-section, substantially as described.

387,568

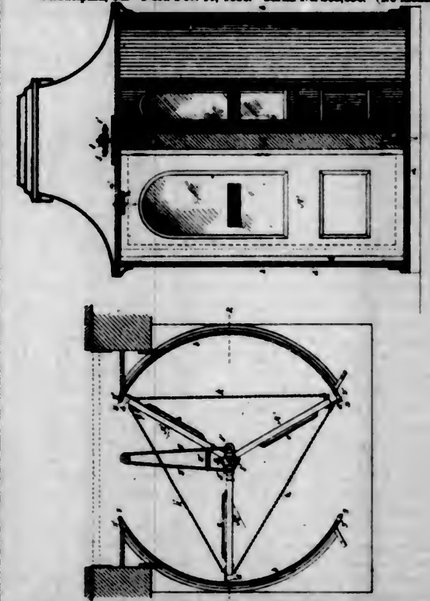
387,569. GRAIN-HARVESTER. ANDREW STARK, Chicago, Ill. Filed Aug. 4, 1883. Serial No. 103,762. (No model.)

Claim.—1. In a harvesting-machine, in combination with a rigid main frame adapted to carry the driving, cutting, and conveying mechanisms, and supported at one end directly upon the main axle, mechanism for raising and lowering the stubble end of said frame on the axle, the finger-bar rigid with the main frame, the grain-wheel lever having its pivot at the end of the finger-bar in line therewith, the grain-wheel journaled to said lever, and a cable or chain loosely connected to the main axle, so as not to be wound with its revolution, and extending thence upward to and over a point on the frame and then downward to the stubble end of the finger-bar, and then along the same to the grain end and thence to the grain-wheel lever and attached thereto, and provided with suitable guides at all the said points where its direction changes, whereby the raising and lowering of the stubble end of the platform relatively to the main axle causes a like change of elevation of the grain end by a longitudinal strain in the line of the rigid finger-bar and by means of the fewest guide-pulleys, substantially as set forth.

2. In a harvesting-machine, the combination of the main axle, the main frame, the axle-guide, the finger-bar secured to the main frame in the vertical plane of the lower end of the axle-guide, the sector-guide E^3, attached rigidly to the finger-bar, the lever E, pivoted at the end of the finger-bar, the grain-wheel *b*, journaled to said lever, and the cable *c*, loosely connected to the main axle and running over suitable guide-pulleys and under the finger-bar to and actuating the free end of the lever E, substantially as and for the purpose set forth.

3. In a grain-harvester, for the purpose of raising and lowering the same on the driving-wheel, the windlass and cable, the ratchet-wheel D, hand-lever D', having the pawl-shoulder d^3, the detaining-pawl D^4, the pawl-trip d^5, and the bell-crank lever D^2, all combined and arranged to operate substantially as set forth.

4. In a grain-harvester, in combination with the rigid main frame, and a draft-pole connected thereto at two points of its length, a windlass and cable for raising and lowering the frame, the helical plate G, secured to said windlass, and the rack H, secured to the pole, substantially as and for the purpose set forth.



5. In a grain-harvester, the combination, with the rigid main frame, of a draft-pole rigidly connected to such frame at two points, mechanism for adjusting the height of said frame, and mechanism connected to such adjusting mechanism and to one of the draft-pole connections, whereby the angle of said draft-pole is automatically adjusted in the act of raising and lowering the frame.

387,570. POCKET-RULE. JESSE A. TRAFT, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. Filed Apr. 17, 1888. Serial No. 270,972. (No model.)

Claim.—A four-fold rule having one leaf of its main hinge formed with a curved inclined way terminating with a hole, *d*, as set forth, a companion hinge-leaf having a hole, *d'*, that may be brought into coincidence with said hole *d*, and a dowel-pin carried by the folding-rule section 5, adapted to engage said holes, substantially as and for the purpose specified.

387,571. STORM-DOOR STRUCTURE. THEOPHILUS VAN KANNEL, Philadelphia, Pa. Filed Feb. 10, 1888. Serial No. 263,690. (No model.)

Claim.—1. The combination, in a storm-door structure, of the fixed portion having opposite segmental sides, with the pivoted door compound of wings, each fitting snugly to the segmental sides of the fixed structure, the latter being of a width equal to or greater in extent than the distance between the outer ends of adjacent wings of the door, all substantially as specified.

2. The combination, in a storm-door structure, of the fixed portion having top, base, and opposite segmental sides, with the pivoted door composed of wings, each fitting snugly to the top, base, and segmental sides of the fixed structure, said segmental sides being of a width equal to or greater in extent than the distance between the outer ends of adjacent wings of the door, all substantially as specified.

3. The combination of the outer or inclosing casing, having opposite segmental sides, with a pivoted door-structure having radiating wings, one or more of which are hinged, in whole or in part, so as to be thrown back out of the way, all substantially as specified.

4. The combination of the pivoted door having radiating wings, some of which are hinged, with bracing-chains connecting the wings, one of said bracing-chains being detachable, all substantially as specified.

5. The combination of two of the wings of the door, one of which is hinged, with a bracing-chain connecting said wings and having a catch-plate, and an inclined bearing-rib on one of the wings for engagement with said catch-plate, all substantially as specified.

6. The combination of the fixed structure, having opposite segmental sides, with the door, the wings of which have projecting flexible strips provided with means of adjustment, whereby they are held taut, all substantially as specified.

7. The combination of the wing of the door and the grooved strip secured thereto with the outer flexible strip and the flexible carrier therefor, consisting of a strip or sheet secured to the outer strip and folded around a cord confined in the groove of the door-strip, all substantially as specified.

8. The combination of the door having radiating wings with the casing structure having opposite segmental sides with flexible jambs, all substantially as specified.

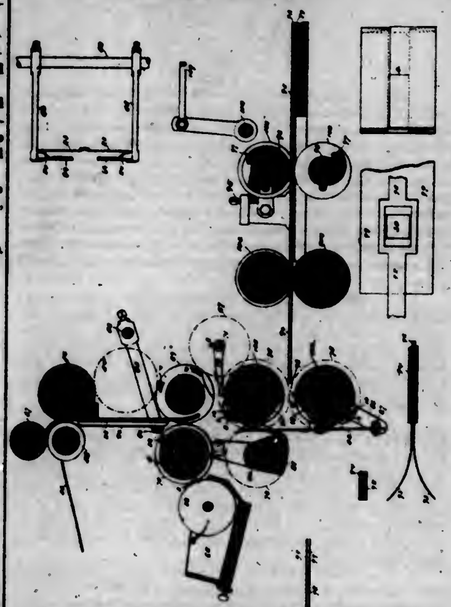
387,572. BALLOT-BOX. RICHARD G. WEBB, Cincinnati, Ohio. Filed Aug. 31, 1887. Serial No. 248,366. (No model.)

Claim.—1. In a ballot-box, the combination of the top and bottom, grooved to receive the sides, the top having an opening to receive a removable turret, the removable turret fitting said opening, the plates C C, secured, respectively, to the top and bottom, the bolts D and nuts *e*, for securing the box together, and one or more locks for securing the turret in place, substantially as shown and described.

2. The combination, substantially as specified, of a ballot-box secured together from the inside and having an opening for access to the interior, with a removable turret adapted to be secured in and to close said opening, and one or more locks to secure the turret against removal.

3. The combination of a ballot-box secured together from the inside and having a circular opening to receive a removable and rotary turret, the turret adapted to enter and close said opening, and having its side perforated to receive lock-bolts, the lock or locks secured to the under side of the top in a position to lock the turret in position to receive the ballots, or in the position shown after the ballots are cast to lock the ballot-opening, substantially as shown and described.

4. The combination, substantially as specified, of the grooved top and bottom, having in addition to the grooves depressions to receive the columns A, the glass sides B, the metal plates C C, bolts D and non-rotatable nuts *e*, for securing the box together, the removable turret, and the locks for securing the turret in the top opening.



5. The combination of the top and bottom, grooved and recessed as shown, the glass sides and metal-bound columns, the plates C C, bolts D and nuts *e*, for securing the box together, the removable turret, and locks for securing the same in the opening, substantially as hereinbefore set forth.

6. The combination, substantially as specified, of the top and bottom, grooved, as set forth, to receive the sides, the plates C C, bolts D and nuts *e*, for securing the same together, the handles E, passing through the top, and plates C, and the nuts *e*, for securing the handles and assisting to secure the plates C to the top, with the removable turret and locks for securing it in place.

7. The combination of a ballot-box secured together from the inside and having a circular opening in the top, the turret F, having a flange, *f*, to rest upon the top of said box, and perforated rim below said flange to enter said opening, locks secured to the under side of said top in a position to have their bolts shot into said perforations, registering mechanism secured within said turret and having an actuating-shaft projecting through said turret and beyond the side of said box, and a cross-head secured upon said shaft, to rotate it when turned with the turret parallel with the side of the box, and to bear upon the top of the box and prevent rotation of the shaft when the turret is turned to bring said shaft diagonal to the box-top, and locks to hold the turret in either position, substantially as specified.

8. The combination of the ballot-box having a circular opening in the top, the turret F, fitted to turn in said opening, the plate M, secured to the under side of the box and projecting beyond the ballot-opening in the turret, to uncover or cover said opening as the turret is turned in one or the other position, and a lock or locks to hold the turret in either position, substantially as and for the purpose set forth.

387,573. BAG-MACHINE. DANIEL APPEL, Cleveland, Ohio, assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Oct 15, 1887. Serial No. 252,621. (No model.)

Claim.—1. The combination, with the blade 9, for completing the severance of the tube, of the former having the openings 50, and the cutting-rolls 101 102, having adjustable portions 96, carrying co-operating blades 97, for making a preliminary central cut in the tube, both of said portions 96 being adjustable to secure the proper register between the preliminary and final cuts, substantially as described.

2. The combination, with the opening-rolls 105 106, having the flattened portions 21, of the presser-plates 88, substantially as described.

3. The combination, with the opening-rolls 105 106, having the flattened portions 21, of the presser-plates 88 and the creasing-blade 89, substantially as described.

4. The combination, with the opening-rolls having the flattened portions 21, of the presser-plates 88 and the rotating pressing-head 81, substantially as described.

5. The combination, with the opening-rolls having the flattened portions 21, of the presser-plates 88, the creasing-blade 89, and the rotating pressing-head 81, substantially as described.

6. The combination, with a cutting mechanism for making the short cuts *a* at the center of the tube, of the opening-rolls 105 106, provided with blades for completing the severance of the tube and with grippers for taking the sides of the tube, and the reciprocating spreader 93, for entering the sides of the tube beneath the grippers, substantially as described.

7. The combination, with the opening-rolls 105 106, set a distance apart, of the blade 9, carried by one of said rolls, and the parallel blades 8, carried by the other of said rolls, substantially as described.

8. The combination, with the opening-rolls having the flattened

portions 21, of the pruner-plates 88, the rotating pruning-head 81, and the creasing-rolls 69 70, substantially as described.

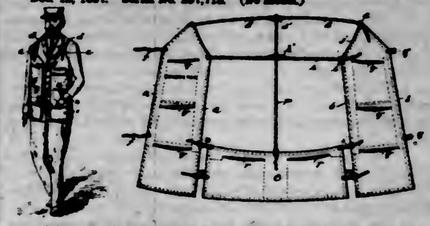
9. The combination, with the opening-rolls 105 106, having the flattened portions 21, of the pruner-plates 88, the rotating pruning-head 81, the creasing-rolls 69 70, provided with the ribs 22, for applying paste, and the folding and pruning rolls 56 58, substantially as described.

10. The combination, with the opening-rolls 105 106, having the flattened portions 21, of the pruner-plates 88, the pruning-head 81, the creasing and pasting rolls 69 70, the folding-blade 64, and the folding and pruning rolls 56 58, substantially as described.

387,574. DETONATING BALL. SAMUEL ARMSTRONG, Newark, N. J., assignor to Ezra J. Warner, same place. Filed Feb. 28, 1888. Serial No. 265,264. (No model.)

Claim.—1. The improved toy herein described, consisting, essentially, of a ball with a slotted plate attached thereto by screws or other suitable means, said plate having ribs on the under side, between which the spring is held, said ribs being provided with notches to receive the pivots of a hammer and a detent, and said plate also having a bar crossing the said slot and adapted to hold the spring in position, a hammer pivoted to said plate and provided with a shoulder for engagement with a detent, and a projection serving as a finger-piece, a spring to actuate said hammer and also hold the anvil in place, a detent to hold the hammer away from contact with the plate, and an anvil fitted into a recess in said plate and held in place by the spring, substantially as set forth.

2. In a detonating ball, the combination, with a ball having a portion removed, of a slotted plate adapted to fill said removed portion and secured to said ball by screws or other suitable means, a flat spring held in position on said plate, an anvil held in position on said plate by said spring, and a hammer working in the slot in said plate and held down in contact with the anvil by the action of the spring, all substantially as shown and described.



3. In a detonating ball, the combination, with a ball having a portion removed, of a slotted plate adapted to fill said removed portion and secured to said ball by screws or other suitable means, a spring held in position on said plate, an anvil held in position on said plate by said spring, a hammer working in the slot in said plate and in pivotal connection therewith, and held down in contact with the anvil by the action of a spring, and a finger-piece on the end of the hammer for raising said hammer from contact with the anvil, all substantially as shown and described.

4. In a detonating ball, the combination, with a ball having a portion removed, of a slotted plate adapted to fill said removed portion and secured to said ball by screws or other suitable means, a spring held in position on said plate, an anvil held in position on said plate by said spring, a hammer working in the slot in said plate and in pivotal connection therewith, and held down in contact with the anvil by the action of a spring, a finger-piece on the end of the hammer for raising said hammer from contact with the anvil, and a detent working in the slot in said plate and adapted to hold the spring in position, a hammer pivoted to said plate and provided with a shoulder for engagement with a detent, and a projection serving as a finger-piece, a spring to actuate said hammer and also hold the anvil in place, a detent to hold the hammer away from contact with the plate, and an anvil fitted into a recess in said plate and held in place by the spring, substantially as set forth.

5. In a detonating ball, the combination, with a ball having a portion removed, of a slotted plate adapted to fill said removed portion and secured to said ball by screws or other suitable means, a spring held in position on said plate, an anvil held in position on said plate by said spring, a hammer working in the slot in said plate and in pivotal connection therewith, and held down in contact with the anvil by the action of a spring, a finger-piece on the end of the hammer for raising said hammer from contact with the anvil, a detent working in the slot in said plate and pivotally connected therewith and adapted to hold said hammer in position away from contact with said anvil, and a cord or rope secured to said detent and adapted to release said detent from contact with said hammer, all said parts being arranged and adapted to operate substantially as and for the purposes set forth.

6. The detonating device herein described, consisting, essentially, of a slotted plate, ribs and cross-bar on the under side of said plate, a spring resting between said ribs and held in position by said cross-bar, a hammer working in said groove and pivotally connected with said plate, an anvil for holding said cap or wafer of fulminate, and a detent working in said slots and pivotally connected with said plate and adapted to hold said hammer away from contact with the anvil, said detent being also provided with a loop or means whereby a cord or rope could be attached thereto, and by drawing or pulling upon said cord the detent would be released from contact with the hammer and the hammer be thrown with great force upon the cap and explode, all as described, as and for the purposes set forth.

387,575. COAT-PROTECTOR. JOHN H. BROOKS, Chicago, Ill. Filed Dec. 12, 1887. Serial No. 257,718. (No model.)

Claim.—1. A coat-protector comprising the two strips or narrow parts *a* and *b*, having pockets arranged one above another, and an adjustable shoulder-strap for supporting said strips or parts at any elevation side by side in front of the body of the wearer, so that they shall occupy substantially vertical positions one upon each side of the middle of the wearer's breast, said strips or parts being separate from each other, so that between their inner or contiguous edges access to the coat-fastenings may be had, and terminating at their outer edges at the sides of the wearer, substantially in the manner and for the purpose set forth.

2. The coat-protector comprising, in combination, the narrow separate front strips, *a* and *b*, having pockets, a supporting shoulder-strap, and a strap for uniting the back edges of said strips *a* and *b* below the shoulder-strap, substantially as set forth.

3. The coat-protector comprising, in combination, narrow separate front strips having pockets, fastening devices for uniting the front edges of said strips, a supporting shoulder-strap, and a strap for uniting the back edges of said strips below the shoulder-strap, substantially as set forth.

4. A coat-protector comprising, in combination, the two front strips or narrow parts, *a* and *b*, having pockets, a shoulder-strap for supporting said strips or parts side by side in front of the body of the wearer, so that they shall occupy substantially vertical positions, one upon each side of the middle of the wearer's breast, and a transverse rear strip, *c*, connected to the lower portions of the front strips below the waist of the wearer, said front strips being separate from each other, so that between their inner or contiguous edges access to the coat-fastenings may be had, and terminating at their outer edges at the sides of the wearer, substantially in the manner and for the purpose set forth.

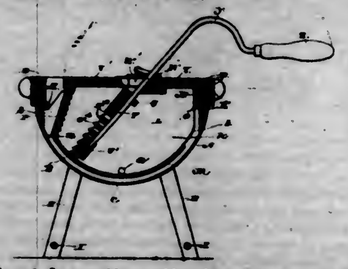
5. The combination of the separate front strips having pockets, a supporting shoulder-strap, and a separate detachable transverse rear strip extending between the rear or outer edges of the front strips and connected to the lower portions thereof, as set forth.

6. The coat-protector comprising, in combination, the following elements, to wit: the separate parts *a* and *b*, each having the desired number of pockets arranged one above another, the adjustable shoulder-strap for supporting said parts side by side in front of the body of the wearer, the back part, *c*, and the adjustable straps for connecting the said back part with the front parts and supporting it below the waist of the wearer, substantially as set forth.

7. The coat-protector comprising, in combination, the following elements, to wit: the separate parts *a* and *b*, having pockets, the shoulder-strap *d*, connected to the parts *a* and *b* and supporting them side by side in front of the body of the wearer, the fastenings for securing together the meeting edges of the said front parts, the strap A, extending behind the wearer and connecting the outer or rear edges of said parts, and the separate back part, *c*, connected to the front parts and supported below the waist of the wearer, substantially as set forth.

8. The coat-protector comprising, in combination, the following elements, to wit: the separate parts *a* and *b*, having pockets, the shoulder-strap *d*, connected to said parts and supporting them in front of the body of the wearer, the separate back part, *c*, connections between said back and front parts, and the strap *p*, connected with the back part, *c*, and with the shoulder-strap *d*, whereby the back part, *c*, is supported, substantially as set forth.

9. The coat-protector comprising, in combination, the following elements, to wit: the separate parts *a* and *b*, having pockets, the adjustable shoulder-strap *d*, connected to said front parts for the purpose of supporting them side by side in front of the body of the wearer, the separate back part, *c*, also connected with said front parts, and the adjustable strap *p*, connected with the back part, *c*, whereby the latter is supported, said strap *p* having sliding connection with the shoulder-strap *d*, substantially as and for the purpose set forth.



10. The coat-protector comprising, in combination, the following elements, to wit: the separate parts *a* and *b*, having pockets, the shoulder-straps connected to said parts *a* and *b* and supporting them side by side in front of the body of the wearer, the back part, *c*, situated below the waist of the wearer and connected at each end with one of the front parts near the lower end thereof, and a supporting-strap connected with the back part, *c*, at a point between its extremities for preventing it from sagging, substantially as and for the purpose set forth.

11. The coat-protector comprising, in combination, the following elements, to wit: the separate parts *a* and *b*, having pockets, the adjustable shoulder-strap *d*, connected to the said parts *a* and *b* for the purpose of supporting them side by side in front of the body of the wearer, the separate back part, *c*, situated below the waist of the wearer and connected to the front parts, *a* and *b*, the adjustable strap *p*, connected to the back part, *c*, and having sliding connection with the shoulder-strap *d*, and the strap *d'*, secured to said shoulder-strap, so as to form a loop for limiting the movement of the strap *p*, substantially as set forth.

12. The coat-protector comprising the following elements, to wit: the front parts, *a* and *b*, having pockets, the adjustable shoulder-strap *d*, the back part, *c*, connected with the front parts, *a* and *b*, the adjustable strap *p*, connected to the back part, *c*, and having sliding connection with the shoulder-strap *d*, the strap *d'*, secured to the said shoulder-strap, so as to form a loop for limiting the play of the strap *p*, the strap A, connected to the front parts, *a* and *b*, and the strap *h'*, secured to the strap *h* and forming a loop through which the strap *p* passes, substantially as set forth.

13. The coat-protector comprising, in combination, the following elements, to wit: the front parts, *a* and *b*, having pockets, and each having its upper rear corner cut away and curved inward, as at *j*, the adjustable shoulder-strap *d*, the adjustable fastenings *f*, for securing together the meeting edges of said parts *a* and *b*, the adjustable strap A, connecting the rear edges of the said parts *a* and *b* at top, the back part, *c*, having pockets, the adjustable connections between said back part and the front parts, *a* and *b*, and the adjustable strap *p*, connected to the back part, *c*, and shoulder-strap *d*, substantially as set forth.

387,576. WASHING-MACHINE. ROBERT CAMPBELL, South Haven, assignor of one-half to H. B. Spackman, Hamden, Mich. Filed Sept. 27, 1886. Serial No. 214,063. (No model.)

Claim.—1. In a washing-machine, the suds-box semicircular in form, combined with the removable box K, similar in form and fitted within the suds-box, and provided with shoulders S O, to bear against the sides of the suds-box and support the box K, the said box containing the clothes to be washed and comprising the end pieces, I, the bottom board M, the inclined wash-board P at one side, and the hinged cover for the suds-box, the dash-board pivoted within the box K on one side of the wash-board, and the operating-lever for the dash-board extending up through a slot of the cover, as set forth.

2. In a washing-machine, the combination of the suds-box, the hollow removable box K, containing the clothes and located in the suds-box, and having the end pieces, I, the bottom board M, and the inclined wash-board P at one side, and the dash-board pivoted within the box K on one side of wash-board P, substantially as set forth.

387,577. CHECK-HOOK. FRANCIS B. CLARK, Shokokville, N. Y., assignor of one-half to Frank E. Shaw, same place. Filed May 21, 1888. Serial No. 274,263. (No model.)

Claim.—A check-rein holder and stop consisting of a hook having the perforations or indentations *a* in the point of the hook, in combination with the open link B, detachably secured in said perforation at one end, while the other end rests upon the main body of the hook to form a stop for the rein, as set forth.

387,577.

387,578. CORSET. G. ALBERTUS GLEIM, Bridgeport, Conn., assignor to Charles H. Langdon, Elizabeth, N. J., and George C. Batcheller, New York, N. Y. Filed Dec. 16, 1887. Serial No. 257,997. (No model.)

Claim.—A corset having an opening or cut-away portion for the breast, a flap adapted to cover said opening, and a water-proof skirt secured to the lower portion of the flap, the upper edge of said skirt being curved to correspond with the curvature of the breast-opening, so that the material of the skirt cannot come in contact with the breast, but the portion of the corset under the breast-opening is covered and the clothing thereby protected from moisture.

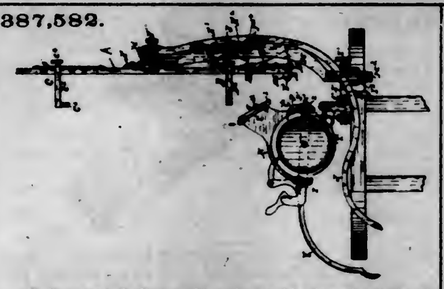
387,579. TREATING CRUDE ANIMAL-HAIR. NICHOLAS OSBORN, Lisbon, Ill. Filed Mar. 1, 1888. Serial No. 265,852. (No specimens.)

Claim.—The process hereinbefore described of cleansing, deodorizing, and rendering moth-proof crude animal-hair, more particularly crude hog-hair, which consists in washing said hair to remove the blood and extraneous dirt, &c., and cooking the hair in a compound or solution of water, quicklime, sal-soda, and sarphuric acid for the purpose of changing the cuticle and shreds of flesh, &c., into a gelatinous substance, and thereby rendering its separation from the hair the more easily effected, afterward rubbing, teasing, and washing the said hair to remove the gelatinous matter and complete the cleansing process, and again cooking the same in a compound or solution of water combined with a solution of sulphuric acid and black oxide of manganese for the purpose of further deodorizing and rendering it moth-proof, thus preparing it for dyeing, curling, and drying in one continuous expeditious and economical process, substantially as and for the purposes hereinbefore described.

387,580. MINERAL-CEMENT GRAVEL ROOFING. ARCHIBALD G. CRESSEY, Chicago, Ill. Filed June 14, 1888. Serial No. 277,448. (No specimens.)

Claim.—The herein-described composition of matter to be used for new felt or recoating old roofs, consisting of the coal-tar pitch, lead-plaster, Portland cement, plaster-of-paris, and sulphur, substantially in the proportion specified.

387,581. POLISHING-DISK FOR DENTISTS. LEVITT R. CRUVER, Dayton, Ohio, assignor to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Mar. 6, 1888. Serial No. 266,936. (No model.)



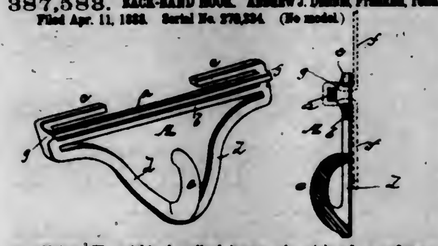
Claim.—A composite polishing-disk for dentists, consisting of a thin carrying-body and a soft working-surface thereon, such as chamois-leather, felt, &c., substantially as described.

387,582. PAPER-PERFORMING MACHINE. C. HOWLETT DAVIS, Washington, D. C. Filed Sept. 22, 1888. Serial No. 284,988. (No model.)

Claim.—1. In a paper-feeding machine, the combination of a feed-table mounted upon pivotal bearings and provided with mechanism for swinging the same, substantially as described, and a bar provided with screw-pins the points of which project from its face, the ends of the said bar being mounted in bearing-slots set at an angle to the line of movement of the said table, whereby when the said bar is impinged upon by the said table it moves up the face of the same, substantially as set forth.

387,582.

2. In a paper-feeding machine, the combination of a feed-table pivotally mounted upon a frame, paper-rests set in perforated projections, teeth mounted upon the ends of the said arms adapted to impinge upon the said paper, and a spring attached to the other end of the said arms and adapted to draw the same toward the table, substantially as set forth

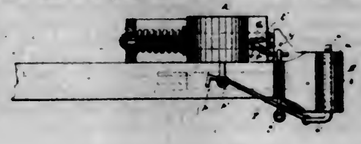


3. In a paper-feeding machine, the combination of a feed-table mounted upon pivotal bearings, substantially as described, paper-rests, substantially as described, secured to the said table, and a separating device placed in the line of movement of said table and adapted to move up the face of same when impinged upon, substantially as set forth.

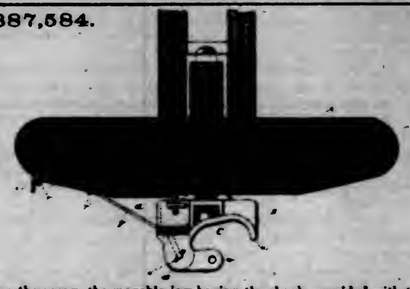
4. In a paper-feeding machine, the combination of a feed-table mounted upon pivotal bearings, substantially as described, a lever attached rigidly to the said table and provided with a handle within convenient reach of the operator, and a regulating device consisting of a pivot working in a socket formed by clamps rigidly attached to one support of the feed-table, a rod loosely mounted in a perforation at the outer end of the said pivot, and a spiral spring infolding the said rod and secured to the end thereof and to the said pivot, substantially as and for the purpose set forth.

5. In a paper-feeding machine, a device for separating one sheet from a supply, consisting of a rod provided with a row of screw-pins and mounted in oblique slots at either end, said slots being set at an angle to the line of movement of the said feed-table, whereby when the said table impinges the said bar the latter is caused to move upward against the face of the said table, substantially as described.

6. In a paper-feeding machine, the combination of the carriage of a printing-machine, substantially as described, two arms mounted thereon and provided with slots set at an angle to the line of movement of a feed-table, a bar provided with screw-pins and mounted in the said slots in the said arms, and a feed-table adapted to move forward against the said bar, substantially as described.



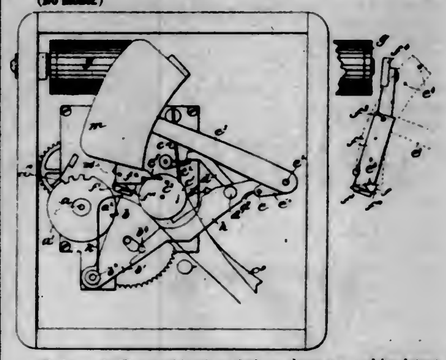
387,583. BACK-BAND HOOK. Andrew J. Dennis, Franklin, Tenn. Filed Apr. 11, 1888. Serial No. 270,334. (No model.)



Claim.—The within-described improved article of manufacture, to wit: a back-band hook or trace-carrier consisting of the bars *b d*, fingers *c c*, arranged in the same plane, the bar *a* and hook *e*, said bar *a* connecting the bars *b d* and fingers *c c* by the intermediate offsets, *g g*, and said hook *e* arranged at the lower portion of the bars *d d*, the whole formed integral, as shown, and for the purpose specified.

387,584. CAR-COUPLING. Reuben H. Dowling, Newark, Ohio, assignor of two-thirds to Charles H. Follett and Charles Follett, both of same place. Filed Jan. 7, 1888. Serial No. 260,663. (No model.)

Claim.—1. In a coupling, the combination of the draw-head hav-



387,584.

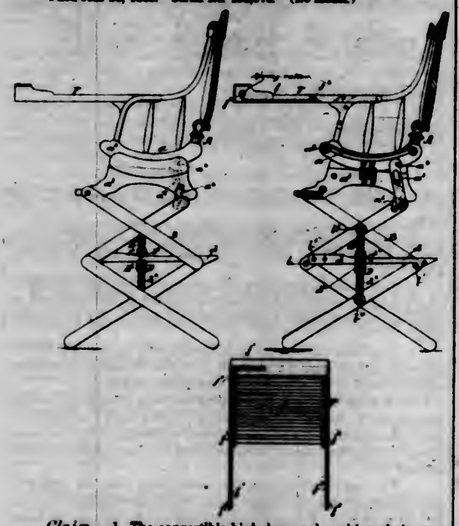
ing the recess, the movable jaw having the shank provided with the projection *m*, the pin D, having the crank portion and the guard *n*, the flat locking-key having the inclined shoulder, the transverse slot, and the retaining-pin *x*, substantially as specified.

2. The combination of the draw-head having the bearing-lugs, the segmental shoulders thereon, and the shoulders *p*, the recesses *r r'*, the openings *s s'*, the key E, having the inclined shoulder and the step *x*, the movable jaw having the shank portion provided with the projection, and the bearing-block having the transverse shoulder, the locking-key having the shoulder and the transverse slot, the pin provided with a guard and crank portion, and the operating-levers, substantially as specified.

387,585. AUXILIARY FIRE-ALARM APPARATUS. Walter J. Dudley, Everett, Mass., assignor, by mesne assignments, to Walter J. Dudley, trustee, same place. Filed July 5, 1887. Serial No. 243,491. (No model.)

Claim.—1. The combination of the main motor and its detent with the secondary motor and detent therefor, said secondary motor when operated causing the detent for the main motor to release said main motor, and said detent for the main motor being provided with a stopping device for the secondary motor, substantially as described.

2. The combination of a motor and controlling-arm therefor, and an electro-magnet and its armature co-operating with said arm which has a progressive stop-by-stop movement when said armature vibrates, the said motor being provided with a restoring device which engages said controlling-arm and restores it to its normal position when said controlling-arm makes less than a predetermined number of stop movements, the said arm passing beyond the reach of said restoring device when it makes a greater number of stop movements, substantially as described.



3. The combination of the main motor and its stopping device with the secondary motor co-operating with said stopping device, as described, the detent and controlling-arm for said secondary motor and the restoring device for the stopping device of the main motor operated by the said controlling-arm of the secondary motor, substantially as and for the purpose set forth.

4. The combination of the main motor and its detent with the secondary motor co-operating with said detent, as described, and the controlling-arm for said secondary motor, and electro-magnet and its armature co-operating with said arm which has a step-by-step movement when said armature vibrates, and a locking device for said controlling-arm operated by the main motor, substantially as described.

5. The combination of a motor and detent therefor, and a pivoted controlling-arm for said detent provided with an indicating device, and an electro-magnet and its armature co-operating with said arm which has a step-by-step movement as the said armature vibrates, the

said arm operating said detent to release the motor with different numbers of step movements, and indicating by its position the number of vibrations of said armature that occurred when the motor was released, substantially as and for the purpose set forth.

387,586. CHAIR. Reuben S. Pierce, Winchendon, assignor, by direct and mesne assignments, to Gilman Wallis, Templeton, Mass. Filed Jan. 28, 1888. Serial No. 262,972. (No model.)

Claim.—1. The convertible high, low, and rocking chair, comprising the seat and its frame of usual construction, rockers applied to the bottom thereof, a base on which said rockers are supported to permit the seat to be freely rocked thereon, and the extensible frames B, connected to the base, the pin a^4 on the chair-seat, and the catch a^5 on the frames, operated by the extension of the frames to engage said seat and hold it stationary when the chair is "high," and locking devices for the frames to hold them in elevated or high position and admit of their being collapsed to make a low rocking-chair, substantially as described.

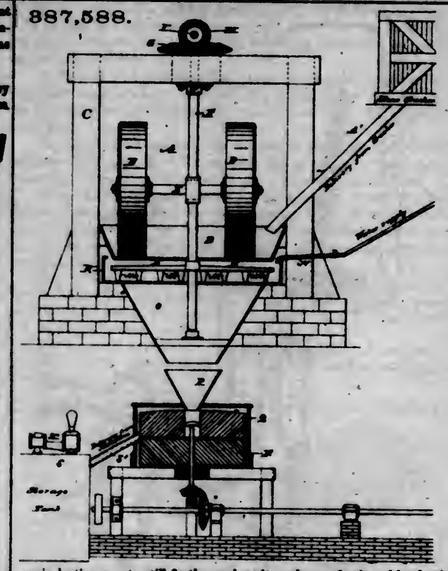
2. The combination of the chair-seat, the base a^2, for supporting it, the extensible lever-frames B, upon the upper ends of which the said base is arranged, the rods d' d^3, connecting the frames, and the sleeve d^4, co-operating with said rods to hold them in alignment and release them, respectively, in expanding and contracting the frames, and the hooked frame or lock d, substantially as described.

3. The rods d' d^3 and sleeve d^4, in combination with the extensible lever-frames B, substantially as described.

4. The hooked frame d, rods d' d^3, sleeve d^4, and extensible lever-frames B, combined together as described.

5. The combination, with a child's chair, of a play-tray having its bottom made of flexible material and a roller upon which it is wound when not in use, substantially as described.

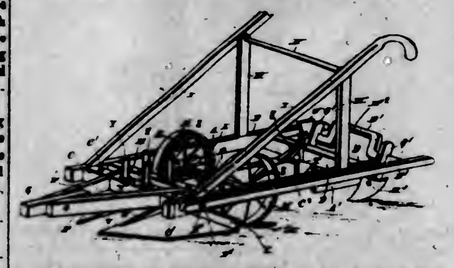
6. The tray having side pieces, f^3, of springy material, and provided with outwardly-extending projections f^4, combined with a chair-seat having arms provided with holes into which said projections are sprung to provide for the ready attachment and detachment of the tray, substantially as described.



387,587. METHOD OF RESTORING OLD METAL CANS. James W. Gibson, Baltimore, Md., assignor of two-thirds to Harrison Hopper and John R. Wright, both of same place. Filed Dec. 30, 1887. Serial No. 259,493. (No specimens.)

Claim.—The method substantially herein described of restoring old used metal cans for repacking, which consists in removing the old tops, then cleansing the cans, then converting the bottom into a top by slicing or punching out the cap or filling-opening, and then placing a new bottom on the body of the can and soldering it from the inner side by access afforded through the died or punched-out cap-opening.

387,588. PROCESS OF MANUFACTURING HYDRAULIC CEMENT. Charles B. Cushing, Whitehall, Pa. Filed Nov. 3, 1887. Serial No. 254,092. (No model.)

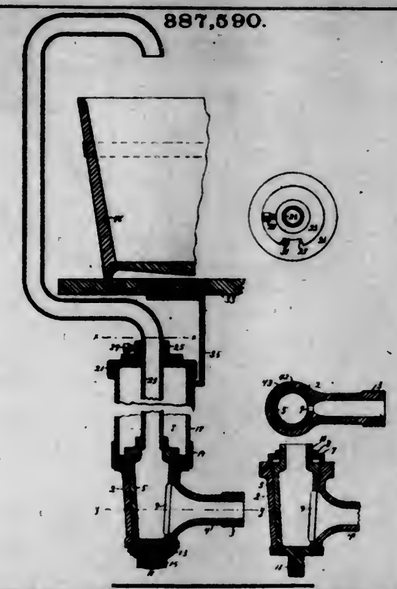


Claim.—An improvement in the art of manufacturing hydraulic cement, which consists in crushing and grinding the material of which the cement is composed, mixing the ground mass with water to reduce it to a plastic or semi-plastic condition, regrinding the plastic or

387,588.

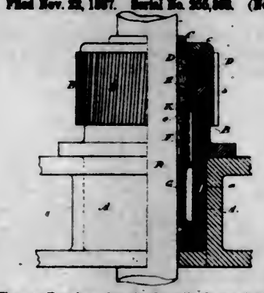
semi-plastic mass to still further reduce it, and transferring this plastic body in mass into a suitable chamber to dry the same, after which it is burned and reduced to an impalpable powder, as set forth.

387,589. COTTON-CULTIVATOR. Theophilus Griffin, Sheridan, Ark., assignor of two-thirds to Joseph S. Williams and Henry Bales, same place. Filed Nov. 28, 1887. Serial No. 256,444. (No model.)



Claim.—1. The combination of the frame A and the horizontally-arranged shovels V, supported under the said frame and detachably and reversibly connected thereto, the said shovels having one side curved outward, as shown, and having the other side provided with the vertical plate W, the rear end of each shovel being turned upward to form the vertical plate X, connected to the rear end of plate W, substantially as described.

2. The combination, in a cotton chopper and cultivator, of the frame A, having the vertically-adjustable shovels or scrapers at its front end, the chopping mechanism provided at its rear end with the fenders A', and the frame B', having its front end pivoted to frame A and carrying at its rear end the cultivating-shovels arranged on the outer sides of the fenders, the said rear end of the cultivating-frame being vertically movable, for the purpose set forth, substantially as described.

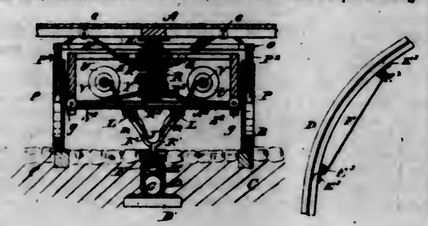


387,590. HYDRANT. Joseph B. Hawkins, Minneapolis, Minn., assignor to John S. Gregory and Guy Hawkins, both of same place. Filed May 13, 1887. Serial No. 238,036. (No model.)

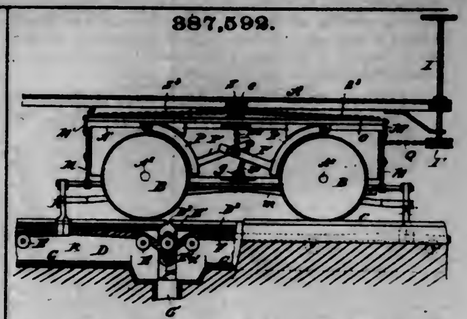
Claim.—The combination, in a hydrant of the class described, of the hollow casing 2, provided with an external screw-thread on its upper end, the hollow plug 5, fitting into said casing, the discharge-pipe 23, secured to said valve, the tube 17, secured to said casing and forming a tight joint therewith, the cap 21, secured to the upper end of said tube 17 and forming a bearing for said pipe 23, the pin 31 in the said cap, and the collar 25, having the notch 27, secured to said pipe 23 by the set-screw 29, all substantially as described.

887,590.

887,591. METALLIC PACKING FOR STUFFING-BOXES. John W. Hayes, Portsmouth, N. H., assignor of two-thirds to Wm. B. Brooks, Erie, Pa. Filed Nov. 22, 1887. Serial No. 255,893. (No model.)



Claim.—The stuffing-box herein described, consisting of the detachable receptacle A, containing the sectional packing-rings D, the spiral encircling spring H, pressing said rings evenly against the rod on its perimeter, and the flanged guide-rings, in combination with the tension-springs, one or more, exerting a longitudinal pressure against said rings D, and the follower C, provided with the lead packing-ring *c*, all constructed and arranged as herein shown, and for the purpose set forth.



887,592. TRACTION-CABLE RAILWAY. John P. Hunt, Philadelphia, Pa. Filed Sept. 2, 1882. Serial No. 70,260. (No model.)

Claim.—1. In a cable railway, the combination, with a car, of a frame, brake-levers pivoted to the same, pivoted angle-levers, a clutch or grip connected to said levers, and means for raising and lowering the frame, substantially as set forth.

2. In a cable railway, the clutch or grip J, formed by the pivoted jaws K, attached to the arms K', connected with the pivoted angle-

887,592.

levers M, which are operated from the car, as and for the purpose set forth.

3. In a cable railway, the combination, with the clutch or grip jaws K, of anti-friction rollers *h*, mounted on the same, for the purpose set forth.

4. In a cable railway, the combination, with the clutch or grip J, of the arms K', rods L, the pivoted angle-levers M, and the frame O, carrying the brake-shoes P, substantially as and for the purpose set forth.

5. In a cable railway, the combination, with the frame O and the brake-shoes P, pivoted to said frame, of a cable clutching or gripping device pivoted to the same frame, substantially as set forth.

6. In a cable railway, the combination, with the frame O, of the brake-shoes P, the pivoted angle-levers M, the arms K', the clutch or grip J, the chains S' and S², and the shaft S, provided with the drums R' and R², and the chains P², substantially as herein shown and described.

7. In a cable-railway car, the combination, with the clutch or grip J, of the rods L, the chains Y, the rods V, the cylinders U, pistons U', and the springs W, substantially as and for the purpose set forth.

8. In a cable railway, the combination, with the curved channel D, of the cable F and the anti-friction rollers or pulleys E² and E³, substantially as and for the purpose set forth.

9. In a cable railway, the combination, with the trough-shaped channel D, having its top inclined from the center outward, and provided with a longitudinal slot, D², in the top, of the top plates, D², substantially as set forth.

10. In a cable railway, the two channel-sections D, one provided with a ball end, H', and the other with a socket end, H, combined with each other, substantially as set forth.

11. In a cable railway, the combination, with the channel D, of the rollers E E E' E², all constructed and arranged substantially as herein shown and described, whereby the cables are depressed at a crossing and one made to pass beneath the other, as set forth.

12. In a cable railway, a car having brake-shoes provided with toggle-jointed levers, a clutch or grip for the cable, and actuating mechanism for the toggle-jointed levers of the brake and for the clutch or grip, substantially as set forth.

13. In a cable railway, a car having a vertically-moving frame, O, brake-shoes P, secured to said frame, and having toggle-levers P', in combination with actuating mechanism for the brake-shoes and frame, substantially as set forth.

14. A cable-motor car having a grip and actuating mechanism therefor, and brake-shoes having toggle-jointed levers, frame O, and actuating mechanism, substantially as set forth.

15. In a cable-motor car, a windlass or drum, R, R', and R², or equivalent, secured to the car and having chain-connection with the brake-shoes and the grip or grips of the car, substantially as and for the purpose set forth.

16. In a cable railway, a depression roller or pulley, E, as and for the purpose set forth.

17. In a cable railway, a depression or deflecting roller or pulley, as and for the purpose set forth.

18. The combination, with crossing lines of a cable-motor-railway system, of a depression pulley or pulleys for one of the cables of the crossing lines, substantially as set forth.

19. The combination, with crossing lines of a cable-motor-railway system, of depression rollers or pulleys at the crossing lines for depressing one or more cables, as set forth.

20. In a cable railway, the combination of a line of car-tracks, a slotted conduit, D, located between the tracks and resting upon the sleepers D', and bent plate-clips, one end of each of which engages with the conduit and the other is bolted to sleepers D', for holding the conduit in position upon said sleepers, substantially as set forth.

21. In a cable-motor railway, a slotted conduit located between

the tracks and having at its top inside edge flanges or projections and detachable top plates upon said projections, which plates extend along the entire length of the conduit, substantially as set forth.

22. A cable-railway conduit having at its top inside edge flanges or projections and detachable top plates, substantially as and for the purpose set forth.

23. A cable-railway conduit having at its top inside edge flanges or projections and separate and detachable top plates, substantially as set forth.

24. In a cable-motor car, the combination of a clutch or grip, J, longitudinally-sliding rods L, connecting mechanism between the clutch-jaws and rods, and actuating mechanism for the rods, substantially as set forth.

25. In a cable-motor car, a pair of clutch or grip jaws, K K, pivoted to one another, and each jaw having connection with longitudinally-sliding rods L, and mechanism for actuating said rods, substantially as set forth.

26. In a cable-motor car, longitudinally-sliding rods L and two grip attachments in connection with and operated by said rods, substantially as set forth.

27. A cable-motor car having two grips operated to simultaneously act upon the cable, separate or independent arms or supporting-bars for each grip, and one grip being in advance of the other, as and for the purpose set forth.

28. The combination, with a conduit having a channel, D, of a cable-motor car having a grip, J, formed of two jaws, K K, pivoted to each other at their upper ends within the channel D, substantially as set forth.

29. The combination, with a conduit having a channel, D, of a cable-motor car having a grip, J, formed of two jaws, K K, pivoted to each other at their upper ends within the channel D and curved in the direction of the cable, substantially as set forth.

30. The combination, with a conduit having a channel, D, of a car having a grip, J, the jaws K K being pivoted to one another immediately above the cable and below the conduit-slot, substantially as set forth.

31. In a cable-motor railway, a car having a grip, J, comprising the jaws K K, pivoted at their upper ends, and the vertical arms K' K', so constructed as to permit its easy movement in the slot of a conduit one inch or less in width, substantially as set forth.

32. A cable-motor car having two separate grips operated to simultaneously act upon the cable, in combination with suitable mountings, whereby they may have a sliding movement in the direction of the length of the car when acting upon the cable, substantially as set forth.

33. In a cable railway, the combination, with longitudinally-sliding rods and grip-jaws secured to said rods, of cylinders and rods provided with pistons at their ends working in said cylinders and connected to said sliding rods, substantially as set forth.

34. The combination, in a cable-motor railway, of a slotted conduit, a car having a clutch or grip attachment with one or more cylinders closed at both ends, and one or more plungers or pistons for preventing the jolting or shocks incident to starting the car, substantially as set forth.

35. In a cable-motor car, the combination of a grip attachment with the horizontal rod V, having two pistons or plungers, U', and cylinders U, substantially as set forth.

36. In a cable railway, a car having two independent or separated grips, one in advance of the other, brake-shoes for the car-wheels, and actuating mechanism for applying the brakes when the grips are released or out of action and for releasing the brakes when the clutches are in action.

37. In a cable railway, the combination of a car having two grips separate from one another and a conduit having depression-rollers E E E', as and for the purpose set forth.

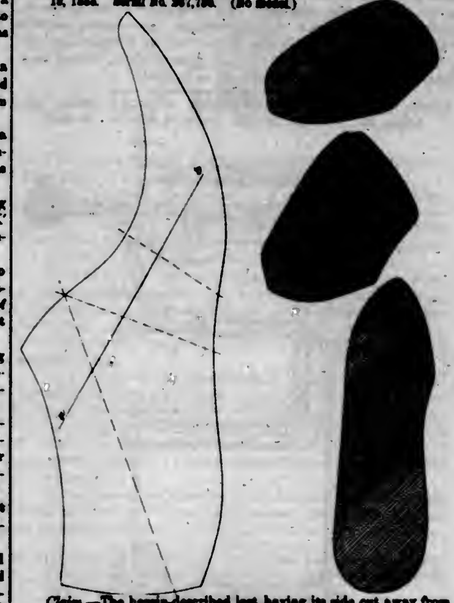
38. In a cable railway, a car having brake-shoes, a grip, actuating mechanism for said shoes and grip, and a cylinder with pistons connected to the grip-actuating mechanism, as and for the purpose set forth.

39. In a cable-motor railway, the combination of a slotted conduit, a smooth cable, supporting-pulleys for the cable journaled in said conduit, a car having a grip supported independently of the car-body, jaws on said grip having pivoted bearings or supports above the cable and below the conduit-slot, and actuating mechanism supported upon the car-body for positively regulating the degree of clamping-pressure of the jaws upon the cable and for releasing them therefrom, substantially as set forth.

40. In a cable-motor railway, the combination, with a smooth cable having supporting-pulleys journaled in a slotted conduit, a car having a grip supported independently of the car-body, one or more jaws for said grip hinged or pivoted together within the conduit, and actuating mechanism for said jaws located upon the car-body, substantially as set forth.

41. A cable-motor car having a clutch, J, formed of two jaws, K K, having pivoted bearings or supports above the cable and below the conduit-slot, and arms K' K', extending above the slot, substantially as set forth.

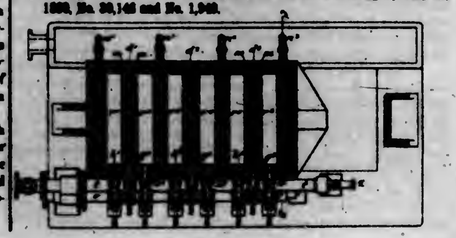
42. A cable-motor-railway car having its grip and brake-shoes supported independently of the car-body and actuating mechanism for the grip and brake-shoes supported upon the car-body, substantially as set forth.



43. A cable-motor-railway car having its grip and brake-shoes supported independently of the car-body and its grip and brake-shoe operating rod supported upon said body, substantially as set forth.

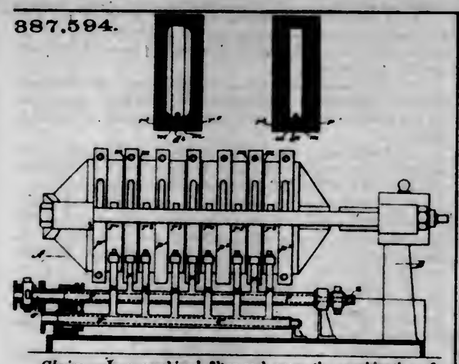
44. A cable-motor car having a grip composed of curved jaws pivoted to one another and having extensions K' K' above said slot, supporting devices for the grip attached to the truck-frame of the car, and actuating devices for the grip located upon the car-body, substantially as set forth.

45. A cable-motor-railway car having a clutch or grip, J, the jaws K K of which are pivoted one upon the other above the cable and below the conduit-slot and having extensions K' K' above said slot, substantially as set forth.



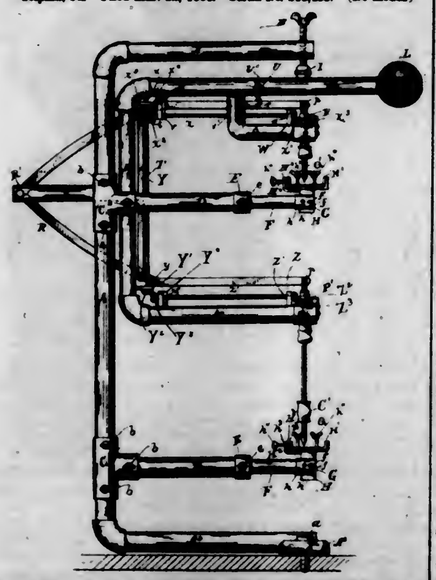
46. A slotted conduit for cable-railway cars having removable top plates the slot sides or edges of which are rounded, substantially as set forth.

887,593. LAST. Joseph L. Joyce, New Haven, Conn. Filed Mar. 19, 1883. Serial No. 267,796. (No model.)



Claim.—The herein-described last, having its side cut away from a line, *a b*, running from the ankle to the ball, the concavity formed by such cut-away extending downward from said line to the bottom of the last at the shank and rearward dying outward at the heel, the said concavity being formed with abrupt turns in transverse section at said line *a b* and at the bottom of the last, substantially as described.

887,594. COMBINED FILTER AND CAKE PRESS. Johann Kress, Halle-on-the-Saale, Prussia, Germany. Filed Mar. 22, 1887. Serial No. 231,973. (No model.) Patented in Germany Nov. 6, 1879, No. 12,944; in England Dec. 5, 1879, No. 4,935, and in Austria-Hungary July 25, 1880, No. 33,145 and No. 1,903.



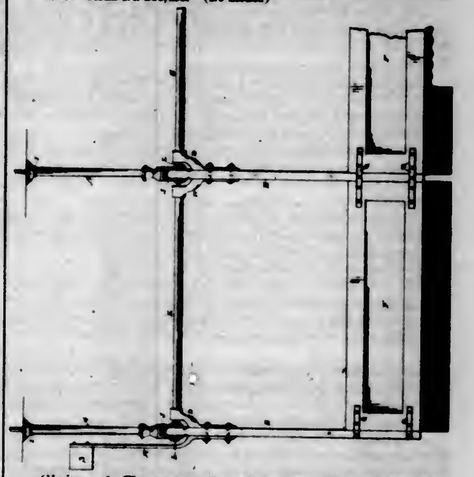
887,594.

Claim.—In a combined filter and press, the combination of a series of cake-forming frames, a pressing-plate between each pair of said frames, independent flexible diaphragms at the opposite sides of each pressing-plate, and having their edges clamped between the sides of the cake-forming frames and said pressing-plates and to rest directly against the cakes to be compressed, the pipe *v*, having branches connected with the cake-forming frames, and the fluid-pressure pipe *t*, having branches connected with the pressing-plates between their independent diaphragms, substantially as described.

887,595. ENGRAVING-MACHINE. WILLIAM B. MOORE, Philadelphia, Pa. Filed Mar. 22, 1888. Serial No. 268,155. (No model.)

Claim.—1. In an engraving-machine, the combination, with a vertical standard and an upper and lower outer horizontal arm, of the vertically-adjustable horizontal arms, horizontal adjustable telescopic extension-arms provided with bifurcations in their outer ends, which receive the downwardly-projecting stems of the plate or work holders, said plate or work holders being pivotally secured to the stems, whereby an angular adjustment is given them, substantially as described.

2. In an engraving-machine, the combination, with the vertical standard and the upper and lower outer horizontal arms, the upper and lower inner horizontal vertical adjustable arms, and the horizontal rearwardly and forwardly adjustable telescopic plate or work holding arms, of the metallic plates secured to the bifurcated outer ends of the telescopic arms and provided with the follower and adjusting thumb-screws, substantially as described.



3. In an engraving-machine, the combination, with the vertical standard and its upper and lower outer horizontal arms, the upper and lower inner horizontal vertically-adjustable arms, and horizontal adjustable telescopic arms, of the T-shaped thimbles or sleeves supporting the vertically-adjustable arms and telescopic arms, substantially as described.

4. In an engraving-machine, the combination of the standard A, arms A′ A², D D, and F F, composing the main frame, of a pivotally-secured adjustable swinging auxiliary tool-carrying frame fulcrumed to the main frame by means of an adjusting-screw, and ball-and-socket joint, substantially as described.

5. In an engraving-machine, the combination, with the auxiliary frame, of the gearing and their respective shafts arranged as described, the stocks or tool-holders having socketed ends for the reception of their connecting stems and tools, whereby said stems and tools are retained or released from their respective places by means of the threaded nuts or thimbles, and set-screws bearing in the annular grooves in the lower ends of the stems, and a turn-button or hand-hold upon the tracer-tool, substantially as set forth.

6. In an engraving-machine, the combination, with the auxiliary frame, of the lugs secured thereto, through which are passed the respective shafts, having beveled pinions upon their ends meshing with beveled gear-wheels secured to the upper sides, and at the free ends of the angular arm and lower horizontal arm of the auxiliary frame, substantially as described, and for the purpose set forth.

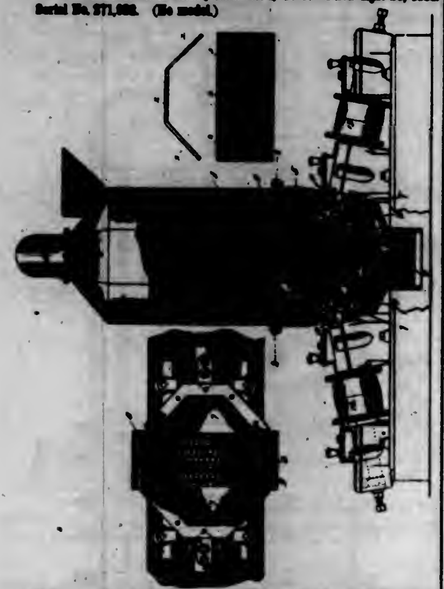
887,596. PAN. JOHN A. MYERS, Louisville, Ky. Filed Apr. 2, 1888. Serial No. 269,455. (No model.)

Claim.—1. The combination of the hangers or supports, the levers which are pivoted in their lower ends, the fan which is connected to the lower ends of the levers, the castings secured to the upper ends of the levers, and the connecting-rods which extend from one casting to the other and connect the levers at their upper ends, substantially as shown.

2. The combination of the hangers, provided with ears at their lower ends, the levers which are pivoted in the hangers, the castings which are secured to the upper ends of the levers, the connecting-rods which connect the castings and the levers together, the fan, and the counter-weights which are secured to the upper ends of the levers, substantially as described.

3. The combination of the fans F, the plates Q, and the levers B, with supports for the levers, the castings D, secured to the upper ends of the levers, and the rods E, which connect the castings together and cause the levers to move simultaneously, substantially as set forth.

887,597. TANNING PROCESS. CHARLES H. PERRIN, Jefferson City, Mo. Filed Dec. 26, 1887. Serial No. 258,504. (Specimens.)



Claim.—1. The within-described process of tanning hides or skins, which consists in steeping the same in an infusion of black sage-brush, substantially as specified.

2. In the manufacture of leather, steeping the hides or skins, after depilating, in an infusion of black sage-brush, substantially as specified.

3. In tanning hides or skins, steeping the same, after depilation, in a heated aqueous infusion of black sage-brush, substantially as specified.

4. The within-described process of tanning hides or skins, which consists in first depilating the hides or skins, then steeping them in an infusion of black sage-brush in water first heated to a high temperature and afterward allowed to stand and partially cool, and subsequently, while in said infusion, turning or stirring them at intervals, and finally removing them from the infusion for subsequent dressing or finishing, as set forth.

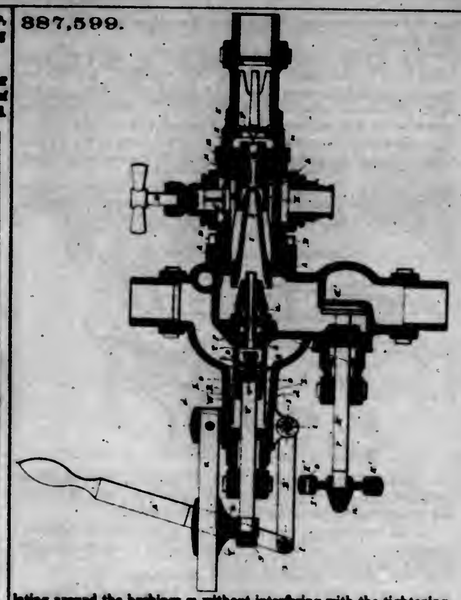
887,598. REDUCING-MACHINE. GEORGE RATHBUN and ALBERT RATHBUN, Chicago, Ill., assignors to the Cyclone Pulverizer Company of the United States of America, New York, N. Y. Filed Apr. 26, 1888. Serial No. 271,982. (No model.)

Claim.—1. In a reducing-machine, in combination with the separating-chamber, disks or heads mounted therein and provided with beaters arranged to operate close to the walls of said chamber, and with pins or spikes projecting from said heads, substantially as described.

2. In a reducing-machine having an inclosed operating-chamber, two oppositely-rotating shafts projecting into said chamber and downwardly inclined with reference to each other outwardly from the chamber, heads secured to said shafts and provided with beaters arranged to operate close to the walls of said chamber, and pins or spikes projecting from said heads, substantially as described.

887,599. EJECTOR. ROBERT RIMBY, Mount Vernon, and LEOPOLD KAMAKEWE, New York, assignors to the Hudson Manufacturing Company, New York, N. Y. Filed June 13, 1888. Serial No. 276,915. (Model.)

Claim.—1. In an injector, the combination of a delivery-nozzle, perforated condensing-nozzle, and an annular forcing steam-nozzle with a jet-valve and a hollow cylindrical double-seated main valve provided with a perforated diaphragm-plate through which a cylindrical prolongation of the jet-valve protrudes, as and for the purpose set forth.



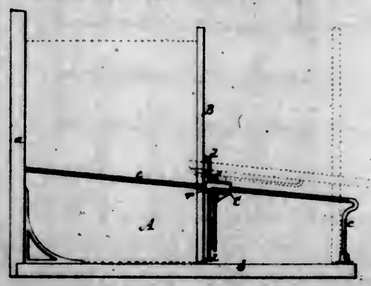
2. In an injector, the combination of a delivery-nozzle, perforated condensing-nozzle, annular forcing steam-nozzle, and central lifting steam-nozzle with a jet-valve and a hollow cylindrical main valve provided with a perforated diaphragm-plate through which a cylindrical prolongation of the jet-valve protrudes, as and for the purpose set forth.

3. In an injector, the combination of an annular forcing steam-nozzle, central lifting steam-nozzle, hollow cylindrical main valve, and diaphragm-plate with a jet-valve provided with a cylindrical stem or prolongation protruding through the diaphragm-plate of the main valve, and with nut T, determining the stroke of the jet-valve, as and for the purpose specified.

4. In an injector, the combination of an annular forcing steam-nozzle, central lifting steam-nozzle, hollow cylindrical main valve and perforated diaphragm, jet-valve R, with cylindrical prolongation protruding through the diaphragm of the main valve, with spindle U, and lock-nut W, the valves opening successively and none of them having rigid connection with the spindle, as and for the purpose set forth.

5. The friction-clamp consisting of ring G′, with nook D′ to receive the guide-rod Z′ and the slotted flange F′, pressed together by means of bolt A, bolt-head A′, and nut *l*, bushings m, interposed between flanges F′ and nut *l* and bolt-head A′, the two arms of the fulcrum-bar coiling around the bushings m without interfering with the tightening of the clamp, as and for the purpose set forth.

887,599.



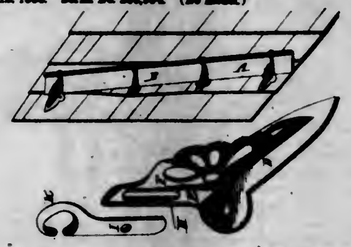
6. In an injector, the combination of an annular forcing steam-nozzle, central lifting steam-nozzle, hollow cylindrical main valve and perforated diaphragm, jet-valve R, with cylindrical prolongation protruding through the diaphragm of the main valve, spindle U, and lock-nut W, with the fulcrum-bar and friction-clamp, as specified.

7. In an injector, the combination of an annular forcing steam-nozzle, central lifting steam-nozzle, hollow cylindrical main valve and perforated diaphragm, jet-valve R, with cylindrical prolongation protruding through the diaphragm of the main valve, spindle U, and lock-nut W, with fulcrum-bar, guide-rod, and friction-clamp, as and for the purpose set forth.

8. In an injector, the combination of an annular forcing steam-nozzle, central lifting steam-nozzle, hollow cylindrical main valve and perforated diaphragm, jet-valve R, with cylindrical prolongation protruding through the diaphragm of the main valve, spindle U, lock-nut W, fulcrum-bar, guide-rod, and friction-clamp, with sliding sleeve Y and operating-lever A′, all constructed and operating as and for the purpose specified.

9. The star-wheel I′, consisting of four knobs, hub, and connecting-wings, one of the knobs being perforated and serving as an indicator for the position of the water-valve, as and for the purpose set forth.

887,600. PAPER-FILE. HENRY REES, Rochester, N. Y., assignor of one-half to Atkinson & Sykes, same place. Filed Jan. 6, 1888. Serial No. 257,774. (No model.)



Claim.—1. In a paper-file, the combination, with the base *b* and back board, *a*, of the side rods, *c c*, forming ways, the slide C, movable forward and back on the same, the lugs *f f*, provided with holes attached to the slide and standing at an upward angle, and the follower B, provided with loops *d d*, passing through the holes of the

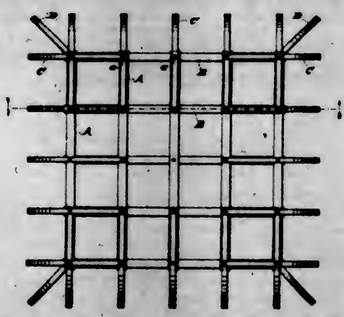
legs, the whole arranged to operate in the manner and for the purpose specified.

2. In a paper-file, the combination, with the base *b* and back board, *a*, of the side rods, *c c*, forming ways, the slide C, movable forward and back on the same, the legs *f f*, provided with holes attached to the slide and standing at an upward angle, the clamping-arms *p p*, pivoted to the slide and bearing against the side rods, and the follower E, provided with loops *d d*, passing through the holes of the legs, the whole arranged to operate in the manner and for the purpose specified.

387,601. EAVES-TROUGH BRACE. LEWIS J. SAWYER, Columbus, Wis., assignor of one-half to Nelson Sawyer, Jr., same place. Filed Mar. 12, 1888. Serial No. 266,994. (No model.)

Claim.—1. An eaves-trough brace for spouting, of the character described, consisting of an upright standard having a hook at one end and a base-plate at the other, substantially as set forth.

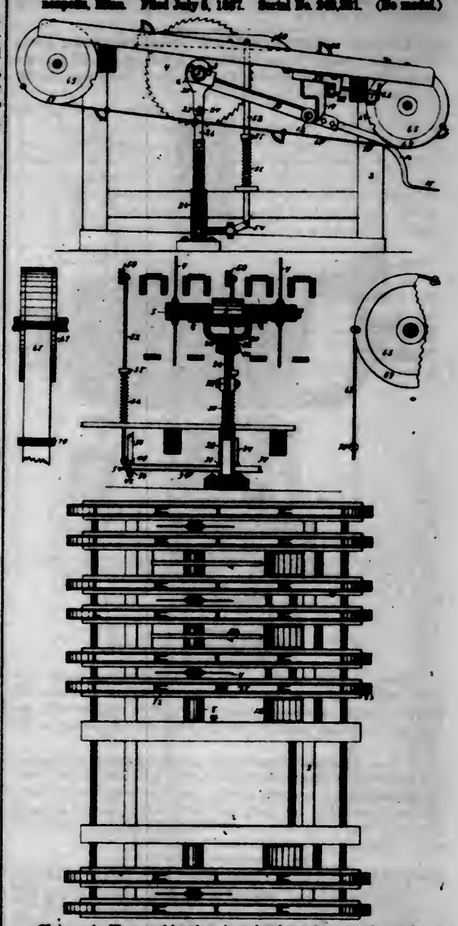
2. An eaves-trough brace for spouting, of the character described, consisting of a two-part upright standard having a bolt for adjustably securing them, substantially as described.



387,602. RAILROAD CROSS-TIE. PETER SIEMENS, Evansville, Ind., assignor to Pierre Siemens, Jr., same place. Filed Feb. 7, 1888. Serial No. 263,242. (No model.)

Claim.—1. A railroad-tie having the fixed clip *a'*, the removable clip B' with serrated face, the key B² with serrated face, and secondary key B³ between clip B' and key B², substantially as described.

2. A railroad-tie having the upset clip *a*, formed as shown, the clip B' with serrated face, the key B² with serrated face, and secondary key B³ between clip B' and key B², substantially as described.



387,603. SHAM PILLOW. WILLIAM M. SIMONS, Greencastle, Ind., assignor of two-thirds to Ellis B. Dooley and Francis Shelton, both of same place. Filed Feb. 13, 1888. Serial No. 263,895. (No model.)

Claim.—1. In a sham pillow, the combination of the rectangular frames placed one above the other and composed of the slats A B, pivotally connected to each other and connected by the outwardly-curved pivoted springs C, and the corner-springs, substantially as specified.

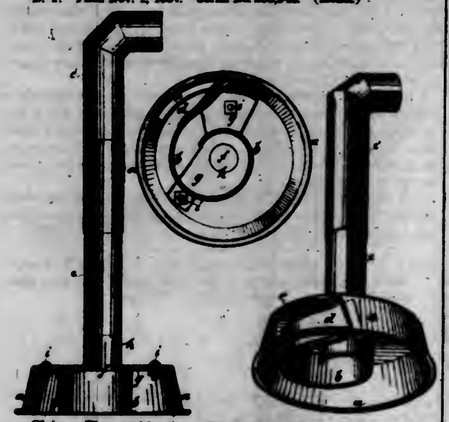
2. In a sham pillow, the combination of the rectangular frames composed of the slats pivotally connected together and at right angles to each other, and the outwardly-curved springs joining said frames together, substantially as specified.

387,604. AUTOMATIC GANG-TRIMMER. JOHN B. ST. LOUIS, Minneapolis, Minn. Filed July 6, 1887. Serial No. 243,321. (No model.)

Claim.—1. The combination, in a lumber-trimmer, of an adjustable frame, a saw mounted therein, a steam-cylinder for adjusting said frame, a valve controlling the supply of steam to said cylinder, and a movable bar connected with said valve and arranged on the machine in the path of the moving lumber, substantially as and for the purpose set forth.

2. The combination, in a lumber-trimmer, of a series of adjustable frames, saws mounted in said frames, steam-cylinders, valves controlling the supply of steam to said cylinders, pistons in said cylinders connected with said frames, and movable bars 50, arranged on the frame of said machine in proximity to said saws and connected with said valves, as and for the purpose set forth.

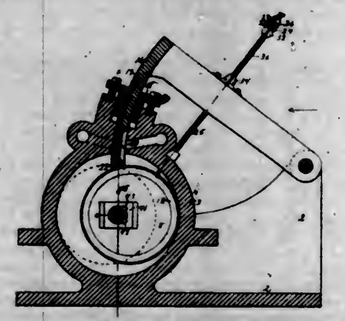
3. The combination, in a lumber-trimmer, with the frame 2, of the pivoted frame 10, the saw mounted therein, the steam-cylinder the piston arranged in said cylinder and connected with said frame, the steam-valve, and the operating-bar 50, mounted on said frame 2 and connected with said valve, substantially as set forth.



4. The combination, in a lumber-trimmer, with the frame 2, of the frame 10, mounted on a pivot, 12, means for adjusting said pivot, the saw mounted in said frame 10, the steam-cylinder, and the piston arranged in said cylinder and connected with said frame 10, substantially as set forth.

5. The combination, in a lumber-trimming machine, with the frame 2, of the pivoted frame 10, the yoke 20, secured thereto, the saw mounted in said yoke, the steam-cylinder, the piston connected with said yoke, the valve controlling the admission of steam to said cylinder, and the bar 50, mounted on the frame 2 and connected with said valve, for the purpose set forth.

6. The combination, in a lumber-trimmer, with the frame 2 and the saws 4, of the sprocket-wheels 66, having the notched flanges 69, the bands 67, having the bars 70 secured thereto and fitting the notches in said flanges, and the carriers 72, secured to said bars, substantially as described.

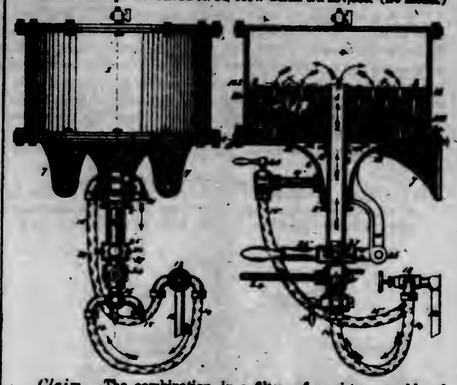


7. The lumber-carrier consisting of the flexible metallic bands 67, having the half-round bars 70 secured upon opposite sides thereof, substantially as described.

387,605. WASH-BOILER. CHARLES H. STODDART, New York, N. Y. Filed Nov. 1, 1887. Serial No. 253,943. (Model.)

Claim.—The combination, with the pan *a*, having inlet *c* and flap *d*, of the partition *b*, having plate *g* and nook A, with fastening-bolts *i i* and tube *e*, substantially as shown and described.

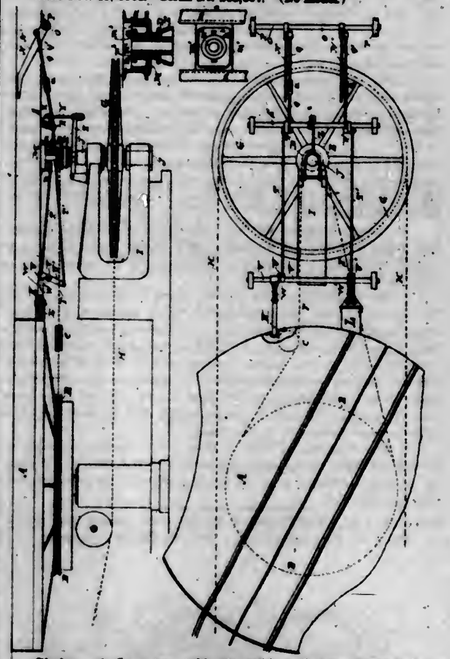
387,606. ROTARY ENGINE. EDWIN R. THOMAS, Minneapolis, Minn. Filed July 13, 1887. Serial No. 244,147. (No model.)



Claim.—1. In a rotary engine, the combination, with two oppositely-placed eccentric-pistons and the radially-sliding abutments provided with arms by which they are pivoted to the frame or bed-plate of the machine, of the equalizing-lever fulcrumed at a point equidistant between the said arms, and means for connecting the opposite ends of the said lever with the arms on the said abutments, substantially as described.

2. In a rotary engine, and in combination with the eccentric-pistons 8 and the radially-sliding abutments 16 of the equalizing-lever 24, attached to the said abutments, the fulcrum-bar 25, provided with the washer 26, and means for adjusting said washer upon said rod, substantially as described.

3. In a rotary engine, the combination, with the cylinder, of the eccentric-pistons, the packing-rings in the ends of the said pistons, and the recesses 14 within the inner circumference of the packing-ring, and the opening 15, connecting the recesses, in the manner and for the purpose substantially as described.

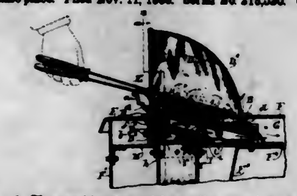


4. In a rotary engine, and in combination with the shaft 6 and the eccentric-piston 8, the rectangular block 41, held upon said shaft and upon which the said piston slides, and means for adjusting the said block in said recess, substantially as described.

387,607. SELF-CLEANSING FILTER. FRANK THOMAS, St. Louis, Mo., assignor of two-thirds to Rudolph Stecher and Clemens Fischer, both of same place. Filed Dec. 14, 1887. Serial No. 257,893. (No model.)

Claim.—The combination, in a filter, of a piston capable of rotary reciprocation, forming the top of the filtering-chamber, and armed with pins projecting into the filtering material, and the bottom of the filtering-chamber having pins projecting into the chamber, substantially as set forth.

387,608. TURN-TABLE FOR CABLE RAILWAYS. CHARLES VOGEL, San Francisco, Cal., assignor to William S. Phelps, same place. Filed Feb. 13, 1888. Serial No. 263,897. (No model.)



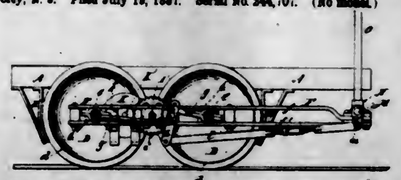
Claim.—1. In a turn-table for cable railways operated by a chain-band connection between two sheaves placed one upon the tail-sheave spindle and the other underneath and secured to the turn-table, the herein-described means of throwing the parts into and out of action, consisting, essentially, of a male half of a friction-clutch moving vertically upon and revolving with the tail-sheave spindle, a female half of a friction-clutch having the driving-chain sheave solidly connected therewith, a hanging frame fastened to the roof of the tail-sheave pit and adapted to hold suspended the upper female half of the clutch directly over the lower male half and permit the same to freely revolve when in engagement, and suitable mechanism for elevating

and depressing the lower male half of the clutch to bring it into engagement with the upper half, substantially as and for the purpose described.

2. In a turn-table for cable railways, the combination of a hand-lever vibrating on a suitable fulcrum-shaft, a suitable lock or latch applied to the table to hold it from moving, a suitable clutch and its parts to connect and disconnect the table from its moving mechanism, and a suitable set of rods and levers connecting between said hand-lever and the locking and clutching device and adapted to first open the lock to free the table and subsequently to throw the clutch into action by the raising of the hand-lever, the whole arranged and operating in the manner and for the purpose substantially as herein described.

387,609. BROILER. William Vogel, Chicago, Ill., assignor, by direct and mesne assignments, to the Vogel Petroleum Heating Company, same place. Filed Nov. 11, 1886. Serial No. 218,530. (No model.)

Claim.—1. The combination, with an oil-burner, of a broiler comprising a thin imperforate metal plate, a frame or casting supporting said plate and forming a closed chamber located over the burner, and a deflecting wall or walls located beneath the said plate and forming therewith a shallow passage beneath the said plate, said passage having an inlet-opening for the products of combustion at one side of the plate and an exit-opening at the other side of the said plate, whereby the heated products of combustion are confined adjacent to and caused to pass over the under surface of said plate in close contact therewith, substantially as described.



2. The combination, with a stove comprising a top plate, F, provided with a hole, *f*, for cooking utensils, and a burner comprising a horizontal plate, H, provided with an opening, *h*, forming the exit-passage of the burner, of a broiler comprising a centrally-apertured plate, B, fitted to rest at its edges upon the top plate, F, of the stove, and provided with depending flanges B' B², engaging the top surface of the said plate H, an inclined plate, A, located in the central opening of the said plate B, and a plate, C, sustained below the said plate A, substantially as described.

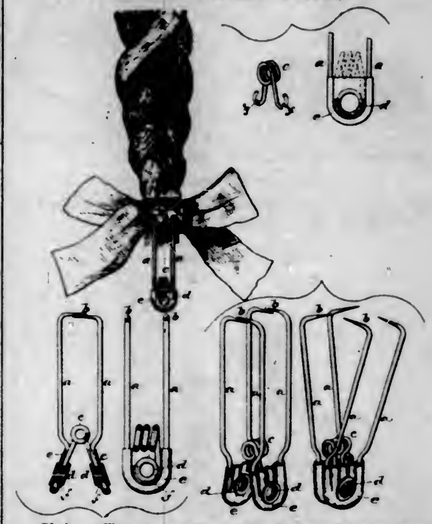
3. The combination, with the plate B, provided with the depending flanges B' B², and the inclined plate A, of the movable plates or flanges B³, adjustably attached to said flanges B' B², substantially as described.

4. The combination, with a stove having an opening, *f*, in its top for cooking utensils, and an oil-burner within the stove, of a broiler comprising a thin imperforate plate, A, a frame or casting surrounding and supporting said plate A, said frame or casting being provided with depending walls or flanges, forming, with the parts of the burner, a closed chamber receiving the products of combustion from the burner, and a hood, D, extending over the plate A, and provided at its lower rear side with an opening, *d*, communicating with the smoke-exit pipe of the stove, substantially as described.

5. The combination, with the plate A of a broiler and walls directing the flame from a burner against the lower surface of said plate, of an upturned flange, *a*, at the forward edge of the plate, substantially as described.

387,610. ELECTRICALLY-DRIVEN CAR. Joseph Weir, Jersey City, N. J. Filed July 19, 1887. Serial No. 244,707. (No model.)

Claim.—1. In an electrically-driven car, a motor-supporting frame mounted directly upon the axles of the car-wheels or driving-wheels and carrying a manually-operative lever system, in combination with car-wheels or driving-wheels having their axles journaled in laterally-movable boxes, for the purpose of enabling the said wheels to be moved by means of said manually-operative lever system into or out engagement with the spur-wheel or friction which transmits from the motor the power to rotate the said car-wheels or driving-wheels.



2. In an electrically-driven car, two pairs of driving-wheels having their axles journaled in laterally-movable boxes, and stationary brakes arranged in the vertical planes of the driving-wheels, as shown, in combination with a manually-operative lever system for moving the said pairs of driving-wheels away from or toward each other, and thereby forcing their faces into or out of contact with said stationary brakes.

3. In an electrically-driven car, two pairs of driving-wheels having their axles journaled in laterally-movable boxes, and an electrically-rotatable shaft carrying at or near its ends spur-wheels or friction-wheels, which are respectively interposed between the driving-wheels, in combination with stationary brakes arranged in the vertical planes of the driving-wheels, as shown, and a manually-operative lever system for moving the said pairs of driving-wheels away from or toward each other, as and for the purposes set forth.

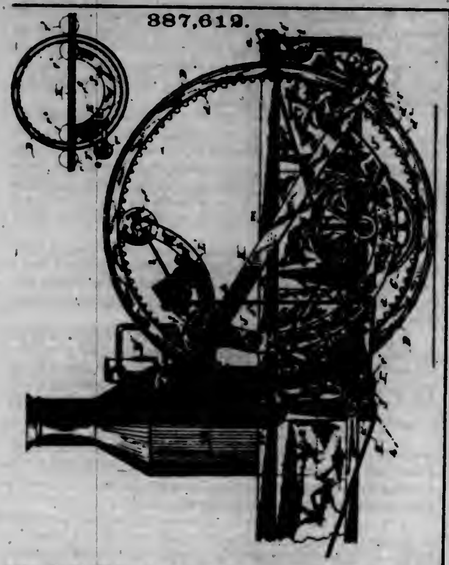
4. A car-body carried by means of springs upon driving-wheel axles journaled in laterally-movable boxes, in combination with a motor-supporting frame independently mounted upon the driving-wheel axles, and having affixed upon it a manually-operative lever system for moving the driving-wheels toward or away from each other, as and for the purpose set forth.

5. The driving-wheel D, provided with the laterally-projecting angular flange *d*, in combination with the electrically-rotatable friction-wheels I, substantially as set forth.

387,611. SAFETY HAIR-BRAID PIN. Frederick G. Wiebe, Leavenworth, Kans., assignor of one-half to James Hunter, same place. Filed Dec. 22, 1887. Serial No. 258,695. (No model.)

Claim.—The spring-pin herein described, consisting of the pin parts, each having a bent shank and a right-angled pin-point, each shank end having an eyelet-seat, a spring, and the eyelets fastening the spring and the pin parts, in the manner shown and described.

387,612. ROAD-ENGINE. William S. Wootton, Scottsburg, Va. Filed Dec. 19, 1887. Serial No. 258,307. (No model.)



Claim.—1. In a road-engine, the combination, with the driving ground-wheels, of a divided driving-shaft, the separate parts of the shaft being connected, respectively, with the driving mechanism and with said wheels, and two or more springs arranged oppositely to and balancing each other about the shaft and connecting the separate portions thereof with each other, substantially as set forth.

2. The combination, with the divided driving-shaft and disks carried by the respective portions thereof, of a plurality of springs and corresponding links secured, respectively, to and connecting with each other the said disks, whereby a movement of the parts of said shaft out of line with each other may be permitted without interrupting their driving-connection.

3. The combination, with the divided driving-shaft and disks carried thereby, one of which is provided with seats or recesses, of a plurality of springs mounted in said recesses, and links pivoted to the springs and to the other disk, substantially as set forth.

4. The combination, with the divided driving-shaft and disks carried by the respective portions thereof, of a plurality of springs secured

387,612.

to one of said disks, and corresponding links pivoted to the said springs and situated at an angle thereto and pivoted at their other ends to the other disk.

5. The combination, with the centerless ground-wheel and its driving-pinion, of a frame connected with the body of the engine, and a roller mounted on said frame and bearing against the periphery of the wheel in the line of its horizontal diameter, for receiving the horizontal propelling force of said wheel.

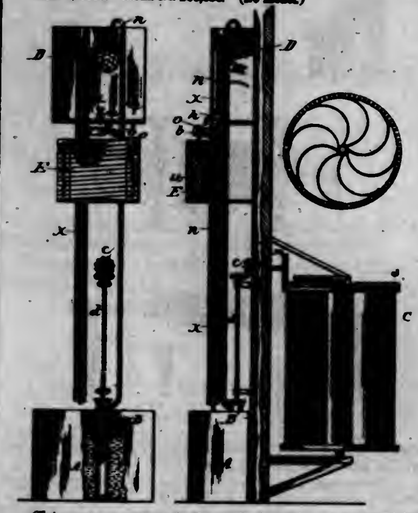
6. The combination, with the centerless ground-wheel and its driving-pinion, of a frame connected with the body of the engine, and rollers mounted on said frame both within and without the wheel, and bearing upon both its inner and outer periphery for receiving its propelling force.

7. The combination, with the centerless ground-wheel and its driving-pinion, of a frame connected with the body of the engine, and a roller mounted on said frame and bearing against the periphery thereof opposite to and adapted to resist the radial pressure of said pinion.

8. The combination, with the centerless ground-wheel and its driving-pinion, of a frame adapted to hold and support said ground-wheel and having a bearing for the journal of said pinion, and a roller bearing upon the periphery of the ground-wheel, said roller and frame being pivoted to the body of the engine on the same axial line.

9. The combination, with the centerless ground-wheel and its driving-pinion, of a frame connected with the body of the engine, a roller mounted thereon and bearing against the periphery of the wheel, an equalising-frame pivoted to the first frame, and rollers carried by the equalising-frame on opposite sides of its pivot and bearing against the periphery of the ground-wheel.

10. The combination, with the centerless ground-wheel and its driving-pinion, of a frame carrying the pinion, rollers mounted on the frame and bearing against the periphery of the wheel, turning on said frame by which the latter is pivotally connected with the body of the engine, and a roller mounted on the frame opposite to said pinion for resisting its radial pressure.

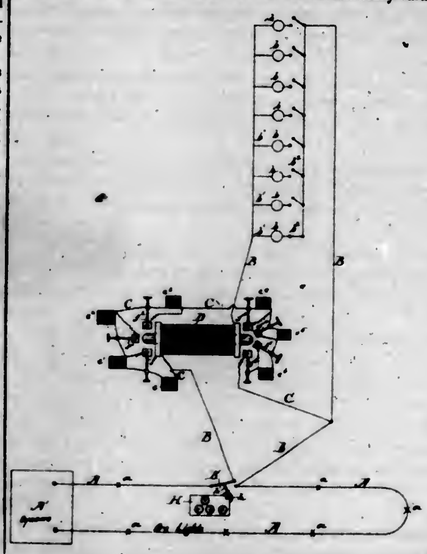


11. The combination, with the centerless wheel and the rollers bearing against its outer periphery, of the scraper *s*, engaging said outer face for clearing the track for said rollers.

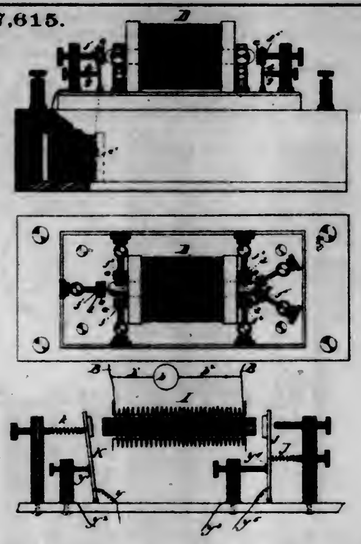
12. The combination, with the centerless wheel and a supporting-frame therefor pivoted to the main frame of the engine, of a roller carried by the main frame and situated upon the opposite side of the wheel from said pivot, for limiting the relative movement of the main frame and said wheel about said pivot.

387,618. PROCESS OF TREATING NATIVE SODA. Laurence F. J. Wheeler, Virginia City, Nev. Filed Mar. 11, 1887. Serial No. 230,582. (Specimens.)

Claim.—In the within-described process of treating natural soda, first making a saturated or approximately saturated solution of the natural or crude soda in hot fresh water, then clearing the solution by allowing it to settle, then straining it while hot and allowing it to partially cool in a separate vessel or vessels and to crystallize therein, afterward running it off into another vessel or vessels and allowing it to further cool and again crystallize, and finally freeing the separated bicarbonate of soda from mother-liquor and drying it, essentially as herein described.



387,614. CLEPSYDRA. Joseph Cardella, Chicago, Ill. Filed Apr. 4, 1888. Serial No. 269,933. (No model.)



Claim.—As an automatic time-indicator, the combination of the revolving fan C, the pump B, the gear-wheels *m*, shaft *a*, bevel gear-wheels *c*, vertical shaft *d*, the vessel A, the tube *n*, reservoir D, the waste or overflow pipe *x*, the discharging-faucet A, receiving vessel or trough *b*, the gaged feeding-faucet *o*, the dial-box E, and siphon *u*, as and for the purpose above set forth.

387,615. SYSTEM OF COMBINED ARC AND INCANDESCENT ELECTRIC LIGHTS. Harold P. Brown, Chicago, Ill. Filed Sept. 20, 1884. Serial No. 144,192. (No model.)

Claim.—1. The combination of a main or high-tension circuit with a local or incandescent-lamp circuit in which two or more incandescent lamps or other translating devices are arranged in parallel group, and a shunt-circuit furnished with an automatically-variable

387,615.

resistance to compensate for such lamps in the parallel group as may not be in use, substantially as specified.

2. The combination of a main or high-tension current circuit with a local or incandescent-lamp circuit, two or more incandescent lamps or other translating devices arranged in parallel group in said local circuit, an electro-motive device in said local circuit, a circuit-controlling lever or device operated thereby, a shunt-circuit, and a series of graduated resistances having connections with said shunt-circuit operated by said circuit-controlling lever or device, substantially as specified.

3. The combination of main or high-tension current circuit A, local or incandescent-lamp circuit B, furnished with two or more incandescent lamps or other like translating devices arranged in parallel group, and shunt-circuit C, furnished with a series of graduated resistance-coils, and means for automatically making connection therewith to increase or diminish the resistance in the shunt-circuit as the resistance in the lamp-circuit diminishes or increases, substantially as specified.

4. The combination of main or high-tension current circuit A with local or incandescent-lamp circuit B, having two or more incandescent lamps in parallel group, each lamp being provided with a switch, and shunt-circuit C, furnished with an automatically-variable resistance to regulate the current through the lamps as the same are lighted or extinguished, substantially as specified.

5. The combination of main circuit A with local or incandescent-lamp circuit B, having two or more incandescent lamps in parallel group, and a shunt-circuit provided with a series of resistance-coils graduated to the number of lamps in the parallel group, and means operated or put in operation by the lamp-circuit current to put said resistance-coils successively in or out of the shunt-circuit according as a lamp in the parallel group is lighted or extinguished, substantially as specified.

6. The combination, with a group of incandescent lamps or other like translating devices in parallel, of a shunt-circuit provided with a variable resistance, an electro-motive device, and a circuit-controlling lever or device operated thereby for varying said resistance, substantially as specified.

7. The combination of the circuit having incandescent lamps or equivalent translating devices in parallel group, a magnet in said circuit provided with several armatures adjusted to require different degrees of force to move them, and several resistance-coils in a shunt-circuit having connections operated by said armatures, substantially as specified.

8. The combination of an incandescent-lamp circuit having two or more incandescent lamps in parallel group with a shunt-circuit furnished with a series of resistance-coils, and an electro-motive device actuated by the lamp-circuit current to make and break connection with said resistance-coils, substantially as specified.

9. A system for operating on one circuit arc lamps and multiple-arc groups of incandescent lamps, said system consisting in a suitable dynamo or electric-current generator, an external or working circuit energized by said generator, arc lamps located in series upon said circuit, and one or more multiple-arc groups of incandescent lamps connected in said circuit with a shunt connecting with said main or working circuit on each side of and around each group of incandescent lamps, and each shunt containing an automatically-variable resistance for determining and governing the current operating said incandescent lamps, substantially as specified.

10. The means of operating on one circuit arc lamps and multiple-arc groups of incandescent lamps, consisting in a shunt about each group of incandescent lamps having an automatically-variable resistance and an electro-motive device to vary the resistance, substantially as specified.

11. The combination, in an arc-light circuit, of a group of incandescent lamps or other translating devices in multiple arc, with a rheostat and an electro-motive device for varying the resistance of the rheostat, substantially as specified.

PHOTO LITH. NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE SECRETARY OF THE INTERIOR.

HOUSTON *v.* BARKER *v.* BANNISTER *v.* EASTMAN.

1. The duties to be performed by the Commissioner of Patents are divisible into two classes, viz: (1) duties imposed by Congressional legislation, and (2) duties imposed only by departmental rules and regulations emanating from or authorized by the Secretary of the Interior.

2. The Secretary of the Interior has no appellate jurisdiction over the Commissioner of Patents in cases involving the performance of judicial or quasi-judicial duties imposed by law upon the Commissioner of Patents.

3. The Secretary of the Interior has authority to direct the Commissioner of Patents to perform the duties, either judicial or ministerial, which the law enjoins upon him; but when these legally-enjoined duties are judicial or quasi-judicial he cannot control the Commissioner's discretion in the manner of their performance.

4. The appellate jurisdiction of the Secretary of the Interior over the actions of the Commissioner of Patents is limited to cases not involving duties directly imposed by Congress, but such only as are imposed by the rules and regulations prescribed by the Secretary for the government of the Commissioner and his subordinates.

5. The determination of questions concerning the admissibility of evidence in interference proceedings involves the exercise of judicial functions.

6. Authority to suppress incompetent evidence is conferred upon the Commissioner by the statutes and not by any departmental regulation.

APPEAL to the Secretary of the Interior.

Mr. A. J. Todd for the appellant.

Messrs. Church & Church for the appellees.

DEPARTMENT OF THE INTERIOR,
Washington, July 26, 1888.

The Commissioner of Patents:

SIR: In the matter of the appeal of E. B. Barker, by his attorney, Mr. Andrew J. Todd, from your action under date of May 5, 1888, whereby the depositions of certain witnesses in the interference case of *Houston* v. *Barker* v. *Bannister* v. *Eastman* were suppressed and ordered to be stricken from the record, I transmit herewith a copy of an opinion of the Assistant Attorney-General for the Interior Department, dated the 23d instant, bearing an indorsement of approval of the Assistant Secretary, who sat with the Assistant Attorney-General at an oral hearing of the case, to the effect that the question involved in the appeal is not within the jurisdiction conferred by law upon the Secretary of the Interior over the acts of the Commissioner of Patents, and recommending that the appeal be dismissed.

I concur in the conclusion reached in the opinion, and the appeal is accordingly hereby dismissed.

The papers belonging to the files of your Office are herewith returned.

Very respectfully,

WM. F. VILAS,
Secretary.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE ASSISTANT ATTORNEY-GENERAL,
Washington, D. C., July 23, 1888.

IN THE matter of the appeal of ERASTUS B. BARKER from the Commissioner of Patents.

To the Hon. Secretary of the Interior:

SIR: I have carefully considered the questions presented by the appeal in the above-named matter, and as the result of such consideration I beg leave to report as follows:

It appears that in the course of a trial (in the Patent Office) of an interference proceeding, in the case of *Houston* v. *Barker* v. *Bannister* v. *Eastman* a motion was made by counsel for Eastman and Bannister to suppress (or strike out) the deposition of one of Barker's witnesses, on the alleged ground that said witness while testifying had under the advice or instruction of Barker's counsel refused to answer certain questions propounded to him on cross-examination.

The Commissioner granted said motion, and it is from his action in so doing that Barker appeals to the Secretary.

Respondent first denies the appellate jurisdiction of the Secretary, and, second, maintains that the said ruling of the Commissioner was strictly legal and proper.

If the objection to the Secretary's appellate jurisdiction is well taken, it will of course be unnecessary to consider the legality of the Commissioner's said ruling.

Then, has the Secretary appellate jurisdiction in the premises?

The Commissioner of Patents has two classes of duties to perform, to wit: duties imposed by Congressional legislation and duties imposed only by departmental rules and regulations emanating from or authorized by the Secretary of the Interior as the head of the Department of which the Patent Office is a part.

When performing that class of judicial or quasi-judicial duties which by an act of Congress have been imposed upon the Commissioner of Patents it seems

to be well settled that no appeal lies from the Commissioner of Patents to the Secretary of the Interior.

Should the Commissioner refuse to perform the duties, either judicial or ministerial, which the law enjoins upon him (for example, should he refuse to hear and decide an application for a patent when properly before him, or should he neglect or refuse to issue a patent which, by a final adjudication, had been duly awarded to the claimant,) I am of the opinion that the Secretary might properly in the exercise of his supervisory power require the performance of such duty; but when these legally-enjoined duties are judicial or quasi-judicial in their character, although the Secretary may require the Commissioner to perform them, he cannot legally control his discretion in the *manner* of their performance.

This, as I understand it, is the doctrine laid down by the Supreme Court in *Butterworth* v. *Hoe*, (112 U. S., p. 50,) where the Court said:

To whatever else supervision and direction on the part of the head of the Department may extend in respect to matters purely administrative and executive, they do not extend to a review of the action of the Commissioner of Patents in those cases in which by law he is appointed to exercise his discretion judicially.

But where it is *not Congress*, but the Secretary of the Interior, who, in the exercise of his legitimate authority as the head of the Department, prescribes rules and regulations for the government of the Commissioner of Patents and his subordinates, I think there can be no question but that he has jurisdiction to review and reverse the action of said Commissioner whenever the latter disregards or violates any of the rules thus legally prescribed by the Secretary for his government.

This brings us to the question whether or not the alleged error of the Commissioner (if error it was) consisted in the violation of a duty imposed on him by *law*, or whether it consisted in the violation of a duty imposed by some rule or regulation prescribed by the Secretary.

Unquestionably every official ruling by the Commissioner of Patents upon the admissibility or the inadmissibility of evidence is the exercise of a judicial function. Hence when in the proceeding now under consideration the Commissioner decided to strike out or to reject as incompetent evidence the deposition referred to he was acting judicially, and that, too, by virtue of an authority conferred (not by any departmental regulation, but) by Congressional enactment, which imposes upon him the duty of trying and adjudicating according to law just such questions as he was then deciding.

I am therefore of the opinion that the Secretary has no jurisdiction to review on appeal the action of the Commissioner complained of, and I think that said appeal should be dismissed.

I return herewith the papers in the case.

Very respectfully,

Z. MONTGOMERY,
Assistant Attorney-General.

—

Having heard this case with the Assistant Attorney-General, I desire to state that I concur in the foregoing opinion.

D. L. HAWKINS,
Assistant Secretary.

COMMISSIONER'S DECISIONS.

EX PARTE DONOVAN.

Decided July 9, 1888.

1. RIGHT OF EXAMINER TO WAIVE OBJECTIONS.

The examiner has the right to waive his requirement that applicant file cross-references and to take such other steps as in his judgment and discretion are necessary to remove any conflict between subject-matter of two pending applications of the same applicant.

2. ANSWER OF EXAMINER SHOULD ADVISE COMMISSIONER.

When an amendment is presented in compliance with a supposed recommendation of the Examiners-in-Chief which the examiner refuses to accept, the Commissioner should be advised by the examiner in his answer to petition whether the proposed claim differs in scope or subject-matter from the claim already adjudicated.

3. RULES 66 AND 139.

Rules 66 and 139 provide that at all times in the investigation of an application and in the progress of appeals it is the duty of each tribunal to see to it that the inventor shall secure a patent for whatever patentable subject-matter may be shown in his application. The Office must put itself in the attitude of a friend and not of a litigant with the applicant.

4. DUTY OF EXAMINER.

It is the duty of the examiner when he is satisfied that an application contains a patentable invention which is not claimed, but which he has reason to believe the applicant is seeking to cover, to advise the applicant briefly and specifically in the premises, precisely as the Examiners-in-Chief and Commissioner are authorized to make suggestions and recommendations.

5. RIGHT TO AMEND AS A MATTER OF COURSE.

An applicant whose claims have been twice rejected and his case is in condition for appeal has no longer the right to amend, as a matter of course. If he has elected to prosecute his claims to a final rejection by the tribunals below, before being permitted to have his case reopened for further amendment he must present a satisfactory showing to the Office why the proposed claim was not originally or earlier introduced.

ON petition.

VAPOR-BURNERS.

Application of John E. Donovan filed October 4, 1886, No. 215,236.

Mr. George J. Murray for the applicant.

HALL, *Commissioner:*

Applicant appeals from the decision of the examiner upon the following grounds:

First, from the requirement to file cross-references in this application referring to subject-matter common to this and applicant's pending case, Serial No. 238,073.

Second, from the refusal of the examiner to consider the amendment filed April 30, 1888.

As to the first requirement, the examiner in his answer to the appeal has seen proper to waive the objection. He says:

After a further consideration of the cases and all the attending circumstances the examiner thinks it best to waive this requirement and use other means later on to remove the conflict between the two cases.

Applicant objects to a waiver of this character, and insists that the Commissioner shall decide the question, as otherwise further action in this direction on the part of the examiner may result in unnecessary delay.

I think the examiner has a right to waive an objection of this kind, and if, as he asserts, there is any conflict between the two applications, to take such steps as in his judgment and discretion are necessary to obviate such conflict; but I direct that he shall give this feature of the case prompt consideration, so as not to cause further or unnecessary delay.

The examiner rejected claim 1, and applicant appealed to the Examiners-in-Chief, who affirmed his decision. Applicant insists, however, that the Examiners-in-Chief in their decision suggested or recommended an amendment which he would be entitled to make, and that the amendment which he has tendered to the examiner is within the suggestion and recommendation of the Board. This is denied by the examiner, and I think myself that it is impossible to find in the decision of the Examiners-in-Chief any statement or recommendation such as the rule contemplates. In his answer to this petition the examiner says:

In regard to the second count, the examiner has to say that the amendment sought to be introduced presents a claim in substitution for claim 1 already adjudicated by the Examiners-in-Chief, who affirmed the Primary Examiner's decision finally rejecting the claim without answering to their decision any recommendation.

This statement is not as specific as it should have been. I think, in cases of this character, when an applicant tenders an amendment different in form and covering less than that covered by the original claim rejected, or a claim narrower and more limited than the original, the examiner ought to advise the Commissioner whether the proposed amendment differs in scope or subject-matter from the original claim rejected, in order that the Commissioner may have the benefit of the examiner's judgment in this essential particular.

It must be borne in mind that the right of an applicant whose claim has been rejected by the examiner to appeal to the Examiners-in-Chief and to the Commissioner, and thus secure the ultimate and final decision of the Office as to the patentability of his claim, is one expressly provided for and contemplated both by statute and rule. The applicant is not to be prejudiced in any manner by such appeals, nor does he forfeit any right whatever. The rules of the Office, particularly Rules 66 and 139, point out that at all times in the investigation of an application and in the progress of appeals it is the duty of each tribunal having jurisdiction of the case to see to it that the inventor shall secure a patent for whatever patentable matter may be shown in his application. As has been frequently stated by me in decisions, the Office must put itself in the attitude of a friend and not of a litigant with the applicant, and see that he secures every right that belongs to him. Not only is this true of the rules cited, but Congress has seen proper to take especial pains to provide that whenever an applicant, in consequence of any inadvertence or mistake in the framing of his specification or claim, has failed to secure that to which he was entitled, or his patent is inoperative or invalid either by reason of having claimed too much or too little, he may have the proper correction made by a reissue, which will secure him the precise invention to which he is entitled.

Now, unquestionably, if under Rules 66 and 139 it is the duty of the Examiners-in-Chief and the Commissioner to suggest and recommend in order that an applicant may receive Letters Patent for subject-matter not involved in the appeal, it must be the duty of the Primary Examiner in the examination of the case made by him to point out and recommend the same thing. I do not mean by this that it is the duty of the examiner to become an agent or an attorney for the applicant; but I think in all cases when he is satisfied or believes that the application contains patentable matter which is not claimed, but which he has reason to believe the applicant is seeking to cover, it is his duty to advise the applicant briefly and specifically, precisely as the Examiners-in-Chief and the Commissioner are authorized to do, as above stated. By acting upon this principle all of the tribunals of the Office become friendly to the applicant, and enable him to clearly see and understand the views of the Office as to the nature and patentability of the invention described. Such practice would undoubtedly tend to lessen the correspondence and conflicts which arise between applicants or their counsel and the Office.

Notwithstanding what is said above, however, it is apparent that the practice and rules of the Office are positive and distinct to the effect that when an applicant has been twice rejected and his case is in condition for appeal his right to amend is no longer a matter of course.

If amendments touching the merits of the application are presented after the case is in condition for appeal, or after appeal has been taken, they may be admitted upon a showing, duly verified, of good and sufficient reasons why they were not earlier presented. (Rule 66.)

Applying the rule to the present case, it will be seen that there has been shown no reason why the amendment proposed, which was refused admission into the case by the examiner, was not introduced at an earlier period. There is no showing why it should not have been originally presented as a part of the application when filed.

If, as understood, the claim rejected by the Primary Examiner and by the Examiners-in-Chief was a broad claim, there is no reason why a narrow and limited claim should not have been presented at the same time and the judgment of the Office thus obtained upon both at once. If, as applicant thinks, the Examiners-in-Chief were of opinion that the limited claim which he now seeks to introduce (if it be such) contained patentable subject-matter, the whole subject would have been adjudicated at once; but if a party is allowed to come into the Office with a broad claim, secure a careful and thorough examination thereof, appeal and take the judgment of the Office rejecting it, then present another more limited claim, as a matter of right, and pursue the same course of appeals, he could occupy the time of the Office unlimitedly, depending simply upon his skill and ingenuity in gradually reducing or limiting the character of his claim from the broadest to the narrowest scope of which the invention described was susceptible. It must be borne in mind that although the original examination of an application is supposed to be thorough and comprehensive, it is impossible for the examiner to retain the subject in his mind and be familiar with it weeks or months afterward, when he takes the case up for a second consideration upon a narrower claim. Hence it is that Rule 66 has been adopted, the purpose of which is to require applicants to present their applications with their claims fully set forth as broad as they see proper or as narrow, in order that the entire subject may receive early and thorough consideration. If applicants fail to observe this requirement and insist upon a single broad claim and take an appeal, their right to amend is restricted and limited. Some showing must then be made why the proposed claim ought to be introduced, and also why it was not earlier presented.

Of course, the subject of admitting amendments under these circumstances rests largely in the discretion of the examiner, and that discretion ought to be ex-

ercised carefully and with due regard to the interest of the applicant and the Office.

If it be apparent from the character of the application and from the manner in which it has been conducted that the applicant has been acting earnestly and in good faith; that his failure to earlier present his claim in the form tendered was the result of inadvertence, ignorance, or mistake, and the subject is brought to the examiner's knowledge in the manner indicated in the rule, the amendment should be recommended or allowed.

As stated above, the examiner in his answer to the appeal in this case has not put me in possession of his opinion in regard to the relation between the claim tendered and the claim rejected, and I do not feel disposed to pass upon that question at all. The action of the examiner is affirmed; but the case is remanded to him without prejudice to the right of the applicant to present a new showing in accordance with the rule, if he sees proper to do so, and the examiner will then act with reference to the subject in accordance with the principles announced in this decision.

EX PARTE LA BORDE.

Decided July 9, 1888.

1. An element forming part of a combination which has become the subject of general invention and manufacture, and which can be used in other relations, cannot be joined in the same application with claims covering the general combination.
2. An applicant has the right to state that while he prefers the form of jack illustrated in his application as an element of the combination, other clamping devices which would accomplish the same purpose could be employed.

ON petition.

MACHINE FOR SPLITTING SHOE-SOLES.

Application of James F. La Borde filed January 25, 1888, No. 261,902.

Messrs. Church & Church for the applicant.

HALL, *Commissioner:*

Applicant appeals to the Commissioner from requirements of the examiner in relation to claims 10, 11, and 12, which involve one of the elements of a combination exhibited in the application, the examiner holding that a division must be made, for the reason that these claims relate to an improved jack which has become the subject of general invention and manufacture, and cannot be joined in the same application with other claims covering the general combination in which it is found as an element.

I have examined the case with considerable care. The answer of the examiner not being quite specific and clear enough as to whether this particular device could be used in other relations, or whether it had any peculiarity of construction which enabled it to perform its function in the present combination alone but rendered it incapable of operation elsewhere, I have re-referred the subject to the examiner, who advises me that the generic features of the jack are old, that the device can readily be used in other machines in the same relation and with the same result, and that many of the patented jacks might well be employed as substitutes for the one used in the present combination. This being the case, under the decision in *ex parte Herr*, (41 O. G., 463,) I affirm the decision of the examiner as to this requirement and direct that division shall be insisted upon.

The examiner also objects to the following clause in the specification. After describing the clamping device to which attention has just been called, applicant proceeds:

> Other clamping devices that would accomplish the purpose could be employed; but it will be noted that by the present construction the motion of the levers on the pivots does not interfere with the operation of the screw, and this by reason of the loose nuts between the bifurcated ends.

The examiner required that this passage should be stricken out, or that applicant should fully and clearly describe and illustrate every part of his invention, meaning that if applicant designed to refer to any other jacks which might be used in this same relation he should describe them, so that such reference could be distinctly understood.

In view of what the examiner has stated to me, as above set forth, I see no reason why the applicant should not be permitted to employ the language objected to. He has the right to state that while he prefers the form of jack illustrated in his application as an element in the combination he does not limit himself to that, but any of the many jacks described by the examiner as having been patented can be used in that relation, and of course the invention, which consists of the combination, would be patentable. As to this objection, I think the examiner should be overruled.

EX PARTE MANNY.

Decided July 16, 1888.

RENEWAL OF APPLICATION FORFEITED FOR NON-PAYMENT OF FINAL FEE.

There is no statute or rule authorizing an applicant to forfeit an application which has been allowed, file a renewal application, and pay the application fee within the six months following such allowance.

ON reference.

LEMON-JUICE EXTRACTOR.

Application of John P. Manny filed October 7, 1887, No. 251,755.

Messrs. J. & A. O. Behel and *Mr. E. C. Seward* for the applicant.

HALL, *Commissioner:*

The original application in this case was filed October 7, 1887, and notice of allowance was issued June 22, 1888, so that the six months within which the final fee is required to be paid will expire on December 22, 1888. On July 9, 1888, applicant appeared before the Office, not having paid the final fee, and tendered fifteen dollars renewal fee, and asked to have the application renewed. The serial number has been changed, the title of the application entered as a renewal case, and it has been sent to the examiner, who refers the application to me for instruction.

An argument has been presented by counsel for applicant urging that he has the right to renew the application after it has been allowed and before it has become forfeited for want of the payment of the final fee.

The statutes provide for the filing of an original application, a renewal application in case of forfeiture for want of payment of the final fee, and a reissue application. The attorney for applicant contends that because the statutes and rules provide that a renewal may be applied for after the original application has been forfeited for want of tender of the final fee, it does not follow that the renewal prior to the forfeiture is prohibited; but this is not a proper view of the matter. It is not the question whether the statute prohibits the thing to be done, but whether it allows it to be done. The attorney points to no statute or rule which authorizes such a course to be pursued, and, although it is to the advantage of the Patent Office to receive as many applications and fees as possible, it is against public policy to encourage the forfeiture of cases and renewals. To permit such a renewal as this would not only be in the face of that policy, but would encourage it, which is a matter of more importance than the fees which could be derived from such a practice.

The examiner is instructed to return the application to the Issue Division as a case allowed, and the applicant will be advised accordingly.

Order No. 490.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., August 6, 1888.

The title of Class No. 27, Coffins, is hereby changed to Undertaking.

The following transfers are ordered:

Sub-class Biers, Class 21, Carriages and Wagons, from Division X to Division XX.

Sub-class Burial apparatus, Class 87, Hoisting, from Division XII to Division XX.

Sub-class Hay-racks, from Class 21, Carriages and Wagons, in Division X, to Class 56, Harvesters, Division VII.

Sub-class Load-binders, from Class 21, Carriages and Wagons, in Division X, to Class 87, Hoisting, in Division XII.

Sub-classes Ox-yokes, Rein-holders, Whip-sockets, from Class 21, Carriages and Wagons, Division X, to Class 54, Harness, Division XI.

Sub-class Umbrella-supports, Class 21, Division X, to Class 135, Umbrellas and Canes, Division V.

Sub-class Stock-cars, from Class 105, Railway-Cars, Division X, to Class 119, Care of Live Stock, Division II.

Sub-class Mail-bag catchers, from Class 105, Railway-Cars, Division X, to Class 87, Hoisting, Sub-division Loading and unloading, Division XII.

Sub-class Bags, from Class 38, Paper-Manufactures, Division XVII, to Class 190, Packing and Storing Vessels, Division XIV.

Sub-class Box-nailing machines, from Class 12, Boots and Shoes, Division XI, to Class 20, Carpentry, Division XXIX.

BENTON J. HALL,
Commissioner.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGehee, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Mellado*.

Issue of August 14, 1888.

DESIGNS.

18,517.—VETERAN'S-GRAVE DESIGNATOR.—*Fred. H. Arnold*, New Haven, Conn. Application filed May 22, 1888. Serial No. 274,701. Term of patent 14 years.

18,518.—COLLAR.—*John Byers*, Brooklyn, assignor to *Corliss Bros. & Co.*, Troy, N. Y. Application filed June 25, 1888. Serial No. 278,152. Term of patent 14 years.

18,519.—CARD OR LETTER RACK.—*Thomas Aldin Crabtree*, Bangor, Me., assignor to *J. P. Greeley*, same place, and *H. A. Alkon*, Boston, Mass. Application filed June 23, 1888. Serial No. 278,052. Term of patent 7 years.

18,520.—BOTTLE.—*William P. Crary*, New York, N. Y. Application filed June 21, 1888. Serial No. 277,883. Term of patent 7 years.

18,521.—CARPET.—*John Christie*, Halifax, England, assignor to *John Crossley & Sons*, New York, N. Y. Application filed April 27, 1888. Serial No. 272,061. Term of patent 3½ years.

18,522 to 18,524, inclusive.—CARPET.—*Henry Horan*, East Orange, N. J., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed June 20, 1888. Serial Nos. 277,646 to 277,648, inclusive. Term of patents 3½ years.

18,525 and 18,526.—ARM-REST FOR BARBERS' CHAIRS.—*Theodore A. Kochs*, Chicago, Ill. Application filed June 15, 1888. Serial Nos. 277,264 and 277,265. Term of patents 7 years.

18,527.—TRIMMING.—*William H. Maurer*, Philadelphia, Pa., assignor to *Francis W. Maurer* and *Joseph W. Maurer*, both of same place. Application filed June 5, 1888. Serial No. 276,155. Term of patent 7 years.

18,528.—HANDLE.—*Frank D. Mersereau*, Orange, N. J. Application filed June 8, 1888. Serial No. 276,515. Term of patent 3½ years.

18,529.—BADGE.—*William T. Mersereau*, South Orange, N. J. Application filed June 8, 1888. Serial No. 276,516. Term of patent 3½ years.

18,530 and 18,531.—HANDKERCHIEF OR BANNER.—*William Hanson Minnix*, Washington, D. C. Applications filed July 12, 1888. Serial Nos. 279,784 and 279,785. Term of patents 3½ years.

18,532 and 18,533.—WATCH-CASE OR LOCKET.—*Harlan S. Noyes*, Brooklyn, N. Y. Applications filed May 18, 1888. Serial Nos. 274,329 and 274,330. Term of patents 14 years.

18,534.—CARPET.—*Edward Poole*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed June 20, 1888. Serial No. 277,645. Term of patent 3½ years.

18,535.—GAS-BURNER.—*Frank Rhind*, Meriden, Conn. Application filed June 11, 1888. Serial No. 276,779. Term of patent 14 years.

18,536.—PULLEY-FRAME.—*Edward C. Stearns*, Syracuse, N. Y. Application filed June 9, 1888. Serial No. 276,640. Term of patent 14 years.

18,537.—TABLE-COVER.—*Carl Wiesen*, Wüste Waltersdorf, Germany, assignor to *G. & J. Ballin*, New York, N. Y. Application filed June 1, 1888. Serial No. 275,762. Term of patent 7 years.

18,538.—PICTURE-HOOK.—*W. Alex. Williamson*, Newark, N. J. Application filed July 14, 1888. Serial No. 280,010. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,761.—COMMERCIAL FERTILIZERS.—*Bowker Fertilizer Company*, Boston, Mass. Application filed June 28, 1888. Used since June 21, 1888.
"The compound word 'SQUARE-BRAND.'"

15,762.—FRESH OYSTERS, LOBSTERS, AND FISH.—*James H. Brookmire & Co.*, St. Louis, Mo. Application filed June 28, 1888. Used since January 1, 1888.
"The representation of an eagle with closed wings sitting upon a cliff."

15,763.—FIRE-PROOF PAINTS.—*Samuel Cabot*, Boston, Mass. Application filed July 7, 1888. Used since January 1, 1888.
"The compound word 'ANTI-PYRE.'"

15,764.—CONDENSED MILK.—*Henry Y. Canfield*, New York, Brooklyn, Washington, and Unadilla, N. Y. Application filed May 18, 1888. Used since January 2, 1888.
"The word 'PANSY.'"

15,765.—STEAM-COOKED CEREALS.—*Edward Elsworth*, New York, N. Y. Application filed July 7, 1888. Used since August 1, 1887.
"The letters 'H—O.'"

15,766.—SPECTACLES AND EYEGLASSES.—*Ernest S. Fowler*, Chicago, Ill. Application filed June 25, 1888. Used since April, 1888.
"The representation of a forearm and closed hand, the hand grasping numerous bolts of lightning."

15,767.—LINOLEUM.—*The German Linoleum Manufacturing Company*, (*Limited*,) Bremen and Delmenhorst, Oldenburg, Germany. Application filed May 23, 1888. Used since March 1, 1888.
"Diamond-shaped borders, a link at the base of the borders, and a fanciful design within the inner border."

15,768.—CHEWING-GUM.—*Charles T. Heisel*, Cleveland, Ohio. Application filed June 30, 1888. Used since June 25, 1888.
"The word 'PARTY' associated with the picture of BEN. HARRISON."

15,769.—PROTECTOR TO PREVENT SOILING THE COLLAR, NECKTIE, AND UPPER PART OF THE COAT.—*Arthur F. Langdon*, Hartford, Conn. Application filed June 22, 1888. Used since June 1, 1888.
"The picture of the head and bust of a man accompanied by the words 'GOOD THING.'"

15,770.—EXTRACT OF BEEF.—*Liebig Extract of Beef Company*, Chicago, Ill. Application filed July 2, 1888. Used since May, 1888.
"The representation of two beeves standing muzzle to muzzle within a diamond-shaped border."

15,771.—CORNMEAL.—*L. K. Lovejoy & Co.*, Minneapolis, Minn. Application filed July 3, 1888. Used since June 1, 1886.
"The words 'OLD GOLD.'"

15,772.—EXTRACTS OF MEATS.—*Julius Maggi & Co.*, Kempttthal, Switzerland. Application filed April 28, 1888. Used since January 1, 1887.
"An Alpine landscape, consisting of mountains in the background, in the middle ground a Swiss chalet or cottage, and some cattle in the foreground, and a roadway leading from the foreground back to the chalet."

15,773.—RYE WHISKY.—*Martin & McAndrews*, Baltimore, Md. Application filed July 23, 1886. Used since May 10, 1886.
"The words 'CELTIC CLUB.'"

15,774.—HAIR DRESSINGS OR TONICS.—*Patrick H. McMahon*, Burlington, Vt. Application filed May 11, 1888. Used since January, 1888.
"The words 'MCMAHON'S IMPERIAL' and the autograph signature of P. H. MCMAHON."

15,775.—SOAP.—*Mexican Amole Soap Company*, Peoria, Ill. Application filed July 2, 1888. Used since the beginning of 1888.
"The representation of a mole and the Mexican word 'AMOLE.'"

15,776.—SOAPS.—*Mexican Amole Soap Company*, Peoria, Ill. Application filed July 9, 1887. Used since January 9, 1883.
"The representation in elevation of a Spanish bayonet-plant with the earth removed in front of the vertical plane passing through the plant's axis, exposing several unequal potato-like tubers of varying size attached by their ends to the plant's base."

15,777.—NUTRIENT BEVERAGES.—*Phillip Best Brewing Company*, Milwaukee, Wis. Application filed July 3, 1888. Used since March 30, 1888.
"The words 'MALT MEAD,' in blue color, with the two initial 'M's' in red."

15,778.—NUTRIENT BEVERAGES.—*Phillip Best Brewing Company*, Milwaukee, Wis. Application filed July 3, 1888. Used since March 30, 1888.
"A monogram consisting of the letter 'B' with the letter 'M' printed twice thereon, one 'M' being above the other."

15,779.—BROWN SOAP IN BARS.—*Procter & Gamble*, Hamilton County, Ohio. Application filed July 5, 1888. Used since August 1, 1877.
"A diagonal blue bar or ribbon and the word-symbol 'MOTTLED GERMAN.'"

15,780.—CERTAIN REMEDY FOR EXTERNAL AND INTERNAL USE AND FOR CERTAIN DISEASES.—*Charles H. Rogers*, New York, N. Y. Application filed June 14, 1888. Used since December 1, 1886.
"The words 'HAM'S OIL OF GLADNESS.'"

15,781.—STOUT.—*B. J. Semmes & Co.*, Memphis, Tenn. Application filed May 17, 1888. Used since October, 1887.
"The words 'CULBRACHER STOUT,' appearing between two diagonal lines extending from the lower left-hand corner to the upper right-hand corner of the label."

15,782.—FLATTING-VARNISHES.—*Lawson Valentine Company*, New York and Hunter's Point, N. Y. Application filed May 21, 1888. Used since March 15, 1888.
"The number 'SIXTY,' expressed by word or numerals."

15,783.—SHIRTINGS AND SHEETINGS.—*Wamsutta Mills*, New Bedford, Mass. Application filed June 2, 1888. Used since December 1, 1872.
"The words 'WAMSUTTA MILLS' and the representation of the registrant's factory at New Bedford."

15,784.—REMEDY FOR DYSPEPSIA.—*The Dr. J. G. Wannamaker Manufacturing Company*, Orangeburg, S. C. Application filed June 29, 1888. Used since February 1, 1888.
"The word 'VICTRINE.'"

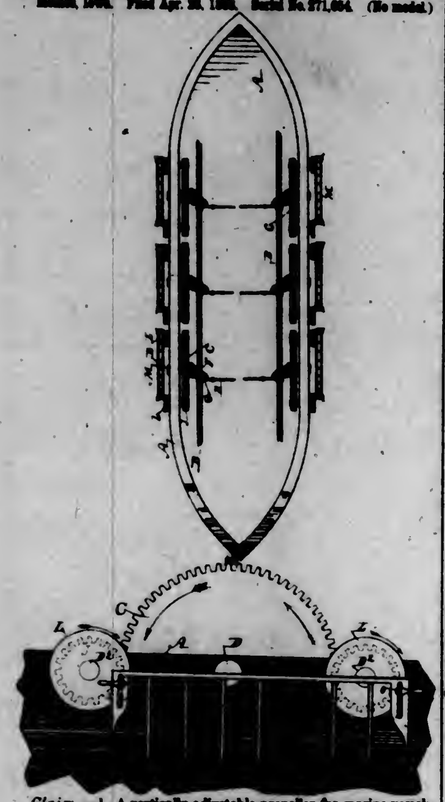
15,785.—ANTI-MALARIAL COMPOUND.—*The Dr. J. G. Wannamaker Manufacturing Company*, Orangeburg, S. C. Application filed June 29, 1888. Used since February 1, 1888.
"The word 'EDISTOINE.'"

LABELS.

5,675.—TITLE: "MALT MEAD," (FOR A BEVERAGE.)—*Phillip Best Brewing Company*, Milwaukee, Wis. Application filed May 21, 1888. (Trade-Mark Registered.)

5,676.—Title: "MALT MEAD," (FOR A BEVERAGE.)—*Phillip Best Brewing Company*, Milwaukee, Wis. Application filed May 21, 1888. (Trade-Mark Registered.)

5,677.—Title: "GINGER WINE AND PEPSIN," (FOR A MEDICINAL PREPARATION.)—*Charles Cook*, *Edward S. Everett*, and *Henry B. Pennell*, Portland, Me. Application filed July 21, 1888.



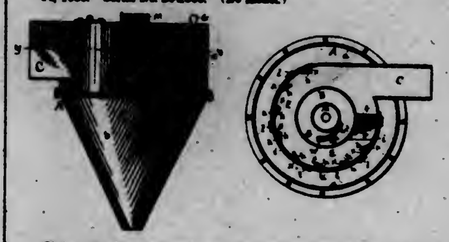
5,678.—Title: "F. E. JOHNSON'S ANODYNE LINIMENT."—*Frank E. Johnson*, Wiscasset, Me. Application filed June 14, 1888.

5,679.—Title: "IMPROVED LIQUID GLUE."—*The Le Page Glue and Cement Company*, Portland, Me., and Gloucester, Mass. Application filed July 23, 1888.

PATENTS

GRANTED AUG. 14, 1888.

887,616. PROPELLER FOR VESSELS. HOSS R. ALLBEE, Des Moines, Iowa. Filed Apr. 28, 1888. Serial No. 271,694. (No model.)



Claim.—1. A vertically-adjustable propeller for marine vessels, comprising an elongated frame or bar having slots in its ends, a series of paddles extending downward at right angles to the frame and parallel to each other, in combination with two crank-wheels connected by means of wrist-pins and nuts, or their equivalents, to said frame, and driving mechanism to operate in the manner set forth, and for the purposes stated.

2. The propeller-frame M, having fixed paddles 1 2 3 4, and vertical slots *s*, in combination with the wheels L, having fixed wrist-pins, and detachable nuts on the ends of said pins, to be vertically adjusted relative to said shafts, and mechanism for simultaneously rotating the said wheels or cranks L in the same direction, in the manner set forth, to accomplish the results stated.

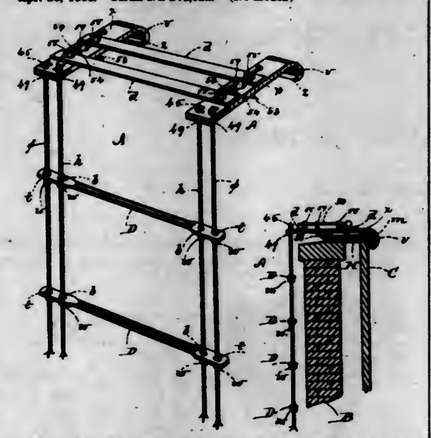
3. In a propeller, a frame having fixed paddles, in combination with two parallel rotating shafts having cranks on their outer ends, mechanism for simultaneously rotating said shafts, and devices for raising and lowering said frame relative to said rotating shafts, for the purposes stated.

887,617. DUST-COLLECTOR. JOSEPH S. ASH, Canal Winchester, Ohio, assignor of one-half to Charles E. Cowan, same place. Filed Feb. 14, 1888. Serial No. 264,060. (No model.)

Claim.—1. In a dust-collector, the combination, with the case A, having a discharge-opening in its lower end and an opening, *d*, in its top plate, and inlet-spout C, of the internal pipe, B, and central internal pipe, M, having lateral opening N near its lower end, substantially as and for the purpose specified.

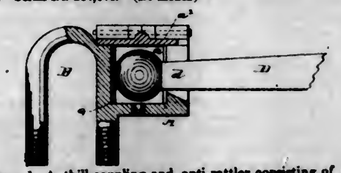
2. In a dust-collector, the combination, with the case A, having a discharge-opening in its lower end and an opening, *d*, in its top plate, and inlet-spout C, of the internal central pipe, M, having lateral opening N, and door *n*, having pin *n'*, arm n^2, connected with said pin, and operating-rod n^3, substantially as and for the purpose specified.

3. In a dust-collector, the combination, with the case A, composed of a cylindrical portion, *a*, and conical portion *b*, having an opening at its lower end, and top plate, D, having openings *d* and *d'*, of the chamber E, having slotted openings H and spout C, communicating with said chamber, and central air-pipes B and M, the latter being supported within the former and within the case A and having an opening, N, in its lower portion, substantially as and for the purpose specified.



4. In a dust-collector, the combination, with the case A, composed of a cylindrical portion, *a*, and conical portion *b*, having its lower end open, and top plate, D, having openings $d\,d'\,d^2$, and slide *p*, of the chamber E, having slotted openings H, inlet-spout C, communicating with said chamber, sliding slotted damper having handle G, and central air-pipes, B and M, the latter supported vertically within the former and within the case A and having an opening, N, in its lower portion, substantially as and for the purpose specified.

887,618. DUMPING-CAR. CHARLES B. BARBER and TIMOTHY F. FURBAR, Waterloo, N. Y., assignors to Cornelius J. Ryan, Flushing, N. Y., and John B. McDonald, Baltimore, Md. Filed Dec. 17, 1887. Serial No. 258,194. (No model.)



Claim.—The combination, in a tilting dumping-car having a swinging gate, of a truck having thereon a catch, E, a tilting box hinged to the said truck and having pivoted thereto a lever, C, and a gravitating lever-catch, E, the gate D, having thereon a bar or catch, F, the bars or posts G and H, the metallic disks I and I', having annular concentric ribs and grooves, and the bolts J J and their nuts, arranged for operation together substantially as and for the purposes specified.

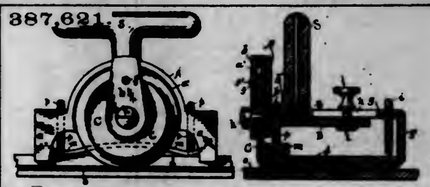
387,619. FIRE-ESCAPE. Arthur F. Bedell, Lowell, Mass. Filed Apr. 26, 1888. Serial No. 271,922. (No model.)

Claim.—In a fire-escape of the character described, the bars *x x*, each provided with a central slot, 54, hook *v*, and holes 49, the braces *d* connecting the bars *x*, the slides 59, respectively fitted to work in the slots 54, and provided with jaws 53 and screws 50, two ropes, *h f*, provided with knots *w*, and secured by knots 45 in the outer end of each of said bars *x*, and the rungs D, provided with two holes, *b t*, in each end, said rungs being disposed on said ropes, all constructed combined, and arranged to operate substantially as specified.

387,620. THILL-COUPLING. Fred. S. Blackman, Port Allegheny, Pa., assignor of one-half to G. L. Blackman, same place. Filed Mar. 13, 1888. Serial No. 267,079. (No model.)

Claim.—1. A thill-coupling and anti-rattler consisting of a box having its interior formed into a cylindrical cavity and an opening in its front face communicating with the cylindrical cavity and provided with a hinged top, a shaft-iron having its end terminating in a ball, and a clip adapted to secure the box to an axle, substantially as described.

2. A thill-coupling and anti-rattler consisting of a box having an interiorly-arranged cylindrical cavity and an opening communicating with the cylindrical cavity and provided with a hinged top, a spring-catch secured to the side of the box and adapted to engage the hinged top, a shaft-iron terminating in a ball, and a clip capable of securing the device to an axle, substantially as set forth.



3. A thill-coupling and anti-rattler consisting of a box having formed integral therewith a clip capable of securing it to an axle and provided with a cylindrical cavity and an opening communicating therewith, and also provided with a hinged top, a spring-catch adapted to engage the hinged top, and a shaft-iron, substantially as and for the purpose set forth.

4. A thill-coupling and anti-rattler consisting of a box having formed integral therewith a clip and provided with a hinged top and a cylindrical cavity and an opening communicating with the cavity, said cylindrical cavity being lined with some suitable sound-deadening substance, a spring adapted to engage the hinged top, and a shaft-iron having its end terminating in a ball, substantially as set forth.

387,621. PAPER-CUTTER. George H. Clarke, Columbus, Ohio, assignor to James S. Patterson and Martin Hensel, same place. Filed Feb. 2, 1887. Serial No. 226,220. (No model.)

Claim.—1. In a paper-cutter, the combination of the plate B, having lugs *a*, depressed projecting portion A, and bearing-arm *b*, with the cutting-disk C, journaled in said arm *b* and portion A, disk-adjusting screw *f'*, slotted extension-arm *g* and its clamp *g'* and set-screw *l*, substantially as and for the purposes specified.

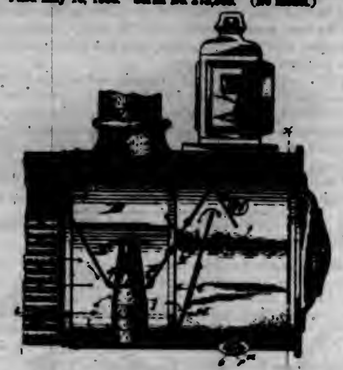
2. The combination of the plate B, having lugs *a*, depressed projecting portion A, and bearing-arm *b*, with the cutting-disk C, journaled in said arm and portion A, disk-adjusting screw *f'*, slotted extension-arm G and its clamp *g'* and set-screw *l*, and adjusting-screws *i* and *p p*, the latter being connected to the pressing-strip *m*, substantially as and for the purpose specified.

387,622. CUSPIDOR. Frank B. Clemis, Lockport, N. Y. Filed Sept. 10, 1887. Serial No. 249,778. (No model.)

Claim.—1. In a cuspidor or spittoon, the combination of the case A, removable saliva-holder B, consisting of a series of receptacles, *c c c c*, nested together therein, and bracket or holder C, all substantially as and for the purpose specified.

2. In combination with the case or shell of a spittoon or cuspidor, the removable saliva-holder B, consisting of a series of receptacles, *c c c c*, nested together therein and adapted to be removed singly when soiled or damaged, all substantially as and for the purpose specified.

3. In a cuspidor or spittoon, the combination of the case or shell A, removable holder B, consisting of a series of receptacles, *c c c c*, nested together therein, covering-piece *a a*, cover A', and bracket C *b*, all arranged and operating substantially as and for the purpose specified.

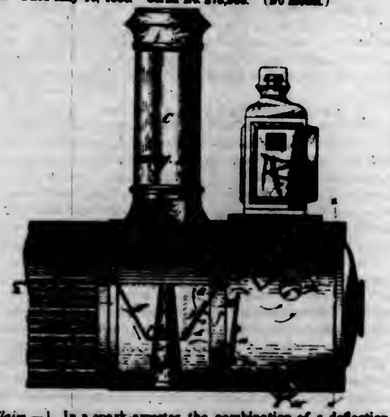


387,623. METHOD OF PROMOTING COMBUSTION AND EXTINGUISHING SPARKS. Robert H. Coleman, Cornwall, Pa. Filed May 10, 1888. Serial No. 273,384. (No model.)

Claim.—1. The method of effecting thorough combustion in furnaces, which consists in discharging the waste products of combustion from a furnace upon or into other like products between the furnace and the stack in motion, and forming eddies and reactionary currents backing up or retarding the heat and gases in the furnace and flues, then conducting the refuse matter to a suitable receptacle and separating the gases from the solids, substantially as described.

2. The method of effecting thorough combustion in furnaces, which consists in discharging the waste products of combustion from a furnace upon or into other like products between the furnace and the stack in motion, and forming eddies and reactionary currents backing up or retarding the heat and gases in the furnace and flues, disintegrating the solid matter, then conducting the waste to a suitable receptacle, and separating a portion of the gases from the solids in their passage, and finally depositing the solid matter and conducting the remaining gases to the atmosphere, substantially as described.

387,624. SPARK-ARRESTER. Robert H. Coleman, Cornwall, Pa. Filed May 10, 1888. Serial No. 273,383. (No model.)



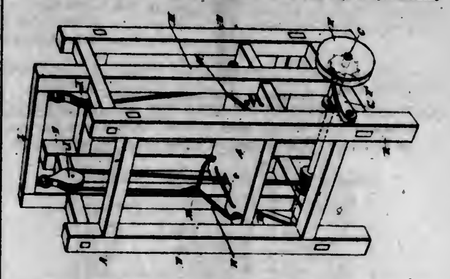
Claim.—1. In a spark-arrester, the combination of a deflection-plate between the tube-sheet and the exhaust-nozzle, a channel-plate, and a dead-plate on the opposite side of the nozzle, substantially as described.

2. In a spark-arrester, the combination of a deflection-plate between the tube-sheet and the exhaust-nozzle, a channel-plate, a nozzle-plate between the deflection-plate and the channel-plate, a dead-plate, a baffle-plate, and an extended passage formed by the channel-plate and the dead-plate, substantially as described.

3. In a spark-arrester, the combination of a deflection-plate, a channel-plate, a dead-plate, a baffle-plate, and a screen between the upper end of the channel-plate and the wall of the smoke-box, substantially as described.

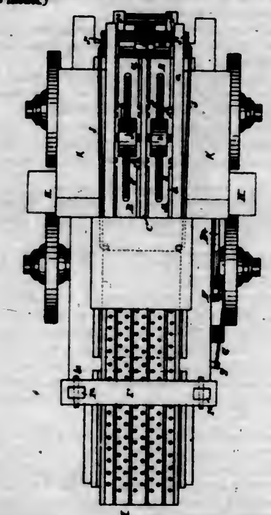
4. In a spark-arrester, the combination of a deflection-plate, a channel-plate provided with a perforated section or wire screen, a dead-plate, a contracted passage between the channel-plate and the dead-plate, a baffle-plate, and a screen between the upper end of the channel-plate and the wall of the smoke-box, substantially as described.

387,625. SPARK-ARRESTER. Robert H. Coleman, Cornwall, Pa. Filed May 10, 1888. Serial No. 273,382. (No model.)



Claim.—1. In a spark-arrester, the combination of a deflection-plate between the flue-sheet and the nozzle, a channel-plate provided with a screen, and a valve or damper for covering said screen, a dead-plate in front of the exhaust-nozzle, and a baffle-plate projecting forward of the dead-plate, substantially as described.

2. In a spark-arrester, the combination of a deflection-plate between the flue-sheet and the exhaust-nozzle, a channel-plate provided with a draft-opening and a valve for controlling it, a dead-plate, an extended passage for the draft, a baffle-plate, and a screen between the baffle-plate and the wall of the smoke-box, substantially as described.

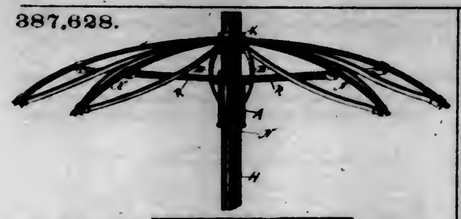


3. In a spark-arrester, the combination of a deflection-plate, a channel-plate provided with a section of wire-gauze and a draft-opening, valves for controlling said section and opening, and a baffle-plate projecting from its upper end, a dead-plate, and a wire-gauze section between the baffle-plate and the crown of the smoke-box, substantially as described.

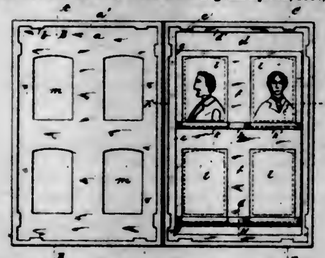
387,626. MACHINE FOR HOISTING HEAVY WEIGHTS. Martin V. B. Davis, Harrison, Ark., assignor of one-half to Chandler Lovette Gibson, same place. Filed Apr. 12, 1888. Serial No. 270,267. (No model.)

Claim.—The improved machine herein described and shown, comprising the frame having the vertical posts H H at the centers of the sides, the cross-beam I, connecting the upper ends of said posts, the pulleys J J, depending from the under side of said beam, near the ends of the same, the platform having recesses in its side edges engaging the posts H, the hangers secured to the platform, the transverse shaft journaled in the frame below the platform, the windlasses and ratchet-wheel on said shaft, the band-pulley on one end thereof and the crank-arm on the other end thereof, the pawl pivoted to the frame and engaging the ratchet-wheel, and the cables secured to the hangers, passing thence over the pulleys J J, thence downward through the recesses in the side edges of the platform, and secured to the windlasses, substantially as specified.

387,627. THRASHING-MACHINE. Daniel J. Devane and John F. Devane, Quitman, Ga. Filed Apr. 11, 1887. Serial No. 234,410. (No model.)



Claim.—The combination of the main frame, the shaft J³, the disks J', mounted on said shaft, the pitmen connected eccentrically with said disks and extending through the openings *j* of said frame, the separator hinged at its inner end to and supported by said pitmen, and the adjustable links supporting said separator at its outer end, substantially as described.



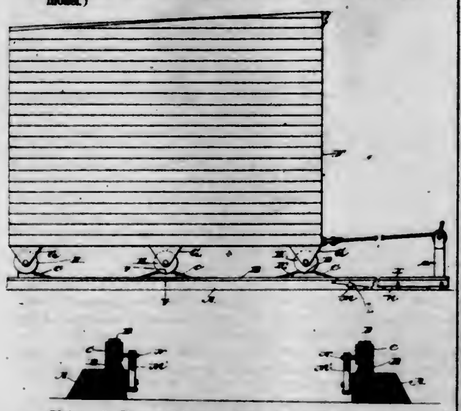
387,628. UMBRELLA. William B. Dunn, Philadelphia, Pa. Filed July 30, 1887. Serial No. 244,673. (Model.)

Claim.—In an umbrella or parasol, the combination, with the ordinary ribs and stretchers, of double auxiliary ribs, substantially as described and shown.

387,628.

387,629. PHOTOGRAPHIC ALBUM WITH SEPARABLE LEAVES. HENRIETTE A. M. DITTMAR, Berlin, Germany. Filed June 16, 1887. Serial No. 241,536. (Model.) Patented in England Apr. 23, 1887, No. 5,966.

Claim.—1. In a photograph-album, the leaves, each of which is formed in two parts, adapted to be fitted together and separated, for the purpose specified, and provided with a detachable or temporary fastening, as distinguished from permanently uniting said parts, whereby the photographs may be laid between and removed from the separated parts instead of being inserted edgewise.



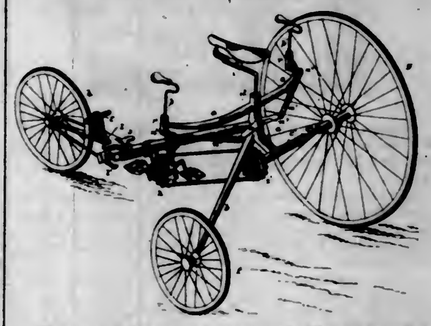
2. In a two-part separable album-leaf, the frames or ribs secured on the inner sides of the respective parts, which ribs fit exactly, one within the other, so that by pressing the two parts together they will be firmly united, substantially as described.

3. The two-part separable album-leaf having lugs or projections secured at alternating points upon the opposite parts and engaging with each other, substantially as described.

4. The combination, with the two-part separable album-leaf, of the frames or ribs having corresponding recesses and projections, which overhang or extend laterally, substantially as described.

5. The combination, with the two-part album-leaf, of the frames, each having a projecting rib and groove, which fit into and partly under one another when the parts are pressed together, substantially as described.

387,630. APPARATUS FOR MOVING HOUSES. FRANK B. DUFFEY, Mound Valley, Kans. Filed Apr. 4, 1888. Serial No. 269,569. (No model.)



Claim.—1. The combination of the sleepers having the tracks B, the skids having the inclined sides supported on the said sleepers and in line with the tracks, and the building having the supporting wheels or rollers mounted on the skids, substantially as described.

2. The combination of the supporting-tracks B, the skids mounted thereon and having the laterally-projecting arms N, the building having the supporting wheels or rollers resting on the said skids, and the springs bearing upon the arms N of the skids and thereby adapted to throw the same from the track out of the way of the rear wheels or rollers when said wheels or rollers have descended the skids to the tracks, substantially as described.

3. The combination of the sleepers having the tracks B, the track-rails I, said track-rails and said sleepers having their meeting ends beveled or inclined and thereby adapted to effect lap-joints, said meeting ends being further provided with the transverse openings L, the keys M, to engage the said openings and couple the track-rails I to the sleepers, the skids arranged on the sleepers in line with track B and having the inclined sides, and the building having the supporting rollers or wheels resting on the skids, substantially as described.

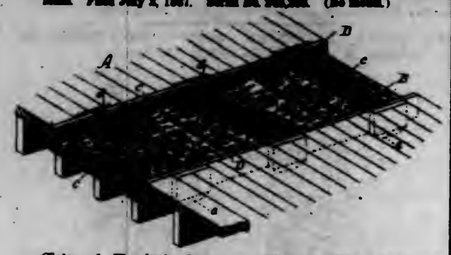
387,631. VELOCIPEDE. CHARLES R. DUNTZ, Washington, D. C. Filed June 16, 1887. Serial No. 241,498. (No model.)

Claim.—1. A front-steering tricycle having the steering-rod continued backward and upward in a line from the forward point of contact with the ground to a point below and behind the saddle and over the main axle, where it is connected by suitable means with two vertically-revolving handles placed one each side of the rider's seat.

2. A front-steering tricycle having the steering-rod continued backward and upward in a line from the forward point of contact with the ground to a point below and behind the saddle and over the main axle, at which point a cross-bar is rigidly attached, of which each end is, by means of a connecting-rod and suitable joints, connected to a crank attached to the stem of a vertically-revolving handle in such a manner that a partial revolution of the handles upon their axes will produce a partial revolution of the steering-rod upon its axis.

3. In a front-steering tricycle, a three-part frame, of which one part extends downward and forward toward the points of contact between the forward wheel and the ground, terminating about level with the forward axle and carrying the pedal-bearing support and the steering-rod, the second part of which frame extends sidewise and downward toward the hub of a small side wheel, terminating at the axle thereof, the third part extending toward the other side of the machine at the same angle as the second part, and terminating in a tube which incases and supports the axle of the driving-wheel.

4. A front-steering tricycle having a three-part frame, of which one part extends downward and forward till level with the forward axle, and the two other parts extend downward and sidewise till in the line of their respective axles, all three parts being straight, and at their junction supporting arms which carry the steering-handles.

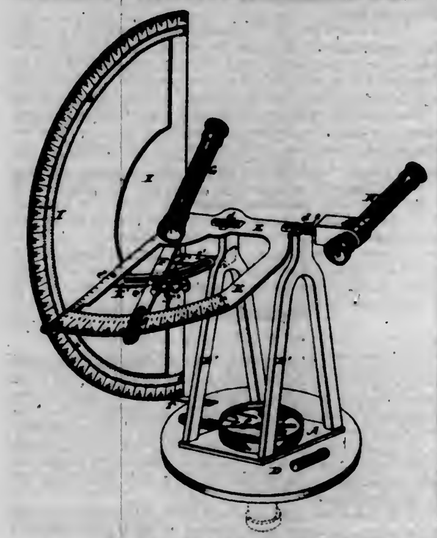


5. In combination with the frame of a tricycle, a support for crank-axle bearings consisting of two yokes of flat iron connected at their ends by U-shaped pieces of round iron on whose projecting ends bearing-boxes are fixed, said supports being attached to the frame of the tricycle by means of clips which pass through holes in the ends of the yokes.

6. In combination with a front-steering tricycle, a brake formed of flat metal of sufficient width to serve as a mud-guard attached at its rearward lower end to the forks by which the front wheel is carried, and having its upper forward end left free, so that it may be pressed against the tire with the toes while the heels rest upon the foot-rest, thus performing the offices of both brake and mud-guard.

7. In a velocipede, the wheels *f g h* and the legs *a b c*, in combination with the cross-bar *n*, the steering-rod *o*, and the fork *l*, said fork being provided with a coiled spring on the end of its lower part, substantially as described.

8. In a velocipede, the wheels *f g h* and the frame *a b c*, in combination with the fork *l*, the steering-rod *o*, cross-bar *n*, connecting-rods *n' n'*, and cranks n^2 n^2 on handles *p p*.



387,632. FLOOR FOR STABLES. JOHN R. DUNTZ, Lawrence, Mass. Filed July 2, 1887. Serial No. 243,202. (No model.)

Claim.—1. The device for moving within a building vehicles provided with runners composed of the continuous runway B, the guides D D, extending its entire length, the vertical slots *d d*, and the transverse pockets *a a*, cast integral therewith and semicircular in cross-section, substantially for purposes stated.

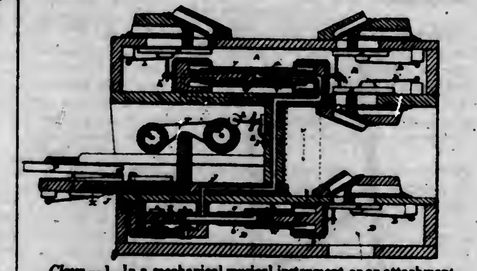
2. The combination, with the floor A, continuous metallic runway B, and the pockets *a a*, cast integral therewith, of a series of rolls, C C, contained partly within said pockets, but projecting above the surface of the runway, and the guides D D, adjacent to the ends of the rolls, and operating substantially as herein described.

387,633. DISTANCE-INSTRUMENT. JAMES B. FAGNETT, Little Rock, Ark. Filed July 9, 1887. Serial No. 243,985. (No model.)

Claim.—1. In a surveying-instrument, the combination of the horizontal base-plate and its magnetic needle and standards thereon, a quadrant-shaped graduated sector-limb secured at one of its radial sides to a horizontal axis supported in said standards and provided with arc and tangential divisions, a tangential sight affixed to said limb, and a radius-bar carrying sights pivoted to the horizontally-pivoted limb to move over the surface of said sector-limb, substantially as described.

2. In a surveying-instrument, the combination of the horizontal base-plate and standards thereon, the graduated sector-limb provided with arc and tangential divisions and pivoted horizontally upon the standards and located upon one side of its axial line, a tangential sight vertically movable with said sector-limb, a radius-bar carrying sights pivoted to the sector-limb, and a graduated vertical limb provided with arc and tangential divisions and secured to the standards upon which the vertically-swinging sector-limb may be adjusted, substantially as described.

3. In a surveying-instrument, the combination of the horizontal base-plate and standards thereon, a revolving horizontal sector-limb graduated with arc and tangential divisions and carried on said standards, a vertical limb located upon one side of its axial line, a tangent-sight secured to the revolving sector-limb, and a radius-bar carrying sights and pivoted to the sector-limb to swing with and move upon said limb, substantially as described.



4. The combination, in a surveying-instrument, of a horizontal plate carrying a magnetic needle and standards adapted to revolve upon a vertical axis, and a graduated quadrant-shaped sector-limb provided with arc and tangential divisions and pivoted horizontally to swing upon one side of said standards and sights, one of which is located, mainly, upon the opposite side of said standards to counterbalance the said sector-limb, substantially as described.

387,634. LIQUID-MIXER. HARRIS H. FULTON and WILBER F. CONNELLEE, Indianapolis, Ind., assignors to David L. Whittier, same place. Filed Dec. 5, 1887. Serial No. 257,010. (No model.)

Claim.—In a liquid-mixer, the combination, with a reciprocating rod, of a glass-holder mounted on the top of said rod, a glass in said glass-holder, a cover to said glass, an agitating device secured in the top of said cover, a vertical rod mounted on the glass-holder and extending up alongside the glass, screw-threaded on its upper end, a clamp loosely mounted on said rod and provided with an arm arranged to bear upon the top of said cover, and a nut engaging the screw-threaded end of the vertical rod provided with a ring to engage a notch in said clamp, substantially as described.

387,635. MECHANICAL MUSICAL INSTRUMENT. MERRITT GAILY, New York, N. Y. Filed Apr. 17, 1883. Serial No. 270,960. (No model.)

Claim.—1. In a mechanical musical instrument or an attachment for performing upon musical instruments, the combination, with a series of sound-producing devices, of a board having pneumatic motors disposed on opposite sides thereof and alternately connecting with and to operate the series of sound-producing devices.

2. The pneumatic action composed of a board having pneumatic motors disposed on opposite sides thereof, and a series of levers alternately disposed and to be operated by the duplex series of pneumatic motors.

3. The combination, with the organ-action, of the pneumatic board having pneumatic motors disposed on opposite sides thereof and made removable, substantially as and for the purpose specified.

4. The combination, with the oblong pneumatic follower, as *c*, of the operating-lever having the angle-arm, as *v*, placed longitudinally with the follower.

5. The combination, with the oblong pneumatic follower, as *a*, of the operating angle-lever, as *v*, the lever having two bearings, as *t t'*, and two operating ends as *h h'*.

6. The valve, as *s*, having the projecting bearing for its spring *b*, arranged substantially as and for the purpose described.

7. The combination, in a mechanical musical instrument, of a winding or take-up roll and mechanism for driving the same, substantially as described, and a spring pressure-roll having its axis parallel with that of the take-up roll and its periphery in contact with the take-up roll until pressed away by the winding of the sheet on the rolls, all co-operating substantially as described.

8. The combination, with the take-up roller for the music-sheet, of the music-belt and the pressure device, the pressure device consist-

ing of the removable bar, as *g*, having spring-arms, as *f*, and roller, as L, substantially as specified.

9. The music-sheet for forming a continuous belt having openings in one end thereof to register with the notes of the other end thereof in lapping the ends to form an endless belt.

10. The combination, with the tracker-range for a mechanical music-sheet, of two organ-actions, one placed above and the other under the tracker-range.

387,636. MECHANICAL TELEPHONE. Marcus Gail, Canton, Ohio. Filed Oct. 24, 1887. Serial No. 253,243. (No model.)

Claim.—1. The combination, with the shell or casing, the cover, and the diaphragm, of the insulated rings *b b*, clamped between the shell and cover, the adjustable eye-bar G, the main wire E, the adjustable post D, and the set-screw *g*, substantially as described.

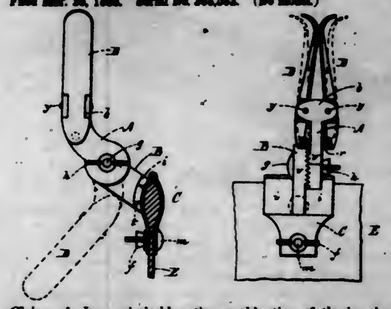
2. The combination, with the shell or casing and cover, of the post D, provided with the nut *c*, the non-metallic collars *d d*, and the spring *f*, the diaphragm C, and the main wire E, substantially as described.

3. The combination, with the receiver and its diaphragm, of the thimble L, the wire h', and the wires h^2 attached thereto and passing through the diaphragm across the face thereof and folded over the edges of said diaphragm, substantially as described.

4. The combination, with the shell or casing, the cover, and the diaphragm, of the post D, made in two sections screw-threaded together and provided with the nut *c*, collars *d d*, the collar *e*, and spring *f*, the adjustable screw-bar G, and the main wire E, substantially as described.

5. In a mechanical telephone, the combination, with the shell or casing, the cover, and the diaphragm, of the post D, made in two parts screw-threaded together, said post having a hole for the passage of the main wire and being provided with the spring F, substantially as described.

387,637. ROAD-CART. Joshua G. Gay, Ottawa, Ill. Filed May 28, 1888. Serial No. 275,269. (No model.)



Claim.—1. The combination, with the axle and seat of a road-cart, of the springs F, having straight portions *f'* rigidly clipped to the axle, and lever portions *f'*, embodying a coil and joined to the seat-bars, substantially as set forth.

2. The combination, with the axle and seat, of the springs F, having their points f^3 secured to the axle by a single clip composed of a holder having a sunken recess, *g*, and a strap-bolt, substantially as set forth.

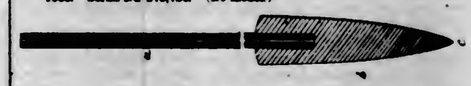
3. In a road-cart, the combination of the seat, the seat-bars, springs F, the shafts pivotally joined to the axle, and the spring *b* uniting the seat-bars and thills, substantially as set forth.

887,638. REIN-HOLDER. Charles W. Gilman, Biddeford, Me. Filed Mar. 26, 1888. Serial No. 268,582. (No model.)

Claim.—1. In a rein-holder, the combination of the bracket B, provided with serrations *v* at its outer end, the body A, pivoted to the bracket B by the bolt *g*, carrying the nut *h*, said body being provided with the cross-head *b* at its outer end and with serrations *v* at its inner end, the jaws D, centrally pivoted to the cross-head *b*, and provided with springs *r*, adapted to close said jaws, and the spring *k*, disposed on the bolt *g*, all being constructed and arranged to operate substantially as set forth.

2. In a rein-holder, the combination of the bracket B, provided with serrations *v* at its outer end, the body A, pivoted to the bracket B by the bolt *g*, carrying the nut *h*, said body being provided with the cross-head *b* at its outer end and with serrations *v* at its inner end, the jaws D, centrally pivoted to the cross-head *b*, and provided with springs *r*, adapted to close said jaws, the spring *k*, disposed on the bolt *g*, the clamp C, secured to the bracket B, the bolt *m*, and nut *f*, all being constructed and arranged to operate substantially as described.

887,639. PROVISION-BASKET. James Goldsmith, New York, N. Y. Filed June 28, 1883. Serial No. 278,194. (No model.)

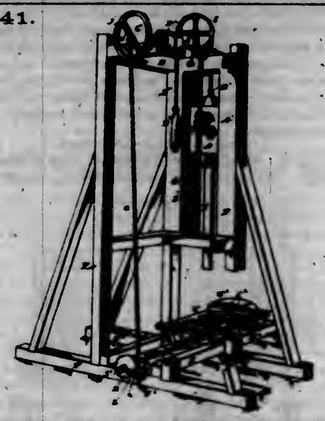


Claim.—1. A basket having longitudinally-running bars on the under side of the bottom, continuous strips placed over the bars on the inside of the bottom, cushioning material between the basket and the strips, and fasteners which pass through the bars and the bottom of the basket and the strips, substantially as and for the purposes set forth.

2. A basket having longitudinally-running bars on the under side of the bottom, a metallic plate covering the inside of the bottom, and fasteners passing through the bars and the bottom of the basket and the metallic plate, substantially as set forth.

3. A basket having longitudinally-running bars on the under side of the bottom, a metallic plate covering the inside of the bottom, a cushion between the bottom and the metallic plate, and fasteners passing through the bars and the bottom of the basket and the cushion and the plate, substantially as set forth.

887,640. POST-HOLE DIGGER. Warren Heaton, Neosho, Mo., assignor of one-half to John C. Alexander, same place. Filed June 1, 1888. Serial No. 275,726. (No model.)



Claim.—The combination, substantially as hereinbefore set forth, of the gas-pipe handle, and the conical cast-iron head cast upon and around the end of the pipe and having its end or point chilled to render it hard and durable.

887,641. MACHINE FOR MAKING CEMENT PIPES. Valentine Hoff, Portland, Oreg. Filed Dec. 19, 1887. Serial No. 258,204. (No model.)

Claim.—1. In a pipe-machine, the combination, with suitable frame-work and a mold, of a sliding cross-head, a plunger, eccentric

887,641.

mechanism located inside the cross-head, and gearing for actuating said mechanism to impart a reciprocating motion to the plunger, substantially as set forth.

2. In a pipe-machine, the combination, with suitable frame-work and a mold, of a sliding cross-head counterbalanced by suitable means, a plunger, eccentric mechanism located inside the cross-head, and gearing for actuating said mechanism to impart a reciprocating motion to the plunger, substantially as set forth.

3. In a pipe-machine, the combination, with suitable frame-work, of a sliding cross-head, a mold, a plunger, eccentric mechanism located inside the cross-head, gearing for operating said mechanism to impart a reciprocating motion to the plunger, and mechanism, substantially as described, for revolving the mold, substantially as set forth.

4. In a pipe-machine, the combination, with suitable frame-work and a mold, of a suspended cross-head, a plunger, eccentric mechanism located inside the cross-head, gearing for actuating said mechanism, a rotary reciprocatory table for supporting the mold, gearing for imparting an intermittent rotary motion to said table, and devices to regulate the speed of such rotation, substantially as set forth.

5. In a pipe-machine, the combination, with suitable frame-work and a mold, of a cross-head, a shaft mounted in the cross-head and carrying an eccentric collar, a yoke within the cross-head, a plunger secured to the yoke, and mechanism for rotating the eccentric collar to impart a reciprocating movement to the plunger, substantially as set forth.

6. In a pipe-machine, the combination, with suitable frame-work, of a table, mechanism for rotating said table, a cross-head, a plunger suspended over the mold, and eccentric mechanism located inside the cross-head for reciprocating the plunger, substantially as set forth.

7. In a pipe-machine, the combination, with a pivoted mold-carrying table, of a cross-head having an interior chamber suspended and counterbalanced to move in vertical guides, a shaft journaled in the cross-head and provided with an eccentric collar, a square block loosely mounted on said collar, a rectangular yoke surrounding this block, a plunger attached to the yoke, and gearing for rotating the shaft to impart a reciprocating movement to the yoke within the cross-head, substantially as set forth.

8. In a pipe-machine, the combination, with suitable frame-work, of a revoluble table having a pinion upon the end of its trunnion, gearing for imparting motion to said pinion, a cross-head mounted in the frame and carrying a plunger, and eccentric mechanism located inside the cross-head for imparting a reciprocating motion to said plunger, substantially as set forth.

9. In a pipe-machine, the combination, with suitable frame-work, a reciprocating plunger, a cross-head, and eccentric mechanism located inside the cross-head for giving motion to the plunger, of a table carrying a shaft, a pinion at one end of the shaft, and a ratchet-wheel near its opposite end, a pivoted table carrying a pinion to mesh with the pinion on the shaft, and gearing for imparting an intermittent rotation to said pivoted table, substantially as set forth.

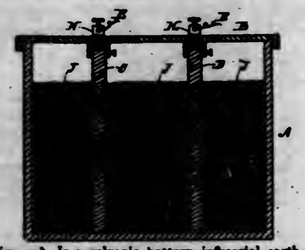
10. In a pipe-machine, the combination, with suitable frame-work, a reciprocating plunger, a cross-head, and eccentric mechanism located inside the cross-head for giving motion to the plunger, of a table carrying a horizontal shaft, a pinion at one end of said shaft, and a ratchet-wheel near its opposite end, an arm loosely mounted on the shaft and carrying a pawl to engage the ratchet-wheel, and gearing for imparting a reciprocating motion to said arm, as and for the purpose set forth.

11. In a pipe-machine, the combination, with suitable frame-work, a pivoted table, and gearing for rotating the same, of a suspended cross-head, a plunger, eccentric mechanism located inside the cross-head, a pinion secured to a shaft of said mechanism, a vertical shaft mounted in the frame-work parallel with the cross-head, a pinion mounted upon a bracket attached to the cross-head and adapted to encircle the vertical shaft to rotate therewith, and gearing for rotating said vertical shaft, substantially as set forth.

12. In a pipe-machine, the combination, with suitable frame-work and a mold-support, of a suspended cross-head, a plunger, eccentric mechanism located inside the cross-head, a pinion fixed to a shaft of said mechanism, a vertical shaft journaled in the frame-work, a pinion journaled in a bracket secured to the cross-head, said pinion being adapted to encircle the vertical shaft and rotate therewith to drive the first-mentioned pinion, a pinion at the upper end of the vertical shaft, and gearing for driving said shaft to impart a reciprocating motion to the plunger at any elevation of the cross-head, substantially as set forth.

13. In a pipe-machine, the combination, with a suitable frame-work, a suspended cross-head carrying a reciprocating plunger, and eccentric mechanism located inside the cross-head for operating said plunger, of a pivoted table beneath said plunger and mechanism for imparting a reciprocating motion to the plunger and an intermittent rotary movement to the table simultaneously, substantially as set forth.

14. In a pipe-machine, the combination, with suitable frame-work, a reciprocating plunger mounted therein, a cross-head, and eccentric mechanism located inside the cross-head for operating said plunger, of a pivoted table carrying a pinion, a shaft mounted beneath said table and carrying a pinion to mesh with the pinion of the shaft, a ratchet-wheel keyed to said shaft, an arm loosely mounted on the shaft, a pawl pivoted to this arm to engage the ratchet-wheel, a driving-shaft carrying a crank-wheel, and a rod connecting said crank-wheel with said arm, substantially as set forth.



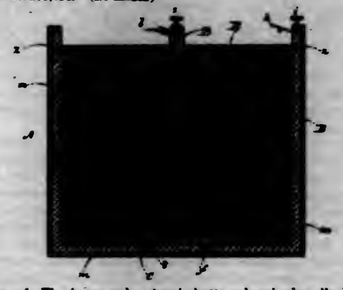
15. In a pipe-machine, the combination, with suitable frame-work and a reciprocating plunger, of a laterally-movable table, a revolving table mounted thereon and carrying a templet of any desired shape, a roller to engage said templet, and mechanism for actuating the laterally-movable table, substantially as set forth.

16. In a pipe machine, the combination, with suitable frame-work and a reciprocating plunger, of a laterally-movable table, a revoluble table mounted thereon, a templet secured to said revoluble table, a roller to engage the templet, devices for actuating the laterally-movable table, and mechanism whereby the revoluble table and plunger are operated simultaneously, substantially as set forth.

17. In a pipe-machine, the combination, with suitable frame-work, a reciprocating plunger, and gearing for actuating the same, of cross-timbers at the base of said frame, rollers mounted thereon, a laterally-movable table mounted on the rollers, a revoluble table mounted on the movable table and carrying a templet, a roller to engage the templet, gearing for rotating the revoluble table, and devices for moving the laterally-movable table, substantially as and for the purpose set forth.

18. In a pipe-machine, the combination, with suitable frame-work and a cross-head carrying a reciprocating plunger, of a laterally-movable table, a revoluble table mounted thereon and carrying a templet, a roller to engage said templet, gearing for rotating the revoluble table, a bracket secured to the frame-work and carrying a pulley, a rope secured at one end to the laterally-movable table and passed over said pulley, and a weight secured to the free end of said rope, substantially as set forth.

887,642. GALVANIC BATTERY. Henry M. Hewett, Boston, Mass., assignor to Hiram S. Parr, same place. Filed Nov. 17, 1887. Serial No. 256,379. (No model.)



Claim.—1. In a galvanic battery, infusorial earth or a similar absorbent substance, sulphuric acid, water, and bisulphate of mercury, in combination with a jar, a zinc plate, and a carbon plate, substantially as set forth.

2. In a galvanic battery, infusorial earth or a similar absorbent substance, sulphuric acid, water, and bisulphate of mercury, in combination with a jar, a cover for said jar, a zinc plate, a carbon plate,

and conducting-wires connected with said plates, substantially as described.

3. As an improvement in galvanic elements, a paste composed of infusorial earth or similar absorbent substance, sulphuric acid, water, and bisulphate of mercury, substantially as set forth.

387,643. GALVANIC BATTERY. Reuben M. Hewett, Boston, Mass., assignor to Hiram G. Parr, same place. Filed Nov. 21, 1887. Serial No. 256,796. (No model.)

Claim.—1. The improved galvanic battery herein described, the same consisting of the carbon jar A, provided with the coating *m*, the dish C, disposed in said jar and containing the mercury *f*, the zinc plate B, resting in said dish, the paste D, composed of infusorial earth or similar substance, moistened or wet with a solution of sulphuric acid, water, and bisulphate of mercury, the cover E, and conducting-wires *l k*, combined and arranged to operate substantially as set forth.

2. In a galvanic battery, a coated carbon jar containing infusorial earth or similar substance, saturated with an acidulated solution, in combination with a zinc plate in contact with said earth, substantially as described.

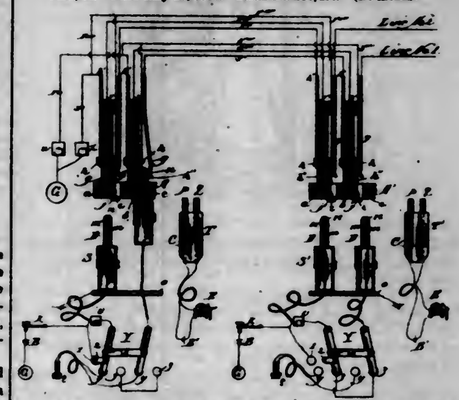
3. In a galvanic battery, a coated carbon jar containing infusorial earth or similar substance, saturated with an acidulated solution, in combination with a zinc plate in contact with said earth, and an insulator interposed between said plate and jar, substantially as set forth.

4. In a galvanic battery, a coated carbon jar containing infusorial earth or similar substance, saturated with an acidulated solution, in combination with a zinc plate in contact with said earth, and a dish containing free mercury for amalgamating said plate, substantially as described.

5. In a galvanic battery, a carbon jar containing infusorial earth or similar substance, saturated with an acidulated solution, a coating for preventing the exudation of acid through said jar, a zinc plate in contact with said earth, a dish containing free mercury for amalgamating said plate, and a cover adapted to tightly close said jar, substantially as set forth.

6. In a galvanic battery, the carbon jar A, provided with the coating *m*, the zinc plate B, disposed in said jar, the paste D, composed of infusorial earth or similar substance, moistened or wet with a solution of acid, bisulphate of mercury, and water, said paste being in contact with said plate, and an insulator for said plate, all combined and arranged to operate substantially as described.

387,644. MOLD FOR CASTING THE TEETH OF DIAMOND SAWS. Thaddeus A. Jackson, New York, N. Y. Filed Mar. 26, 1888. Serial No. 268,577. (No model.)



Claim.—1. The combination, with the upper section, A, of the mold hereinbefore described, comprising the parts C and E and F, held together by the pins *a* and the dowels *b*, and the parts *x*, *y*, and *z*, held together by the pins *c*, of the V-gages D, D′, D″, and D‴ within said mold, and the bars *g* and A, attached, respectively, to the gages D′ and D″ and projecting without said mold to afford facility for adjusting the positions of the said gages D′ and D″, substantially as and for the purpose set forth.

2. The combination, with the upper section, A, of the mold hereinbefore described, comprising the parts C, E, and F, held together by the pins *a* and the dowels *b*, and the lower section, B, of said mold, comprising the parts *x y z*, held together by the pins *c*, of the screws *d*, inserted within the walls of said mold, and the pins *d*′, detachably held by said screws, extending within said mold to afford facility for holding diamonds in said mold and to be cast therewith into a saw-tooth, all substantially as and for the purpose set forth.

3. The combination, with the lower section, B, of the mold hereinbefore described, comprising the parts *x y z*, held together by the pins *c* and attached to the upper section of said mold, as hereinbefore specified, of the screws *d*, inserted into the walls of said section of said mold, the pins *d*′, partly within said screws, having heads *d*‴, spring *d*″, and extending within said mold to afford facility for holding diamonds to be cast into the teeth of a saw, all substantially as and for the purpose set forth.

387,645. MULTIPLE SWITCH-BOARD. Milo G. Kellogg, Ryde Park, Ill. Filed May 26, 1887. Serial No. 238,627. (No model.)

Claim.—1. The combination, with a pair of flexible conducting-cords and their plugs for connecting two subscribers' lines, of an operator's telephone, a clearing-out annunciator, and a switch, said annunciator being in the circuit of said cords and said switch having contact-points to switch said telephone in and out of the circuit of the cords, and other contact-points to shunt said annunciator by a circuit of small resistance, of which the telephone is not a part, when said telephone is switched into the circuit of the cords, substantially as set forth.

2. The combination, with two telephone-lines connected together for conversation, of an operator's telephone, a clearing-out annunciator, and a switch, said annunciator being in the circuit of the lines and said switch having contact-points to switch said telephone in and out of the circuit of the lines, and other contact-points to shunt said annunciator by a circuit of small resistance, of which the telephone is not a part, when said telephone is switched into the circuit of the lines, substantially as set forth.

3. The combination, with telephone-lines radiating from the central office and a loop provided with means for connecting it at opposite ends with any two of said lines, of an operator's telephone, a signal-receiving device, and a switch, said signal-receiving device being in the circuit of said loop and said switch having contact-points to switch said telephone in and out of said loop, and other contact-points to shunt said signal-receiving device by a circuit of small resistance, of which the telephone is not a part, when said telephone is switched into the circuit of the loop, substantially as set forth.

4. The combination, with a telephone-line and a line-switch, of two test-bolts, one of which is connected by a branch connection to the circuit of the line on one side of the pair of switch-points and the other of which is normally insulated from the line and is adjacent to one of the switch-points and is crossed with said point by the plug on its insertion, said point being that point of the switch which is connected to the same side of the line as said branch connection is, substantially as set forth.

5. The combination, with a telephone-line, of two or more switches for said line, one on each of two or more switch-boards, and two or more pairs of test-bolts, one pair on each of said switch-boards, one bolt of each pair being connected by a branch connection to the circuit of the line outside of and to one side of the switches, and the other bolts being normally insulated from the line and connected together by a circuit-connection, each bolt being adjacent to one of the switch-points at its board and crossed with it by the plug on its insertion, said point being that point of the switch which is connected to the same side of the line as said branch connection is, substantially as set forth.

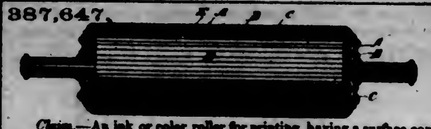
6. The combination, with a telephone-line and two or more switch-boards, at each of which said line may be switched for conversation, of two or more pairs of test-bolts for said line, one pair on each of said boards, one bolt of each pair being connected by a branch connection to the circuit of the line outside of and on one side of the switches, and the other bolts of the pairs being connected together and each adjacent to one of the switch-points at its board, said point being that point of the switch which is connected to the same side of the line as said branch connection is, substantially as set forth.

7. The combination, with a telephone-line, of two or more switches for said line, one on each of two or more boards, and two or more pairs of test-bolts for said line, one pair on each of said boards, one bolt of each pair being connected by a circuit-connection to the circuit of the line between its switches and the office ground, and the other bolt of each pair being connected with its corresponding bolts on the other boards adjacent to the contact-point of the line-switch at its board, which is connected with the office ground and crossed with said point by the plug on its insertion, substantially as set forth.

8. The combination, with telephone-lines and two or more switch-boards, at each of which said lines may be switched for conversation, of pairs of test-bolts for each of said lines, one pair on each of said boards, one bolt of each pair being connected to the circuit of the line between the switches and the office ground, the other bolt of each pair being connected with its corresponding bolts on the other boards adjacent to the ground contact-point of the line-switch at its board and crossed with said point by the switch-plug on its insertion, and sets of testing apparatus, one set at each board, each set consisting of a double testing plug or device, with a double flexible cord, the two contact-pieces of each plug being adapted to be brought into contact with any pair of test-bolts at its board, and a test-receiving instrument and a battery in a loop, which connects the two conductors of said flexible cord, substantially as set forth.

9. The combination, with telephone-lines and two or more switch-boards, at each of which said lines may be switched for conversation, of pairs of test-bolts for each of said lines, one pair on each of said boards, one bolt of each pair being connected to the circuit of the line outside of and on one side of its line-switches, the other bolt of each pair being connected with its corresponding bolts on the other boards adjacent to the point of the switch of its line at its board, connected to said first-mentioned bolt and crossed with said point by the switch-plug on its insertion, and sets of testing apparatus, one set at each board, each set consisting of a test-receiving instrument and a battery in a loop, and means for connecting the two sides of the loop to the two test-bolts of any pair of test-bolts at its board, substantially as set forth.

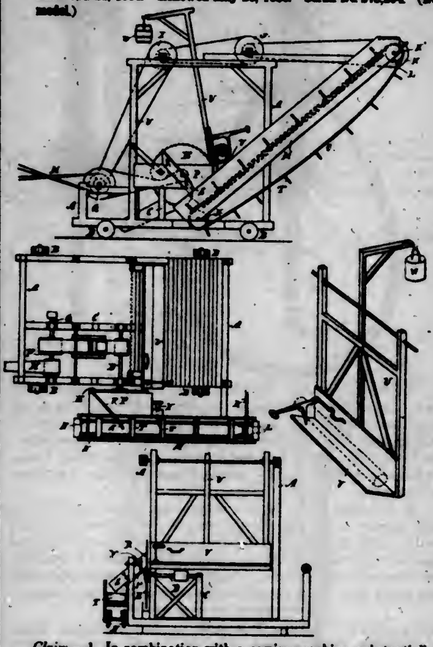
387,646. SAND-BAND AND CLIP FOR VEHICLE-AXLES. Nathaniel S. Keyser, Marshalltown, Iowa. Filed Apr. 12, 1888. Serial No. 270,422. (No model.)



Claim.—1. In an unsplit, inexpansible, combined collar, sand-band, and clip made in one piece, as described, the wall d^3, in combination with the portions d d^5 and collar d^2, the said wall d^3 extending beyond the back of the collar and forming an abutment for the wooden stock, and also forming an elongated substantial upper bearing for the axle, substantially as described.

2. In the unsplit, inexpansible, combined sand-band, collar, and clip made in one piece, as described, the wall d^3, in combination with the portion d, formed with the unbroken upwardly-sloping surface d', for guiding away the sand, collar d^2, cut away to form the sand-escape f between the portion d and the hub, and the portion d^5, substantially as described.

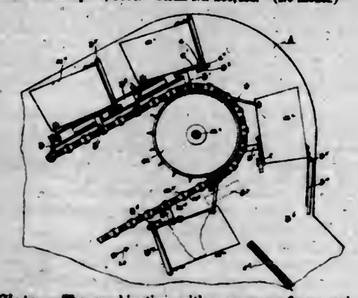
3. The unsplit, inexpansible, combined sand-band, collar, and clip made in one piece, as described, having the portion d, sloped at d', wall d^3, extended back of the collar, the portion d^5, and the horizontally-extended brace-rod lugs E E, substantially as and for the purpose described.



4. The within-described unsplit, inexpansible, combined sand-band, collar, and clip made in one piece, said combined device having the wall d^3, forming a bearing and an abutment, and provided with the cut-away collar d^2, forming space f between portion f and the hub, and also having the sloped surface d' and portions d^5, provided with laterally-extended horizontal brace-rod lugs E E, substantially as and for the purpose described.

387,647. PRINTER'S INK-ROLLER. Friedrich H. Lahs, Anger, near Leipsic, Saxony, Germany. Filed Sept. 26, 1887. Serial No. 250,703. (No model.)

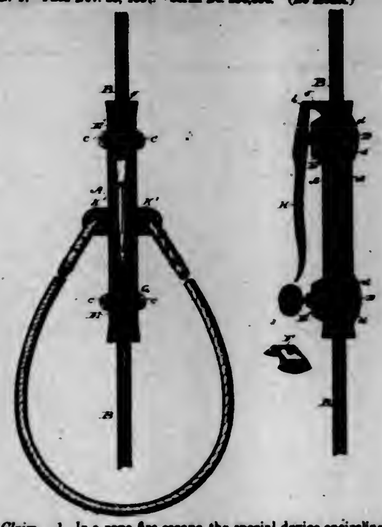
Claim.—An ink or color roller for printing, having a surface composed of felt saturated with a mixture of beef-tallow, copal-lac, varnish, and turpentine-oil.



387,648. SAWING-MACHINE. Will P. Langley, Detroit, Mich. Filed Oct. 20, 1886. Renewed May 26, 1888. Serial No. 275,294. (No model.)

Claim.—1. In combination with a sawing-machine, substantially as described, provided with an elevating-carrier, an inclined table, F, located between such carrier and the saw, said table being provided with a guide, R, and gate S, pivoted to said guide, substantially as and for the purposes described.

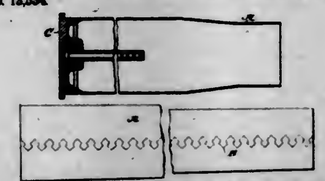
2. In a machine for the purpose described, the combination of the portable frame A, carrying a saw, E, adapted to be operated from any suitable power, an oscillating table, U, an elevating-carrier, O, and an inclined table, F, provided with a guide, R, and gate S, pivoted to said guide, all combined and operating in the manner and for the purpose described.



387,649. CONVEYER-BUCKET. Frederic A. Lockwood, Boston, Mass. Filed Apr. 3, 1888. Serial No. 269,483. (No model.)

Claim.—The combination, with a conveyer-frame and endless chain therein, of a bucket provided with a hinged bottom, a locking

device and link *b* and hanger *b'*, to attach said bucket to said chain, and means to operate said locking device, substantially as described.

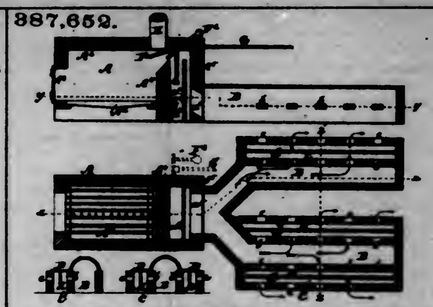


387,650. ROPE FIRE-ESCAPE. RUSSELL P. LOVEJOY, Carthage, N. Y. Filed Nov. 26, 1887. Serial No. 256,693. (No model.)

Claim.—1. In a rope fire-escape, the special device encircling the rope, wire, or cable, consisting of the hollow tubular device A A, with trumpet-shaped ends, the enlarged portions D D, with the frictional bearing-ridges *d d*, antagonized by the adjustable bearing-saddles F and I, the former being controlled by the thumb-screw G and the latter actuated by and under the control of the thumb-lever H, as shown and described.

2. A tubular device in two longitudinal sections, each having three pairs of flat perforated projections, one pair near each end, which shall serve for receiving retaining screws or rivets, binding the sections together, while the third and much larger pair are near the center and constitute, when the sections are together, a pair of stout rings for the attachment of a loop or swing-seat for the occupant of said escape.

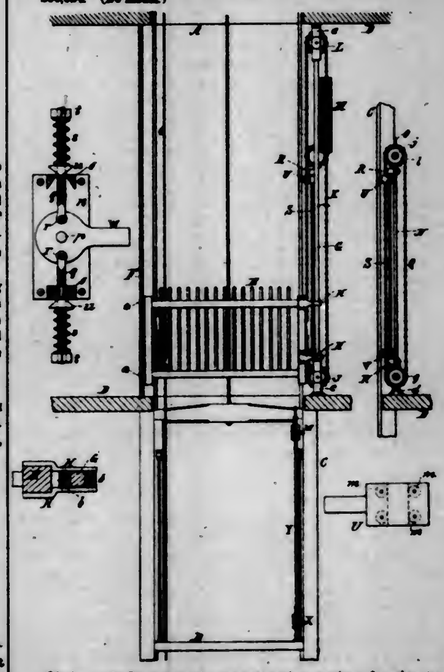
387,651. METHOD OF MAKING CARTRIDGE-SHELLS. HIRAM S. MAXIM, London, England. Filed Oct. 11, 1887. Serial No. 252,079. (No model.) Patented in England Oct. 2, 1886, No. 12,561, and Oct. 22, 1886, No. 13,534.



Claim.—1. The improvement in the method or process of manufacturing cartridge-cases, which consists in first forming from sheet metal a blank with serrated edges, then bending the same and interlocking the serrated edges to form a tube, and then shaping or finishing said tube by inserting it in a chamber of hard metal of the required shape or configuration and rolling it from the interior, as herein set forth.

2. The method or process of making cartridge-cases which consists in punching or stamping from sheet-steel or similar metal a blank with serrated edges, bending the blank into tubular shape and interlocking the serrations, and then welding the serrated edges together and uniting a head or base to the tube, as set forth.

387,652. DRIER. WALLACE MCPHERSON, Texarkana, Tex. Filed Apr. 2, 1888. Serial No. 269,393. (No model.)



Claim.—1. In a drier, the combination of a furnace having a bridge-wall in front of its rear wall, a pendent plate, *a*, between said bridge-wall and rear wall, and a standing partition, a^2, between said pendent plates and rear walls, the latter having an opening, a^3, therein, and passages provided with lateral openings, substantially as and for the purpose described.

387,652.

2. In a drier, the combination of a furnace having a bridge-wall and an opening, a^3, in its rear wall, and passages B, having lateral openings *b* below their arch or cover, and flues C, having lateral openings, and a pendent plate, *d*, substantially as and for the purpose described.

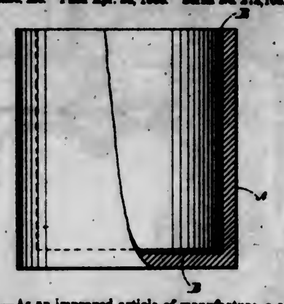
387,653. ELEVATOR-HATCHWAY GATE. GEORGE S. BURKE and HELLER P. BURKE, Dayton, Ohio. Filed Mar. 3, 1888. Serial No. 266,094. (No model.)

Claim.—1. In automatic gate-operating devices for elevator-hatchways, the combination of a horizontal shaft secured near the side of the hatchway, two sprocket-wheels arranged one loose and the other tight upon said shaft and connected by an intermeshing pinion, two supporting-wheels arranged one vertically above each of said sprocket-wheels, two drive-chains, one connecting each of said sprocket-wheels with its corresponding supporting-wheel, two projecting lugs secured one on each of said chains and so arranged thereon that when one is elevated the other will be depressed, a vertically-sliding gate operated by said horizontal shaft, and an elevator provided with two catches arranged one in line with each of the lugs on the drive-chains, substantially as described, whereby the movement of the elevator automatically raises and lowers said gate.

2. In automatic gate-operating devices for elevator-hatchways, the combination of a horizontal shaft secured near the side of the hatchway, two sprocket-wheels arranged one loose and the other tight upon said shaft and connected by an intermeshing pinion, two supporting-wheels arranged one vertically above each of said sprocket-wheels, two drive-chains, one connecting each of said sprocket-wheels with its corresponding supporting-wheel, two projecting lugs secured one on each of said drive-chains and so arranged thereon that when one is elevated the other will be depressed, a third sprocket-wheel secured upon said horizontal shaft, a supporting-wheel arranged above the same, a drive-chain connecting said wheels, a vertically-sliding gate secured to said drive-chain, and an elevator provided with two catches arranged one in line with each of the lugs on the first-mentioned drive-chains, substantially as described, whereby the movement of the elevator automatically raises and lowers said gate.

3. In automatic gate-operating devices for elevator-hatchways, the combination of a horizontal shaft secured near the side of the hatchway, two sprocket-wheels arranged one loose and the other tight upon said shaft and connected by an intermeshing pinion, two supporting-wheels arranged one vertically above each of said sprocket-wheels, two drive-chains, one connecting each of said sprocket-wheels with its corresponding supporting-wheel, two projecting lugs secured one on each of said drive-chains and so arranged thereon that when one is elevated the other will be depressed, two additional sprocket-wheels secured to said horizontal shaft, one near each end, two additional supporting-wheels arranged one above each of said sprocket-wheels, two drive-chains, one connecting each of said sprocket-wheels with its corresponding supporting-wheel, two vertically-sliding gates, one secured to each of said drive-chains, and an elevator provided with two catches arranged one in line with each of the lugs on the first-mentioned drive-chains, substantially as described, whereby said gates are automatically and simultaneously raised and lowered by the movement of the elevator.

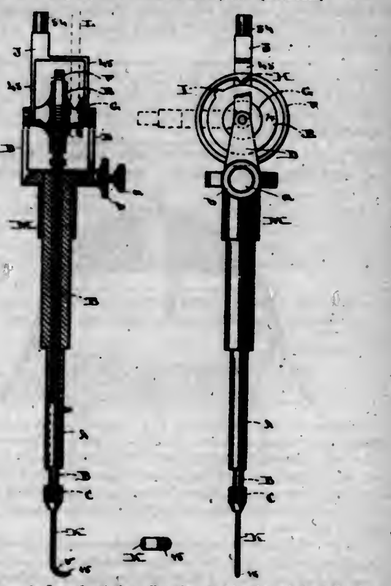
4. In automatic gate-operating devices for elevator-hatchways, the combination of a horizontal shaft secured near the side of the hatchway, two sprocket-wheels arranged one loose and the other tight upon said shaft and connected by an intermeshing pinion, two supporting-wheels arranged one vertically above each of said sprocket-wheels, two drive-chains, one connecting each of said sprocket-wheels with its corresponding supporting-wheel, two projecting lugs secured one on each of said drive-chains and so arranged thereon that when one is elevated the other will be depressed, two vertical guides, one for each of said lugs, a third sprocket-wheel secured upon said horizontal shaft, a supporting-wheel arranged above the same, a drive-chain connecting said wheels, a vertically-sliding gate secured to said drive-chain, and an elevator provided with two catches arranged one in line with each of the lugs on the first-mentioned drive-chains, substantially as described, whereby the movement of the elevator automatically raises and lowers said gate.



5. In automatic gate-operating devices for elevator-hatchways, the combination of a horizontal shaft secured near the side of the hatchway, two sprocket-wheels arranged one loose and the other tight upon said shaft and connected by an intermeshing pinion, two supporting-wheels arranged one vertically above each of said sprocket-wheels, two drive-chains, one connecting each of said sprocket-wheels with its corresponding supporting-wheel, two projecting lugs secured one on each of said drive-chains and so arranged thereon that when one is elevated the other will be depressed, a third sprocket-wheel secured upon said horizontal shaft, a supporting-wheel arranged above the same, a drive-chain connecting said wheels, a vertically-sliding gate secured to said drive-chain, and an elevator provided with two spring-catches arranged one near the top and one near the bottom of the elevator and one in line with each of the lugs on the first-mentioned drive-chains, whereby the movement of the elevator automatically raises and lowers said gates.

6. The combination of the shaft I, sprocket-wheels *f g*, the former tight and the latter loose upon said shaft, the gears *h h i*, connecting said sprocket-wheels, the supporting-wheels *k l*, drive-chains P Q, projecting lugs U V, the former secured to the chain Q and the latter to the chain P, sprocket-wheel J, secured to the shaft I, supporting-wheel L, drive-chain K, vertically-sliding gate E, secured to the chain K, and elevator B, provided with the spring-catches W X, substantially as and for the purpose specified.

7. The combination of the shaft I, sprocket-wheels *f g*, the former tight and the latter loose upon said shaft, the gears *h h i*, connecting said sprocket-wheels, the supporting-wheels *k l*, drive-chains P Q, projecting lugs U V, secured the former to the chain Q and the latter to the chain P, guide-rods S T for said lugs, brackets or stops R, sprocket-wheel J, secured to the shaft I, supporting-wheel L, drive-chain K, vertically-sliding gate E, secured to the chain K, and elevator B, provided with the spring-catches W X, substantially as and for the purpose specified.

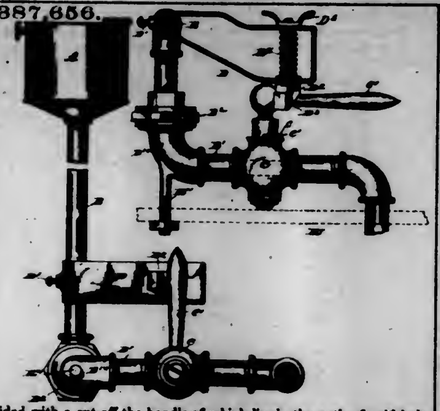


8. A spring-catch for elevators, composed of the pivoted catch-piece W, plate *n*, perforated lugs *o o*, rods *q q*, pivoted at one end to the catch-piece W, passing through said lugs *o o*, and provided with beveled washers *v v*, nuts *t t*, and springs *s s*, surrounding the rods and interposed between the nuts and washers, substantially as and for the purpose specified.

387,654. JAR FOR GALVANIC BATTERIES. BERNARD OVERLACH, Boston, Mass., assignor to the Overlach Electric Composition Company, East, Me. Filed Apr. 30, 1888. Serial No. 272,102. (No model.)

Claim.—As an improved article of manufacture, a containing-jar for galvanic batteries constructed of an acid-proof composition composed of white sand, resin, slaked lime, boiled linseed-oil, sulphuric acid, and oxboxide of copper, in the proportions and compounded substantially as specified.

387,655. DENTAL PLUGGER. DANIEL D. PEABODY, Stoneham, Mass. Filed May 22, 1888. Serial No. 274,063. (No model.)



Claim.—1. In a dentist's mallet, the combination of the following instrumentalities, to wit: a body, a head for said body, a spindle fitted to work in said body, a head-piece secured to the upper end of said spindle and provided with a cam, a disk journaled on the head of said body and provided with a cam adapted to engage the cam on the head-piece of the spindle and move the spindle in the direction of said disk, a pulley for driving the disk journaled on said head, and a plugger-point secured to said spindle, the lower portion of said point being bent or curved at an angle to its body, substantially as set forth.

2. In a dentist's mallet, the piston B, provided with a head-piece, as F, having a cam, as H, in combination with the pulley G and disk E, having the cam I, said cams being adapted to engage when the disk is revolved by the pulley and throw the piston in the direction of said disk, and said disk and pulley journaled in a support on the body of the hammer, substantially as described.

387,656. CUT-OFF FOR GASOLINE-STOVES. P. ALPHONSE ERNST, Jamestown, Dak. Filed Aug. 4, 1887. Serial No. 246,155. (No model.)

Claim.—1. In a gasoline-stove, the combination, with a vertical supply-pipe carrying a bracket having a spring-bolt, of a horizontal branch pipe pivotally connected to said vertical supply-pipe, and pro-

387,656.

vided with a cut-off the handle of which lies in the path of said bolt, substantially as specified.

2. The combination of the reservoir A and pivotally-connected pipes B and B', the former having the bracket D, carrying a bolt, D^2, secured thereon, and the latter having the cut-off C mounted therein and provided with a handle, C', lying in the path of the bolt D^2, substantially as specified.

3. The bracket D, having the set-screw D', bolt D^2, chamfered, as at D^3, the coiled spring D^4, and button D^5, in combination with the pipe B, and the pipe B', having the cut-off C, provided with the handle C', arranged in front of and adapted to be operated by said bolt, substantially as specified.

387,657. PYROTECHNIC HELMET. Charles B. Rockwood, Keystone, Minn. Filed Apr. 4, 1888. Serial No. 269,692. (No model.)

Claim.—1. The combination, with a helmet having a lamp and a closed chamber separate from said lamp, of a filling of absorbent material in said chamber adapted to hold light hydrocarbon oils in suspension, an exit-tube from said chamber having its discharge end adjacent to the lamp-burner, and a blast-tube terminating within said chamber and extending to within reach of the helmet-wearer's mouth, substantially as described.

2. The combination, with a helmet having a lamp attached thereto and an inclosed receptacle in its dome divided into compartments by a vertical partition stopping short of its bottom, of an exit-tube from one of said compartments having its discharge end adjacent to the lamp-burner, a blast-tube terminating near the top of the other compartment and provided with an extension to within reach of the helmet-wearer's mouth, and a filling of absorbent material within said receptacle adapted to hold hydrocarbon oils or their gases in suspension, substantially as described.

3. The combination, with a helmet having a lamp and a closed chamber separate from said lamp, of a tubular chin-strap having an opening within reach of the helmet-wearer's mouth and provided with an extension terminating within said closed chamber, an exit-tube from said chamber having its outlet adjacent to the lamp-burner, and a filling of absorbent material within said chamber holding hydrocarbon oils in suspension, substantially as described.

4. The combination, with the helmet A, having a receptacle in its dome with two compartments formed by the horizontal diaphragm C and the vertical portion E E', stopping short of the bottom, of the lamp D, having its body within said receptacle and its burner D' projecting through the top of the helmet, the perforated exit-tube F, starting from the bottom of one compartment and terminating outside the helmet adjacent to the lamp-burner, the rigid blast-tube H within the other compartment terminating near the top of the helmet, the flexible tubular chin-strap H', attached to the lower end of the tube H and provided with the opening A, and the absorbent material G within said chamber adapted to hold hydrocarbon oils in suspension, substantially as described.

5. A helmet having an inclosed chamber in its dome adapted to contain oil, and an exit-tube projecting through the top of the helmet adapted to serve as a burner, substantially as described.

387,658. CRIMPING-TONGS. Lorenzo L. Sagendorph, Cincinnati, Ohio, assignor of one-half to Marion P. Lloyd, same place. Filed June 20, 1887. Serial No. 241,857. (No model.)

Claim.—1. The combination of the hinged jaws A A, arms D D, provided with helical projections F F and lever G, having head G', provided with helical projections *g*, substantially as and for the purposes specified.

2. The combination of hinged jaws A A, arms D D, provided with lugs E E, and helical projections F F, and lever G, having head G', provided with helical projections *g*, substantially as and for the purposes specified.

3. The combination of hinged jaws A A, arms D D, provided with lugs E E, and helical projections F F, spring H, and lever G, having head G', provided with helical projections *g*, substantially as and for the purposes specified.

387,659. PIPE-WELDING BALL. Andrew M. Sandberg, McKeesport, Pa. Filed Apr. 30, 1888. Serial No. 271,266. (No model.)

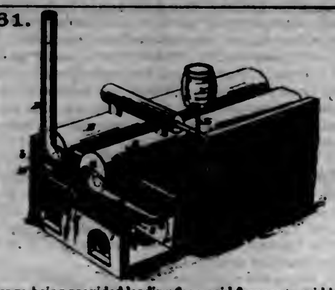
Claim.—1. A pipe-welding ball formed of two halves and provided with an axial socket for a rod, bolts uniting the two halves and serving as a means for adjusting the distance between them, and springs interposed between the halves and serving to separate the halves as far as the bolts will permit, combined substantially as and for the purpose set forth.

2. In a pipe-welding ball, the combination, substantially as set forth, of two ball-halves in shell form, a pair of internal bolts serving to unite the halves and adjust the distance between them, dowel-sockets in the contiguous faces of the halves, dowel-pins in such sockets, and springs interposed between the halves and serving to separate the halves as far as the attachment of the bolts will permit.

3. In a pipe-welding ball, the combination, substantially as set forth, of the ball-halves A, having arms B and sockets C, bolts E, located within the ball, bolts F, located outside the open end of the ball, and springs interposed between the two halves.

4. In a pipe-welding ball, the combination, substantially as set forth, of ball-halves provided with sockets C, bolts E, counterbored dowel-sockets H, dowel-pins J, and springs K.

387,660. POST FOR VERANDA-RAILINGS. John G. Smeltzer, Clay City, Ind. Filed Mar. 31, 1888. Serial No. 269,093. (No model.)



Claim.—In combination with a post, the base comprising the upper and lower plates affixed, respectively, to the bottom of the post and the floor, and provided with registering sockets having right and left internal screws, and the threaded stem or body mounted at its ends in the said sockets, substantially as specified.

387,661. SMOKE-CONSUMER. Robert H. P. Sewall, Birmingham, Ala. Filed June 23, 1887. Serial No. 242,294. (No model.)

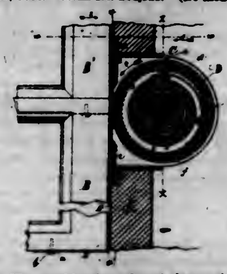
Claim.—1. In a smoke-consumer, the combination of a furnace, a burner or burners separated from said furnace, and a superheater, a smoke-passage being provided leading from said furnace to said burner or burners through the superheater, substantially as set forth.

387,661.

2. A smoke-consumer, substantially as herein described, comprising the superheating-chamber, the smoke-passage communicating therewith, the oil-supply pipe leading into such chamber, and the perforated burner pipe or pipes, substantially as set forth.

3. In a smoke-consumer, a superheating-chamber, a smoke-flue leading therefrom, and a perforated burner pipe or pipes combined with an oil-supply pipe and a steam-pipe leading into the superheating-chamber, substantially as set forth.

4. A grate having hollow end portions and hollow tubes extended therebetween and forming a superheating-chamber, combined with a burner pipe or pipes, and a smoke-flue communicating with such superheating-chamber, substantially as set forth.

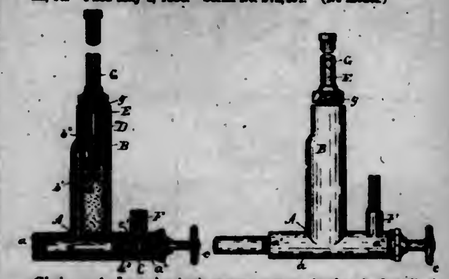


5. In a smoke-consumer, the combination, with a boiler and an oil tank or reservoir, of a superheating-chamber, a burner tube or tubes, the smoke-flue, the steam and oil pipes leading, respectively, from the boiler and the oil-tank to said superheating-chamber, and valves in said pipes for controlling the supply of steam and oil, substantially as set forth.

6. In a smoke-consumer, a hollow grate forming a superheating-chamber, in combination with a tube or main leading from said chamber, and a plurality of perforated burner-tubes connected with said tube or main, and a smoke-flue or passage communicating with said hollow grate, substantially as set forth.

7. In a smoke-consumer, the combination of the grate forming a superheating-chamber and having the end portions 1 2, and hollow tubular connections between said portions 1 and 2, the smoke-flue connected with portion 2, and the main or tube connected with portion 1 and provided with a burner or burners, substantially as and for the purposes specified.

8. The combination, with two boilers, of a furnace under one of said boilers, a burner or burners under the other boiler, a superheater, a pipe connecting such superheater with the burner or burners, and a pipe or flue for conducting the products of combustion into the superheater, all being substantially as described, whereby the products of combustion from the furnace are conducted through the superheater to the burner or burners, as and for the purposes specified.

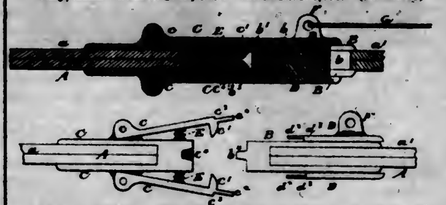


387,662. SASH-BALANCE. Jonas Rothrock, New York, N. Y. Filed Apr. 20, 1888. Serial No. 271,235. (No model.)

Claim.—1. The combination of a window-sash, a window-frame, A, having casing C, a drum or barrel mounted to revolve in the said casing, a band attached with one end to the rim of the said barrel and with the other end to the foot-rail of said sash, a spring coiled around the hub of the barrel and attached with one end to the said hub and with the other end to a fixed point in the barrel-casing, and a friction spring-stop fixed to the said casing and bearing against the inner circumference of the said rim, the said spring being set by lowering the sash, substantially as described.

2. The combination of a window-sash, a window-frame, A, having casing C, a drum or barrel mounted to revolve in the said casing, a band attached with one end to the rim of said barrel and with the other end to the foot-rail of said sash, a spring coiled around the hub of the barrel and attached with one end to the said hub and with the other end to a fixed point in the barrel-casing, and a friction spring-stop fixed to the said casing and bearing against the inner circumference of the said rim, said rim having interiorly corrugations, and the said friction-stop being adapted to engage such corrugations, and the said spring being set by lowering the sash, substantially as described

387,663. MERCURY PRESSURE-GAGE. Frank T. Sutley, Franklin, Pa. Filed May 1, 1888. Serial No. 272,491. (No model.)



Claim.—1. In a plumber's mercury-gage, the herein-described casting, consisting of a pipe, *a*, having an internal valve-seat, and a projecting hollow stud, F, and an arm, B, containing a mercury-chamber and a duct leading therefrom to the pipe *a*, substantially as and for purpose specified.

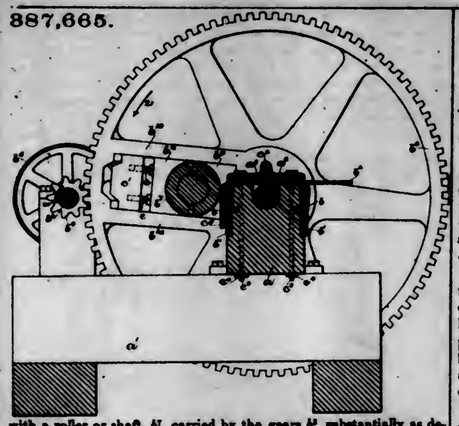
2. The combination of the pipe *a*, chambered arm B, and a duct, *b'*, leading from the chamber thereof to said pipe, with a valve in one end of said pipe *a*, hollow stud connected with said pipe, and an indicator-tube secured tightly in the upper end of said chambered arm and extending into the chamber thereof, substantially as and for the purpose specified.

3. The combination of a pipe, *a*, and mechanism, substantially as described, for introducing and retaining air under pressure, with an arm, B, containing a mercury-chamber and a duct leading therefrom to the pipe *a*, an internal annular shoulder, b^3, in said arm B above the mercury-chamber, an indicator-tube, a rubber washer, and a nut for pressing said washer against said shoulder, substantially as and for the purpose specified.

387,664. HORSE-DETACHING DEVICE. Alonzo T. Trahlin, Roxbury, Mass. Filed Jan. 13, 1888. Serial No. 260,626. (No model.)

Claim.—1. A horse-detacher consisting of the two clasps B C, constructed and combined with two sections of a trace and a detaching-cord, substantially as shown and described.

2. The hinged arms *c c*, having the subjacent studs *c' c'*, and held apart by the spring E, in combination with the slide D, arranged to lock the clasps B C together, whereby the two parts of the trace may be fastened or unfastened, as set forth.

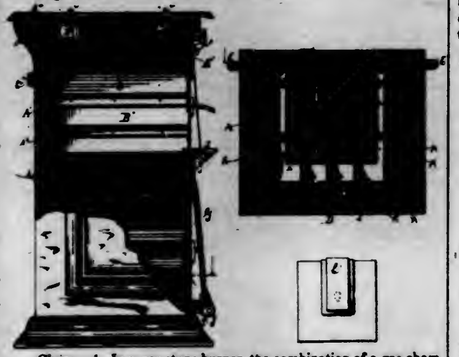


3. A trace made in two parts connected by two clasps, B C, provided at their meeting ends with the tenon and slot b^4 c^4, the stud $\bar{c}^5$, and the opening c^5, whereby the two parts of the trace cannot become vertically or horizontally displaced.

387,665. MACHINE FOR FLANGING METAL. James Tetlow, Boston, Mass. Filed Dec. 27, 1887. Serial No. 259,031. (No model.)

Claim.—1. In a machine for bending or flanging metal sheets, a bed, *a*, to support the metal sheet to be flanged, formers detachably connected to the sides of the said bed, and a clamp to secure the metal sheet on top of the said bed, with its sides projecting beyond the bed, combined with a roller, and mechanism constructed, substantially as described, to move the said roller over the said bed, and clamp to bend the sides of the sheet over the said formers to form flanges to the portion of the metal sheet held between the clamp and bed, substantially as described.

2. The bed *a*, having a groove, a^2, a shaft, a^3, having gears b^2, combined with a shaft, b^3, having pinions in mesh with said gears, and



387,665.

with a roller or shaft, b^3, carried by the gears b^3, substantially as described.

3. In a machine for bending or flanging metal sheets, the combination, with a bed and formers secured on opposite sides thereof, of a clamp to secure the metal sheet on the said bed, a roller, and mechanism constructed, substantially as described, to move the roller over the said bed, and clamp to bend the sides of the sheet over the said formers, and adjustable bearings for the said roller to permit metal sheets of varying thicknesses to be bent, substantially as described, and for the purpose specified.

387,666. GAS-STOVE. Peter G. Van Wie, Cleveland, Ohio. Filed Aug. 6, 1887. Serial No. 246,287. (No model.)

Claim.—1. In a gas-stove burner, the combination of a gas-chamber provided on its outer side with corrugations, said corrugations provided with jet-orifices, and air-pipes alternating with the crests of said corrugations and provided with jet-orifices, substantially as set forth.

2. In a gas-stove burner, the combination, with a chamber provided on one of its outer sides with corrugations and having the crests of said corrugations provided with jet-orifices, of air-pipes located in the valleys between said crests, said air-pipes provided with jet-orifices, substantially as set forth.

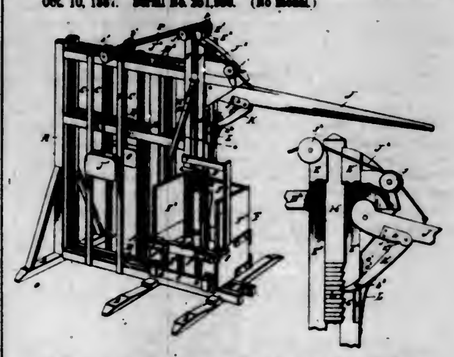
3. In a gas-stove burner, the combination, with a gas-chamber having one of its outer sides provided with corrugations, the crests of said corrugations provided with jet-orifices, of air-pipes secured to said chamber and alternating with said crests and provided with jet-orifices, the series of orifices in one crest and its adjacent pipe converging toward each other, substantially as set forth.

4. In a gas-stove burner, the combination, with a gas-chamber having one of its outer sides provided with corrugations, the crests of said corrugations provided with jet-orifices, of air-pipes secured in the valleys between said crests, said pipes provided with jet-orifices, the outer ends of said air-pipes being substantially flush with the outer stove-wall and opening into the outer air, substantially as set forth.

5. In a gas-stove, the combination of rear and side stove-walls, an oven located within the same, a space intermediate of the rear and side walls, respectively, of said oven and stove, air-inlet openings connecting said intermediate space with the outer air, an inner oven located within said first oven, a space intermediate of the side and rear walls, respectively, of the two ovens, and an outlet-opening located centrally above the top of the inner oven and connected with the air-space between the two ovens, substantially as set forth.

6. In a gas-stove, the combination of a burner provided on its lower side with corrugations and having air-pipes alternating with the crests of said corrugations, said pipes and crests each provided with jet-orifices, an oven located above the same, and a flue passing around a portion of said oven and having its outlet centrally above said oven, substantially as set forth.

7. In a gas-stove, the combination of a burner having alternate gas and air orifices, a primary oven within which it is located, and a secondary oven located within the extended wall of the primary oven, flue-passage being formed intermediate of said wall and secondary oven, the wall of said primary oven being provided with air-inlet and air-outlet openings, respectively, on opposite sides of said secondary oven, substantially as set forth.



8. In a gas-stove, the combination of a primary oven extending from the bottom to near the top of the stove, an air-space intermediate of said oven and the rear wall and two side walls of the stove, a burner located substantially midway of the vertical height of said oven and provided with jet-orifices opening downwardly, a secondary oven located within said primary oven and directly above the burner, and an air-space intermediate of the side walls, respectively, of said two ovens, substantially as set forth.

9. In a gas-stove burner, the combination of a gas-inlet pipe, a gas-chamber provided with perforations, an air-pipe provided with perforations and lying contiguous to said gas-chamber, and a separator provided with perforations located intermediate of said gas-inlet pipe and said air-pipes, substantially as set forth.

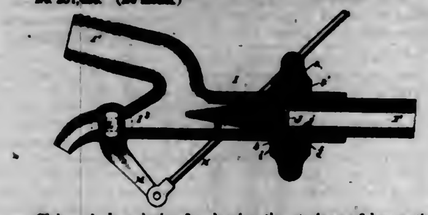
10. In a gas-stove burner, the combination of a gas-chamber provided on its lower side with corrugations and having perforations in the crests of the same, air-pipes provided with perforations and alternating with said crests, a gas-inlet pipe opening into said chamber, and a separator provided with perforations located across the discharge opening of said gas-inlet pipe, substantially as set forth.

11. In a gas-stove, the combination, with a series of gas-pipes having one or more gas-discharge outlets, of an air-pipe located parallel with and in proximity to said gas-pipes and having one or more discharge-outlets, the air-inlet opening of said air-pipe being flush with the stove-wall, substantially as set forth.

387,667. HAY-PRESS. Asbell Wellsby, Somerset, Wis. Filed Oct. 10, 1887. Serial No. 251,909. (No model.)

Claim.—1. A hay-press comprising the foot-pieces D, the cross-beams B B' B^3, the standards A, stay-bars C, the posts E E' E^2 E^3, secured to the ends of the cross-beams B' and B^3, and forming a bearing, the rack-bar mounted in said bearing and adapted to work vertically therein, the detent-pawl, the releasing-lever N, the power-lever, the actuating-pawl K, the follower carried by the rack-bar, and the bale-box mounted on an extension of the cross-beam B, substantially as shown.

2. In a hay-press, the combination, with the rack-bar, the rack-bar bearing, and the detent-pawl pivotally supported between its ends, one end bearing on the rack-bar and the other end extending outward, of the lever pivoted at its upper end and adapted to bear upon said outward-extending end of the detent-pawl, substantially as described, for the purpose specified.



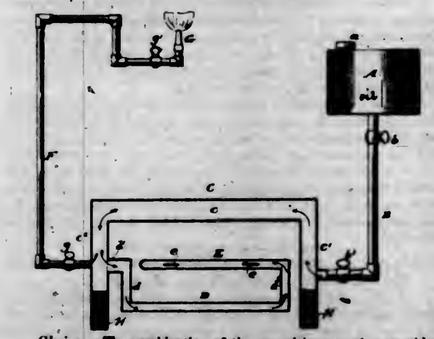
3. In a press, the combination, with the rack-bar and the rack-bar bearing, of the power-lever, and the actuating-pawl having lateral projections which bear and ride on said bearing to relieve the rack-bar of unnecessary lateral pressure, substantially as set forth, for the purpose described.

4. The combination, with the bearing composed of posts recessed, as at *e*, the rack-bar and the power-lever, of the actuating-pawl having lateral projections which are adapted to travel in said recesses.

5. The combination, with the bearing, the rack-bar, and the power-lever, of the actuating-pawl having lateral projections, the spring L, and the plates *c'*, having inclined ends, substantially as described.

6. The combination, with the bearing, the rack-bar, and the power-lever having a shoulder, *j*, of the actuating-pawl K, having a corresponding shoulder, the weight J', connected with the power-lever, and the spring L, substantially as described.

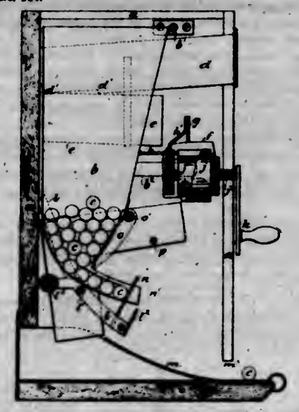
387,668. CLEANING STRAINERS OF LOCOMOTIVE FEED-PIPES. John M. Waller, near Greenstown, Md. Filed Dec. 10, 1887. Serial No. 257,462. (No model.)



Claim.—1. In a device for cleaning the strainers of locomotive feed-pipes, substantially as specified, the combination, with the injector feed-pipe, of a screen arranged within and forming a partition across a substantially straight portion of said feed-pipe, with its axis in line therewith, an orifice controlled by a cock situated on the inlet side of the screen, and mechanism for actuating said cock from the locomotive-cab, all substantially as shown and described.

2. In a device for cleaning the strainers of locomotive feed-pipes, substantially as specified, the combination, with the injector feed-pipe, of a conical screen arranged within and forming a partition across a substantially straight portion of said feed-pipe, with its axis in line therewith, an orifice controlled by a cock and situated on the inlet side of the screen, and mechanism for actuating said cock from the locomotive-cab, all substantially as shown and described.

3. In a device for cleaning the strainers of locomotive feed-pipes, substantially as specified, the combination, with the injector feed-pipe, of a screen arranged within and forming a partition across a substantially straight portion of said feed-pipe, with its axis in line therewith, an orifice controlled by a cock situated on the inlet side of the screen and substantially in line with the straight portion of the feed-pipe containing the screen, and mechanism for actuating said cock from the locomotive-cab, all substantially as shown and described.



4. In a device for cleaning the strainers of locomotive feed-pipes, substantially as specified, the combination, with the injector feed-pipe, of a screen-box arranged at the bottom of said pipe and having a water-inlet opening in an arm extending from its top, a water-exit opening in another arm adapted to be attached to the feed-pipe, and a tubular orifice placed opposite to said exhaust-opening and at the bottom of the box, a cock situated in said tubular orifice, whereby it can be opened or closed at will, mechanism for actuating said cock from the cab of the engine, and a screen situated at the end of the exhaust-opening, with its axis substantially in line with the said opening, all substantially as and for the purpose specified.

387,669. APPARATUS FOR VAPORIZING AND BURNING OIL IN STOVES, &c. Charles A. Wiess, Rockville, Conn. Filed Nov. 18, 1887. Serial No. 255,592. (No model.)

Claim.—The combination of the vaporizing-chamber provided with downward-extending branches terminating in solid tapering lower ends, which are adapted to be inserted in apertures in the grate-bars, an oil-reservoir communicating with one of said branches, a vaporizing and heating burner communicating with the other branch, and an illuminating-burner communicating with the said latter branch.

387,670. VENDING APPARATUS. Richard Whittaker, 106 Hatton Garden, County of Middlesex, England. Filed Nov. 21, 1887. Serial No. 256,253. (No model.) Patented in England Aug. 31, 1886, No. 11,104; in France May 31, 1887, No. 183,907, and in India June 10, 1887, No. 117.

Claim.—1. The combination, substantially as hereinbefore set forth, of the case, the suspended hopper, its pivots, and the cut-off adapted to be automatically actuated by each movement of the hopper to deliver one of the articles contained therein.

2. The combination, substantially as hereinbefore set forth, of the case, the suspended hopper, its pivots, the rocking lever *l*, its pivots on the hopper, its counter-balance *P*, and its cut-off adapted to be automatically traversed across the mouth of the hopper by the movement of the latter to deliver one of the articles contained therein.

3. The combination, substantially as hereinbefore set forth, of the case, the suspended hopper, its pivots, the counterbalanced cut-off adapted to be automatically actuated by the movement of the hopper to discharge one of the articles contained therein, and the secondary stop *n*, which is adapted to be automatically interposed between the article being discharged by the cut-off and the succeeding articles by the same movement of the hopper.

4. The combination, substantially as hereinbefore set forth, of the case, the suspended hopper, its pivots, the cut-off adapted to be automatically actuated by each movement of the hopper, the stirrers pivoted on the hopper and working through slots therein, and the stop-bar, which actuates the stirrers on the return or forward stroke of the hopper after discharging one of the articles contained therein.

5. The combination, substantially as hereinbefore set forth, of the case, the suspended swinging hopper, the cut-off, the secondary stop, and the stirrers, the cut-off, secondary stop, and stirrers being all adapted to be automatically actuated by the swinging of the hopper, as set forth.

6. The combination, substantially as hereinbefore set forth, of the case, the swinging hopper, the cut-off adapted to be automatically actuated by the movement of the hopper, and the guideway traversed by the discharged article, which guideway delivers the article outside the case after its discharge from the hopper.

7. The combination, substantially as hereinbefore set forth, of the case, the suspended swinging hopper, its pivots, the automatic cut-off, its pivots on the hopper, and the actuating mechanism by which the hopper is moved from the outside of the case.

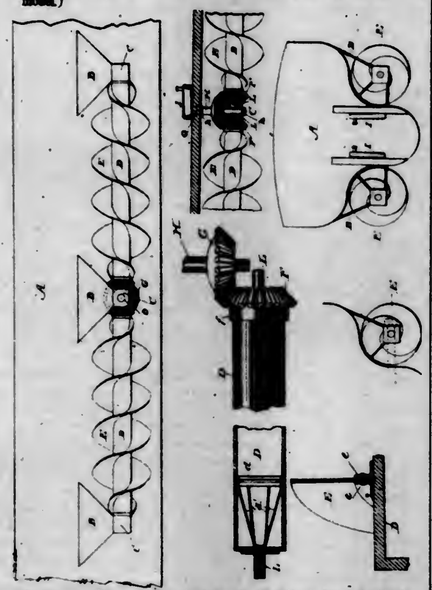
8. The combination, substantially as hereinbefore set forth, of the case, the hopper, its pivots, the automatic cut-off, the endwise-moving pin or push-rod, and the cam which actuates it to traverse the hopper.

9. The combination, substantially as hereinbefore set forth, of the case, the hopper, its pivots, the cut-off, actuating mechanism on the case, the rocking lever *g*, and the push-rod carried by said lever and interposed between the actuating mechanism and hopper when the latter is to be actuated.

10. The combination, substantially as hereinbefore set forth, of the case, the suspended swinging hopper, the cut-off, the actuating mechanism, the counterbalanced rocking lever, the coin-receiver mounted thereon, and the push-rod carried by said lever, and adapted to be automatically interposed between the actuating mechanism and hopper when the latter is to be actuated.

11. The combination, substantially as hereinbefore set forth, of the case, the hopper, the cut-off, the actuating mechanism, the case

having the coin slot and guide, the rocking lever, the coin-receiver on the rocking lever, and the push-rod, also carried by said lever and adapted to be automatically interposed by the action of the coin in the receiver between the actuating mechanism and hopper to actuate the latter.



12. The combination, substantially as hereinbefore set forth, of the case having a coin-slot and guide, the suspended swinging hopper, the rocking lever, the coin-receiver carried thereby, and the coin-liberating arm or stop on the hopper adapted automatically to discharge the coin from the receiver as the hopper swings back after delivering the article.

13. The combination, substantially as hereinbefore set forth, of the case, the suspended swinging hopper, the coin-receiver, the coin-liberating arm, the coin-holder, its reciprocating fingers, and the connection with the hopper, whereby they are actuated to deliver the coin step by step to its final receptacle.

14. The combination, substantially as hereinbefore set forth, of the case, the suspended swinging hopper, the coin-holder, its reciprocating fingers, and the connections with the hopper, whereby they are intermittently actuated to deliver the coin step by step to its final receptacle.

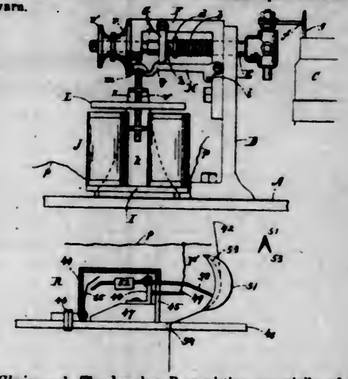
15. The combination, substantially as hereinbefore set forth, of the case, the suspended swinging hopper, the coin-holder, its fixed inclines P, its opposing reciprocating inclines F', their actuating-bar H, and the actuating-pin G on the hopper.

387,671. SCREW-PROPELLER. Theodore T. Woodruff, Philadelphia, Pa., assignor to Elias M. Woodruff, John R. McManus, and Adam Wartham, same place. Filed Sept. 23, 1887. Serial No. 250,504. (No model.)

Claim.—1. The propeller-shaft herein described, formed of hollow metal, provided at one end with the strengthening internal annular flange and the inclined stay or brace rods, for the purpose described.

2. The propeller-shaft herein described, formed of hollow metal, provided with the internal flange and stay-rods at one end and with bevel gear-wheel at the opposite end, for the purpose described.

3. The propeller-shaft herein described, formed of hollow metal, having internal flange and stay-rods at one end, bevel gear-wheel on opposite end, and the flange on the outer surface secured to the shaft by means of angle-irons, substantially as described.



4. The combination, with the hull of a vessel having the bilges and coves, of hangers depending from the bilged sides at the ends and center of the hull, closed journal-boxes in the said hangers in which the outer ends of the shafts are carried, and a central journal-box in which the inner ends of the shafts and the driving-shaft are carried, substantially as described.

5. The combination, with the vessel having the hangers provided with closed journal-boxes depending therefrom, of the propeller-shafts carried at their outer ends in the said journal-boxes and at their inner ends carried in a box carried by the driving-shaft, whereby the driving-shaft forms a central support for the shafts, substantially as described.

6. The combination, with the hollow propeller-shafts having the bevel gear-wheels on their inner ends, of the driving gear-wheel meshing with said gear-wheels and having its shaft arranged at right angles to the propeller-shafts to form a support for the inner ends of said shafts, substantially as described.

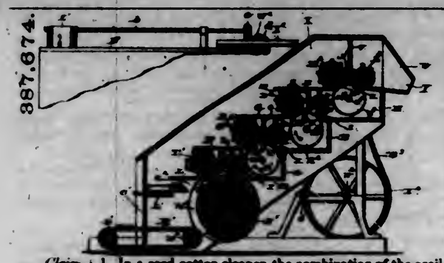
387,672. STOP MECHANISM FOR KNITTING-MACHINES. Matthew C. Yarwood, Fall River, Mass. Filed Dec. 22, 1887. Serial No. 258,092. (No model.)

Brief.—The invention consists in the improved devices for completing the circuit of the electrical stop mechanism and for causing the removal of the presser from the needles upon the breaking of the yarn.

Claim.—1. The drop-box R, consisting, essentially, of the case 44, provided with the spring 65, the standard 48, mounted on the insulating-block 47 and provided with the arm 49, and the lever 50, provided with the weight 51, having a thread-groove, 53, and counter-balance 52, combined and arranged to operate substantially as set forth.

2. The sliding shaft E, mounted on the standard D, and provided with the presser *f* at one end and with adjusting-nuts at the other end, spring *b*, and collet *d*, the pivoted bar H, provided with the catch *g*, the pivoted bar G, adapted to engage said catch, the sliding rod *v*, carrying the arm *m*, and armature L, the magnet J, battery N, and electrical conductors for connecting said magnet and battery, substantially as described.

387,673. TYPE-WRITING MACHINE. Walter J. Barron, New York, N. Y., assignor of one-half to Ames Densmore, Meadville, Pa. Filed Apr. 20, 1887. Serial No. 235,512. (No model.)



Claim.—1. In combination with a type-writer frame and its paper-carriage, guide-rod B, and letter-spacing mechanism, the paper-carriage having its hinge-rod in a vertical plane clearly in the rear of a vertical plane passing through the guide-rod B, whereby the carriage is retracted to its seat by gravity and independently of a spring, substantially as and for the purpose described.

2. The combination of the pawl of the letter-spacing mechanism of a type-writer, the rack-bars and yoke having lugs on top thereof, with the paper-carriage back rod, D, passing freely through said lugs, and the paper-carriage guide-rod B, located in a vertical plane inwardly of the rod D, whereby the carriage is free to be drawn forward to disengage the spacing racks from their pawl and allowed to be moved to the right or to the left and returned to its seat by gravity and independently of a spring, substantially as and for the purpose described.

387,674. SEED-COTTON CLEANER. Louis F. Carr, Helena, Ark. Filed Aug. 26, 1887. Serial No. 247,950. (No model.)

Brief.—An oscillating drum armed with segmental saws upon its side carries the seed-cotton upward, to be seized and acted upon by a series of revolving saws and brushes arranged in a series of ascending chambers. One series of brushes operates through screens which allow trash but not cotton to be carried through by said brushes. An endless carrier is provided for removing trash.

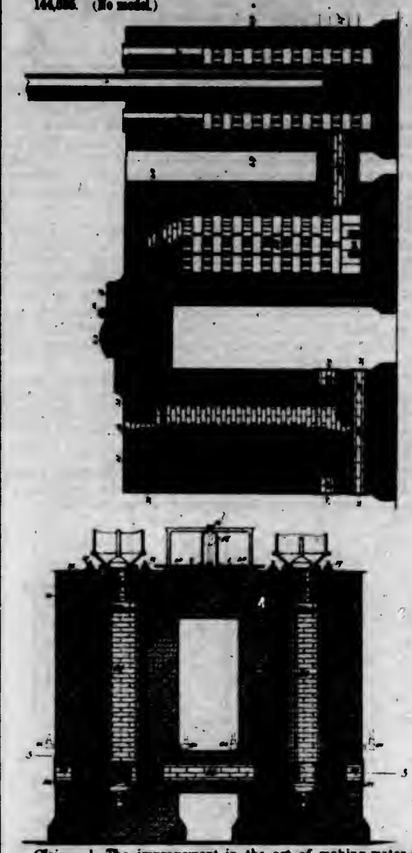
Claim.—1. In a seed-cotton cleaner, the combination of the oscillating drum having segmental saws, the screen arranged above the drum, and the brush arranged above the screen and rotating on the upper side of the drum, whereby the foreign substances will be swept or brushed from the cotton as the latter passes under the screen, substantially as described.

2. The combination, in a machine for cleaning seed-cotton, of the casing having the ascending series of communicating chambers, the rotating saws having their upper sides projecting through the communicating openings in the chambers, the screens arranged above the saws, and the rotating brushes arranged in the said chambers above the screens and saws, substantially as described.

3. The combination of the oscillating drum having the lever L^2, the dog pivoted to the said lever, and the endless conveyer having the ratchet-wheel engaged by the said dog, whereby the oscillating drum will be automatically fed, and means, substantially as specified, to operate the oscillating drum, substantially as described.

4. The combination, in a seed-cotton cleaner, of the casing having the chamber K^3, provided with the inclined bottom boards, E', the chamber L, having the screen V' on its lower side, the oscillating drum having the toothed segments on one side adapted to sweep through the front side of the chamber K^3, and the rotating brush T, arranged in the chamber L, substantially as described.

387,675. ANCHOR OR SUPPORT FOR DEEP-WELL PACKERS OR TUBING. Solomon R. Dresser, Bradford, Pa. Filed Aug. 14, 1887. Serial No. 247,203. (No model.)



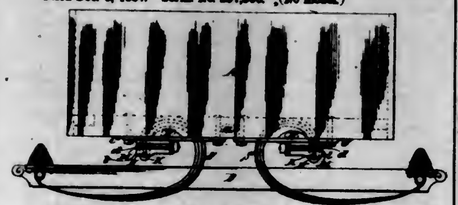
Claim.—1. In a tubing-supporter, the combination of a tapering piece of tubing or casting, slip-wedges in said tubing, and a removable retainer for holding the wedges at or near the apex of the tapering tube, for the purpose set forth.

2. The combination of tapering casting or tubing A with dovetailed slots E, slip-wedges B and B', with dovetailed lugs F, elastic cord or spring C, and catch-springs D and D', with wire G, substantially as shown and set forth.

3. The combination of tapering casting or tubing A, slip-wedges B and B', catch-springs D and D', and wire G, substantially as shown and set forth.

4. The combination of tapering casting or tubing A, slip-wedges B and B', elastic cord or spring C, with wires G, substantially as shown and set forth.

387,676. PROCESS OF MANUFACTURING GAS. George Strong Dwight, Rosenberg, Germany; Mary Torrey Dwight administratrix of said George Strong Dwight, deceased. Filed Oct. 2, 1884. Serial No. 144,553. (No model.)

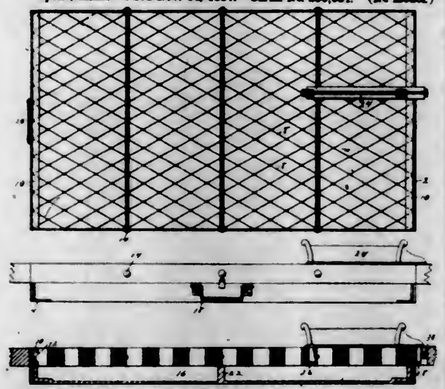


Claim.—1. The improvement in the art of making water-gas, which consists in passing the products of partial combustion given off from a mass of burning fuel through a second mass of fuel in order that said products or partial combustion may impart their sensible heat thereto, and then burning said products of partial combustion in a mass of refractory material in an air-heating chamber for the purpose of heating the same, and then passing a blast of air through said air-heating chamber and masses of fuel in the reverse direction, substantially as described.

2. The improvement in the art of making water-gas, which consists, first, in passing the products of partial combustion given off from a mass of burning fuel through a second mass of fuel in order that said products of partial combustion may impart their sensible heat thereto, then burning said products of partial combustion in a mass of refractory material for the purpose of heating the same; second, in passing the steam through said second mass of fuel in the reverse of the direction previously followed by said products of partial combustion, so that the temperature of the steam shall be gradually raised to the point of its decomposition with carbon by the direct action of and in the presence of carbon, and then passing the resulting gases through the first mass of fuel to recarbonize the carbonic acid, and, third, in passing a blast of air through said heated refractory material to heat it, and

thence through the two messes of fuel in the same course followed by the steam, substantially as described.

387,677. VEHICLE-SPRING. WILLIAM M. HOBLES, St. Louis, Mo. Filed Dec. 8, 1887. Serial No. 257,260. (No model.)



Claim.—1. In a vehicle, a spring composed of two or more leaves each shorter than its preceding one, whereby the spring increases in tension from its eye end toward its heel end, and bent from its heel end over its back toward its eye end in a gradually-receding curve for more than half a circle, and having the flexion of the heel end starting from about a perpendicular when the spring is attached to the body and running-gear, in combination with the body and rigid side bars of a vehicle, substantially as set forth.

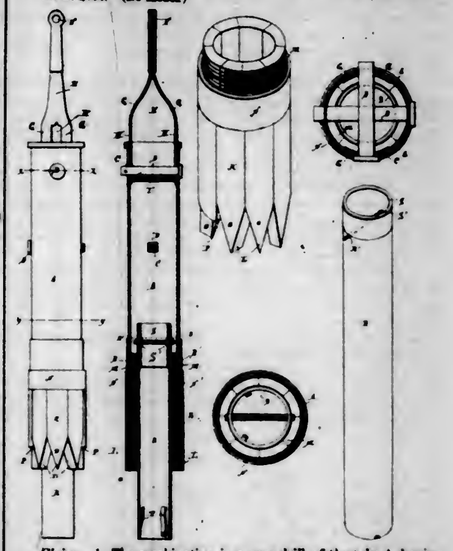
2. In a vehicle-spring, a clamping device consisting of a plate of iron adapted to be securely fastened to a spring-bar or to the bottom of the body of a vehicle, and having on its sides two parallel lips embracing the end of the spring, and having a bearing against which the end of the spring rests, and having a clevis surrounding the end of the spring and the bearing and securely holding it between the lips and against the bearing, all operating to securely hold the heel end of the spring fast and permanently connect it to the spring-bar or to the bottom of the body.

3. In a vehicle-spring, a key inserted in the end of the spring through an ordinary loop formed therein and resting with its ends on the edges of the lips of the clamping device C, in combination with said clamping device, substantially as described, and operating to prevent the spring from working out of the clamping device.

387,678. DOOR-MAT. HENRY FISCHER and LEO EWALD, Minneapolis, Minn. Filed Nov. 14, 1887. Serial No. 255,081. (No model.)

Claim.—1. The combination, in a door-mat, with the frame or casing 2, provided with the end bars, 10, having the lips or flanges 12, forming the rectangular recesses 13, of the corrugated metal plates extending across said frame and having ends fitting the recesses 13, and the bolts 14, passing laterally through the frame and the plates 8, substantially as described.

2. The combination, in a door-mat, with the open frame or casing 2, of the corrugated metal plates 8, extending across said frame, with open spaces between them, the angle-irons 4, secured to the ends of the casing 2, with the flanges projecting inward, and the drawer or receptacle 16, arranged beneath said corrugated plates and resting upon said angle-irons, substantially as described.



3. In a door-mat, the combination, with the frame, of the series of crimped or corrugated metallic plates 8, arranged upon their edges in said frame, the rod 14, for securing the plates together, the removable scraper 24, the lug 26, secured to said scraper and engaging said rod, and the lug 28, also secured to said scraper and provided with the set-screw 30, which bears upon the frame and holds the said scraper in place, substantially as described.

4. The combination, in a door-mat, with the open frame 2, of the corrugated plates 8, extending across said frame, with open spaces between them, and the drawer or receptacle 16, arranged to slide in said frame beneath said plates, and provided with the central partition, 22, forming a support for said plates 8, substantially as described.

387,679. ELECTROLYTE FOR GALVANIC BATTERIES. DENNIS H. PETER, Canonsville, N. Y. Filed Jan. 12, 1888. Serial No. 260,857. (No specimens.)

Claim.—Muriatic or chlorhydric acid in connection or combination with the solution for galvanic batteries, made by dissolving chloride of ammonium and chlorate of potassium or chlorate of sodium together in water.

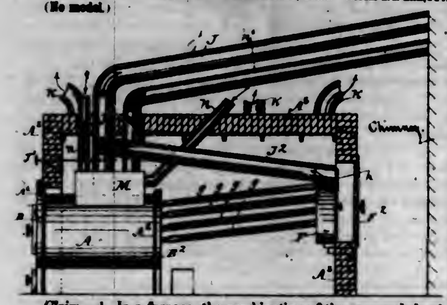
387,680. CORE-DRILL. JOHN F. GOURLEY, THOMAS G. WIBBY, and JOHN F. HERSTEILER, Lawrence, Kans. Filed Feb. 21, 1888. Serial No. 264,707. (No model.)

Claim.—1. The combination, in a core-drill, of the tube A, having the hollow cylindrical drill-head at its lower end, and the tubular core-lifter R, vertically movable in the tube and in the drill-head extending through the bore of the latter, and having the retaining devices T at its lower end, substantially as described.

2. In a core-drill, the drill-head K, comprising the series of segmental separable cutters arranged in contact with each other to form a hollow cylinder, and having the lower cutting-edges, substantially as described.

3. The cutter-head for core-drills, comprising the series of segmental separable cutters L, arranged in contact with each other to form a hollow cylinder, in combination with the annular band or ring N, securing the said cutters together, substantially as described.

4. The combination, in a core-drill, of the tube A, the hollow cylindrical cutter-head K, secured to the lower end of tube A, and removable therefrom, and the tubular vertically-movable core-lifter R, arranged in the lower portion of tube A and extending through the bore of the drill-head, substantially as described.



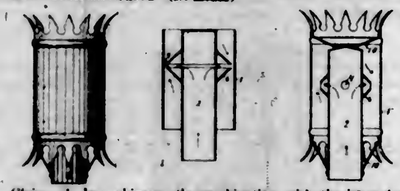
5. The combination, in a core-drill, of the tube A, having the hollow cylindrical drill-head at its lower end, the vertically-movable core-lifter R, arranged in the lower portion of the tube and extending through the bore of the drill-head, and the yoke E, attached to the upper end of tube A and vertically movable therein, substantially as described.

6. The combination, in a core-drill, of the tube A, having the hollow cylindrical drill-head at its lower end, the yoke E, having the slotted arm arranged in the upper end of the tube, and the pin D, extending transversely through the latter and through the slot in the yoke-arms, substantially as described.

7. The combination, in a drill-head for core-drills, of the segmental cutters L, arranged in contact with each other to form the hollow cylinder, some of the said cutters having the point beveled on opposite sides at O, and the remaining cutters on diametrically-opposite sides of the head having their lower ends truncated and provided with the concaves P, substantially as described.

8. The combination, in a core-drill, of the tube A, having the hollow cylindrical drill-head at its lower end and the vertically-movable core-lifter R, arranged in the lower end of the tube and extending through the bore of the drill-head, said core-lifter having the retaining-springs T on its inner side at its lower end, substantially as described.

387,681. HEATING AND VENTILATING BUILDINGS. WILLIAM H. HEATON, Des Moines, Iowa. Filed Dec. 20, 1886. Serial No. 222,117. (No model.)



Claim.—1. In a furnace, the combination of the open-ended cylinder and wall A, having flanges A^3, the door-frame B, the end B^2, having tubular projections 1 2 3 4, the chamber F, having a door, A, and the tubes *g*, and flue J^2, substantially as shown and described, for the purposes stated.

2. The grate-bars having projections *d''* on their ends, in combination with the plates B and B^2, having inclined bearings *d'* and flanges *c* on their inside faces, substantially as shown and described, for the purposes stated.

3. The combination of the open-ended cylinder or wall A, having flanges A^3, the door-frame B, having a flange, *c*, and inclined bearings *d'*, the plate B^2, having a flange, *c*, bearings *d''*, and tubular extensions 1 2 3 4, the grate-bars having projections *d''*, the chamber F, having a door, A, the tubes *g*, and the flues J and J^2, constructed and combined within a wall, A^3, substantially as shown and described, for the purposes stated.

4. The ventilating device for buildings, consisting of an auxiliary chamber attached to the outside of the heater or furnace, and tube or tubes connected therewith and extending into a room or rooms to be ventilated, and a tube extending from the same chamber to an escape-flue, substantially as shown and described.

387,682. CHIMNEY-COWL. HENRY HAMES, Stillwater, Minn., assignor of one-half to Charles P. Gregory, same place. Filed July 18, 1887. Serial No. 244,574. (No model.)

Claim.—1. In a chimney, the combination, with the inner draft or smoke pipe closed at the upper end and open at the lower end and provided with a series of openings in its circumference, of an outer cylindrical case or shield surrounding said inner pipe and open for the free admission of air at both ends, and a cone-shaped hood with its base next to the side of the pipe surrounding said openings in the inner pipe and extending laterally and opening into the annular space formed between the outer case or shield and the inner pipe, substantially as and for the purposes described.

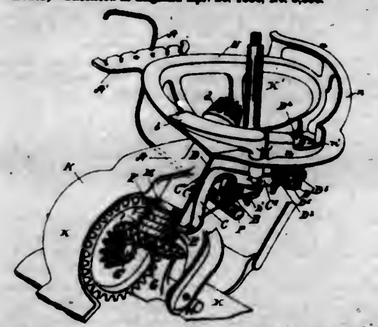
2. In a chimney-cowl, the combination of the draft-pipe closed at its upper ends and provided with a series of openings in its circumference, laterally-projecting conical hoods secured to said pipe over said openings, having bases next to the side of the pipe and larger than said openings, and having openings in their outer ends that are of substantially the same size as the openings in the wall of the pipe, and a single outer cylindrical case or shield surrounding said pipe and all of said hoods and open at its top and bottom for the admission of air, substantially as described.

387,683. JAR-FASTENER. THOMAS R. HOWE, Scranton, Pa., assignor of two-thirds to M. A. Goodwin and G. A. Clearwater, both of same place. Filed June 16, 1888. Serial No. 277,186. (No model.)

387,688.

Claim.—1. The combination, with the cover having the inclined surface and vent-hole, of the bail pivoted to the side of the jar and having the rubber roller thereon for closing the vent when in locked position, substantially as described.

2. The combination, with the cover having the inclined surface and the vent-hole, of the bail pivoted to the side of the jar, having its central portion bent up, forming shoulders, and the rubber roller on the bail between the shoulders, adapted to cover the vent when in locked position, substantially as described.



3. The combination, with the bail pivoted to the side of the jar and the cover having the inclined surface up which the bail rides to lock the cover, of the wire bridging the bail to secure the cover thereto fastened to the cover at the edge, but free at the center, substantially as described.

4. The combination, with the bail pivoted to the side of the jar and the cover having the inclined surface, up which the bail rides to lock the cover, of the wire bridging the bail to secure the cover thereto, fastened at the ends to the side of the cover at separate points, but free at the center, said central part being bent slightly inward to prevent the ready escape of the bail, as set forth.

5. The combination, with the cover having the inclined surface up which the bail rides to lock the same, of the bail formed into relatively large coils at the ends, surrounding and taking their bearings on trunnions at the side of the jar, substantially as described.

6. The combination, with the cover, of the bail for locking the same formed into the relatively large coils at the ends and trunnions at the sides of the jar, on which the said coils take the bearings, substantially as described.

387,684. REAPING-MACHINE. GEORGE H. HOWE, Rocket Falls, N. Y., assignor to the Walter A. Wood Mowing and Reaping Machine Company, same place. Filed Dec. 5, 1887. Serial No. 257,081. (No model.) Patented in England Apr. 20, 1886, No. 5,893.

Claim.—1. In a rake-controlling mechanism for sweep-rake reapers, the combination, with a cone formed with a spiral on its surface, of the sliding lever resting upon the spiral and raised by the revolution thereof, and a switch and a wing attached thereto, against which the lever is raised to operate the switch, substantially as and for the purpose described.

2. The combination, with the cone formed with a spiral on its surface, of a sliding and swinging lever resting upon the spiral and adapted to be raised by the revolution thereof, the spring-switch provided with a projecting wing against which the upper end of the lever bears, and a cam formed on the apex of the cone to swing the sliding lever after it has been raised by the spiral thereon against the projecting wing of the switch to close the switch, substantially as and for the purpose specified.

3. The combination, with the cone formed with a spiral on its surface, of the sliding and swinging lever resting upon the spiral, a cam at the apex of the spiral onto which the lever is raised by the revolution of the cone, the switch and its wing against which the lever is swung to open the switch, and an adjustable stop to regulate the distance to which the lever drops after leaving the cam, substantially as and for the purpose specified.

4. The combination, with the rakes, their cam-track and its switch, of a spring adapted to keep the switch open to compel the rakes to

act as beaters, a projecting wing attached to the switch, the conical spiral, the lever resting upon the spiral, the cam at the apex of the spiral, upon which the lever is raised by the revolution of the spiral, and by which the lever is swung against the projecting wing of the switch to close the same against the action of the spring, tending to keep it open, substantially as and for the purpose specified.

5. The combination, with the cone formed with a spiral on its face, of the lever resting on the spiral, the cam at the apex of the spiral, the switch and its wing against which the lever is swung by the cam to operate the switch, the forked plate upon which the lever falls after leaving the cam, and leverage-connections within reach of the driver's foot attached to the forked plate, whereby the driver at will may move the lever resting on the spiral free and clear therefrom.

6. The combination, with the cone formed with a spiral on its face, of a lever resting on the spiral, a cam at the apex of the cone, the index-plate, a lever taking into the index-plate, a forked stop-plate loosely mounted on the index-lever, and the abutting projections on the forked stop-plate and the index-lever, substantially as and for the purpose specified.

7. The combination, with the cone formed with a spiral on its face, of a lever resting upon the spiral, a cam at the apex of the cone, a switch, and a wing attached thereto, against which the lever raised by the spiral onto the cam is swung to operate the switch, the index-lever, the forked stop-plate loosely mounted on the index-lever, abutting projections on the forked stop-plate and index-lever, leverage-connections with the forked plate within reach of the driver, and a spring attached to such leverage-connections within reach of the driver acting to force the forked stop-plate backwardly against the projection on the index-lever, substantially as and for the purpose described.

387,685. VEHICLE-WHEEL. HENRY G. LANE, Bucyrus, Ohio. Filed Mar. 10, 1888. Serial No. 266,810. (No model.)

Claim.—The herein shown and described metal wheel, composed of the tubular hub having a pair of annular flanges at or near each end thereof, the spokes held between the annular flanges, the rim consisting of the two oppositely-flared rings embracing the outer ends of the spokes, the band bearing against the ends of the spokes and uniting the outer edges of the rings, and the tire, substantially as specified.

387,686. RESERVOIR PEN-HOLDER. ISAAS LEUTHER, Halle-on-the-Saale, Prussia, Germany. Filed May 10, 1886. Serial No. 201,712. (No model.) Patented in England Mar. 29, 1886, No. 4,363.

Claim.—1. In a reservoir pen-holder, the combination, with a cylinder or casing having an ink-reservoir therein, of a stopper closing the front end of said tube and having a longitudinal ink-conveying passage communicating with the ink-reservoir and an outwardly-extending tubular portion, and a pen-clamp adapted to fit within said tubular extension of said stopper, and having a longitudinal ink-conveying passage, and at its outer end a transverse ink-conveying passage, and a spring-tongue adapted to hold said pen-clamp in position within said stopper, substantially as set forth.

2. A reservoir pen-holder comprising an open-ended cylinder or casing, a stopper closing the rear end thereof and having a threaded longitudinal bore therein, a screw extending through said bore and having a recessed and collared inner end and at its outer end an operating-knob, a longitudinally-bored stopper closing the front end of said casing and having an annularly-recessed inner end and an outwardly extending outer end, an elastic reservoir connected at its respective ends with the inner ends of said screw and front stopper, a reservoir-compressing pin having a flanged inner end and extending transversely through an opening in the side of the casing, and a pen-clamp seated within the outwardly-extending tubular portion of the front closing-stopper and having a spring securing-tongue and longitudinal and angular ink-conveying channels, substantially as set forth.

3. The combination of the cylinder or casing *d* and flexible reservoir *f* with the knob *a*, screw *b*, nut *c*, stopper *h*, clamp *g*, and the pressure-pin D, substantially as and for the purpose described in the specification, and shown in the accompanying drawings.

387,687. HOISTING-MACHINE. NAPOLEON B. B. LOUD and PERRY A. ATCHLEY, Prairie City, Ind. Ter. Filed Apr. 30, 1888. Serial No. 271,277. (No model.)

Claim.—1. In a hoisting-machine, the combination of the shaft journaled in the standards rising from opposite ends of the base-block, a ratchet-wheel fixed thereon, and the lever I, provided with the arms *i i*, the longitudinal slots *i' i'*, through which the said shaft passes, and the shoulder i^2 at the junction of the arms and facing the teeth of the ratchet-wheel, substantially as specified.

2. In a hoisting-machine, the combination of the shaft D, journaled in the arms rising from opposite ends of the base-block, the ratchet-wheel E on one end thereof, the spring-controlled pawl engaging said wheel, the ratchet-wheel H on the opposite end of the shaft D and turning in the same direction as the wheel E, and the lever-handle I, provided with the arms *i i*, slots *i' i'*, arm i^3, and shoulder i^2, to engage the teeth of the ratchet-wheel H, substantially as specified.

3. In a hoisting-machine, the combination of the block A, pivoted on the block B by the bolt *a* and nut *d*, the standards C C, rising from said block A, the shaft D, the ratchet-wheels E and H, the spring-controlled pawl F, engaging the wheel E, the rope J, attached to the shaft D and having the hook *j* on its free end, and the lever-handle I, having the arms *i*, the slots *i'*, the arms i^3, and shoulder i^2, substantially as specified.

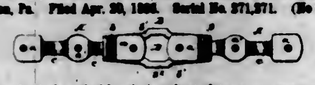
4. In a hoisting-machine, the combination, with the base-blocks, the standards, the shaft D, the ratchet-wheel E, and spring-controlled pawl F, of the ratchet-wheel H, the lever I, provided with the arms *i* and slots *i'*, and the removable key or spline i^4, holding the ratchet-wheel H in place on the shaft D, and extending on each side of the said wheel into the slots *i'*, substantially as and for the purpose specified.

387,688. EXTRACTION OF ZINC FROM ORES. ALBERT H. LOW, Denver, Colo. Filed Aug. 20, 1887. Serial No. 248,169. (No specimens.)

Claim.—1. The herein-described process of extracting zinc from ores containing precious metals, consisting in leaching the ore at a low temperature with an aqueous solution of sulphurous-acid gas, substantially as described.

2. The herein-described process of extracting zinc from ores containing precious metals, consisting in leaching the ore with an aqueous solution of sulphurous-acid gas to dissolve out the zinc, and then boiling the leached liquor to expel the sulphurous-acid gas and cause a precipitation of the zinc, substantially as described.

387,689. DRAFT-REGULATING DEVICE FOR PLOWS AND CULTIVATORS. ABEL LUSH, Spring Hill, Pa. Filed Nov. 22, 1887. Serial No. 256,913. (No model.)



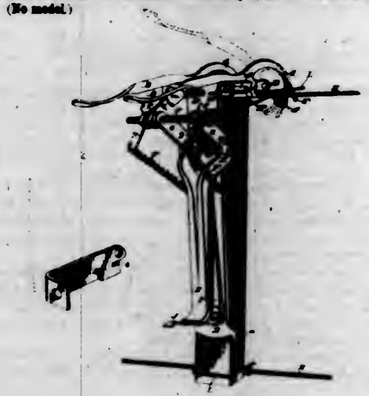
Claim.—1. In a draft-regulating device, the guide-piece B, draft-piece D, vertically adjustable in said guide-piece B, and adjusting-lever L, in combination with devices for securing said lever L at any point, the bars *c*, connected to and moving with the draft-piece D, and wheel R, substantially as described.

2. In a draft-regulating device, the guide-piece B, draft-piece D, one of said pieces having a T-slot and the other flanges to fit said slot, whereby vertical adjustment may be obtained, adjusting-lever L, devices for securing said lever at any point, in combination with the bars *c*, connected to and moving with the draft-piece D, and wheel R, substantially as described.

3. In a draft-regulating device, the guide-piece B, draft-piece D, one of said pieces having a T-slot and the other flanges to fit said slot, whereby vertical adjustment may be obtained, in combination with the adjusting-lever L, rack-bar P, look-bolt *l*, spring for returning the same, trigger *t*, and connecting-rod *w*, bars *c*, secured to and moving with the draft-piece D, and wheel R, carried by said bars, substantially as described.

387,690. DETACHABLE CHAIN. JAMES F. MCCREARY, New Brighton, Pa. Filed Apr. 20, 1888. Serial No. 271,371. (No model.)

Claim.—1. A detachable chain adapted to carry cross-slats, the links of which chain are coupled by means of flattened ends *a*, passed through openings D formed in the adjacent links, the portions of the links adjacent to each flattened end *a* being depressed, as at *c*, in which depressed portions lie the said end bars, wherein they are held by the cross-slats, substantially as described.



2. A detachable chain adapted to carry cross-slats, the links of which chain are coupled to each other by means of flattened ends passed through openings D formed in the adjacent links, which openings are bounded by the side bars, *b'*, and the end bars, *b*, the flattened ends being expanded to a width greater than the distance between the side bars, *b'*, at points adjacent to the end bars, upon which side bars the flattened ends *a* rest when the links are coupled, the links having depressed portions *c* adjacent to the ends *a*, in which depressed portions the end bars rest, and wherein they are held by the cross-slats, substantially as described.

3. A detachable chain formed of bar-links having flattened ends adapted to have cross-slats secured thereto, the bars being depressed between the ends to form open spaces below the slats, and of centrally-open links having end bars, *b*, adapted to lie in the open spaces adjacent to the ends of the bar-links, substantially as described.

4. A detachable chain formed of bar-links having flattened expanded ends *a*, adapted to have cross-slats secured thereto, and centrally-open links having end bars, *b*, and side bars, *b'*, situated at a distance apart less than the width of the expanded ends of the bar-links at points adjacent to the end bars, but bowed outward centrally at b^3 to permit the passage of the expanded ends *a* between them, substantially as described.

5. A detachable chain formed of bar-links having flattened end bearing-faces, *a*, and intermediate bearing-faces, *a'*, such bearing-faces being connected by depressed portions *c* of the links, and centrally-open links having the end bars, *b*, and the side bars centrally bowed outward, substantially as described.

387,691. WIRE-FENCE STAY-BINDER. ELI P. NEWBAKER and JOHN SHIVLAR, Beloit, Kans. Filed May 3, 1888. Serial No. 272,570. (No model.)

Claim.—1. The combination, with the plate having the standards B, of the levers D, pivoted to the standards and provided with the wire-coiling arms *d*, substantially as and for the purpose described.

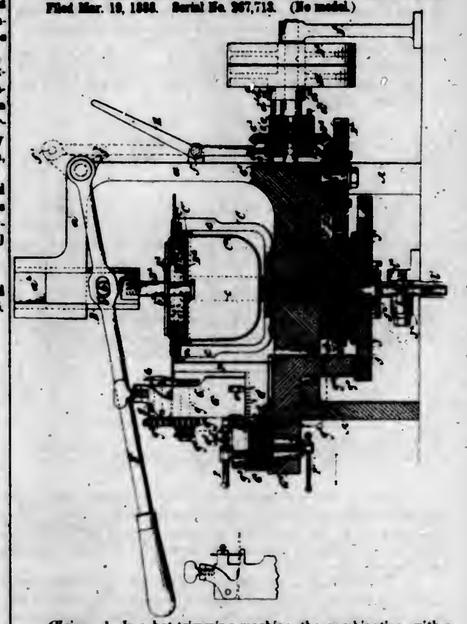
2. The combination, with the plate having the standards B, which are provided with the wire-receiving notches *b*, of the levers D, pivoted to the standards and provided with the wire-coiling arms *d*, substantially as and for the purpose described.

3. The combination, with the plate, the standards B, and means for adjustably connecting the standards with the plate, of the levers D, pivoted to the standards and provided with the wire-coiling arms *d*, substantially as described.

4. The combination, with the plate having the standards B, of the levers pivoted to the standards and having the wire-coiling arms *d*, the ends of the arms being bifurcated to form the prongs *d'* and d^2, the prongs *d'* being the longer, substantially as set forth.

5. The combination, with the plate and the levers D, having the wire-coiling arms *d*, of the lever E and the hooks G, substantially as set forth.

6. The combination, with the plate and the levers D, having the wire-coiling arms, of the lever E, the cross-bar F, and the adjustable hooks G, substantially as and for the purpose described.



7. The combination, with the plate and the levers having wire-coiling arms, of the lever, the hooks G, connected with the front end of the lever, and the catch J, substantially as described.

8. The combination, with the plate and the levers having wire-coiling arms, of the lever E, the hooks having rear extensions, *g*, and the springs interposed between the extensions *g* and the plate, substantially as described.

9. The combination, with the plates A, the levers having the wire-coiling arms and the levers E, provided with the hooks G, of the plate M and means for adjustably connecting the end plate M with the plate A, substantially as and for the purpose described.

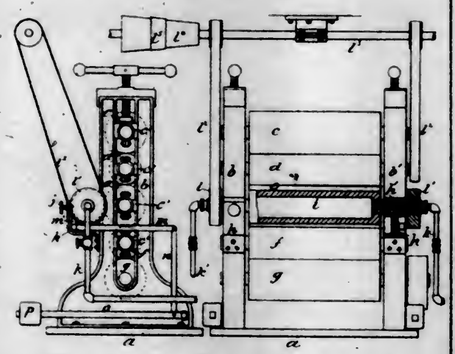
10. The herein shown and described wire-fence stay-binder, composed of the plate A, having the legs *a* and the cross-bar A', the standards having wire-receiving notches *b*, adjustably connected with the cross-bar A', the levers D, having the wire-coiling arms *d*, the adjustable plate M, the lever E, the cross-bar F, threaded at its ends, the nuts *f* and *f'*, the hooks G, having extensions *g*, the springs *g'*, the spring I, and the catch J, substantially as specified.

387,692. HAT-TRIMMING MACHINE. SAMUEL T. NEWMAN, Danbury, Conn., assignor of one-fourth to Charles H. Merritt, same place. Filed Mar. 19, 1888. Serial No. 267,713. (No model.)

Claim.—1. In a hat-trimming machine, the combination, with a rotary frame adapted to receive a hat-body, of an expansible and contractible cushion for securing the hat-body in the frame, and a longitudinally-movable device upon which said cushion is mounted adapted to compress the cushion, substantially as specified.

2. In a hat-trimming machine, the combination, with a rotary frame adapted to receive a hat-body, of an expansible and contractible cushion for securing the hat-body in the frame, a longitudinally-movable device upon which the said cushion is mounted for compressing the cushion, and a spider or like device for securing the brim of the hat and forced downwardly by said cushion, substantially as specified.

3. In a hat-trimming machine, the combination, with a rotary frame for supporting a hat-body, of a knife for trimming the brim of the hat, a sliding piece in which said knife is mounted, an expansible and contractible pattern-cam for causing a reciprocating motion to be imparted to said knife, and a connection between said pattern-cam and said sliding piece, substantially as specified.



4. In a hat-trimming machine, the combination, with a rotary frame for supporting a hat-body, of a knife for trimming the brim of the hat, a sliding piece in which said knife is mounted, a pattern-cam comprising two sections for causing a reciprocating motion to be imparted to said knife, a pattern-changing device extending between the two sections of the cam for causing an expansion of the cam, a spring or springs for causing a contraction of the cam, and a connection between the cam and said sliding piece, substantially as specified.

5. In a hat-trimming machine, the combination, with a rotary frame for supporting a hat-body, of knives for trimming the brim of the hat, a pattern-cam comprising two sections for causing a reciprocating motion to be imparted to the knives, and an adjustable pattern device comprising a number of projections or spokes of different sizes, each of which is adapted to be inserted between the portions of the cam to cause an expansion of the cam and by which the degree of such expansion may be varied, substantially as specified.

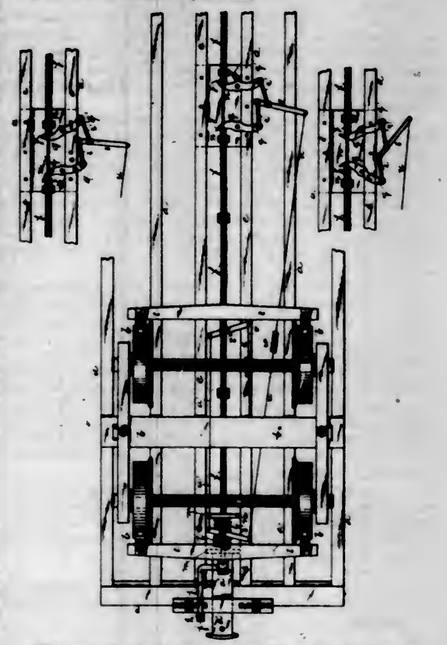
6. In a hat-trimming machine, the combination, with a rotary frame for supporting a hat-body, of knives for trimming the brim of the hat, a wheel imparting motion to said frame, a pattern-cam supported by and having a sliding connection with said wheel, and a sliding piece operated by the pattern-cam to cause a reciprocating motion to be imparted to the knives, substantially as specified.

7. In a hat-trimming machine, the combination, with a frame comprising a ring for supporting a hat-body, said ring being provided with a projection, of securing devices for retaining the hat-body in position in the frame, a sliding piece having a portion adapted to be moved into contact with the projection on the ring, a second sliding piece mounted upon the sliding piece first named and bearing knives, a gage on one of said sliding pieces and a pointer on the other, a third sliding piece supporting both the sliding pieces previously named, means for securing all said sliding pieces together, and a pattern-cam for causing the reciprocation of all the sliding pieces, substantially as specified.

387,693. PAPER-FINISHING ROLL. JAMES D. PINKLEY, Manchester, Conn., assignor of two-thirds to Peter Adams, Paterson, N. J., and James Symington, Lancaster, Pa. Filed Dec. 14, 1887. Serial No. 257,864. (No model.)

Claim.—1. The combination, with a stack of calender-rolls, of an adjustable polishing-roll supported in bearings with its surface in rubbing contact with paper borne on one of the intermediate rolls of the stack, the polishing-roll bearings, and means for yieldingly pressing said bearings, all substantially as described.

2. The combination, with the intermediate roll, *e*, of a stack of calender-rolls, the roll-supporting brackets *h*, secured to the frame of the stack, the polishing-roll *i*, supported on the brackets, the set-screws borne in the brackets and by means of which the outward movement of the roll is limited, and the system of levers and weight, by means of which the roll is held inward with a yielding pressure, all substantially as described.



387,694. TOBACCO-BOX. JOHN G. PIERSON, New York, N. Y., assignor of one-half to David L. Prendit, same place. Filed Aug. 29, 1887. Serial No. 247,693. (No model.)

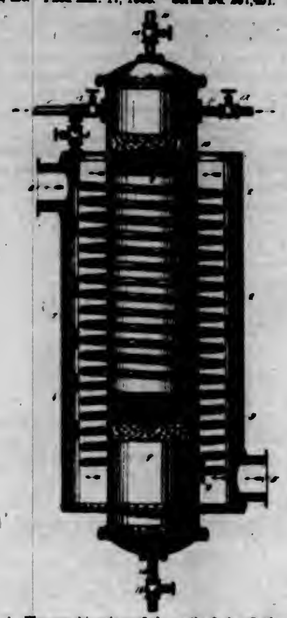
Claim.—1. The combination, with a case or shell provided upon its exterior with a flap, of a receptacle for matches outside said case or shell, adapted to be covered by said flap, and a receptacle for tobacco contained within the case or shell, but wholly independent thereof, substantially as specified.

2. The combination, with a case or shell comprising a flap, the whole being made in one integral piece, of a receptacle for matches upon the outside of the case or shell and adapted to be covered by said flap, and a receptacle for tobacco contained within the case or shell, but wholly independent thereof, substantially as specified.

387,695. CAR-BRAKE. ABRAM REESE, Pittsburg, Pa., assignor to the Reese Safety Brake Co., (Limited,) same place. Filed Dec. 5, 1887. Serial No. 257,054. (No model.)

Claim.—1. In a car-brake apparatus, the combination of a draw-head, a draw-bar, a movable recessed filling block or plate extending into the draw-head in front of the draw-bar, and suitable connections between said draw-bar and the brakes, substantially as and for the purpose set forth.

2. In a car-brake apparatus, the combination of a draw-head, a draw-bar, a movable recessed filling-block extending into the draw-head in front of said draw-bar, and lever mechanism for moving said filling-block, substantially as and for the purpose set forth.

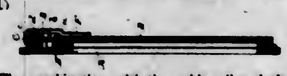


3. In a car-brake apparatus, the combination of the draw-heads and the draw-bars moving with the same with a lever pivoted in the rear of each draw-bar and having one end in the line of movement of the same and connected at their other end to a single brake-operating lever, substantially as and for the purpose set forth.

4. In a car-brake apparatus, the combination of the draw-heads and the draw-bars capable of movement with the same with a lever pivoted with one end in the line of movement of each draw-bar and connected by links at their other end to a brake-operating lever, substantially as and for the purpose set forth.

5. In a car-brake apparatus, the combination of the draw-heads *d*, draw-bars *f*, moving with the same, levers *q q'*, pivoted in the rear

of said draw-bars, and a brake-operating lever, *s*, connected by links *r r'* to said levers *q q'*, substantially as and for the purpose set forth.

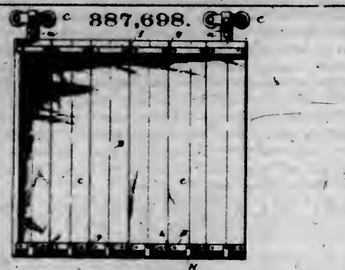


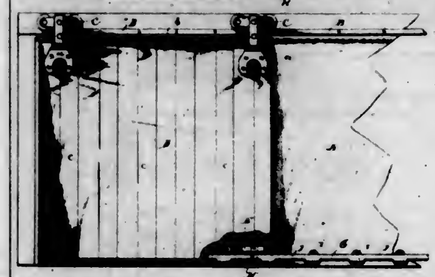
387,696. FEED-WATER HEATER AND FILTER. PHILIP ROMAN, St. Louis, Mo. Filed Mar. 17, 1888. Serial No. 267,461. (No model.)

Claim.—1. The combination of the coil of pipe 2, the cold-water feed-connection 1, the drum 4, having ports 5 6, for the purpose described, a second drum, 7, within the first-mentioned drum, connected with the coil 2 at the point 8, a filtering-chamber within said second drum, a settling-chamber beneath said filtering-chamber, having a blow-off and cock controlling said blow-off, a hot-water connection, 11, controlled by a cock, an upper chamber within said second drum, a surface blow-off, 15, connected to the same and controlled by a cock, an extension of the cold-water connection 1, piercing said upper chamber and controlled by a cock, 17, and a cock, 3, controlling the circulation within the coil, substantially as and for the purpose described.

2. The combination of a coil of pipe, a cold-water feed-connection, a drum surrounding the same, having ports permitting a circulation of exhaust-steam therein, a second drum within the first-mentioned drum, connected with said coil at its lower end, a hot-water or steam boiler connection controlled by a cock for said second drum, and a surface blow-off controlled by a cock connected with the upper part of said second drum.

387,697. DEVICE FOR HANGING DOORS. WILLIAM A. SCHUSSMANN, Calumet Harbor, Wis. Filed Apr. 9, 1888. Serial No. 270,134. (No model.)

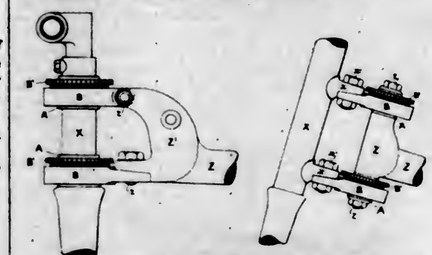




Claim.—The combination, with the guide-rail and the door, of the cap secured above the door-opening, the hangers secured to the door and carrying the rollers, and the pins *b*, projecting rearwardly from said hangers and working between said cap and guide-rail, substantially as and for the purpose specified.

387,698. DOOR. WILLIAM A. SCHUSSMANN, Calumet Harbor, Wis. Filed Apr. 9, 1888. Serial No. 270,135. (No model.)

Claim.—The combination, with the door-sections formed at their

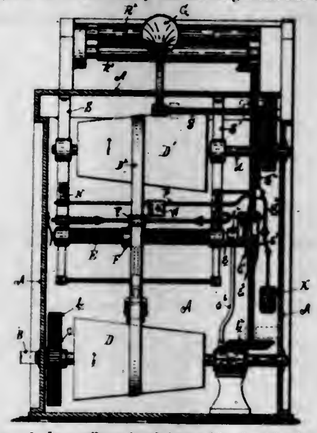


adjacent edges with sockets *d*, of the straps E, formed with lugs *e*, fitting in said sockets, and with tongues and grooves pivotally connected together by vertical pivots, substantially as shown and described.

387,699. ATTACHMENT FOR PLOWS. JAMES R. THOMSON, Mount Pleasant, Tex. Filed May 26, 1888. Serial No. 275,178. (No model.)

Claim.—The combination, with the rear of the landside of a turning-plow, of an attachment for dirting the plants, consisting of a shank having a rearwardly and upwardly extending blade diagonally attached thereto, having a sharp curved lower edge and a curved upper edge, said edges forming a point on the outer end of the blade, said blade having a concaved upper face, substantially as described.

387,700. VELOCIPEDE. HARRY THRESHER, London, County of Middlesex, England, assignor to Albert H. Overman, Boston, Mass. Filed May 17, 1887. Serial No. 238,457. (No model.)



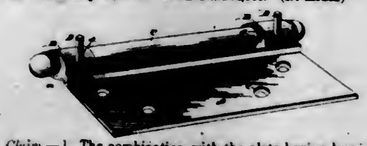
Claim.—1. In a cycle, the combination, with the frame thereof, of two horizontal ball-bearing casings attached one above the other to the forward end of the frame which is adapted thereto, an adjustable cap for each of the said casings, and a spindle connected with the

steering-wheel and passing through such casings and caps which confine anti-friction balls, substantially as set forth

2. In a cycle, the combination, with the frame thereof provided at its forward end with two arms, of two horizontal ball-bearing casings respectively attached to the said arms, which are located one above the other, an adjustable cap for each casing, a spindle or pillar connected with the steering-wheel and passing through the said casings and caps, two grooved sleeves secured to the spindle, so as to combine, respectively, with the upper casing and cap and the lower casing and cap, and balls located in the raceway formed by the casings, caps, and sleeves, substantially as set forth.

387,701. EVENER FOR RAILWAY-HEADS. Clarence A. Upton, Lowell, Mass. Filed Nov. 5, 1886. Serial No. 218,058. (No model.)

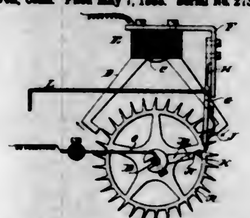
Brief.—The object of the invention is to produce improved devices for preventing excessive action of the evening mechanism, thereby making the sliver of more nearly uniform weight and size than heretofore.



Claim.—1. In a railway-head, in combination, the drawing-rolls the opposing conical drums D D′, belt D^2, and gearing intermediate the drums and drawing-rolls to transmit power to said rolls, the cornet G, having a weighted rod, g^2, bearing a weight, K, and the connecting mechanism, substantially as described, whereby the belt is shifted upon said drums, the pivoted weight-bearing arm P, connected to the belt-shifting mechanism, and supplementary weight W, and means, substantially as described, for moving said weight along said arm as the belt is shifted upon said drums, substantially as set forth.

2. In a railway-head, in combination, the drawing-rolls to attenuate the sliver, the opposing conical drums D D′ and belt D^2 and intermediate gearing to transmit power to the said rolls, the cornet G, having a weighted rod bearing a fixed weight, K, and connecting mechanism, substantially as shown and described, whereby the said belt is shifted upon said drums and the speed of the said rolls thereby regulated, a weight-bearing arm pivoted at one end to the frame of the machine and connected through a portion of the said connecting mechanism to the said cornet in the manner described, a supplementary weight adapted to slide upon said arm, and means, substantially as described, for automatically moving said weight upon said arm as the speed of the drawing-rolls is altered, substantially as set forth.

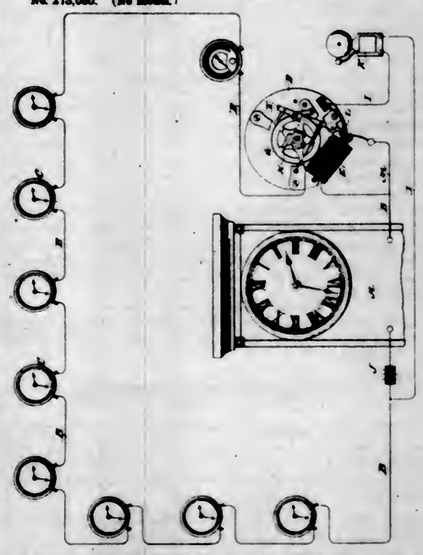
3. In a railway-head, in combination, drawing-rolls to attenuate the sliver, the conical drums D D′, belt D^2, gearing intermediate the drums and the drawing-rolls, the cornet G, its arm g', and weighted rod g^2, the weight-bearing arm P, pivoted to the frame of the machine, connections between said rod g^2 and arm P, and the weight W and shipper F, and connections between said weight and shipper, whereby the weight upon the arm g^2 is increased or diminished as the said belt is shifted upon the said drums, substantially as and for the purposes set forth.



387,702. WAGON-FENDER. Charles R. Wagner, Holmesburg, Pa. Filed May 16, 1888. Serial No. 274,063. (No model.)

Claim.—1. The combination, with the plate having bearing-lugs, and having transverse openings through the lugs, of the roller journaled in the lugs and having annular grooves opposite the said openings, and the pins passing through the openings in the lugs and fitting in the grooves in the roller, substantially as described, for the purpose specified.

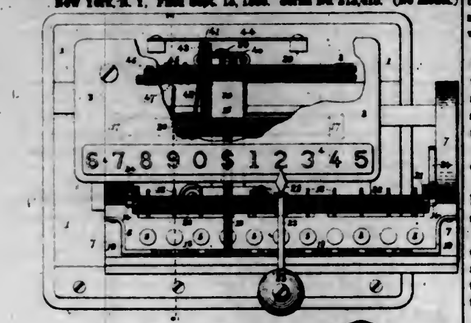
2. The herein-described fender, composed of the plate having bolt-openings, and having one edge provided with a flange, and with bearing-lugs at each end, the lugs having transverse openings, the roller of uniform diameter from end to end journaled in the lugs, and having annular grooves opposite the said openings, and the pins passing through the said openings and fitting in the grooves, substantially as and for the purpose set forth.



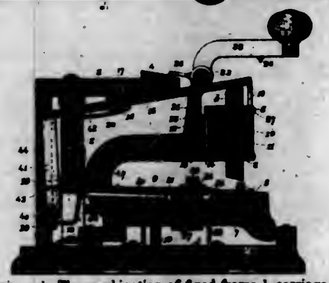
387,703. CIRCUIT-CLOSER FOR ELECTRIC CLOCKS. Charles D. Warner, Assignor to the Standard Electric Time Company, New Haven, Conn. Filed May 7, 1888. Serial No. 273,084. (No model.)

Claim.—1. In an electric clock, the combination, with the escapewheel and its anchor, the insulated arm F, mounted upon the anchor-arbor and carrying the contact-spring I, provided with the head J, and the contact M, mounted upon the escape-wheel arbor, substantially as described.

2. In combination with the escapement and escape-wheel, the arm F, the spring-arm G, carrying the contact-spring J K, the adjusting-screw L, and the contact N, all substantially as described.



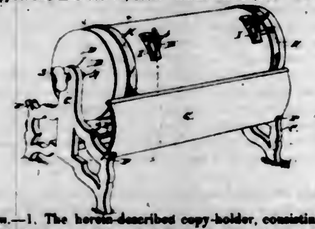
387,704. ELECTRIC-CLOCK SYSTEM. Charles D. Warner, Ansonia, and Arthur D. Bennett, New Haven, assignors to the Standard Electric Time Company, New Haven, Conn. Filed May 7, 1888. Serial No. 273,085. (No model.)



Claim.—1. In an electric-clock system, the combination of a secondary-clock circuit, a regulator for operating the same, and an alarm-circuit connected with said secondary circuit and rendered inoperative by the working thereof, whereby the alarm is prevented from sounding during the normal action of the secondary-clock circuit and sounded when their action becomes abnormal or ceases.

2. In an electric-clock system, the combination, with the regulator A, and the secondary-clock circuit B, the local clock D, and the alarm-circuit I K, connected with the working-circuit and the local clock, substantially as described, and for the purpose described.

387,705. CHECK-PUNCHING MACHINE. J. Newton Williams, New York, N. Y. Filed Sept. 13, 1886. Serial No. 213,415. (No model.)



Claim.—1. The combination of fixed frame 1, carriage 7, guided thereon, spring-retracted punches 5 and corresponding dies, 6, in line on said carriage, shaft 38, carrying ratchet-wheel 40 and feed-roller 37, rock-shaft 16, mounted on the stationary frame, spring-retracted lever 15 on said shaft, carrying on one end feed-pawl 41 and projecting at the other over the punches, horizontal bar 22, having arms 21 pivoted on the carriage, and hand-lever 23 on said horizontal bar, substantially as set forth.

2. The combination of a stationary frame, a carriage mounted so as to slide thereon, a series of vertically-moving punches mounted in said carriage, a lever pivoted on the stationary frame and projecting over said punches, a spring for maintaining said lever in elevated position, a horizontal bar over said lever parallel with the series of punches and having arms at each end pivoted to the carriage, a finger-piece for operating said bar, and stops on the said carriage for limiting the motion of said arms and bar, substantially as set forth.

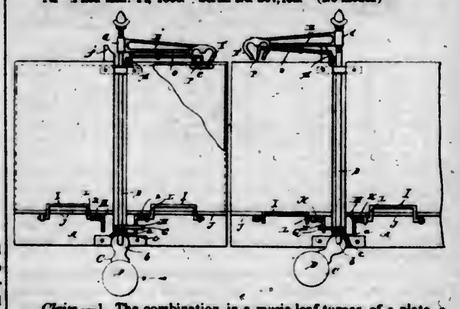
3. The combination of a stationary frame, a table supported thereon, a feed-roller mounted below and projecting through said table peripherally, a check-holding plate mounted above said table, a guide-roller, a spring whereon said guide-roller has bearings, and a pivot-screw for said spring fixed to said holding-plate in line with the feed, substantially as set forth.

387,706. COPY-HOLDER. Edward A. Bennett, Weston, W. Va. Original application filed Aug. 26, 1887, Serial No. 247,986. Divided and this application filed Oct. 19, 1887. Serial No. 252,849. (No model.)

Claim.—1. The herein-described copy-holder, consisting of a revolving cylinder mounted in suitable standards, and an independent guide-plate adapted to be mounted on either side of said cylinder, substantially as described.

2. In combination with the standard C, carrying the cylinder A and having the slots F, the guide-plate G, adapted to be mounted on opposite sides of the cylinder by having its lower ends received in the slots F, substantially as described.

3. In combination with the standards C, carrying the cylinder A and having the slots F and the brace E, the guide-plate G, adapted to be mounted on either side of the cylinder by being received in the slots F, and the arms *d*, having inner hooked ends adapted to engage with the brace E, substantially as described.



4. The combination of the standards C, having vertical top grooves, D, and a threaded aperture on one standard and a recess in the other, the cylinder A, the axle B, to which the cylinder is fixedly mounted, and having trunnions engaging with sockets in the standards, and the set-screw S, having a recess formed at its inner end to clamp the trunnions of the shaft, substantially as described.

5. In combination with the revolving cylinder A, the double clasps H, to hold the ends of the copy from either side, as set forth.

6. In combination with the revolving cylinder, the clasps H, to hold the ends of the copy to the cylinder, and the elastic bands *k*, as set forth.

7. In a copy-holder, the combination, with the standards C, the copy-cylinder A, having fixed trunnions journaled in the standards, and the friction-brake operated by hand to engage the trunnions, so that after the cylinder is turned it will cease its revolution as soon as the hand is taken therefrom, as set forth.

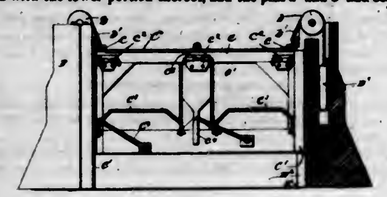
387,707. MUSIC-LEAF TURNER. Louis Bernhard, Bloomsburg, Pa. Filed Mar. 14, 1888. Serial No. 267,152. (No model.)

Claim.—1. The combination, in a music-leaf turner, of a plate, a shaft journaled thereon, a lever and gearing for turning said shaft in both directions, an arm rotating with and sliding upon said shaft, a lug on said plate to raise said arm, and engaging devices on said arm, and the music-leaves, substantially as described.

2. The combination, in a music-leaf turner, of a plate, a shaft journaled thereon, a weighted lever and gearing for turning said shaft, an arm rotating with and sliding upon said shaft, a lug on said plate for raising said arm, and engaging means on said arm and leaf, substantially as described.

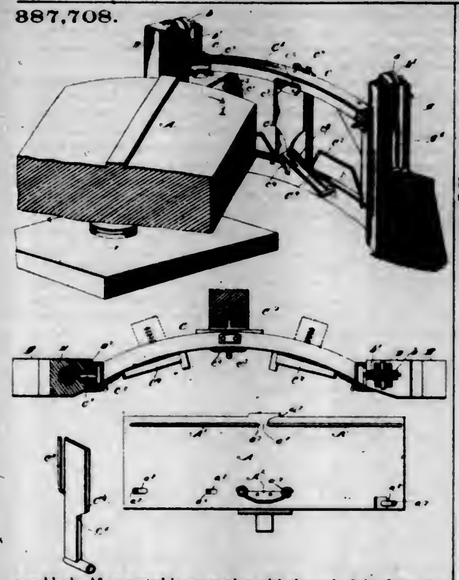
3. The combination, in a music-leaf turner, of a shaft and operating means, an arm on said shaft rotating therewith and sliding thereon, a lug on said plate for raising said arm, a magnet on the arm, and an armature on the music-leaf, substantially as described.

4. The combination, in a music-leaf turner, of a shaft and operating means, a movable and sliding arm on said shaft, a lug on the plate, and armatures provided with spurs to adapt them for attachment to music-leaves, substantially as described.



5. The combination of the rotating shaft and gearing therefor, the rock-shaft, and the arm on the rotating shaft to actuate the rock-shaft, as set forth.

6. The combination of the rotating shaft, the arm E, the plate M, and the rod O, pivoted on the arm E and actuated by the plate M, as set forth.



7. The combination of the plate A, the shaft B, the rock-shaft carving around the edge of the shelf, and the arm on the shaft B, to actuate the rock-shaft, as set forth.

387,708. DRAW-BRIDGE. William J. Benson, Fort Worth, Tex. Filed May 23, 1887. Serial No. 239,126. (No model.)

Claim.—1. The combination, with the gates adapted to ascend and descend in a vertical plane, of the levers O^4, mounted in connection with the lower portion thereof, and the pins a^3 and a^7 and central

387,708.

cam-block, A^3, mounted in connection with the end of the draw-platform, as herein set forth, whereby the said gate may be raised or lowered in whatever direction the draw-platform may be swung, substantially as described.

2. In combination with the gates having the levers C^4 in the lower portions thereof, the projecting wires or rods c^6 in the upper portions thereof, the projecting pins arranged at different elevations upon the end of the draw-platform, the central cam-block on the draw-platform, and the metallic strips A', having a space between their central ends, all arranged as and for the purposes herein set forth, substantially as described.

3. The combination, with the gates C, of the posts D, the guiding-connection between the said gate and posts, the levers C^4, mounted in the lower portion of said gates, the central projection c^5, and the pins and central cam-block arranged in connection with the ends of the draw-platform, substantially as described.

4. The combination, with the gate C, of the levers C^4, arranged in the lower portion thereof and steadied in their movements, as set forth, one of said levers being recessed, and the pins c^5 c^7 and the central cam-block, A^3, substantially as described.

5. The combination, with the lower central portion of the gate C, of the leverage-extension block D, and the levers C^4, and the draw having the contact-points to act on the levers, substantially as described.

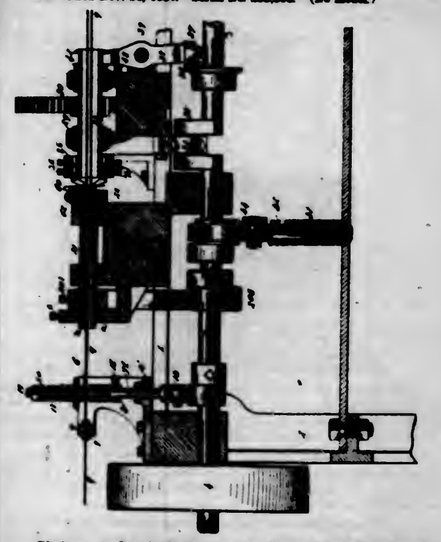
6. The combination, with the upper portion of the gate, of the wire rods or pins c^6, and the strips A', secured to the end of the draw-platform, substantially as described.

7. In combination with the gates having the levers C^4, which are adapted to be reversed from side to side and to assume an inclined position, the contact-points on the draw to coact with the levers to reverse the same and bear thereupon, as set forth.

8. In combination with the gates having the levers C^4, which are adapted to be reversed from side to side and to assume an inclined position, the contact-points on the draw to coact with the levers, the strips A' on the draw, and the contact points or projections on the gates, against which projections the strips A' coact, as set forth.

9. The combination, with the gate posts or columns B B, of the gate having its ends guided in the posts or columns, and provided at its center with the vertical guide-iron C^3, having movement in the platform of the bridge, the rope or chain connected to the gate, the weight attached to the rope or chain and working in the posts or columns, and the draw acting on the gate to depress the same when the draw is closed, substantially as specified.

387,709. EYE-PROTECTOR. Alonzo P. Cole, Waltham, assignor to John W. Smith, Boston, Mass. Filed Dec. 24, 1887. Serial No. 258,576. (No model.)



Claim.—The eye-protector *a*, having concave or cup-shaped portions *a' a'* on either side of its middle portion, a midway cut-away

387,709.

portion, *a''*, and a flexible gore-piece, *b*, secured to the edges of the said portion *a''*, substantially as and for the purpose set forth.

387,710. BARB-WIRE MACHINE. Louis J. Cressler, St. Louis, Mo. Filed Nov. 21, 1887. Serial No. 255,393. (No model.)

Claim.—1. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, mechanism for holding the wires on each side of the barb-forming mechanism, one of said holders consisting of a head, 5, having a projection, 6, movable head 10, a stem or rod on the movable head, a cam for operating the movable head, and springs 18, located above the projection 6, substantially as and for the purpose set forth.

2. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, mechanism for holding the wires on each side of the barb-forming mechanism, one of said holders consisting of pivoted levers 80, blocks or plates 82, secured to the upper ends of the levers, and means for opening and closing the upper ends of the levers, substantially as and for the purpose set forth.

3. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, mechanism for holding the wires on each side of the barb-forming mechanism, one of said holders consisting of pivoted levers 80, adjustable blocks 82 in the upper ends of said levers, and means for closing the upper ends of said levers, consisting of toggle-arms connected to the levers and cams for moving the arms, substantially as and for the purpose set forth.

4. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, holders on each side of the barb-forming mechanism, one of said holders consisting of pivoted levers 80, blocks secured to the upper ends of the levers, and means for closing the upper ends of the levers, consisting of toggle-arms and means for operating the arms, substantially as and for the purpose set forth.

5. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, mechanism on each side of the barb-former for holding the strand-wires, one of said holders consisting of pivoted levers 80, blocks on the upper ends of said levers, and means for closing the upper ends of the levers, consisting of toggle-arms, a sliding plate to which the toggle-arms are connected, a pin on the plate, and an eccentrically-grooved cam in which the pin fits, substantially as and for the purpose set forth.

6. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, mechanism for holding the

wires on each side of the barb-former, one of said holders consisting of pivoted levers 80, blocks 82 in the upper ends of the levers, springs 86, for opening the arms, toggle-arm 87, sliding plate 89, pin 88, and eccentrically-grooved cam 97, substantially as and for the purpose set forth.

7. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, a holding and feed device consisting of a sliding head, levers pivoted to and carried by the head, and means for opening and toggle-levers for closing the levers at the proper time, substantially as and for the purpose set forth.

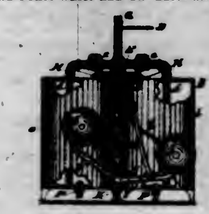
8. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, mechanism for holding the strand-wires on one side of the barb-former and for feeding the strand-wires, said mechanism consisting of a sliding head, levers pivoted to the head, blocks in the upper ends of the levers, means for opening and closing the levers, and means for reciprocating the head, substantially as and for the purpose set forth.

9. In a barb-wire machine, in combination with mechanism for forming the barbs upon the strand-wires, mechanism for holding the strand-wires on one side of the formers, consisting of a sliding head, levers pivoted to the head, blocks in the upper ends of the levers, means for opening and closing the levers, consisting of a sliding head, an eccentrically-grooved cam, toggle-arms, a sliding plate, a pin on the plate entering the groove in the cam, and means for reciprocating the head, consisting of a pitman, disk, adjustable wrist-pin in the disk, shaft to which the disk is secured, and means for turning the shaft, substantially as and for the purpose set forth.

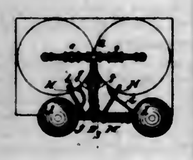
10. In a barb-wire machine, the combination of the mechanism for forming the barbs upon the strand-wires, hollow spindle 21, through which the strand-wires pass, means for feeding the barb-wire forward, and means for cutting off the barb-wire, consisting of a stationary knife, an arm secured to the said spindle and to which the movable knife is secured, a lever secured to the spindle, and a cam for operating the lever to turn the spindle and operate the movable knife, substantially as and for the purpose set forth.

11. In a barb-wire machine, in combination with mechanism for feeding the barb-wire forward, mechanism for forming the barbs upon the wire, consisting of a reciprocating longitudinally-movable spindle, fingers 24 on the spindle bent inwardly toward the path of the wire and provided with extensions 27, and means, substantially as described, for imparting to the spindle a longitudinal movement, as specified.

12. In a barb-wire machine, the combination of mechanism for forming the barbs upon the strand-wires, said mechanism consisting of fingers and a reciprocating longitudinally-movable spindle and cam 36, lever 38, and spring 43, whereby the spindle is moved backward and forward from its initial position, substantially as and for the purpose set forth.



13. In a barb-wire machine, in combination with means for feeding the barb-wire forward, mechanism for forming the barbs upon the wire, and spring-holders for the barb-wire before it is wound around the strand-wires, substantially as set forth.

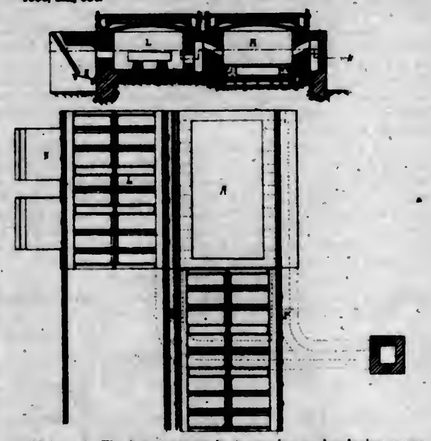


14. In a barb-wire machine, the combination of mechanism for feeding the barb-wire forward, mechanism for forming the barbs upon the strand-wires, and mechanism for holding the barb-wire after it is cut off and before it is formed upon the strand-wires, consisting of plates 60 61, free at their lower ends and formed as shown and described, substantially as and for the purpose set forth.

15. In a barb-wire machine, in combination with means for forming the barbs upon the strand-wires, mechanism for feeding the barb-wire forward, consisting of a pivoted bell-crank lever, a dog carried by the free end of the lever, and means for operating the lever, consisting of a yoke to which one end of the lever is secured, a cam fitting in the yoke, a stem on the yoke, a guide, 51, through which the stem passes, and spring 52, surrounding the stem, substantially as and for the purpose set forth.

387,711. PNEUMATIC WATER-ELEVATOR. James B. Erwin, Milwaukee, Wis. Filed Mar. 21, 1887. Serial No. 231,695. (No model.)

Claim.—1. In a pneumatic water-elevator, the combination, with two direct receiving water-chambers, each provided with direct inlet and outlet water and air ducts and passages and air and water con-



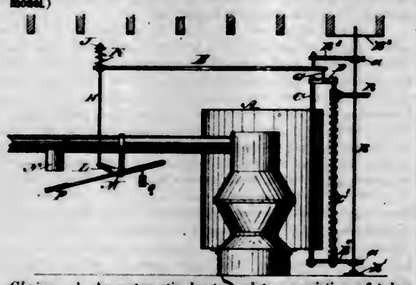
trolling valves, of two water-receiving valve-controlling floats respectively counterbalanced by each other upon a two-armed lever and connected with the respective water-chambers by flexible air and water tubes, through which tubes they are alternately filled with air and water from the respective chambers with which they are connected, whereby the gravity of the water in one float and the buoyancy of the air in the other float co-operate to move the valve mechanism, substantially as and for the purpose specified.

2. In a pneumatic water-elevator, the combination of two water-chambers, *a* and *b*, each alike provided with water and air inlet and outlet ducts, passages, and valves, two water-receiving floats, I I, counterbalanced by each other upon a two-armed lever, J, lever J, two flexible air or vent tubes, *h h*, and two flexible water-tubes, *g g*, said tubes *g g* and *h h* being adapted to permit the water to enter one of said water-receiving floats I as it is withdrawn from the other float I, substantially as and for the purpose specified.

3. In a pneumatic water-elevator, the combination of two water-chambers, *a* and *b*, of like construction, each provided with inward-opening check-valves F F, for the direct admission of the exterior surrounding water, two outlet branch water-pipes, *d d*, both communicating with the same single water-pipe G, single air-pipe D, communicating from the air-receiver through the two branch pipes H H, two valve-actuating water-receiving floats, I I, counterbalancing each other upon the respective ends of an oscillating lever, J, an air-controlling cock or valve, E, and connecting-link M, communicating motion from the oscillating floats I I to said air-controlling valve or cock, all substantially as and for the purpose specified.

4. In a pneumatic water-elevator, the combination of two direct-receiving water-chambers, *a* and *b*, each provided with inlet check-valves F F, inlet check-valves F F, through which the surrounding water enters into the respective chambers *a* and *b*, two outlet branch water-pipes, *d d*, and single water-pipe G, said branch pipes *d d* communicating between said chambers *a* and *b* and said single pipe G, outward-opening check-valves *c c*, located, respectively, in said branch water-pipes *d d*, single air-tube D, air-controlling cock E, and branch air-tubes H H, said single air-tube D, cock E, and branch tubes H H serving to control the admission of compressed air from the air-reservoir to and from the respective chambers *a* and *b*, centrally-pivoted two-armed lever J, water-receiving floats I I, supported, respectively, upon the respective arms of said lever J, flexible inlet-water tubes *g g* and air-tubes *h h*, communicating, respectively, between said floats I I and said water-chambers *a* and *b*, and connecting-bar M, communicating between said two-armed lever J and said air-controlling cock E, all substantially as and for the purpose specified.

387,712. HARDENING AND TEMPERING ARMOR-PLATES, &c. Alfred Evrard, Paris, France, assignor to the Compagnie Anonyme des Forges de Chatillon et Commentry. Filed Sept. 19, 1888. Serial No. 213,869. (No specimens.) Patented in France June 30, 1886, No. 177,113; in England Aug. 24, 1886, No. 10,888, and in Italy Sept. 10, 1886, XL, 393.



Claim.—1. The improvement in tempering or hardening armor-plates, cannon-tubes, and other large objects of that order, consisting in heating the object to or about a cherry-red or orange-yellow, forcing it while thus hot under a tempering-bath of molten metal having an initial temperature of about 400° centigrade, and being of a volume readily comparable with that of the object to be tempered, particularly a bath of molten lead of three or four times the weight

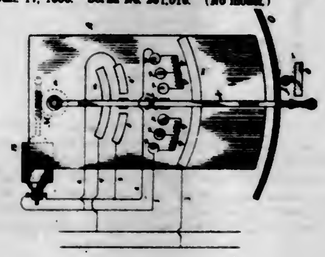
of said object, and keeping the said object submerged till it has attained the temperature of the molten-metal bath, so that the tempering or hardening is effected by a comparatively prolonged conduction from the surface of the armor-plate, cannon-tube, or other large object of that order to the molten metal in contact therewith, and also through the mass of the said object and of the molten metal, under a surface-pressure in excess of that attained by the old use of non-metallic liquids, substantially as described, the specified conditions of temperature and the like being variable more or less, according to the nature of the metal to be tempered, the degree of temper to be produced, and the special circumstances, as the skilled operator may determine, as hereinbefore set forth.

2. The new and improved apparatus for tempering or hardening armor-plates, cannon-tubes, and other large objects of that order in molten-metal baths, consisting of two furnaces, each provided with means for heating the contents, and one of them containing a molten-metal tempering-bath, and being also provided with means for forcing the large objects to be tempered under the molten metal of the bath and holding them there, and, in connection with said furnaces, of mechanical appliances—such as trucks and lifts—for transferring said large objects to the furnace containing the metal bath from the other of said furnaces, substantially as described.

387,713. HEAT-REGULATOR FOR STOVES OR FURNACES.

Lorenzo D. Farra, Philadelphia, Pa., assignor of one-half to Horace F. McCann, same place. Filed July 25, 1887. Serial No. 245,196. (No model.)

Claim.—1. An automatic heat-regulator, consisting of tubes, levers, a connecting-rod, and damper, substantially as described, in combination with a column having brackets vertically adjustable thereon and supporting said tubes and levers, substantially as described.



2. An automatic heat-regulator, consisting of tubes, levers, a connecting-rod, and damper, in combination with the column B, the brackets B^2 and B^4, vertically adjustable on said column, the bracket B^4, sustaining the tubes of said regulator, and the bracket B^3, sustaining the supporting-lever thereof, substantially as described.

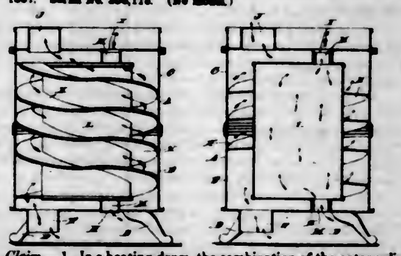
3. An automatic heat-regulator, consisting of tubes, levers, a connecting-rod, and damper, in combination with the column B, having its foot in the step B' and loosely passing through opening in bracket B^3, the brackets B^2 and B^4 vertically adjustable on said column, the said bracket B^3 sustaining the supporting-lever, of said automatic heat-regulator, and the bracket B^4 supporting the tubes thereof, substantially as described.

4. A heat-regulator for a stove or furnace, consisting of two tubes secured to an arm or bracket, B^4, one of said tubes being within the casing of the stove or furnace, the lever D, connected with the upper ends of said tubes, the lever E, pivoted to an arm or bracket, B^3, above said casing, and having its shorter arm connected by a link to said lever D, the rod H, the nut J, and spring K, the pivoted lever L, the rock-shaft M, with damper P, the weight Q, and a pipe having inlet N, said parts being combined substantially as described.

387,714. ELECTRIC MOTOR. Bradley A. Fiske, U. S. Navy.

Filed Jan. 17, 1888. Serial No. 261,016. (No model.)

Claim.—1. The combination of a movable body, a rotary electric motor, gearing whereby the rotation of said motor moves said body, an arm movable independent of said body and adapted to be moved by hand, a circuit-controlling switch carried by said body and operated by said arm, and electrical connections between said switch and said motor, such that when said arm is moved said movable body is moved so long as the movement of the arm is continued, substantially as set forth.



2. The combination of a movable body, a rotary electric motor, gearing whereby the rotation of said motor moves said body, an arm movable independent of said body and adapted to be moved by hand, contacts on said body and contacts controlled by said arm, and electrical connections to the motor, whereby variations in the relative position of said contacts due to movements of said arm relative to the movable body affect the motor so as to cause said movable body to follow the movements of said arm, substantially as set forth.

3. The combination of a movable body, an electric motor for moving the same, a switch carried by said movable body, an arm movable independent of said movable body for controlling said switch, connections to said motor, such that when said arm is moved in either direction the body is moved in the same direction, and means for returning said arm and the switch to their original position when said arm is released by the hand, substantially as set forth.

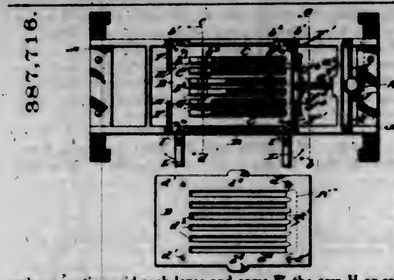
4. The combination of an electric motor, a body connected therewith so as to be moved thereby, an arm movable independently of said movable body, a switch for the motor-circuit controlled by said arm, having a central position at which the circuit is open, and closing the circuit in one direction or the other as said arm is moved in one or the other direction, whereby said body is caused to follow the movement of said arm, and means whereby said arm is returned to its central position when it is released by the hand, substantially as set forth.

5. The combination of a movable body, a rotary electric motor, gearing whereby the rotation of said motor moves said body, an arm movable independently of said movable body and adapted to be moved by hand, switch-contacts carried by said movable body, and switch-contacts controlled by said arm, and electrical connections from said switch to the motor, such that at the central position of the arm the motor-circuit is broken, and on its movement in either direction circuit is closed to the motor, so that it moves said body in the same direction, following the movements of the arm, and on a more rapid movement of the arm the speed of the motor is increased, substantially as set forth.

387,715. HEATING-DRUM. Isaac H. Fry, Tower City, Dak., assignor of one-half to Hiram J. Whittlesey, same place. Filed Dec. 16, 1887. Serial No. 258,113. (No model.)

Claim.—1. In a heating-drum, the combination of the outer cylinder composed of two sections detachably united, and the inner cylinder having an external spiral flange extending to the side of the outer cylinder, as set forth.

2. In a heating-drum, the combination of the outer cylinder, having inlet and discharge openings in its ends and composed of two sections having a screw-threaded connection, and the inner cylinder, having the pipes M at its ends and having an external spiral flange projecting to the side of the outer cylinder, as set forth.



3. The improved heating-drum herein described and shown, comprising the outer cylinder, provided at its ends with the openings H I and the inlet and discharge pipes E J, and composed of two sections united by a screw-thread connection, and the inner cylinder, having the pipes M at its ends, engaging the openings H I, and provided with the external spiral flange projecting to the side of the outer cylinder, as specified.

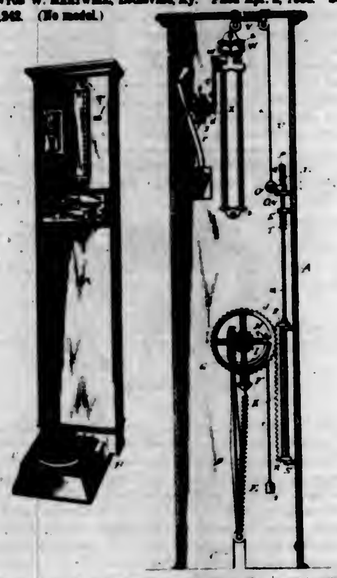
387,716. MOLDING-MACHINE. Thomas B. Harkins, Bristol, Pa.

Filed Feb. 20, 1888. Serial No. 265,014. (No model.)

Claim.—1. In a machine of the class recited, the combination of the supporting-frame, the patterns secured thereon, the vertically-movable table provided with slots registering with said patterns, the shafts E, the cams F F' thereon, the shaft G, the rock-lever thereon, the rods connecting said rock-lever and cams F, and the arm H on said shaft G, substantially as and for the purpose set forth.

2. In a machine of the class recited, the combination of the supporting-frame, the slotted table D, the patterns C, the strips or bases c', working in the slots in said table, the plate B, the shafts E, the cams F F' thereon, the shaft G, the rock-lever thereon, the rods connecting said rock-lever and cams F, and the arm H on said shaft G, substantially as and for the purpose set forth.

rods connecting said rock-lever and cams F, the arm H on said shaft G, the pawl on said arm H, the toothed perforated segment, and the attachable and detachable stop-pin, substantially as and for the purpose set forth.



2. In a machine of the said class, the combination of the supporting-frame, the plate B thereon, the vertical guide-pins b^2 on said plate, the stop or set-screws b', working therein, the patterns secured on said plate, the vertically-movable table D, provided with bosses d', into which extend said guide-pins, and with slots which register with said patterns, the shafts E, the cams F F' thereon, the shaft G, the rock-lever thereon, the rods connecting said rock-lever and cams F, and the arm H on said shaft G, substantially as and for the purpose set forth.

3. In a machine of the said class, the combination of the supporting-frame, the plate B thereon, provided with the transverse slots b^3, the patterns, the thumb-screws connecting said patterns with said plate, the vertically-movable table provided with slots registering with said patterns, the shafts E, the cams F F' thereon, the shaft G, the rock-lever thereon, the rods connecting said rock-lever and cams F, and the arm H on said shaft G, substantially as and for the purpose set forth.

4. In a machine of the said class, the combination of the supporting-frame, the slotted table D, the patterns C, the strips or bases c', working in the slots in said table, the plate B, the shafts E, the cams F F' thereon, the shaft G, the rock-lever thereon, the rods connecting said rock-lever and cams F, and the arm H on said shaft G, substantially as and for the purpose set forth.

387,717. COIN-RELEASED WEIGHT-MEASURING MACHINE.

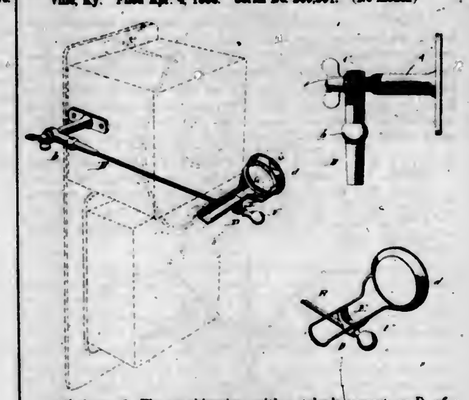
Newton W. Hartwell, Louisville, Ky. Filed Apr. 2, 1888. Serial No. 269,342. (No model.)

Claim.—1. In a measuring apparatus, the combination of an indicator, a ratchet-wheel, a gage supported by the ratchet-wheel, a locking-rod, as c', connected to the gage and resting on the ratchet-wheel, and means, as the anchor h and escape-wheel f, for releasing said ratchet-wheel, substantially as described.

2. In a measuring apparatus, the combination of an indicator and gage, a locking-rod connected thereto, and a tube adapted to receive a coin, with a ratchet-wheel, d, on which the locking-rod rests, an escape-wheel, f, connected to the ratchet-wheel, an anchor having pallets engaging with the escape-wheel, and an arm projecting in the path of the coin traveling in the tube, substantially as described.

3. In a measuring apparatus, the combination of a treadle, B, cross-head W, and intermediate mechanism, as the racks G K, pinion H, gear J, rod L, and cord U, with a locking-rod, c', and means, as the escapement h and wheels d f, for holding and liberating the same, substantially as described.

4. In a measuring-machine, the combination of an escapement, a gage held normally in fixed position by said escapement, and means, as the cord U, treadle C, and connections between them, for bringing the gage into operative connection with the escapement, substantially as described.



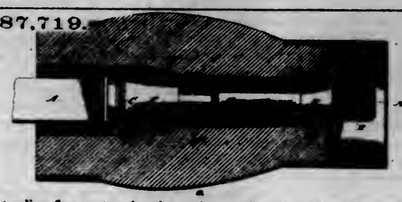
5. In a measuring-machine, the combination, with an escapement, of a gage normally held in a stationary position by the same, and an adjustable weight acting to partly counterbalance the weight of the gage, and also governing the pressure on said escapement, substantially as described.

6. The combination, with a measuring-machine, of a channel adapted to receive a coin, an escapement having an arm projecting into the coin-channel, a cross-head carrying a gage, a pointer, and a rod coacting with said escapement, a weight, O', a cord passing over suitable pulleys and connected at one end with the cross-head and at the other to said weight O', with a rod, L, loosely connected to said weight, a treadle, and intermediate connections between the treadle and the rod, substantially as described.

7. The combination, in a measuring-machine, of a channel adapted to receive a coin, an escapement having an arm projecting into the coin-channel, a cross-head, a gage, a pointer, and a rod attached to said cross-head, said rod coacting with said escapement, a weight, O', a cord passing over suitable pulleys and connected at its opposite ends to said cross-head and weight, with a rod, L, loosely connected to said weight and carrying at its lower end a rack, K, a gear meshing with said rack, a pinion connected with said gear, a rack meshing into said pinion, a treadle connected with said rack, and a spring or weight acting to raise the treadle, all substantially as shown and described.

8. The combination of a ratchet-wheel and an escapement with a rod, c', having a projection and pin, c'', acting on said ratchet-wheel, substantially as shown and described.

387,718. TELEPHONE-SUPPORT. Newton W. Hartwell, Louisville, Ky. Filed Apr. 4, 1888. Serial No. 269,891. (No model.)



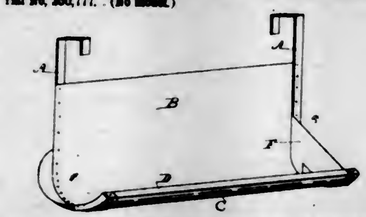
Claim.—1. The combination, with a telephone-rest, as D, of a flaring ring fixedly attached to said rest and performing the double function of holding the receiver on the rest and a sound-insulator, substantially as described.

2. A telephone-support comprising a standard, A, adapted to be attached to the telephone-case, a bar pivotally connected thereto, and a rest attached to said bar to hold the receiver and provided with a flaring ring, serving the double function of holding the receiver on the rest and a sound-insulator, substantially as and for the purpose specified.

387,719. AXLE-BEARING. Daniel E. Hull, Adrian, Mich. Filed Feb. 16, 1888. Serial No. 264,191. (No model.)

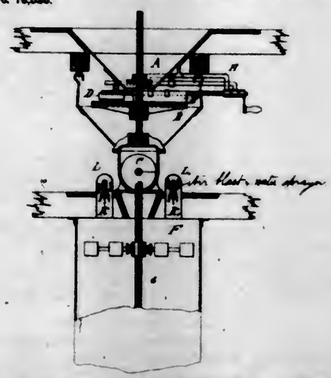
Claim.—1. The combination, with a spindle having a cone on its inner end and a movable or adjustable cone on its outer end, of the spring-washer bearing against the outer cone and the nut screwed on the outer threaded end of the spindle and having an annular inward-

387,719.



extending flange, O, embracing and concealing the said spring-washer, substantially as and for the purpose specified.

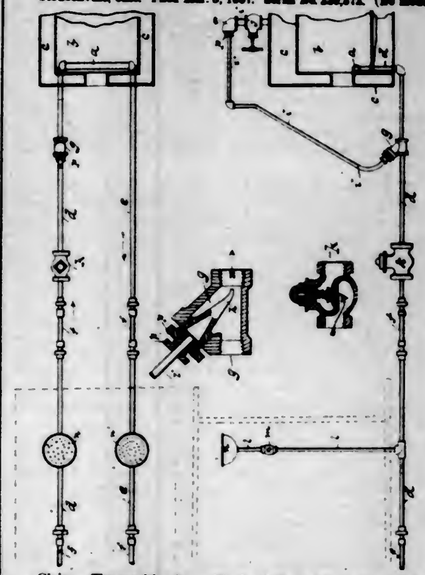
2. The combination, with a spindle having a reduced portion, D, the oil-groove M, and cones on the opposite ends of the spindle, of the box mounted on the spindle and bearing on the cones and the said reduced portion, and having oil-space U, surrounding the spindle at an intermediate point, substantially as specified.



3. In a bearing, the combination of the spindle B, having the shoulder C at its inner end and a reduced portion, D, the longitudinally-movable cone F on the inner end of the spindle and held from rotary motion, substantially as specified, the longitudinally-movable cone K on the outer end of the spindle and held from rotary motion, the nut screwed on the end of the spindle and having the inward-extending flange O, the spring-washer inclosed within the said flange and bearing against the outer end of the cone K, and the box mounted on the spindle and cones and having an oil-space, U, formed therein around the spindle, substantially as and for the purpose specified.

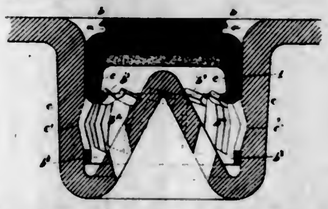
387,720. CULTIVATOR ATTACHMENT FOR GATHERING POTATO-BUGS. JOSEPH HUNT, Ashley, Iowa. Filed Sept. 26, 1887. Serial No. 250,777. (No model.)

Claim.—In a straddle-row cultivator having an outwardly-projecting scoop-shaped trap device fixed direct to each one of the two parallel cultivator-beams, and a vibrating bar carrying brooms suspended upon supports fixed to the same parallel beams, said vibrating bar having a handle secured to one end and within the reach of the driver, for the purpose of operating the same at will, and arranged and combined to operate in the manner set forth, for the purpose of gathering bugs from the vines at the same time the vines are cultivated.



387,721. APPARATUS FOR MANUFACTURING ARTIFICIAL STONE. PAUL JOCHUM and THEODOR EBERHARDT, Ottweiler, Prussia, Germany. Filed May 13, 1887. Serial No. 238,100. (No model.) Patented in Germany Nov. 12, 1886, No. 40,546; in England Feb. 18, 1887, No. 2,573; in France Feb. 28, 1887, No. 181,860, and in Belgium Feb. 28, 1887, No. 76,523.

Claim.—1. The herein-described apparatus for the manufacture of artificial stone, said apparatus comprising a series of feed-hoppers, and rotary discharging-disks below the hoppers, in combination with a preparing-blade, D, over the disk, an adjustable scraper, E, and a mixer into which the materials are fed, substantially as set forth.



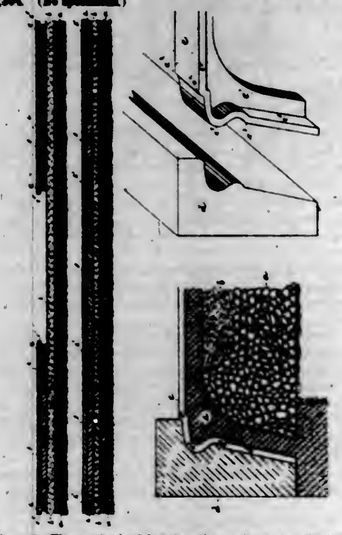
2. The herein-described apparatus for the manufacture of artificial stone, said apparatus comprising a mixing or pugging apparatus and a feeding-trough, in combination with air-blast pipes, and valved water-spraying nozzles over the mixing apparatus, substantially as set forth.

387,722. SYSTEM OF CAR-HEATING. CHARLES L. KLINE, Steubenville, Ohio. Filed Mar. 8, 1887. Serial No. 230,572. (No model.)

Claim.—The combination, with the boiler and fire-box of a locomotive, of a pipe within the latter, pipes *d* and *e* connected to the ends of the said pipe in the fire-box, a pipe, *i*, communicating with the steam-space of the boiler, provided with a regulating-valve, an injector connected to the said pipe *i*, and also to the pipe *d*, a stand-pipe provided with a globe, *n*, communicating with pipe *d*, a check-valve, *k*, applied to said pipe *d*, and a stand-pipe provided with a globe, *n'*, applied to pipe *e*, substantially as specified.

387,723. PERCUSSION-CAP FOR GUN-CARTRIDGES. WILHELM LORENZ, Carlsruhe, Baden, Germany. Filed June 24, 1887. Serial No. 242,342. (No model.)

Claim.—1. The cartridge-shell *c*, provided with an aperture for the cap, in combination with the herein-described cap provided with a flange, *b*, extending at right angles to the line of its longitudinal axis and forming an annular notch, *a*, the diameter of said flange being less than that of the body of the cap, as and for the purpose specified.

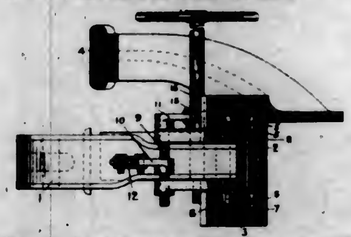


2. The cartridge-shell *c*, provided with an aperture for the cap, said aperture having depressions *c'* in its sides, in combination with the herein-described cap having elastic tongues bent outwardly and adapted to engage said depressions for holding the cap in place, substantially as specified.

3. The cartridge-shell *c*, provided with an aperture for the cap, said aperture having depressions *c'* in its sides, in combination with the herein-described cap, the same comprising a base, a cylindrical body, a ring, b^3, at the open end thereof, and longitudinal stripe b^2, connecting said body with said ring and forming slits in the side of the cap between them, said strips being bent outwardly and adapted to engage said depressions in the cartridge-shell, substantially as specified.

4. The cartridge-shell *c*, provided with an aperture for the cap, in combination with the cap *f*, outwardly-bent elastic tongues b^4 thereon, and inwardly-bent tongues b^5 thereon, and the fulminate *e*, the latter being retained in place by said inwardly-bent tongues, substantially as specified.

5. The cartridge-shell *c*, provided with an aperture for the cap, said aperture having depressions *c'* in its sides, in combination with the herein-described cap, the same comprising a base, *e*, an outwardly-projecting flange, *b*, on said base, said flange extending at right angles therefrom and forming an annular notch, *a*, the diameter of said flange being less than that of the base, and a cylindrical body the mouth whereof is oval, forming elastic sides adapted to engage the depression *c'* in the wall of the aperture in the cartridge-case, as and for the purpose specified.



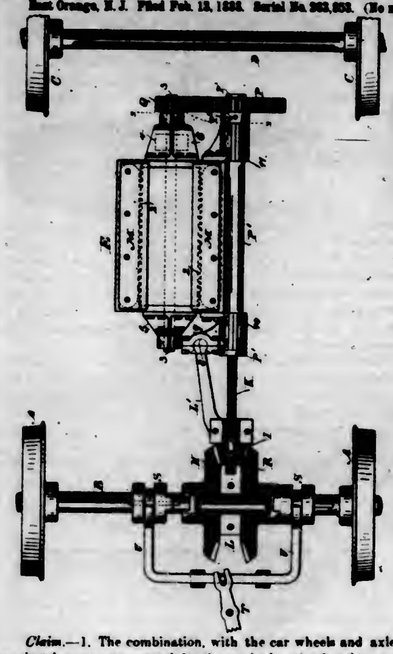
387,724. METHOD OF LAYING ARTIFICIAL PAVEMENTS. JOHN W. MACKENZIE, New York, N. Y. Filed June 20, 1888. Serial No. 278,304. (No specimens.)

Claim.—1. The method of forming the curb of an artificial pavement, which consists in spreading an even foundation forming a chamber by mold and joists around the curb, that is open at its back, and filling the top layer into the chamber and between the joists, so as to extend around the front and over the top of the foundation, substantially as specified.

2. The process of laying an artificial pavement, which consists in forming flanges *c'* upon alternate blocks, and then filling in the intermediate blocks with their top layers, *f*, resting upon said flanges, substantially as specified.

387,725. LOCOMOTIVE-COUPLER. ALBERT P. MASSEY, Watertown, N. Y., assignor to the Remsen Vacuum Brake Company, same place. Filed Feb. 2, 1888. Serial No. 262,770. (No model.)

Claim.—1. In a locomotive-coupler, a draw-hook attached to a shuttle which is free to move in a raceway in a transverse direction, but is firmly secured against a longitudinal strain, substantially as set forth.



2. In a locomotive-coupler, a draw-hook combined with a shuttle moving in a raceway which is practically concentric with the centerpin of a standard passenger-car when said car is coupled to the locomotive, substantially as set forth.

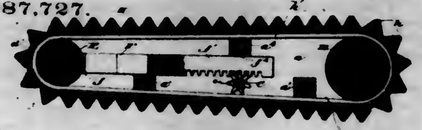
3. In a locomotive-coupler, a buffer which is concave in the central portion, in combination with a draw-hook attached to a shuttle moving in a raceway which is practically concentric with the centerpin of a standard passenger-car when said car is coupled to the locomotive, substantially as set forth.

4. In a locomotive-coupler, the live rollers 5 5 and 6 6, in combination with a draw-hook attached to a shuttle moving in a raceway, substantially as set forth.

5. In a locomotive-coupler, the shaft 16, crank 15, links 14, cranks 11 and 10, links 12, and hook 1, for the purpose described, and substantially as set forth.

387,726. MOTOR FOR RAILWAY-CARS. WILLIAM M. MCDOUGALL, East Orange, N. J. Filed Feb. 13, 1888. Serial No. 263,853. (No model.)

Claim.—1. The combination, with the car wheels and axle and an electric motor supported by the car-body, of a bevel gear-wheel upon the car-axle, a pinion to drive the same, a frame supported at one end by a journal or bearing upon the car-axle and connected at the other end by a ball-and-socket joint to the frame of the electric motor, and a flexible shaft between the pinion and the electric motor, substantially as set forth.



2. The combination, with the car axle and wheels, of an electric motor having flanges at the upper part of the frame, slides attached to the under side of the car-body for supporting the flanges and motor, the bevel-gearing and a flexible shaft for connecting the armature of the motor and the axle of the car, and a frame having a journal box or bearing at one end for the car-axle, and the ball-and-socket joint at the other end to connect the frame with the frame of the electric motor, substantially as set forth.

3. The combination, with an electric motor connected at the under side of a railway-car and the axle or wheels, of a bevel-wheel upon the axle, a pinion gearing with the same, a frame extending from the axle to the frame of the motor, and a connection that allows the parts to turn as the car rises and falls, a tubular shaft receiving motion from the revolution of the armature, and a flexible shaft passing into said tubular shaft and attached at one end to said pinion and at the other end to said tubular shaft, substantially as set forth.

387,727. ENDLESS CARRIER. ALBERT L. MIDDLETON, Portlie, Minn. Filed Apr. 3, 1888. Serial No. 269,669. (No model.)

Claim.—1. In a carrier, the combination of the apron H with the main frame A, the larger end roller, B, journaled in one end of the main frame, the transverse shaft C, having the pinion *c*, the ratchet

387,727.

D, and pawl *d*, the fork F, having the rack-bar *f'*, engaging the pinion *e*, and the parallel legs *f f*, sliding in guide-grooves in the inner surfaces of the sides of the main frame, and the smaller end roller, E, journaled in and between said legs, substantially as specified.

2. In a carrier, the combination of the apron H, the frame A, the fixed roller B, the adjustable roller E, and the means for adjusting said roller E, comprising the fork F, having the rack-bar *f'*, the pinion *e* on the shaft C, and the pawl and ratchet, as set forth.

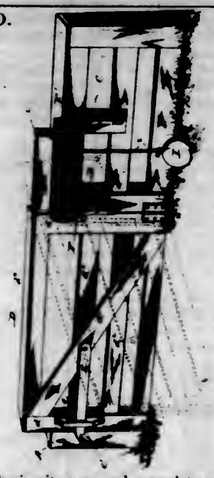
387,728. **REVOLVING BRUSH FOR WASHING TUMBLERS, &c.** JAMES M. MUSGRAVE, Brooklyn, assignor to Silas A. Isley, New York, N. Y. Filed Dec. 16, 1887. Serial No. 258,060. (No model.)

Claim.—1. The hanging stand *c*, provided with a plate at the top to be fastened to the under side of the counter, and a bow, 6, in combination with the bevel gear-wheel *f*, and handle *g* upon a gudgeon at the side of the stand, the bevel-pinion *h* within the bow, the arbor *k* in bearings in the stand and connected to the bevel-pinion, and having a screw at the lower end, and the circular brush *m*, having a hole in the end of its handle *l*, into which the arbor passes and is screwed, substantially as set forth.

2. The combination, with the counter *a* and the water-vessel *b*, of a hanging stand screwed at its upper end to the under side of the counter and inclined forwardly, a bevel gear-wheel upon the side of the stand, and a handle for rotating the same, a bevel-pinion and arbor supported by the inclined stand with the arbor extending below the stand and terminating as a screw, and the circular brush having a handle perforated longitudinally for the reception of the arbor, substantially as set forth.

387,729. **PAPER-BAG HOLDER.** WILLIAM M. NIX, Mayfield, Ky. Filed June 7, 1888. Serial No. 276,330. (No model.)

Claim.—1. A paper-bag holder consisting of a base-plate, A, having a central perforation and a rod, in combination with a plurality of plates or leaves perforated, as described, and a top plate provided with a spring terminating in a hook or ring having a fastening device, and a tube, all arranged and operating substantially as and for the purposes set forth.

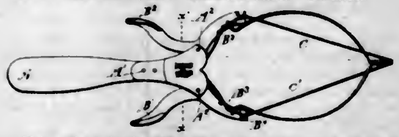


2. A paper-bag holder consisting of a base-plate having a central perforation, a rod, and uprights having guides or recesses adapted to receive a cross-piece, in combination with a plurality of leaves or plates perforated, as described, and a top plate provided with a spring terminating in a hook or ring, a fastening device, and tube, all arranged and operating substantially as and for the purposes set forth.

3. A paper-bag holder comprising the following elements: a base-plate provided with a perforation, a rod, and uprights having guides or recesses formed on their inside, a plurality of leaves or plates perforated, as described, a top plate having a spring secured thereto, a tube, a fastening device for said spring, and a cross-piece having legs, all arranged and operating substantially as and for the purposes set forth.

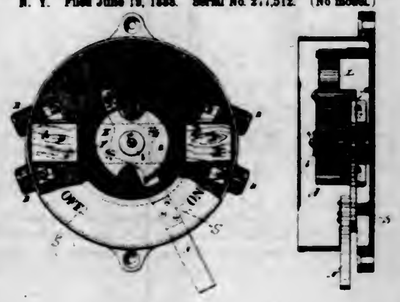
387,730. **GATE.** JAMES W. PARK and WILLIAM R. SANDERS, Sullivan, Ind. Filed Apr. 24, 1888. Serial No. 271,666. (No model.)

Claim.—1. The combination, with the hinged gate and the arm extending therefrom over the fence-panel adjoining and attached to the hinge-post, of the horizontal roller of large diameter journaled in brackets at the top of the panel, which are respectively secured to the hinge-post and to the middle portion of the panel extending from said post, the rope having its upper end secured to said arm near the end thereof, and the weight secured to the lower end of the rope and nearly touching the ground when the gate is closed, substantially as specified.



387,730.

2. The combination, with the hinged gate and the arm extending horizontally from the end bars thereof, adjoining the hinge-post and extending over the panel adjoining said post, of the rope attached to said arm near the end thereof, the long horizontal roller of large diameter journaled in brackets secured to the top of the panel adjoining the hinge-post, and the weight attached to the lower end of said rope, the weight and the leverage of the arm combined counterbalancing the gate and preventing the same from sagging, substantially as specified.

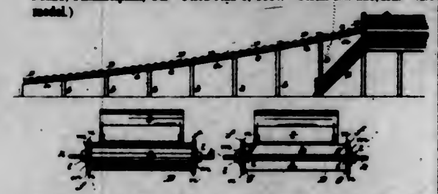


3. The combination of the latch-post A, the vertical bar A^2, secured thereto, the latch-hook *c'*, the gate composed of the pairs of end bars, *d d'*, and connecting-rails, the latch-bar pivoted to the gate, the hinge-post B, the panel C, extending from the hinge-post, the arm H, extending over said panel, the long horizontal roller G, journaled on the brackets F, secured to the top of the panel C, the rope *i*, and the weight I, all constructed and arranged substantially as and for the purpose specified.

387,731. **PIE-PLATE LIFTER.** AMOS L. POMEROY, Sand Lake, N. Y. Filed Mar. 26, 1888. Serial No. 268,549. (No model.)

Claim.—In a pie-plate lifter, the combination, with a pair of lifter-arms provided with coiled wire springs, of a supporting-frame provided with wire-receiving eyes and a pair of levers provided at one end with arm-supporting guides, at the opposite end with operating-handles, and intermediately with coil-supporting knbs, through which the levers are pivoted to the supporting-frame, substantially as described.

387,732. **ELECTRIC CUT-OUT.** JOSEPH A. POWERS, Lansingburg, N. Y. Filed June 19, 1888. Serial No. 277,512. (No model.)



Claim.—1. The combination, with a box or can provided with a central stud, of insulating-supports and contact-terminals secured thereto, an insulating-block carrying contact-plates adapted to connect the terminals in pairs and pivoted on the stud, a handle for turning said block, and a brace-shaped spring adapted to be compressed by the movement of the handle in either direction and to force it into its extreme positions, as set forth.

2. The combination, with the cast-iron box formed with a stud, C, of the insulating-block D and four terminal springs secured thereto, the block E, carrying contacts on its periphery and turning on the stud C, a handle for shifting said box, and a bow-spring secured to the wall of the box, against which the extension or projecting end of the handle impinges, as and for the purpose set forth.

3. The combination, with the cast-iron box having insulated openings through its sides for the insertion of wires and a detachable cover, of an insulating-block secured within the box, spring-plates and terminals secured thereto, to which the wires are connected, a circular insulating-block mounted on a stud and provided with contact-plates on its periphery, a handle secured to said block and extending through a slot in the side of the box, and a bow-spring secured to the wall of the box and upon which the extended end of the handle impinges, as set forth.

387,733. **ARTIFICIAL TOBOGGAN OR COASTING HILL.** JOSHUA PUSEY, Philadelphia, Pa. Filed Jan. 5, 1887. Serial No. 223,622. (No model.)

Claim.—1. An artificial coasting-course or toboggan-slide consisting of the combination of the inclined longitudinal frames or stringers, the supporting-frame or trestle-work, and the series of rollers journaled in and between said stringers, adjacent to and out of contact with each other, substantially as and for the purpose set forth.

2. An artificial coasting device consisting of the combination of a toboggan and a series of wide rollers journaled in a suitable frame-work to form an inclined track way, whereby the weight of the toboggan will be distributed evenly across the peripheries of the rollers, together with means, substantially as described, for preventing the toboggan from running off laterally, substantially as and for the purpose set forth.

3. An artificial toboggan or coasting hill consisting of a series of hollow rollers journaled in a suitable frame-work to form an inclined track way, substantially as and for the purpose set forth.

4. A hollow roller for artificial toboggan or coasting hills of the class described, having the cylindrical portion thereof made of paper or similar light and strong material, substantially as and for the purpose set forth.

5. A roller adapted for use in artificial toboggan or coasting hills, consisting of the combination of a hollow cylindrical body, of paper or other suitable material, heads with flanges extending beyond the ends of said body, and shafts secured to the heads, substantially as and for the purpose set forth.

6. A roller for artificial toboggan-slides, consisting of the combination of the tube, of paper or similar material, the grooved heads and the shaft, with means, such as threaded nuts, for holding together the heads and tube, substantially as and for the purpose specified.

7. An artificial toboggan or coasting hill consisting of an inclined track way of hollow rollers whose width is greater than the toboggans or sleds adapted to run upon the same, and provided with end flanges adapted to prevent the toboggans or sleds from running off sidewise, substantially as and for the purpose described.

8. An artificial toboggan or coasting hill composed of a series of track ways ascending in opposite directions to substantially the same altitude, and provided with a continuous series of suitably-journaled rollers, excepting spaces at the ends of the track ways, alternately at and beyond the points where the natural loss of momentum of the toboggans or sleds acquired in descending the one incline of a series brings the toboggans, &c., to a stop, which spaces are covered with a suitable flooring, substantially as and for the purpose set forth.

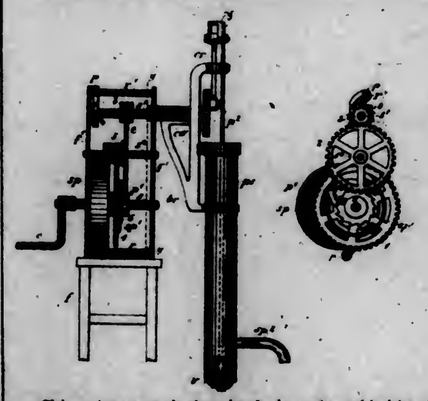
387,734. **CRUMB OR DUST SCOOP.** JOSHUA PUSEY, Philadelphia, Pa. Filed June 14, 1887. Serial No. 241,240. (No model.)

Claim.—1. The scoop consisting of the curved box having its lower edge made thin and the longitudinally-extending handle, all constructed and adapted to operate substantially as and for the purpose recited.

387,734.

2. The scoop consisting of a box having a thin extension at the bottom adapted to be placed flat on a plane surface and having a sharp edge, in combination with a partition extending up from the bottom of the box and adjacent to said extension, substantially as described.

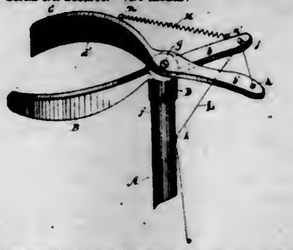
3. The scoop consisting of the combination of the curved box having the thin lower edge and the partition projecting up into said box from the bottom thereof adjacent to said thin edge, together with the longitudinally-extending handle for rotating the same, substantially as and for the purpose set forth.



4. In combination with the scoop consisting of the curved box provided with the longitudinally-projecting handle, the brush secured to said box, substantially as and for the purpose set forth.

387,735. **WAGON-JACK.** ERWIN A. RIMMON, Eau Pleine, Wis. Filed Apr. 9, 1888. Serial No. 270,167. (No model.)

Claim.—A folding wagon-jack consisting of a base-piece having a block, B, two uprights, C C, pivoted to the block B and provided with racks O O, a hook, F, adapted to hold the uprights in perpendicular position, a lever-arm, G, pivoted in the top of the uprights C C, said lever-arm being provided with a shoulder, K, and a recess, L, the recess L being higher than the shoulder K, and a retaining-rod, M, pivoted to the lever-arm G and provided with cross-bar N, adapted to engage the racks O O, substantially as described.



387,736. **SPRING-MOTOR FOR PUMPS.** CHARLES M. REED, near Greensville, and WILLIAM C. FRASER, near Clermont, Ind. Filed Nov. 28, 1888. Serial No. 212,707. (No model.)

Claim.—A pump mechanism wherein the suction-rod is driven by means of a pitman pivoted at one end to a yoke bolted to such suction-rod, at the other to a wrist-pin upon a crank-wheel mounted on the end of a shaft supported in bearings in a suitable frame, and in bearings connected with a bracket which is connected to the top of the pump-stock, the shaft connected with the crank-wheel carrying a

pinion which is operated by means of a gear mechanism driven by a spring coiled about the main shaft, all combined substantially as described.

387,737. PARCEL-CLASP. William S. Rock, Dayton, Ohio, assignor of one-half to William W. Kirkpatrick, same place. Filed Feb. 24, 1888. Serial No. 265,210. (No model.)

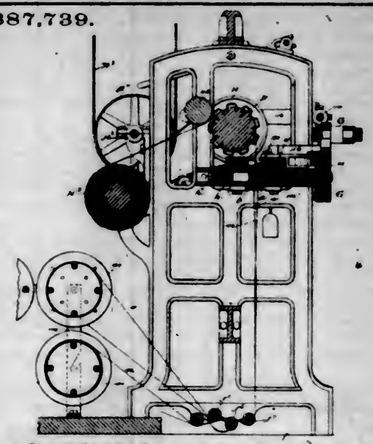
Claim.—The combination, with the handle A, the stationary jaw B, having the extension *b* and socket D, formed with said jaw, and said socket connected to the top of handle A, of the pivoted jaw C, having extension *b'*, the spring N, connecting said movable jaw and extension of the stationary jaw, and the wire or string connected to extensions *b b'* and handle A, as shown and described.

387,738. DOOR-CHECK. William D. Scarborough, Pennington, Tex. Filed Feb. 23, 1888. Serial No. 264,947. (No model.)

Claim.—1. In a door-check, the combination of a rail secured parallel to the upper edge of the door, a brace or arm pivoted to the lintel of the door-frame at one end, and a casing pivoted to the outer end of the brace or arm and sliding upon the rail and provided with means for engaging the said rail, as shown, and for the purpose specified.

2. In a door-check, the combination of a rail secured to the door parallel to the upper edge of the same and having notches in its under side, a bolt-casing sliding upon the rail and having a bolt engaging the notches of the same, and a brace or arm pivoted to the bolt-casing and to the lintel of the door-frame, as shown, and for the purpose specified.

3. In a door-check, the combination of a rail secured with its bent ends to the face of a door parallel to the upper edge of the same and above the same, and having notches in its under side, a bolt-casing having a transverse perforation at the upper end and sliding upon the rail with this perforation and formed with two laterally-projecting lips upon the upper end, a spring-bolt within the casing engaging the notches of the rail and having a chain for releasing it, and a brace or arm pivoted upon the lintel of the door-frame and between the lips of the bolt-casing, as shown, and for the purpose specified.



387,739. MACHINE FOR THE MANUFACTURE OF WIRE-NETTING. Benjamin Scarlin, Clinton, Mass., assignor of one-half to the Clinton Wire Cloth Company, same place. Filed Sept. 9, 1887. Serial No. 249,217. (No model.)

Claim.—1. In a machine for the manufacture of wire-netting, a series of twisting-segments and means to rotate them, substantially as described, in opposite directions during the formation of each transverse row of twists, combined with gripping mechanism, substantially as described, to hold the wires previously twisted in one direction while they are being twisted in the reverse direction, substantially as described.

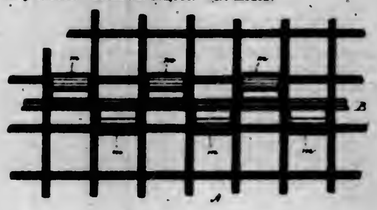
2. In a machine for the manufacture of wire-netting, the combination, with twisting-segments to receive the wires to be twisted and means, substantially as described, for rotating the said segments in one and then in an opposite direction during the formation of each transverse row of twists, of a series of pins and means to support them, the said pins entering between the wires after the completion of the first portion of the twist in each line of meshes and holding the wires while the reverse twist is taking place, substantially as described.

3. In a machine for the manufacture of wire-netting, carriages D E, and cars C and C^{10}, attached, respectively, to them, and projections on said cars, combined with the shaft A^7, provided with two cams set opposite to each other to intermittingly but positively move the said carriages in opposite directions, substantially as described.

387,739.

4. In a machine for the manufacture of wire-netting, two reciprocating carriages, D E, combined with twisting-segments, some of which have two or more passages for auxiliary wires, whereby some of the longitudinally-twisted strands extended through the netting may contain two wires which are twisted with a third wire at the twisting-point, leaving the two wires carried by one segment parallel between the said twisting-points, substantially as described.

5. In a machine for the manufacture of wire-netting, the mesh roller, two or more carriages, D E, means to reciprocate them in opposite directions at the proper time, two series of twisting-segments carried by the said carriages, and means to rotate the said twisting-segments in one and then in the reverse direction during the formation of each transverse row of twists, combined with a tension-spring held or yielding arm, 120, which stands rigidly when the jaw 107 is being moved toward the jaw 108, the cam-bar at such time being moved longitudinally, the said arm yielding when the cam-bar is moved to regulate the tension upon the wires passing to the said segments, substantially as described.



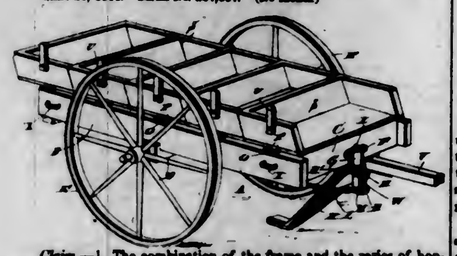
6. In a machine for the manufacture of wire-netting, the carriages D E, their twisting-segments, and means to rotate the said twisting-segments in one and then in a reverse direction during the formation of each transverse row of twists, combined with jaws 107 and a series of pins, 130, the latter to enter between the said wires after they have been twisted in one direction and to hold them while the wires are being twisted in the opposite direction, substantially as described.

7. In a machine for the manufacture of wire-netting, the carriages D E, the twisting-segments therein, and means to rotate them, combined with gripping mechanism having jaws corrugated longitudinally to crimp the twisted wire, substantially as described.

8. In a machine for the manufacture of wire-netting, the reciprocating carriages D E, the twisting-segments *a b* therein, and means to rotate them, and the jaws 107 and 108 of the gripping mechanism, combined with a cam-bar, 126, means to move it, and with the arm 120, free to yield in but one direction, and the spring 123 and stop, to operate substantially as described.

9. In a machine for the manufacture of wire-netting, the carriage D, the jaw 107, mounted thereon to slide transversely, and the swivel-studs 113, and means to move the said carriage longitudinally, combined with the rock-shaft 116, and intermediate connecting mechanism between it and the said studs, whereby the outward movement of the jaw may be effected at the proper time in different positions of the carriage D, substantially as described.

387,740. METALLIC LATHING. Benjamin Scarlin, Clinton, Mass., assignor to the Clinton Wire Cloth Company, same place. Filed May 1, 1888. Serial No. 272,500. (No model.)

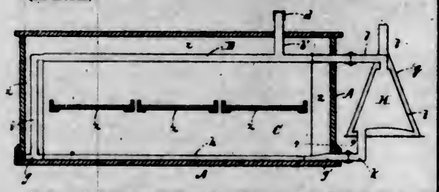


Claim.—1. As an improved article of manufacture, a metallic furring-strip provided at intervals at its edges or sides with flanges for attaching it to wire-cloth, the body of said strip being approximately U-shaped in cross-section and the flanges integral therewith, substantially as set forth.

2. As an improved article of manufacture, a metallic furring-strip having a body which is approximately U-shaped in cross-section and provided at its edges or sides with flanges for attaching it to wire-cloth, said flanges being integral with said body and arranged alternately or in such manner as not to stand opposite each other, substantially as and for the purpose set forth.

3. In a metallic lathing, the combination of the wire-cloth, A, and furring-strip B, provided with flanges *m*, the body of said strip being approximately U-shaped in cross-section and secured to the cloth by the flanges bent downward over the wires of the cloth, substantially as shown and described.

387,741. TRUCK. Edward F. Sheldon, Hepler, Kans. Filed Mar. 30, 1888. Serial No. 267,967. (No model.)



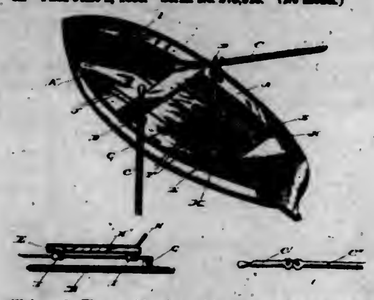
Claim.—1. The combination of the frame and the series of hoppers pivoted on the frame, the said hoppers having their front and rear sides inclined, the rear side of one hopper resting against and closing the front side of the next adjacent hopper, as set forth.

2. The truck having the supporting-wheels E mounted at a suitable distance near the center thereof and provided at its front end with a pivoted trailing supporting-arm, substantially as described.

3. The combination, in a truck, of the frame having the supporting-wheels E and provided at its front end with the pivoted trailing arm having the ear M, adapted to receive a whiffletree, and the tongue or shaft having the hook engaging the bracket or plate at the front end of the frame, substantially as described.

4. The combination, in a truck, of a frame having the bearings P in its sides and the hoppers having the trunnions engaging the said bearings, the said hoppers being provided with the standards or arm U, substantially as described.

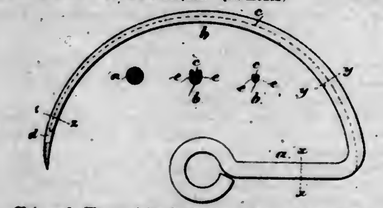
387,742. INCUBATOR. William P. Shepard, Fall River, Mass., assignor of three-fourths to Matthew C. Yarwood, Parker Borden, and Roland G. Buffington, same place. Filed Dec. 30, 1887. Serial No. 259,266. (No model.)



Claim.—1. In an incubator of the character described, the body A, having the door B, the case C, provided with the tank D, having the filling-pipe *d*, the pipes A, connected with said tank by the pipes *g* and *i*, the cone-shaped boiler H, the pipes *l k g'*, for connecting said boiler with the tank D and pipes A, the funnel-shaped jacket *q*, and lamp P, all being constructed, combined, and arranged to operate substantially as set forth.

2. In an incubator of the character described, the body A, case C, disposed within said body, and provided with the tank D, having the curved bottom *f* and filling-pipe *d*, the pipes A, disposed at the bottom of said body and connected with the tank D by the pipes *g* and *i*, the trays *x*, the conical boiler H, pipes *l k g'*, connecting said boiler with said tank and the pipes A, the funnel-shaped jacket *q*, lamp P, and bracket *p*, combined and arranged to operate substantially as described.

3. In an incubator of the character described, the body A, provided with the door B and chamber C, the trays *x*, disposed in said chamber, the tank D, provided with the filling-pipe *b* and having the concaved bottom *f*, the pipes *h*, connected with the tank D by the pipes *g* and *i*, the conical boiler H, connected with the tank D by the pipe *l*, and with the pipes *h* by the pipes *g'* and *k*, the conical jacket *q* for the boiler H, the lamp P, disposed beneath said boiler, and the bracket *p*, attached to the body A, all combined and arranged to operate substantially as described.



387,743. ROWING APPARATUS. Arthur C. Smith, Richwoods, Ill. Filed June 2, 1888. Serial No. 275,813. (No model.)

Claim.—1. The combination, with a boat and two oars fulcrumed upon its sides, respectively, of two foot-rests sliding upon bars fixed to the bottom of the boat in rear of the oars, two inclined pulleys fixed to the boat in front of the oars near the junction of the bottom and sides, and two cords passing around the pulleys, respectively, and connecting each foot-rest with the lever-arm of the corresponding oar.

2. The combination, with a boat and oars fulcrumed upon its sides, of sliding foot-rests secured to the bottom of the boat in the rear of the oars and each having a stop to receive the thrust of the foot and a rearwardly-narrowing recess for the back of the heel, two pulleys fixed to the boat in front of the oars, and two cords passing over the pulleys, respectively, and connecting each foot-rest with the lever-arm of the corresponding oar, substantially as and for the purpose set forth.

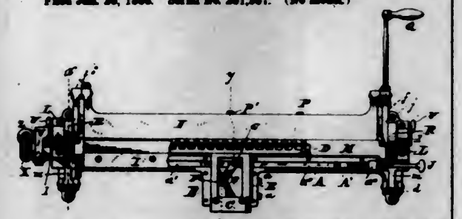
387,744. NEEDLE FOR BOOK-SEWING MACHINES. David M. Smyth, Northwood, N. H., and John R. Reynolds, Hartford, Conn., assignors to the Smyth Manufacturing Company, Hartford, Conn. Filed Feb. 16, 1888. Serial No. 264,146. (No model.)

Claim.—1. The semicircular book-sewing needle grooved at *c* in the periphery of the semicircle and throughout nearly its entire length, and the eye pierced at *d* and with the sides flattened at *c c*, substantially as and for the purposes set forth.

2. The semicircular book-sewing needle having a shank, *a*, a peripheral groove at *c* of nearly the length of the semicircle, flattened sides at *c c*, and tapered gradually from the shank to the point, substantially as set forth.

387,745. GEARING. Frank J. Sprague, New York, N. Y. Filed Apr. 18, 1887. Serial No. 235,149. (No model.)

Claim.—1. A split toothed wheel having an adjustable rim or periphery, substantially as set forth.



2. A gear-wheel having in combination an internal web composed of two parts united together, and a toothed rim or periphery, also made in two parts united together and adjustably secured upon said web, substantially as set forth.

3. The combination of a shaft provided with two pinions situated

at different points thereon, and a shaft provided with two toothed wheels engaging said pinions respectively, and one of said wheels being a split wheel provided with an adjustable rim or periphery, substantially as set forth.

4. The combination of a wheeled vehicle, an electric motor thereon, a pinion at or near each end of the armature-shaft of said motor, a split toothed wheel having an adjustable rim or periphery upon the driving-axle of said vehicle at one end thereof and engaging with one of said pinions, and a toothed wheel at the other end of said axle engaging with the other pinion, substantially as set forth.

387,746. SHEET-METAL FOLDER. Michael J. Spare, Buffalo, N. Y., assignor to Adam Hetne and George J. Munnshauer, same place. Filed Jan. 26, 1888. Serial No. 261,967. (No model.)

Claim.—1. In sheet-metal folders, the combination, with the bed-piece A, having the guide-piece B fitted with a gib and set-screws, of the slide C, having the link H, connecting the gage with the gage-screw, as described, whereby the lateral movement of the said gage-screw causes the movement of the slide in a direction at right angles to that of the said gage-screw, as and for the object specified.

2. In sheet-metal folders, a gage, D, operated by a gage-screw, J, having stud G, in combination with the link H and slide C having the stud F, as and for the purpose stated.

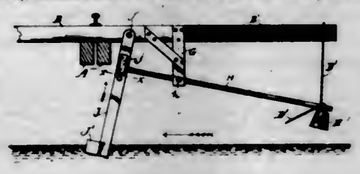
3. In sheet-metal folders, a bed having a forwardly-projecting guide, B, fitted with gib E and set-screws *a a*, in combination with an open slide, C, having the link as an intermediary between it and the gage-adjusting screw J, substantially as and for the object stated.

4. In sheet-metal folders, the combination, with the shoe S, of the adjusting mechanism consisting of the cam-shaped button U, whereby the clamping-bar M is adjusted, substantially as and for the purpose specified.

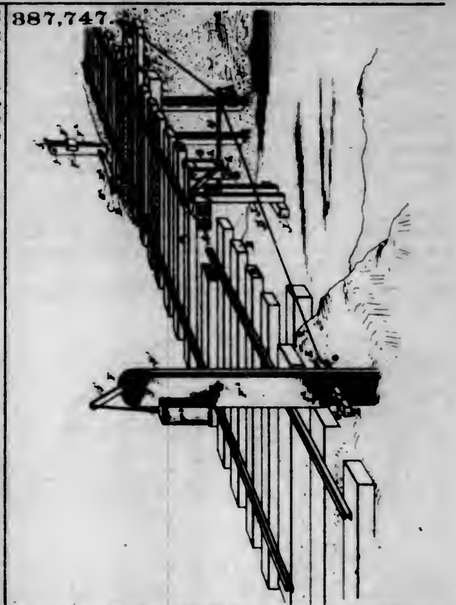
5. The combination, with the clamping-bar, of the shoe S and the buttons U, having notches of varying depth to raise and lower the clamping-bar by turning said buttons, as indicated.

6. In sheet-metal folders, the wing N, having the incline *g'*, in combination with the wedge-bar O, having the rack *h*, wing-bar K, and pinion *p*, as and for the purpose stated.

7. In sheet-metal folders, the combination, with the wing-bar K, having the pivot *l*, of the lever V, spiral spring X, and a tensioning device for the spring, as stated.



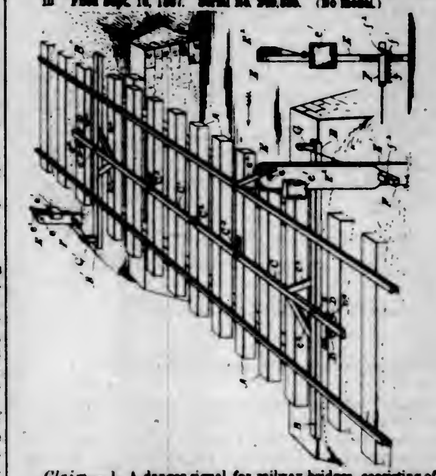
8. The combination, with the wing-bar K, having the pivot *l*, of the slotted lever V, stud *e*, spiral spring X, chain-links Y, and the foot-hook Z, as and for the purpose specified.



387,747. DANGER-SIGNAL FOR RAILWAY-BRIDGES. James W. Steele, Topeka, Kans., assignor of one-half to Andrew McNally, Chicago, Ill. Filed Sept. 16, 1887. Serial No. 249,834. (No model.)

Claim.—1. The combination, with a bridge and one or more signals or semaphores provided with means, as sliding blocks and springs, for maintaining them in a normal position, of a wire connecting said blocks, and a trigger (designed to be released by the abnormal action of the elements) for sustaining a weight above the wire and in operative connection therewith, substantially as shown and described.

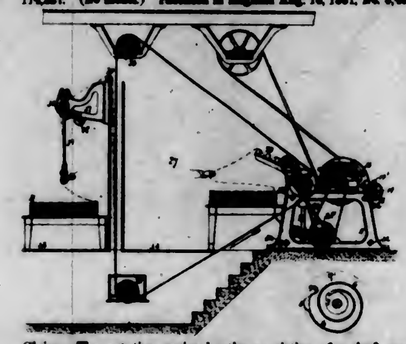
2. The combination, with a signal or semaphore and its releasing mechanism, as the block *e*, of the weighted and pivoted bar H, the suspended frame or trigger J, and a wire in operative connection therewith and with said releasing-block, substantially as shown and described.



3. In a danger-signal for railway-bridges, a suspended trigger adapted to float and move in the direction of the current in the event of an abnormal rise of water, in combination with a semaphore and its releasing mechanism, as the block *e*, and means, as the pivoted bar

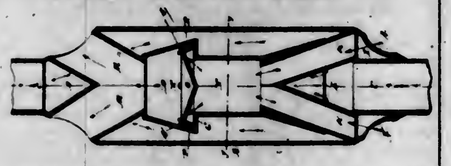
H, weight H', and wire D', for connecting the two, substantially as set forth.

387,748. RAILWAY-BRIDGE DANGER-SIGNAL. James W. Steele, Topeka, Kans., assignor of one-half to Andrew McNally, Chicago, Ill. Filed Sept. 16, 1887. Serial No. 249,835. (No model.)



Claim.—1. A danger-signal for railway-bridges, consisting of a semaphore provided with a releasing device, as the block F, in combination with a tripping mechanism, as the bars B and C, attached to the bridge and in operative connection with the semaphore, whereby a displacement or destruction of the bridge may serve to automatically operate said semaphore, substantially as shown and described.

2. The combination, with a railway-bridge, of a semaphore or signal, means, as a sliding block and spring, for maintaining the same in a normal position, and a tripping mechanism, as the bars C B, attached to each other and to the bridge and in operative connection with the semaphore, substantially as shown and described.



3. The combination, with a railway-bridge and a semaphore or signal, of the cross or trigger C B, attached to said bridge and in operative connection with said semaphore, substantially as shown and described.

387,749. MACHINE FOR REELING CLOTH. Duncan Stewart, Glasgow, County of Lanark, Scotland. Filed Dec. 11, 1888. Serial No. 114,327. (No model.) Patented in England Aug. 10, 1881, No. 3,402.

Claim.—The rotating spring-beetler consisting of a shaft carrying elastic metal bands bent into coiled or similar form, and disks or plates carrying steps for the outer ends of the bent bands, substantially as set forth.

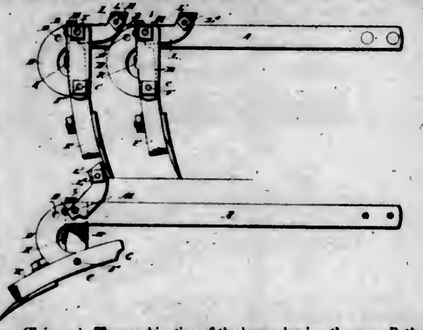
387,750. HEATING-DRUM. Jeremiah J. Sullivan, Oswego, N. Y. Filed Mar. 3, 1888. Serial No. 265,982. (No model.)

Claim.—1. The combination of the drum having the pipes C C communicating with its upper and lower ends, the receiving-chamber located at the bottom of the drum around the lower pipe, C, the hot-air chamber located in the drum and communicating with the receiving-chamber through suitable pipes, K, and provided at an intermediate point with a shoulder or offset, forming an annular passage between its edges and the sides of the drum, and the outlet-flues M at the upper end of the hot-air chamber, substantially as and for the purpose specified.

2. The combination of the drum, the smoke-pipes, and the hot-air chamber located in the drum and comprising the upper conical compartment, E, communicating with the outside air through suitable outlet-tubes, and the lower compartment, F, communicating with the outside air through suitable inlet-tubes, and communicating with the upper compartment, E, through an annular opening, O, substantially as and for the purpose specified.

3. The combination, with the drum having smoke-pipes entering it at its upper and lower ends, respectively, of the hot-air chamber communicating at its opposite ends with the outside air and comprising the lower cylindrical compartment, F, and the upper conical compartment, E, having a shoulder, G, at its lower end, and the deflecting-disk arranged above the said shoulder and forming an annular opening between its edges and the sides of the compartment, substantially as specified.

4. The combination, with the drum and the smoke-pipes communicating with the same, of the hot-air chamber within the drum, comprising the lower compartment, F, and the upper compartment, E, having a shoulder, G, between them, the spring clips or supports mounted on the said shoulder and the deflecting-disk engaged at its edges by the said clips or supports, substantially as and for the purpose specified.



5. The combination of the drum, the conical caps B B on the upper and lower end thereof, the lower cap being provided with openings, the plate H at the lower end of the drum, between the same and the lower cap, B, the lower smoke-pipe passing through the lower conical cap and the said plate H, the upper smoke-pipe passing through the upper conical cap, the hot-air chamber located in the drum and out of communication therewith, the discharge-flues communicating with the upper end of the hot-air chamber and passing through the upper conical cap, and the conducting-flues K K, connecting the lower end of the hot-air chamber with the space within the lower conical cap, substantially as and for the purpose specified.

6. The combination, with the drum and the smoke-pipes, of the hot-air chamber isolated from the drum and having the discharge-flues communicating with its upper end, the conducting-flues passing from the lower end of the said chamber through the lower end of the drum on opposite sides of the lower smoke-pipe, and the conical deflector disposed over the upper end of the said lower smoke-pipe, substantially as and for the purpose specified.

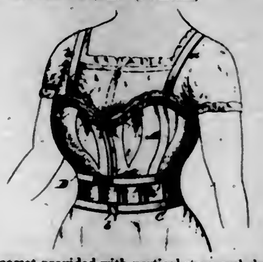
7. The combination, with a drum provided with the smoke-pipes C C, communicating with its upper and lower ends, of the hot-air chamber communicating with the outside air through suitable inlet and outlet flues, K and M, respectively, and the conical deflector L, depending from the lower end of the hot-air chamber over the lower smoke-pipe, C, and surrounding the upper ends of the inlet-flues K, whereby the incoming heat from the said pipe is concentrated against the bottom of the hot-air chamber and the upper ends of the said flues, substantially as and for the purpose specified.

8. In combination with the drum A and the smoke-pipes entering the same at its upper and lower ends, respectively, of the hot-air chamber located in the interior of the drum, the conducting-flues communicating with the lower end of the said chamber and diverging at their lower ends, so as to pass through the lower end of the drum upon opposite sides of the lower smoke-pipe, the discharge-flues communicating with the upper end of the said chamber and diverging toward their upper ends, and the conical deflector depending from the lower end of the hot-air chamber over the upper end of the lower smoke-pipe and embracing the upper ends of the conducting-flues, substantially as and for the purpose specified.

387,751. CULTIVATOR. Columbus A. Swearingen, Lampasas, Tex. Filed Apr. 19, 1888. Serial No. 271,157. (No model.)

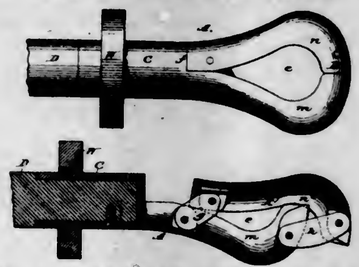
Claim.—1. The combination of the beams having the arms B, the standards pivoted to the lower ends of the said arms, the plates H, having their lower ends secured on the pivotal bolt of the standards and provided with the flanges or ears on the rear side, for the purpose set forth, and the triggers pivoted on the beams and adapted to be adjusted longitudinally thereon and to engage the upper ends of the standards, for the purpose set forth, the upper ends of the plate H being secured on the pivotal bolts of the triggers, substantially as described.

2. The combination of the beams having the arms B, provided with the openings C, the beams having openings D concentric with openings C, the standards, the bolts pivoting the latter to the arms and extending through the openings C, the plates having their lower ends secured on said pivotal bolts and adapted to engage the rear sides of the standards, the triggers, and the bolts to pivot the said triggers to the beams, said bolts being adapted to pass through either of the openings D, the upper ends of the plates H being secured on the said pivotal bolts, substantially as described.



387,752. ATTACHMENT FOR TYPE-WRITING MACHINES. Charles W. Thayer, Collinsville, Conn., assignor of one-half to Frank H. Thayer, same place. Filed Sept. 30, 1887. Serial No. 251,011. (No model.)

Claim.—1. In combination with the carriage of a type-writing machine, a supplemental paper-guide composed of the clamps, in combination with the parallel bars supported by the clamps, and the clamp-screws whereby the clamps and the rods are held in position, all substantially as described.



2. In combination with the paper-carriage, the key *g*, having a socket adapted to hold the upright of the paper-rack, the paper-rack, the clamps adjustably secured thereto, and the bars held by the clamps in position to support and guide the paper, all substantially as described.

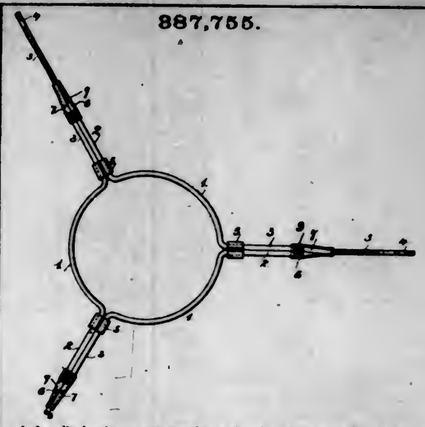
387,753. **CORSET.** Idalia Webb, Leavenworth, Kans. Filed May 9, 1888. Serial No. 273,342. (No model.)

Claim.—A corset provided with vertical stays and shaped to the body of the wearer, and provided with an elastic band extending around its entire lower edge, in combination with an independent belt having flexible strips connecting the same to the said lower edge of the corset and means for clasping the belt in front, as set forth.

387,754. **VEHICLE-POLE TIP.** Frank A. Aldrich, Winchendon, Mass. Filed Jan. 12, 1888. Serial No. 260,564. (No model.)

Claim.—1. The tip for the thills or poles of vehicles, consisting of a hollow metallic shell or casting formed with a socket at one end to receive the thill or pole and enlarged at its opposite end to form an oblate rounded head, said head being divided longitudinally into two sections, the one hinged or pivoted upon the other, whereby the diameter of the head may be reduced when required, substantially in the manner and for the purpose herein set forth.

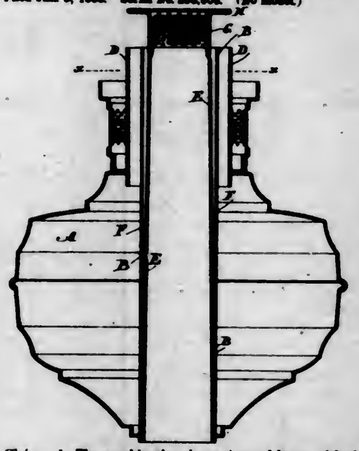
2. The combination, in a tip for the thills or poles of vehicles, of the socket-piece C, the fixed head-section *m*, united to said socket-piece, the movable head section *n*, fitting upon the section *m*, to form therewith an enlarged head, B, the pivoted links *g* and A, by which the movable section is hinged to the fixed section, and the spring K, bearing upon the inner link, *g*, all substantially in the manner and for the purpose herein set forth.



387,755. **SHADE-HOLDER.** Lewis J. Atwood, Waterbury, Conn., assignor to the Plume & Atwood Manufacturing Company, same place. Filed Jan. 3, 1888. Serial No. 259,603. (No model.)

Claim.—1. A shade-holder having projecting radial arms, each arm being composed of one long projecting wire and a short wire, in combination with a separate and independently-attached conical or tapering sheet-metal clip surrounding the two parts of the arm at the end of the short arm and confining the parts together, substantially as set forth.

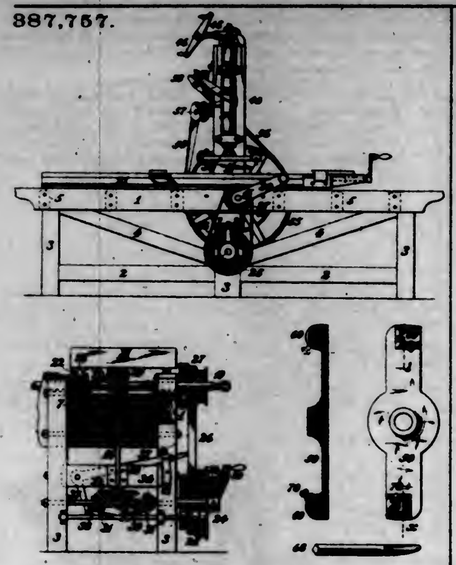
2. A shade-holder having projecting radial arms, each arm being composed of one long projecting wire and a short wire, in combination with a tapering or conical sheet-metal clip applied to each arm at the junction of the two parts thereof, the short arm having a tapering end and the long arm being bent within the clip and both arms



387,755.

and the clip having a corrugation or bend to prevent end motion, substantially as set forth.

387,756. **ARGAND LAMP.** Lewis J. Atwood, Waterbury, Conn., assignor to the Plume & Atwood Manufacturing Company, same place. Filed Jan. 3, 1888. Serial No. 259,604. (No model.)



Claim.—1. The combination, in an Argand lamp, with the wick-tube D, of the air-tube B, extending through the fount and connected at its lower end to the same and perforated about midway of its length, and the supplemental air-tube E within the air-tube B, and rigidly fastened thereto at its lower end, said tube E being tapering and imperforate, its upper end being smaller than the air-tube B, so that an annular space is formed between the parts to catch overflowing oil and return it to the reservoir, substantially as specified.

2. The combination, in an Argand lamp, with the wick-tube D, of the air-tube B, extending through the fount and connected at its lower end to the same, and perforated about midway of its length, and the supplemental air-tube E within the air-tube B, and rigidly fastened thereto at its lower end, said tube E being tapering and imperforate, its upper end being smaller than the air-tube B, so that an annular space is formed between the parts to catch overflowing oil and return it to the reservoir, the extreme upper end of the tube E being formed with a ledge or offset which is adapted to support a foraminous skirt and deflector, substantially as set forth.

387,757. **WOOD-PLANING MACHINE.** John Baller, Salem, Ohio, assignor to Erwin Baller, same place. Filed Mar. 9, 1888. Serial No. 266,515. (No model.)

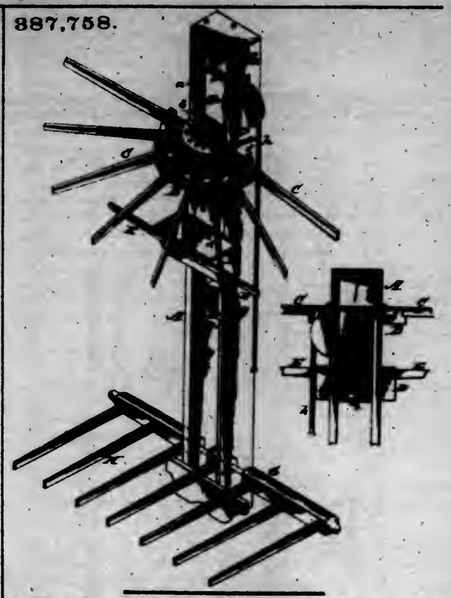
Claim.—1. The combination of a frame formed of separable longitudinal stringers and vertical posts, a bed-piece connecting said stringers and posts and forming the base of a cutter-head post or standard, and a cutter-shaft and cutters mounted in bearings on a standard fixed upon said bed-piece, substantially as set forth.

387,757.

2. The combination of a frame, a bed-piece connecting the stringers thereof, a driving-shaft mounted in a bearing in the bed-piece and carrying upon one end a driving-pulley and upon the other a cent or bearing for a hand-crank, a vertical standard fixed upon the bed-piece, and a cutter-shaft and cutters mounted in bearings in said standard, substantially as set forth.

3. The combination of a frame, a bed-piece connecting the stringers thereof, a driving-shaft mounted in a bearing in the bed-piece, a horizontal feed-shaft adapted to be rotated either by a belt from the driving-shaft or independently thereof, and a vertical feed-shaft gearing with said horizontal feed-shaft, said vertical shaft being journaled in a bearing in the bed-piece, and carrying a gear meshing with a rack on a table adapted to traverse on ways upon the frame-stringers, substantially as set forth.

4. The combination of a frame, a driving-shaft carrying a pulley and mounted in bearings transversely to the frame, a vertical post or standard located upon one side of the frame, a carrier adapted to travel vertically on said post, a cutter-shaft carrying a head and cutters and a long pulley and journaled in said carrier, and a pair of idlers or guide-pulleys journaled on the cutter-head standard, said idlers being arranged in approximately the same vertical plane and having their axes inclined one to the other and located on the same side of the cutter-shaft, substantially as set forth.



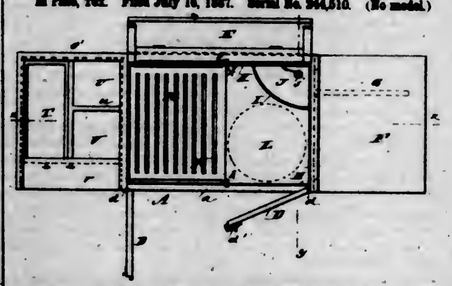
5. The combination of a frame formed of longitudinal stringers and vertical posts, a bed-piece connecting said stringers and posts and provided with a lateral extension, a vertical post or standard fixed upon said lateral extension, a carrier adapted to traverse vertically on said post, a cutter-shaft carrying a head and cutters and journaled in said carrier, a driving-shaft journaled in the bed-piece, and a pair of idlers or guide-pulleys journaled on the cutter-head standard and adapted to carry a belt from a pulley on the driving-shaft to a pulley on the cutter-shaft, substantially as set forth.

6. The combination of a cutter-shaft carrier having an upper and a lower guide-bearing, an oil-chamber secured to the top of said carrier, a step or bearing fitted in said chamber, a cutter-shaft passing through the guide-bearings and having a cutter-head and cutters on its lower end, a collar fixed upon the cutter-shaft and resting upon the step, and a set-screw engaging the cap of the oil-chamber and bearing against the upper end of the cutter-shaft, substantially as set forth.

387,758. **CLOTHES-RACK.** Daniel K. Bassmann, Gratz, Pa. Filed Apr. 5, 1887. Serial No. 233,704. (No model.)

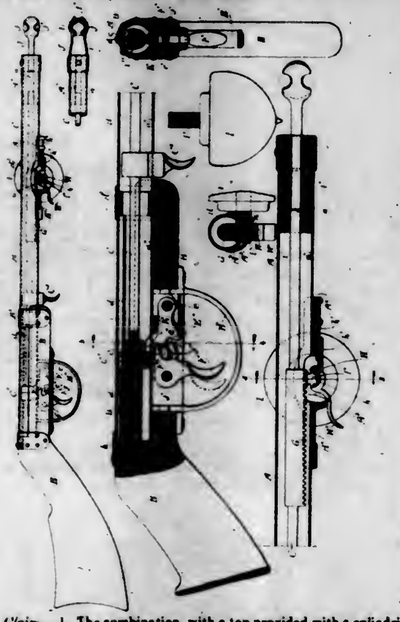
Claim.—The combination, with the standard provided with grooves *a*, of the block guided in said grooves, the bracket B, carried by said block, the segmental radially-slotted rim *f* on the upper face of said bracket, the radial arms C, seated in the slots of said rim, the upwardly-extending pins *g* on said arms, and the cap-plate P, having holes receiving said pins, all substantially as shown and described, and for the purpose specified.

387,758.



387,759. **WELL-CURB.** Henry L. Brack, Montrose, Pa. Filed Oct. 26, 1887. Serial No. 253,502. (No model.)

Claim.—The bucket B and pipe D, in combination with the valve E, trip E', the bent bail G, and the stop *a*, for controlling the upward movement of the bail and allowing the trip to open the valve, and the spout F, all constructed and arranged substantially as and for the purpose herein set forth.



387,760. **KITCHEN TABLE AND CABINET.** Mary S. Brack, El Paso, Tex. Filed July 16, 1887. Serial No. 244,510. (No model.)

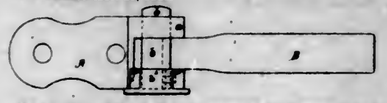
Claim.—A kitchen-table comprising the frame having a water-compartment, H, in its upper part, and having its front *e* cut away below the compartment, hinged front section, D, above the upper edge

of said compartment, a partition, I, forming a wash-basin, J, adapted to receive the overflow from said compartment, an outlet for said basin, and the cover E, hinged to the rear edge of the table, substantially as set forth.

387,761. TOP-SPINNING TOY SPRING-GUN. ORLANDO P. BESSON, Chicago, Ill., assignor to Charles H. Briggs, Lincoln, Nebr. Filed May 8, 1888. Serial No. 273,196. (No model.)

Claim.—1. The combination, with a top provided with a cylindric spindle, of a spinning apparatus comprising a longitudinally-movable rod, a spring for actuating the same, a detent and trigger for holding the spring compressed and releasing the same, and a yielding bar opposing said rod and adapted to hold the cylindric spindle of the top in engagement with the rod when the latter is moved endwise, substantially as described.

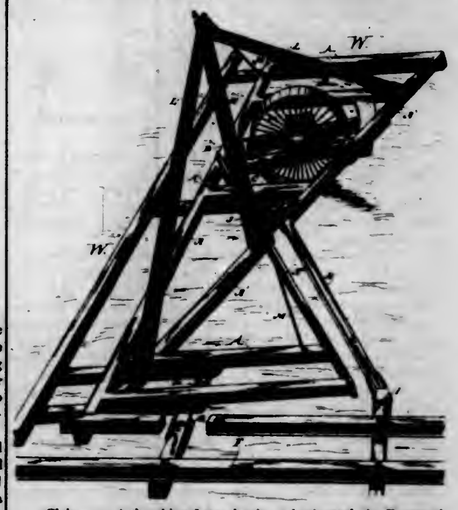
2. The combination, with a top provided with a cylindric toothed spindle, of a spinning device comprising a longitudinally-movable rod provided with a rack-bar, a spring for moving said rod, a detent and trigger for holding the spring compressed and releasing the same, and a recessed yielding bar opposing the rack-bar and adapted to hold the toothed spindle of the top in engagement therewith, substantially as described.



3. The herein-described toy having the form of a gun or pistol and provided with a barrel, a sliding rod within the barrel, a spring for actuating the rod, a detent and trigger for holding the spring compressed and releasing the same, and a yielding bar having a recess opposed to the said sliding rod and adapted to receive and hold in contact with the rod the cylindric spindle of a top, substantially as described.

4. The herein-described toy having the form of a gun or pistol, provided with a barrel and a longitudinally-movable rod therein, a spring for actuating the rod, a detent and trigger for holding the spring compressed and releasing the same, and spring-arms at the end of the barrel provided with holders at their free ends to receive and hold a ball or marble, substantially as described.

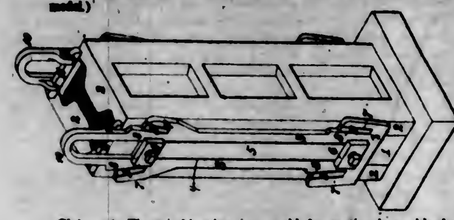
5. The herein-described toy having the form of a gun or pistol and provided with a barrel and a longitudinally-movable rod within the barrel, a spring for actuating the rod, a detent and trigger for holding the spring compressed and releasing the same, a spring-bar provided with a recess opposing an edge of the rod and adapted to hold in engagement with the rod the spindle of a top, and spring-arms attached to the end of the barrel and provided with holders adapted to sustain a marble or ball in front of and in alignment with said rod, substantially as described.



6. The herein-described toy having the form of a gun or pistol and provided with a slotted barrel, a longitudinally-movable rod within the barrel provided with an arm or handle extending through the slot of the same, a spring actuating said rod, a detent and a trigger for holding the spring compressed and releasing the same, and a spring-bar provided with a socket arranged in position opposed to the said rod and adapted to hold the cylindric spindle of a top in engagement with the said rod, substantially as described.

387,762. THILL-COUPLING. GEORGE BROWNLESS, Jr., Penola, South Australia. Filed Jan. 3, 1888. Serial No. 259,726. (No model.) Patented in South Australia Aug. 26, 1887, No. 865; in Victoria Sept. 12, 1887, No. 5,396; in New South Wales Sept. 13, 1887, No. 188; in England Nov. 15, 1887, No. 15,045; in Queensland Mar. 27, 1888, and in New Zealand Mar. 29, 1888.

Claim.—In a thill-coupling, the combination of the clip or shackle A, having the jaws or eyes *a*, one of which is provided with a hinged segment, *a'*, and the thill-iron B, having the T-head or trunnions *b*, provided with the disk or flange *b'*, and arc-shaped plate *b²*, substantially as herein described.



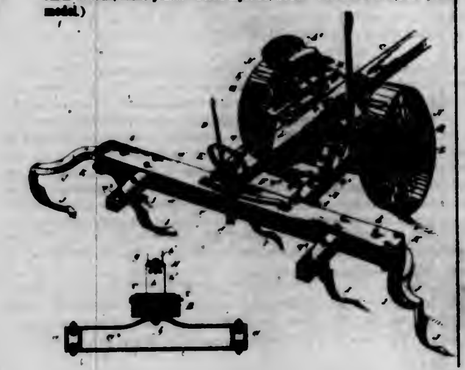
387,763. HEADER ATTACHMENT FOR HARVESTERS. HENRY RYAN, Modesto, Cal. Filed Dec. 1, 1887. Serial No. 256,721. (No model.)

Claim.—1. A thrashing-frame having a horizontal pin, E, extending outwardly from the front of the side adjacent to the header-frame, said pin being hinged to the thrashing-machine frame, so as to have a vertical movement on the hinge G, a header-frame pivoted upon this pin so as to have a rocking movement about it in the direction of the line of travel of the machine, and a wheel, B, by which the outer side of the header-frame is supported, the shaft of said wheel being journaled approximately in line with the pivot-pin E, in combination with the diagonal bar H, having one end hinged to the side of the thrashing-machine frame near the rear on a line with the hinge G, and the other end pivoted to the header-frame near the center and in line with the pin E, substantially as and for the purpose herein described.

2. In a combined header and thrasher, a header-frame consisting of the timbers A, secured together at right angles with each other, the diagonal timber A", and the bracing-timber A', extending diagonally across from the front of the side nearest the thrasher-frame to the rear of the outer side of the header-frame, the hinged pivot-pin E, by which the header-frame is connected with the side of the thrashing-machine frame, the wheel B, by which the outer side of the header-frame is supported, the diagonal brace-bar H, pivoted to the header-frame near its center and in line with the pivot-pin E, and hinged to the side of the thrashing-machine frame near the rear end and in line with the hinge G, in combination with the upright post K, the brace-timbers L, extending from the upper end of the post to the outer ends of the diagonal timber A', and the rods M, extending from the upper end of the post to the remaining two corners of the header-frame, substantially as and for the purpose described.

387,764. MOLD FOR CASTING BEAM-BLANKS. EDWARD M. BOAL, Allegheny, Pa. Filed Apr. 3, 1888. Serial No. 269,402. (No model.)

Claim.—1. The combination, in a mold for casting beam-blanks, of separable sections forming the walls of the mold and sliding clamps provided with inclined faces adapted to bear alternately against opposite faces of inclined projections on said sections in alternately-opposite movements of the clamps, substantially as set forth.



2. The combination, in a mold for casting beam-blanks, of a pair of mold-wall sections having their inner faces elevated at their central portions and depressed at and near their ends in conformity with the contour of the longer sides of a beam or other shape, one or more sections, each having its inner face corresponding with those of the flanges or projections constituting the shorter sides of a beam or other shape and interposed between the side-contour sections, projections having inclined bearing-faces fixed upon the longer side-contour sections adjacent to their ends, and a pair of clamps fitted to slide upon longitudinal guides on the shorter side-contour sections, and provided with inclined faces adapted to bear against said inclined bearing-faces, substantially as set forth.

3. The combination, in a mold for casting beam-blanks, of two pairs of opposite sections forming the walls of the mold and adapted to fit closely together at the angles thereof, inclined projections fixed upon the sides of one pair of said sections, longitudinal guides fixed upon the other pair of sections, and a pair of clamps fitted to slide freely upon said guides, and provided with wedging-faces adapted to bear against said inclined projections, substantially as set forth.

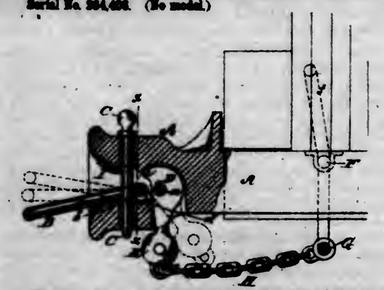
4. The combination, in a mold for casting beam-blanks, of two pairs of opposite sections forming the walls of the mold and adapted to fit closely together at the angles thereof, inclined projections fixed upon the sides of one pair of said sections and having inner and outer bearing-faces, and a pair of clamps fitted to slide freely upon the other pair of sections and provided with inner and outer inclined faces adapted to bear against the inner and outer faces, respectively, of said inclined projections in the movement of the clamps in one or the other direction, substantially as set forth.

5. The combination, in a mold for casting beam-blanks, of a pair of mold-wall sections having two or more inclined projections on two opposite sides, a pair of interposed mold-wall sections fitting between those first specified and provided with longitudinal guides on their outer faces, a pair of clamps fitted to slide longitudinally on said guides, shoulders or projections fixed to said guides for preventing displacement of the clamps, inner and outer inclined faces fixed upon said clamps and adapted to bear against corresponding faces on the inclined projections, and transverse keys or wedges bearing against the ends of the sections on which the guides are formed and against projections on the clamps, substantially as set forth.

387,765. ORCHARD AND VINEYARD CULTIVATOR. GUY W. CAMPBELL, San Jose, Cal., assignor of one-half to the San Jose Agricultural Works, same place. Filed Apr. 26, 1888. Serial No. 272,175. (No model.)

Claim.—1. In an orchard and vineyard cultivator, the combination of the frame and the supplementary teeth having bent standards extended to one side and adapted to be fitted into and detachably secured to the frame, whereby the width of the machine is varied, substantially as herein described.

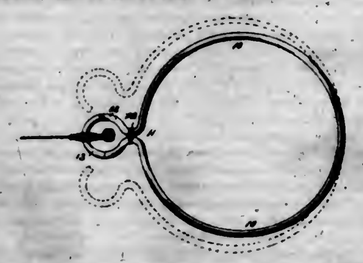
2. In an orchard and vineyard cultivator, the frame having the fixed teeth, in combination with the independent or supplementary teeth having shanks adapted to be fitted into and detachably secured to the sides of the frame to vary the width of the machine, substantially as herein described.



3. In an orchard and vineyard cultivator, the cross-plates of the frame having the grooved castings bolted between their ends, in combination with the supplementary attachable and detachable teeth having shanks fitted to the grooved castings, and the set-screws for holding said shanks, substantially as herein described.

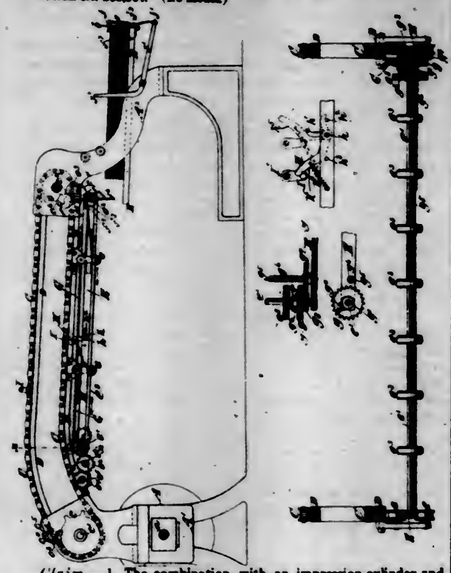
4. In an orchard and vineyard cultivator, the main frame, consisting of the parallel longitudinal body-bars, the cross-plates, between which the rear ends of the body-bars are bolted, and the parallel back bars bolted to the cross-plates outside of the planes of the body-bars and within the planes of the ends of the cross-plates, substantially as herein described.

5. In an orchard and vineyard cultivator, the main frame consisting of the parallel longitudinal body-bars, the cross-plates connecting their forward ends, and cross-plates connecting their centers, the cross-plates, between which the rear ends of the body-bars are bolted, and the parallel back bars bolted to said cross-plates outside of the planes of the body-bars and within the planes of the ends of said cross-plates, substantially as herein described.



6. In an orchard and vineyard cultivator, the single casting serving as a hub or dust cap or cover for the wheel and as a support for the wheel-scraper, substantially as herein described.

387,766. CAR-COUPLING. WILLIAM R. CRADDOCK, Chicago, Ill., assignor to W. A. Ogden Hageman, New York, N. Y. Filed Feb. 17, 1888. Serial No. 264,402. (No model.)



Claim.—In a car-coupler wherein the link-socket is provided with an elevated link-fulcruming surface and a depressed throat, the combination therewith of a pivoted weighted hook and connected transverse hand-operated shaft extending to the side of the car, and having a spring for holding said returning the same to its normal position, the spur of said hook projecting into the back of said socket over the throat-depression, and adapted by the described oscillation about the hook-pivot to engage the innermost end of the link or release the same and effect the latter's elevating or lowering movements, as set forth.

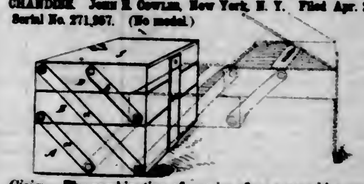
387,767. MAST-HOOP. THOMAS CLAPHAM, Roslyn, N. Y. Filed Mar. 26, 1888. Serial No. 268,932. (No model.)

Claim.—As an improved article of manufacture, a mast-hoop consisting of a spring-metal rod bent upon itself to form an approximately-open circle or hoop, and having its ends bent or curved outward from the open point and then inward upon themselves in opposite direction to form sister hooks, as set forth.

387,768. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. CALVERT B. COTTRELL, Stonington, Conn. Filed Jan. 12, 1888. Serial No. 260,807. (No model.)

Claim.—1. The combination, with an impression-cylinder and front delivery apparatus and a receiving-table at the farther end of the machine, of a reciprocating carriage provided at opposite ends with tape-rollers and endless tapes on which the printed sheet is deposited by the delivery apparatus, said tapes passing around and directly between said rollers, and being wholly supported and moved by the rollers, and having a progressive movement during the return movement of the carriage toward the cylinder, whereby their upper sheet-supporting portions are moved forward toward the table at the same speed that the carriage is moving toward the cylinder, substantially as herein described.

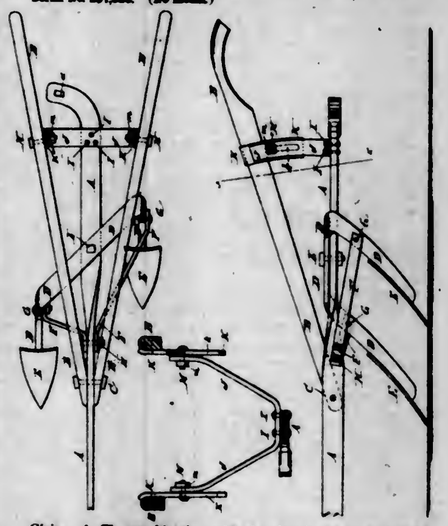
2. The combination, with an impression-cylinder and front delivery apparatus and a receiving-table at the farther end of the machine, of a reciprocating carriage provided at opposite ends with tape-rollers and endless tapes on which the printed sheet is deposited by the delivery apparatus passing around and directly between the tape-rollers, by which they are wholly supported and moved, said tapes having a progressive movement carrying their upper portions toward said table while receiving the sheet upon them and a corresponding movement while the carriage makes its return movement toward the cylinder, but being motionless on their rollers during the forward movement of the carriage toward said table, substantially as herein described.



3. The combination, with an impression-cylinder, a receiving-table at the farther end of the machine, and a front delivery apparatus composed of endless chains or travelers having one or more sets of grippers between them, of a reciprocating carriage provided with tape-rollers and endless tapes, gearing whereby a progressive travel of the tapes to carry their upper portions toward the said table is produced while the carriage is at rest in its inner position, a tappet on the delivery chains or travelers for engaging said carriage and moving it forward after the delivery of the sheet upon its tapes, a stationary rack, and a wheel engaging said rack and imparting a progressive movement to the tapes during the return movement of said carriage, substantially as herein described.

4. The combination, with an impression-cylinder, A, the receiving-table B, and the delivery-chains and their grippers, of the tape-carriage E, having tape-rollers and endless tapes and guided below said chains, the lever H, pivoted to the carriage, and a spring for drawing it down out of reach of the delivery-grippers, and the tappet-arm I, carried by said chains for acting upon said lever to move the carriage forward, substantially as herein described.

5. The combination, with the cylinder A, the receiving-table B, and the delivery-chains C, with their grippers, of the reciprocating carriage E, provided with tape-rollers and endless tapes, the stationary rack G, parallel with the line of movement of said carriage, gears operated by the delivery-chains and through which a tape-roller and the tapes are operated when the carriage is at rest in its inner or rearward position, a spring on the carriage, and gears, one of which engages said rack and has a clutch-connection with a tape-roller shaft, whereby said gear will be rotated to put the spring under tension during the forward movement of the carriage and will be rotated by the spring to draw the carriage along the rack, and thus produce its backward movement and the simultaneous forward travel of the tapes, substantially as herein described.



6. The combination, with a receiving-table and receiving-nippers at its front and a lever connected with said nippers for raising and lowering them, of a reciprocating tape-carriage having a cam for acting on said lever to raise the nippers during the forward movement of the carriage, substantially as herein described.

387,769. PACKAGE FOR CONTAINING AND DISPLAYING MERCHANDISE. JOHN R. GOWLAN, New York, N. Y. Filed Apr. 30, 1888. Serial No. 271,957. (No model.)

Claim.—The combination of a series of superposed boxes or trays with their corresponding sides in the same plane and each connected at its opposite ends to the next above it by a lever having its extremities pivoted to each, two levers pivoted to the rear ends of the lower box and the forward ends of the upper box of the series, and a supporting-bar rigidly secured to and in the plane of the rear face of the upper box and extending to the bottom of the lower box, substantially as described.

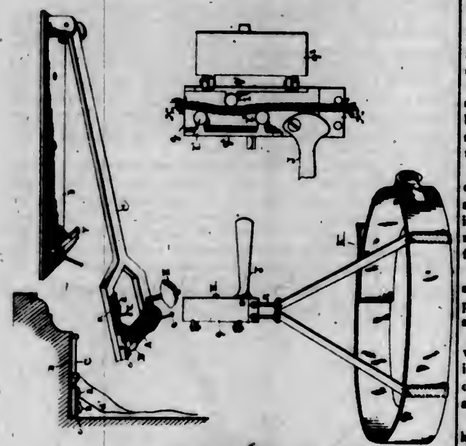
387,770. DOUBLE-SHOVEL PLOW. WILLIAM R. CRAIG, Columbia, Texas., assignor to Charles H. Shepard, same place. Filed May 6, 1887. Serial No. 237,220. (No model.)

Claim.—1. The combination, with the plow-beam A, the handles B, and the plows E, of the inclined cross-bar D, having its ends bent downward and forward to bring them into position to receive the said plows, and the braces F, substantially as herein shown and described, whereby said plows will be firmly supported and kept from becoming clogged, as set forth.

2. A double-shovel plow consisting of the beam A, having its end curved laterally, the inclined cross-bar D, secured to the beam and having its ends bent downward, the braces F, secured to the beam and to the cross-bar, the braces J, secured to the beam, and the handles B, secured to the beam and provided with the bars or hangers K, adjustably secured to the braces, substantially as herein shown and described.

387,771. GATE-HINGE. JAMES H. DAVIS, Danville, Ky. Filed Jan. 20, 1887. Serial No. 225,084. (No model.)

Claim.—1. The pivot-plate having a non-circular portion and provided with an opening arranged eccentrically to said portion, the hinge-section having a pin fitted to said eccentric opening, and the second section or strap fitted to said first section, all combined substantially as set forth.

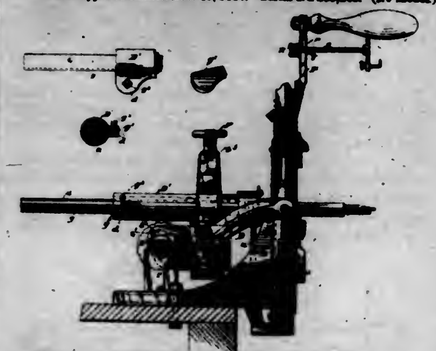


2. In a hinge, a pivot plate or section having a non-circular portion and provided with an opening arranged eccentrically to said non-circular portion, combined with a hinge-section adapted to receive or coact with another hinge-section and having a pin or stem fitted to enter said opening, all substantially as and for the purpose specified.

3. The improved hinge herein described, comprising the hinge-section 6, having main rounded bearing 7, and provided at the opposite sides thereof with ribs 8 8, and the hinge-section 5, having a socket or recess formed with a main portion, 13, and with depressions 14 14 at the opposite sides of such portion 13, substantially as and for the purposes specified.

387,771.

387,772. FIRE-ESCAPE. WILLIAM J. DIBBIN, Rochester, N. Y. Filed Apr. 26, 1888. Serial No. 271,702. (No model.)



Claim.—1. The herein-described fire-escape, composed of the case having three sides and having projections extending up from the bottom and braced from the sides, the projections being set on opposite sides of the longitudinal center of the case, the cam-lever extending at right angles to the case and adapted to clamp the line between it and the side of the case, and the door hinged to one side of the case and adapted to be fastened at its free end to the other side of the case, substantially as described.

2. The herein shown and described friction fire-escape, composed of the case open at its ends and one side, and having projections integral with its bottom and sides and arranged with their opposing sides approaching close to the longitudinal center of the case, the cam-lever adapted to clamp the rope between it and the side of the case, the door hinged to one side of the case and provided with a pivoted latch, and the arm extending from the other side of the case, to be engaged by the said latch to fasten the door and hold the line in place between the projections and between the side of the case and the said cam-lever, substantially as described.

3. In a fire-escape, the combination of the strap D, the bracket C, hinged thereto at one end and having arms *e* at its other end, the reel journaled between the arms *e*, the line wound on the reel and having its end weighted, the gong-bell supported on the bracket, the hammer carried by the reel, the catches for supporting the weighted end of the line and holding the bracket folded, and the releasing-cord for operating the catches, substantially as described.

387,773. HUB-BORING MACHINE. FRANK R. DURBIN, Salem, Ohio. Original application filed Oct. 4, 1886, Serial No. 215,674. Divided and this application filed Nov. 15, 1887. Serial No. 255,305. (No model.)

Claim.—1. In a hub-boring machine, a yoke having a vertical hub, a bearing for the mandrel having a spindle set in the hub and adjustable therein, a mandrel, and a feed-nut fixed on the inner end of the bearing, substantially as set forth.

2. In a hub-boring machine, a vertically-adjustable yoke pivoted on the main frame, a bearing for the mandrel vertically adjustable in said yoke, and a spline to guide said mandrel, in combination with a feed-nut on the inner end of the bearing, substantially as set forth.

3. In a hub-boring machine, a sectional feed-nut, one section having studs on its meeting face and the other section having slots fitting about the studs, and a lock pivoted on one section and having a substantially L-shaped slot and a set-screw, substantially as set forth.

4. In a hub-boring machine, a sectional feed-nut having studs, and slots for the studs, and a dovetailed groove at one end to engage the bearing for the mandrel, in combination with a lock pivoted on one section and having a slot and a set-screw to hold it on the other section, substantially as set forth.

5. In hub-boring machines, a nut formed in two parts having a dovetail groove at one end to engage the bearing for the mandrel, studs on one part and slots on the other part, and a lock on the nut at its outer end, constructed to clamp the nut on the mandrel, in combination with the mandrel and the bearing therefor, substantially as set forth.

6. In hub-boring machines, a clamping device consisting of a screw-rod adjustable in the arm of the revolving head, a clamp-plate pivoted on said screw-rod, and a clamping-bolt adjustable in said plate, substantially as set forth.

7. In a hub-boring machine, a revolving head for carrying the wheel, having arms with holes through their extremities, nuts swiveled in said holes, and screw-rods in the nuts, with clamping-plates on the outer ends of the rods and clamping-bolts on the plates, substantially as set forth.

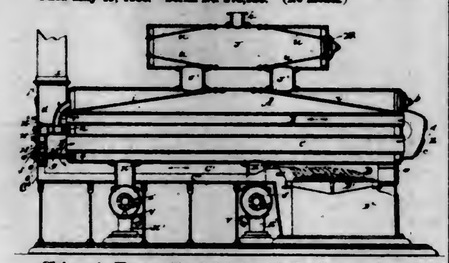
8. In a hub-boring machine and combined with the revolving head for holding the wheel to be bored, swivel-nuts set into the arms of the revolving head, rods adjustable in said nuts, and clamps for holding the wheel pivotally attached to the outer extremities of said rods, substantially as set forth.

387,774. ARTIFICIAL TOOTH-CROWN. CHARLES E. DUBEL, Pittsburg, Pa. Filed Feb. 1, 1888. Serial No. 262,653. (No model.)

Claim.—The improvement in the manufacture of tooth-crowns, which consists in first forming a pattern presenting the contour of the crown portion of a natural tooth, then depositing thereon a shell or casing of metal by the action of an electric current, and finally removing the pattern from the inclosing-shell, substantially as set forth.

387,775. WINDING OR DRIVING DRUM. SAMUEL DEECKER and JOHN J. MCGILL, Pittsburg, Pa. Filed Jan. 27, 1888. Serial No. 262,126. (No model.)

Claim.—1. A winding-drum formed in two parts, in combination with two or more rings, the two parts of the drum having a spring-bearing upon the rings, substantially as set forth.



387,775.

2. A winding-drum formed in two parts, each part being provided with a flanged rim, in combination with two or more rings interposed between the flanges of the rim, and bolts having a spring-bearing for clamping the parts together, substantially as set forth.

3. A winding-drum formed of two parts, each part being provided with two or more sockets, in combination with two or more locking-blocks engaging said sockets, substantially as set forth.

387,776. STEAM-BOILER. PETER DONALD, New Orleans, La. Filed May 15, 1888. Serial No. 273,982. (No model.)

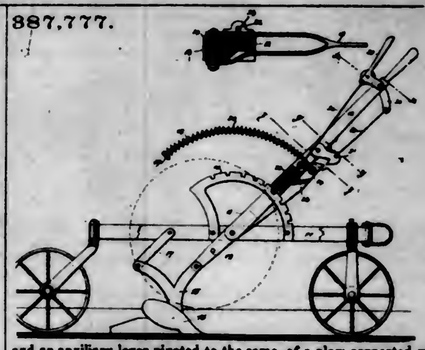
Claim.—1. The combination, with a boiler, a smoke-box, and a fire-chamber located beneath the boiler, of two or more sets of flues extending through the boiler, a deflector located in the smoke-box and in open communication with the boiler between the sets of flues, and pipes connecting the deflector with the lower portion of the boiler, substantially as set forth.

2. The combination, with a boiler, a smoke-box, and a fire-chamber located beneath the boiler, of two or more sets of flues opening into the smoke-box at one end, a chamber for affording a communication between the flues at the opposite end, and a deflector extending across the smoke-box and in open communication at one end with the boiler between the sets of flues, said deflector having pipes extending therefrom and opening into the boiler above and below the flues, substantially as set forth.

3. The combination, with a boiler, a casing about the same, a smoke-box in one end thereof, and a fire-chamber within the casing and beneath the boiler, of two sets of flues in the boiler, a deflector extending across the smoke-box and in open communication at one end with the boilers at a point between the two sets of flues, said deflector having pipes therein communicating with the boilers above and below the flues, and a steam-chest above the boilers and in communication therewith, substantially as set forth.

4. In a steam-boiler, the combination, with a boiler-shell and a smoke-box, of a double-walled angular deflector having a horizontal leg and a depending leg, the horizontal leg being in connection with the water-space of the boiler-shell, a set of upwardly-projected tubes which are bent to connect the top wall of the deflector with the flue-sheet of the boiler, and a set of tubes which are attached to the lower portion of the depending leg of the deflector and connect it with the lower part of the adjacent flue-sheet to afford free water-circulation through the deflector and adapt it to receive water from the boiler-shell and return it thereto, substantially as set forth.

387,777. LEVER FOR SULKY-PLOWS. EARL W. DRAKE, Poynette, Wis. Filed May 23, 1888. Serial No. 274,731. (No model.)



Claim.—1. In a sulky-plow, the combination, with the main or lifting lever, of a spring-actuated auxiliary lever pivoted to the main lever and adapted to carry the plow, substantially as and for the purpose specified.

2. In a sulky-plow, the combination, with the main or lifting lever, of a spring-actuated auxiliary lever pivoted to the main lever, and a plow connected with the auxiliary lever at or near the lower extremity, as and for the purpose specified.

3. In a sulky-plow, the combination, with the main or lifting lever, of a spring-actuated auxiliary lever pivoted to the main lever, a plow connected to the lower extremity of the said auxiliary lever, and a means, substantially as shown and described, for manipulating the auxiliary lever independent of the main lever, as and for the purpose specified.

4. In a sulky-plow, the combination, with the main or lifting lever

387,777.

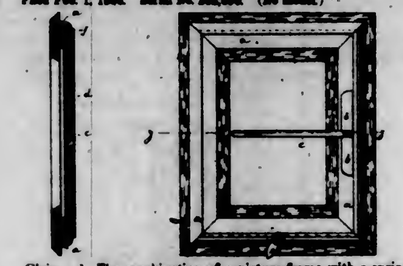
and an auxiliary lever pivoted to the same, of a plow connected with the lower extremity of the said auxiliary lever, and means, substantially as shown and described, for jointly manipulating the main and auxiliary levers, as and for the purpose specified.

5. In a sulky-plow, the combination, with the main or lifting lever, an auxiliary lever pivoted to the main lever, and a plow connected with the lower extremity of the said auxiliary lever, of a yoke attached to the upper extremity of the auxiliary lever, extending over and beyond the main lever, a spring secured upon said yoke bearing upon the main lever, and means, substantially as shown and described, for locking the said main lever in a predetermined position, as and for the purpose specified.

6. In a sulky-plow, the combination, with the main or lifting lever, an auxiliary lever pivoted to the main lever, provided with a lug at the upper extremity engaging the main lever, and a plow connected with the lower extremity of the said auxiliary lever, of a yoke secured to the said lug extending over and beyond the main lever, a spring held upon said yoke and bearing upon the main lever, a spring-actuated latch pivoted upon the said main lever in advance of the yoke, and means, substantially as shown and described, for manipulating said latch, as and for the purpose specified.

7. In a sulky-plow, the combination, with a main lever, an auxiliary lever carrying the plow, provided with a lug engaging the main lever, and a rack, of the latch 21, engaging the auxiliary lever, the latch 23, engaging the rack, the elbow-lever 25, pivoted on the main lever and connected with the latch 23, the lever 26, pivoted on the same point with the lever 25 and connected with the latch 21, and the adjustable button 28, substantially as shown and described.

387,778. CULTIVATOR. SOLOMON DRAPER, Sullivan, Ind. Filed May 29, 1888. Serial No. 275,464. (No model.)

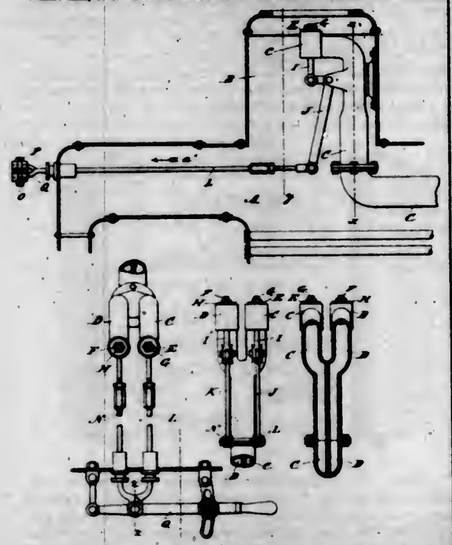


Claim.—1. The combination, in a wheel-cultivator, of the main frame, the arched bar B, having annular portions *a* formed on its lower ends, the brackets journaled on the said ends *a* and provided with spindles, the rearwardly-extending arms fixed to the brackets, and the

hand-bar pivoted to and connecting the ends of the said arms, substantially as specified.

2. The combination, in a cultivator, of the front and rear arched bars secured to the draft-beam, the axle-spindle journaled on the ends of rear arched bars, and having rearwardly-extending arms pivotally connected, the front arched bar terminating in horizontal branches, the rods connecting the said branches with the lower ends of the rear arched bar, the cultivator-frames journaled on the front arched bar, and the curved notch-bars for engaging the handles of the cultivators, substantially as specified.

387,779. PICTURE-FRAME. HENRY RUSSELL, New York, N. Y. Filed Feb. 1, 1888. Serial No. 262,893. (No model.)

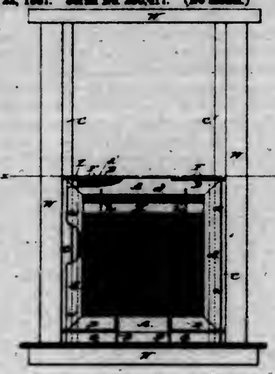


Claim.—1. The combination of a picture-frame with a spring, *c*, bulged toward the front and projecting across the frame, one end of the spring being secured to the frame, while the other end is disconnected therefrom, substantially as specified.

2. The combination of frame *a* with the block *b*, and with the spring *c*, secured to such block at one end, the other end of the spring being free, substantially as specified.

3. The combination of frame *a*, having flange *f*, with back *d*, having one grooved edge to engage said flange, and having the other edge flanged to overlap frame *a*, substantially as specified.

387,780. LOCOMOTIVE-BOILER. MIDDLETON G. FELLER, Tea Mile Hill, S. C. Filed Dec. 30, 1887. Serial No. 259,594. (No model.)



Claim.—1. The combination, with a locomotive-boiler provided with a live-steam pipe for each engine and a throttle-valve for each pipe, of a connecting-rod for each valve, and a single lever to which the said rods are detachably connected, substantially as shown and described.

2. The combination, with two dry-pipes leading to the two locomotive-engines, of valves held at the inner ends of said dry-pipes, bell-crank levers connected with the said valves, rods operating on the said bell-crank levers, and a throttle-valve lever, on which the said rods are pivoted at the same distance from the fulcrum-point of the said lever, substantially as shown and described.

3. The combination, with the locomotive-boiler, of the pipes C D, leading from the engines of the locomotive to the steam-dome, the valves E F in the said pipes, the bell-crank levers J K, the links I I', connecting the short arms of the bell-crank levers with the valves, the rods L N, connected to the long arms of the bell-crank levers, and the lever Q, to which the rods L N are detachably connected, substantially as herein shown and described.

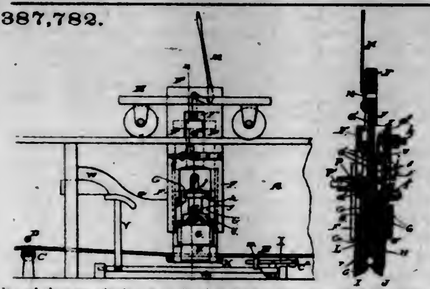
4. The combination, with a throttle-valve lever and two bolts held one above the other on the said lever, of rods pivoted by the said bolts on the said valve-lever, a valve-lever, bell-crank levers pivotally connected with the said rods, links pivotally connected with the said bell-crank levers, throttle-valves held on the said links, and dry-pipes in which the said valves operate, said dry-pipes being connected with the two locomotive-engines, substantially as shown and described.

387,781. WINDOW-SCREEN. GEORGE H. GOULD, West Lebanon, assignor to himself, and Charles King Gould, Rockfield Depot, Me. Filed Sept. 22, 1887. Serial No. 250,417. (No model.)

Claim.—1. The combination, in a window-screen, of a frame provided with screen-cloth and fitted to guides on the window-frame, and clamp-plates fitted to the screen and provided with elastic facings having frictional contact with the guides, substantially as described, for the purpose set forth.

2. The combination, in a window-screen, of a frame, A, provided with screen-cloth, B, and clamp-plates D, provided with open-ended slots *d*, having elastic or yielding facings E, adapted to guides on the window-frame, and provided also with slots *d*, and screws or bolts F, passed through the clamp-slots *d* into the screen-frame, substantially as herein set forth.

3. The herein-described window-screen clamp, consisting of a plate, D, having an open-ended slot, *d*, provided with an elastic or yielding facing, E, and provided also with a slot, *d'*, adapted to receive fastenings to hold the clamp to the screen-frame, substantially as herein set forth.



4. The combination, with a window-screen frame, of guides A, fitted to the top rail of the frame and projecting downward about parallel with the screen-cloth, and a bar or plate, H, fitted on the guides A and against the screen-cloth and made about the same thickness as the screen-frame, substantially as shown and described, whereby should the top bar of the screen-frame be too high to fit against the lower rail of the raised window-sash, the bar H may be adjusted within the screen-frame to fit against said sash-rail, as and for the purpose set forth.

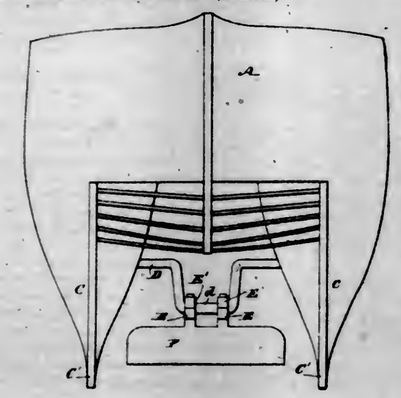
387,782. CABLE-RAILROAD GRIP AND CROSSING. JOSEPH J. GRAFF, San Francisco, Cal. Filed Aug. 31, 1887. Serial No. 248,414. (No model.)

Claim.—1. A cable-railway grip consisting of the exterior stationary frame and guide, F, and the secondary frame G, having a vertical movement within the frame F, in combination with the rope-gripping jaws attached to the lower end of the frame G, the wedge-shaped slides between which these jaws are held in position, and a lever and connecting-slides, whereby one of the wedges may be operated to open or close the jaws for the purpose of releasing or gripping the cable, substantially as herein described.

2. In a cable-railway grip, the stationary frame F, fixed to the car or dummy, a supplemental frame, G, sliding vertically within the frame F, and having the jaw J hinged to its lower end, so as to open outwardly about its hinge, a wedge-shaped slide by which said jaw is closed and held in a vertical position, and the opposing jaw I, having guiding and holding pins upon which it moves to and from the jaw J, and a vertically-moving wedge-shaped slide connected with the operating-lever in the car for the purpose of compressing the cable between

387,782.

it and the opposite jaw or releasing the same, substantially as herein described.



3. The stationary frame F, secured to the car or dummy, the supplemental frame G, sliding vertically within the same and carrying the gripping-jaws at its lower end, and a sliding frame, G', guided and moving upon the main stationary frame and having a spring-actuated lever and pin, in combination with the vertically-moving wedge shaped slide L, by which the jaws are operated to release or grip the cable, said slide having a hole which is engaged by the pin, so as to connect it with the operating-lever upon the dummy, substantially as herein described.

4. The stationary frame fixed to the dummy and having the supplemental vertically-sliding frame G, carrying the gripping-jaws at the lower end and movable within the main frame, the horizontally-moving jaw I, with the operating wedge-shaped slide L, connected with the lever in the car, and the opposing hinged jaw J, having a wedge-shaped slide, U, movable behind it and holding it in position, the roller *f*, projecting from the side of the sliding wedge U, and the stops *g* and *h*, to limit the upward movement of the wedge upon the frame G, in combination with the fixed incline T on the side of the rope-tube, whereby the frame G is automatically raised upon approaching the transverse crossing rope of another line, substantially as herein described.

5. The main frame of a cable-railway grip, fixed to the car or dummy, the supplemental vertically-sliding frame G, guided within the main frame, having the gripping-jaws, with their operating wedge-shaped slides upon opposite sides of the frame G, one being connected by a spring-actuated lever and pin with the operating-lever upon the car and the other provided with an anti-friction roller or lug, *f*, whereby it may be raised or depressed, in combination with fixed lugs or projections upon the side of the tube, which will disengage the spring-lever and pin, and the incline, whereby the movable frame is raised with its grip above the level of the obstruction to be passed, substantially as herein described.

6. The fixed and movable frames of the grip, the jaws with their actuating and holding wedge-shaped slides and operating-lever, and the connecting spring-actuated pin *i*, in combination with the fixed guide or channel W within the tube and the projections or lugs, whereby the holding-catches are disengaged and the grip thrown down again for the purpose of grasping the rope after passing the obstruction, substantially as herein described.

387,783. PROPELLER. LOUIS GEBERT, New York, N. Y. Filed Mar. 3, 1888. Serial No. 266,041. (No model.)

387,783.

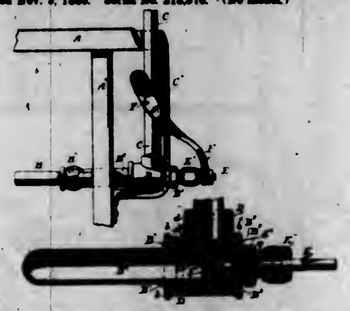
Claim.—The body A of the vessel, constructed with the two hulls C C, the two shafts D D, cranks *d d* thereof, bars E, and blades F, attached to the said cranks, in combination with the two stern-shafts D' D', cranks *d'* *d'*, of greater length than the cranks *d d* of the front shafts, D D, the bars G, connected to the cranks *d'*, and the blades H, attached to the bars, substantially as described.

387,784. CALENDAR. HENRY S. HAGY, Taunton, Mass., assignor, by mesne assignments, to Emily F. Hagy, same place. Filed Dec. 12, 1881. Serial No. 47,615. (No model.)

Claim.—The improved double-roll calendar above described, consisting of the backing, the two spindles, each mounted in a pair of bearings, and the calendar-strip, the two pairs of bearings being supported solely by the backing and that part of the strip lying between the rolls being uncovered.

387,785. DEVICE FOR COOLING ALES AND SIMILAR LIQUIDS. WILLIAM B. HAWKINS, New York, N. Y. Filed Aug. 30, 1887. Serial No. 248,197. (No model.)

Claim.—1. In a device for cooling liquids, the reservoir A, having inlet and outlet apertures, and the spider-like metal jacket B, formed in two sections bolted together around the receptacle, and having pipes *b'* registering with the inlet and outlet apertures therein, substantially as set forth.

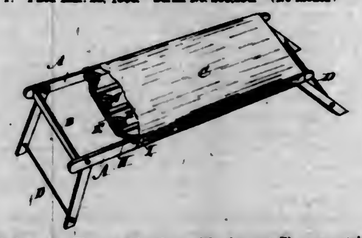


2. The combination, with the reservoir A, having inlet and outlet

387,785.

apertures provided with nipples *a*, of the two-part spider-like jacket B, bolted together around the reservoir and provided with integral sleeves *b*, receiving the nipples *a*, and having lengths of pipe *b'*, substantially as set forth.

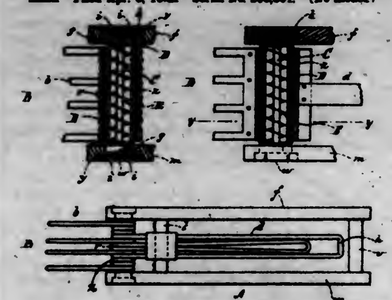
387,786. VAPOR-STOVE. FREDERICK J. HUBBARD, Chicago, Ill., assignor to the Adams & Westlake Manufacturing Company, same place. Filed Nov. 9, 1886. Serial No. 218,376. (No model.)



Claim.—1. The combination, with a non-rotating horizontal oil-pipe of a vapor-stove leading to the burner or burners, and a tank-pipe pivoted to the non-rotating pipe and leading from an elevated oil-supply tank, of a valve arranged in one of said pipes and having its movable part provided with a projection or lever arranged in position to be engaged for the closing of the valve in the swinging movement of the tank-pipe, substantially as described.

2. The combination of an oil-pipe leading to a burner or burners, a pipe pivoted thereon leading from an oil-supply tank, and a valve for cutting off the flow of oil from the tank toward the burner, the oil-pipe and the tank-pipe being severally provided in their joint with passages which coincide to form a continuous passage for the back-flow of oil from the oil-pipe to the tank-pipe when the latter is depressed, substantially as described.

3. The combination, with the tank-pipe C and pipe B^2, having passages *b'*, b^2, and b^3, of a coupling, D, rigid with the pipe C, but rotatably supported on the pipe B^2, and provided with passages d'' d''', a valve for closing passage *b'*, and a lever connected with said valve arranged in the path of the pipe C, substantially as and for the purpose set forth.



387,787. SPRING BED-BOTTOM. ANTHONY HEISER, New York, N. Y. Filed Mar. 23, 1888. Serial No. 268,282. (No model.)

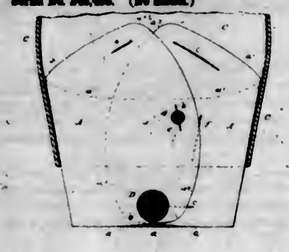
Claim.—1. The combination, with the metallic cross-strips E, formed with integral hangers H, having outward and downward bent integral hooks I at their upper ends, of the longitudinal strips F, crossing the strips E and riveted thereto at their points of intersection, and the spiral springs secured at said points of intersection, whereby when said spring-supporting frame is in place on a set the side bars thereof will be braced against outward movement, substantially as set forth.

2. The combination, with the frame A, of the cross-strips E, bent upward at their ends to form integral hangers H, then outward and downward to form hooks I, overlapping the side bars of the frame, and suspending the said strips within the frame, and bracing the side bars thereof against outward movement, the longitudinal strips F, crossing the strips E and riveted thereto at their points of intersection, the springs G, secured at said points of crossing, and the fabric bottom extending across the frame over the springs, substantially as set forth.

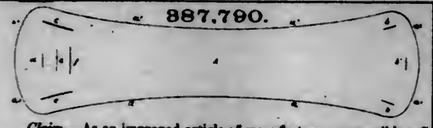
387,788. WEFT-FORK FOR LOOMS. IRA JACKSON, Lawrence, Mass. Filed Apr. 6, 1888. Serial No. 269,861. (No model.)

Claim.—1. The combination of the following instrumentalities, to wit: a body, a fork proper provided with a centrally-disposed transversely-arranged tube, a sleeve disposed within said tube and secured thereto, a rod mounted in said body and having a fixed head at one end and a nut at the other, said rod extending longitudinally through said sleeve, a spring disposed around said rod within said sleeve and having one of its ends secured to said rod and the other to said sleeve, and a stop for said fork proper, substantially as set forth.

2. The fork proper, B, having the teeth *b*, tube *z*, and tail-piece *d*, provided with the dog *h*, the sleeve D, disposed in the tube *z* and secured thereto by the screw *r*, the body A, provided with the stop *t*, and rails *m* *f*, having the counterbored holes *g*, the screw-threaded rod C, provided with the flanged head *w* and flanged nut *k* said rod being inserted in said sleeve with its head resting in one of said holes and the nut in the opposite hole, and the coiled tension-spring K, disposed around said rod and having one of its ends secured thereto and the other secured to said sleeve, all being constructed, combined, and arranged to operate substantially as described.



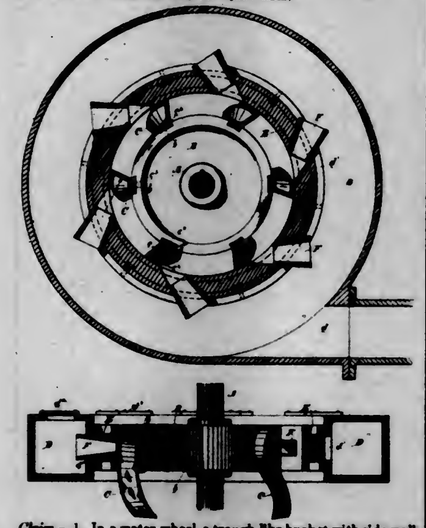
387,789. PERMUTATION-LOCK. CONRAD A. JOHANNSEN and SYBRO B. JOHANNSEN, Erie, Pa. Filed Oct. 27, 1887. Serial No. 253,489. (Model.)



Claim.—1. In a permutation-lock, the combination, with two disks and tumblers arranged in connection therewith, of a spring-plate and ratchet arranged between the lock-case and the outer dial, and an inversely-arranged spring-pawl plate and ratchet arranged between the dials, substantially as described.

2. In a permutation-lock, the combination, with a lock-case formed with a central web and carrying a spring-ratchet plate, 15, of a dial formed with a sleeve, 19, which passes through an aperture in the web-case and is provided with a ratchet upon its inner face, an inner tumbler fixed to the sleeve of the dial, an inner dial connected to the shank, an operating-rod the shank of which passes through the sleeve 19, an outer tumbler secured to the said shank, a spring-ratchet plate carried by the first-named dial, and a ratchet formed upon the inner face of the last-named dial, substantially as described.

387,790. APPAREL-CUFF. WILLIAM KAHLER, Drummond, Wis., assignor of one-half to Isidore Swinehart, Chicago, Ill. Filed Aug. 8, 1887. Serial No. 246,493. (No model.)



887,790.

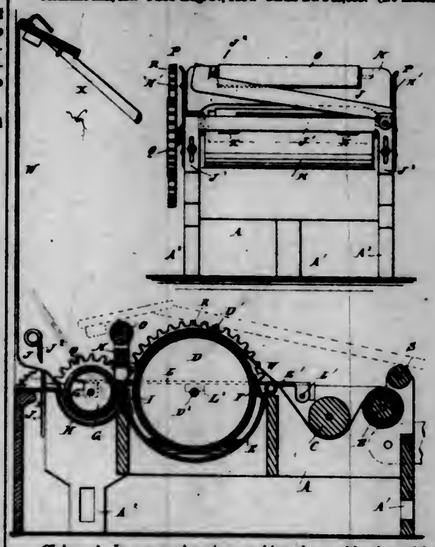
Claim.—As an improved article of manufacture, a reversible cuff having the button-holes *b* at one end and the long button-holes *c* at the other end for adjusting the sides of the cuff, and the transverse button-holes *b'* at one end and *d*, *e*, and *f* at the other end intermediate the button holes *b* and the button-holes *c*, respectively, for adjusting the middle portion, substantially as set forth.

887,791. WATER-WHEEL. ISAAC P. LAUBER, Iona, Ont. Filed Oct. 14, 1887. Serial No. 252,302. (No model.)

Claim.—1. In a water-wheel, a trough-like bucket with side walls and a bottom deeper along its outer edge, said bucket curving inwardly and the depth of its outer edge diminishing in the direction of its length to its discharge end, substantially as described.

2. In a water-wheel, a bucket having a bottom and side walls, and curved inwardly in the direction of its length to its discharge end, said bottom being at an obtuse angle to the perimeter of the wheel, the angle diminishing gradually toward the discharge end, and the bottom then inclining inwardly, substantially as described.

3. In a water-wheel, and in combination with the disk and its buckets, the encircling hollow casing for the water, having on its inner surface the continuous slot, the adjustable ring secured to the inner surface of the hollow casing, and the nozzles carried by the ring, and communicating with the casing through its slot, substantially as described.



887,792. PAPER-HANGING CLAMP. JOHN F. MCAFEE, Pleasant Hill, Mo. Filed Aug. 27, 1887. Serial No. 248,034. (No model.)

Claim.—1. In a paper-hanging clamp, the combination, with a handle, a grooved plate on the end thereof, and a brush on the plate, of a spring-pressed bell-crank lever pivoted on the said plate, a bar carried by the crank-lever and engaging the groove of the board, and a rod for operating said crank-lever, substantially as herein shown and described.

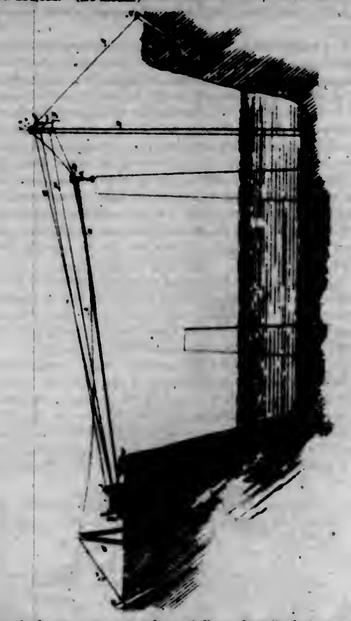
2. In a paper-hanging clamp, the combination, with a handle, an inclined plate secured to the end of the handle and provided with a semi-circular groove in its upper surface, and a brush on the lower surface of the plate, of a bell-crank lever pivoted on the plate, a bar carried by said bell-crank lever, a spring for holding the bar in the groove of the plate, and a rod passing through bearings on the handle and provided with an offset for engaging the upper bearing to lock the clamp open, substantially as herein shown and described.

887,793. WALL-PAPER-HANGING MACHINE. JOHN F. MCAFEE, Pleasant Hill, Mo. Filed Aug. 27, 1887. Serial No. 248,033. (No model.)

Claim.—1. In a paper-hanging machine, the combination, with a paste-pan, of a roller supported to rotate in said paste-pan, and over which passes the back of the wall-paper, a scraper operating against said roller, a friction-roller geared with said paste-roller, and a drip-pan surrounding the lower half of said friction-roller, substantially as shown and described.

2. In a paper-hanging machine, the combination, with a paste-pan, and a paste-roller covered with fibrous material, and held to rotate in said paste-pan, of a friction-roller geared with said paste-roller, a drip-pan surrounding the lower half of said friction-roller, and a guide-roller under which the paper passes to said paste-roller, substantially as shown and described.

3. In a paper-hanging machine, the combination, with a paste-pan, and a paste-roller covered with fibrous material and held to rotate in said paste-pan, of a friction-roller geared with said paste-roller, a drip-pan surrounding the lower half of said friction-roller, a guide-roller under which the paper passes to said paste-roller, and a scraper pivoted on the paste-pan and acting against the fibrous covering of the paste-roller, substantially as shown and described.



4. A paper-hanging machine comprising a paste-pan, a roller covered with fibrous material held to rotate in said pan, a scraper pivoted on the paste-pan and acting against the covering of the roller, a friction-roller geared with the paste-roller, a drip-pan surrounding the lower half of the said friction-roller, and a cutting mechanism held in front of said friction-roller, substantially as herein shown and described.

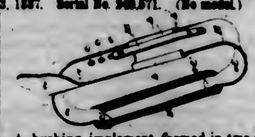
5. In a paper-hanging machine, the combination, with a frame, of arms held adjustably on the front end of said frame, a stationary knife part secured to said arms, a knife part pivoted to said stationary knife part, and lugs projecting from said stationary knife part and adapted to rest on the top of the mop-board, substantially as shown and described.

6. In a paper-hanging machine, the combination, with a main frame, of a roller carrying a paper roll and mounted on said main frame, a guide-roller mounted in said main frame, a paste-roller mounted in said main frame, a friction-roller in gear with said paste-roller, and side beams pivoted to the main frame and carrying said friction-roller, substantially as shown and described.

7. In a paper-hanging machine, the combination, with a main frame, of a roller carrying the paper roll and mounted on said main frame, a guide-roller mounted in said main frame, a paste-roll mounted in said main frame, a friction-roller in gear with said paste-roller, side beams pivoted to the main frame and carrying said friction-roller, and means, substantially as described, for locking said side beams in place on the main frame, as set forth.

887,794. APPARATUS FOR TRANSPORTING AND HOISTING STONE. RONALD MCDONALD, Louisville, Ky. Filed Dec. 21, 1887. Serial No. 258,622. (No model.)

Claim.—1. In an apparatus substantially as described, the combination, with a mast suitably supported, whereby it may be adjusted or moved laterally at its upper end, of the cable G, having its end portions disposed around guides on said mast and having such end portions extended from the mast in opposite directions and at approximately right angles to the direction of the main portion of the cable, substantially as set forth.



2. The combination of a hoisting device, 3, a mast, B, suitably supported, whereby it may be adjusted or moved laterally at its upper end, and having guides *g g'* at its upper end, and the cable G, passed around the drum of hoisting device 3, thence over the guides *g g'*, and having its ends extended laterally from the mast in opposite directions and anchored, substantially as set forth.

3. An apparatus, substantially as described, comprising a mast, a cable-track extended therefrom and anchored at its ends, a carrier on said track, a cable, G, engaging guides on and extended at its ends in opposite directions from said mast, and a hoisting device for operating said cable G, substantially as set forth.

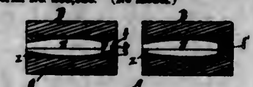
4. The apparatus comprising the mast, the track-cable, the cable G, the cable F, the carrier, and the hoisting devices 2 and 3 for said cables F and G, substantially as and for the purposes specified.

5. The improved apparatus herein described, consisting of the mast B, having guides *g g'*, the tower C, the track-cable A, extended from said mast over the tower and anchored at its ends, the traveler or carrier on track A, the line E, connected therewith, the hoisting device 1 for operating said line E, the cable F, and hoisting device 2, the cable G, passed around the guides *g g'* and extended thence in opposite directions from the mast, and the hoisting device for operating said cable G, substantially as set forth.

887,795. CORN-HUSKER. THEODORE H. MEYERS, Niobrara, Nebr. Filed Sept. 13, 1887. Serial No. 249,571. (No model.)

Claim.—1. A husking implement formed in two sections, sliding one upon the other, one section having a series of apertures, a spring-catch secured to one section and engaging any of the apertures in the other section, and a husking-pin on one section, substantially as set forth.

2. A husking implement comprising the section A, having the curved guard *a*, the pin *a'*, series of apertures *c*, and inward-projecting lips *b b*, the section B sliding between the said lips and provided with a guard, *d*, and the spring-plate E, secured at its outer end to the section B, projecting beyond the inner end thereof, and having a pin or projection engaging an aperture in section A, substantially as set forth.



3. The combination, with the two sections of a corn-husker sliding one upon the other and provided with guards, of an elastic connection between said guards and drawing the sections toward each other, substantially as set forth.

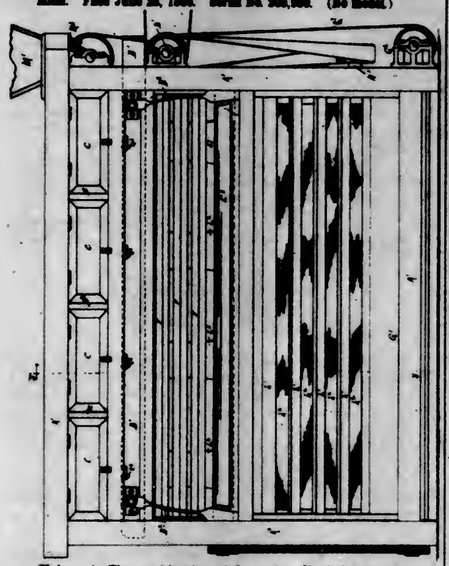
4. The combination, with the two sections of a corn-husker sliding upon each other and formed with guards having hooks or heads at their extremities, of an endless elastic band engaging the said hooks or heads, substantially as set forth.

5. A corn-husker consisting in the section A, formed with curved guard *a*, terminating in a hook, *c'*, the spar *a'*, series of apertures *c*, and opposing inward-extending side lips, *b b*, the section B sliding between said lips, and formed with curved guard *d*, terminating in a head, *d'*, the spring-plate E, secured to the outer face of the section B, extending beyond the inner end thereof, and provided with a pin, *e*, engaging an aperture, *c*, in the section A, and the endless elastic band D, engaging the head and hook, substantially as set forth.

6. In a corn-husking implement, a continuous or unbroken thimble formed with teeth and an aperture or opening in one side wall between its ends and closed on all sides, substantially as set forth.

887,796. CIGAR-MOLD. CHRISTIAN F. T. MILLER, Detroit, Mich., assignor of two-thirds to Edward Martin, same place. Filed Feb. 13, 1886. Serial No. 202,033. (No model.)

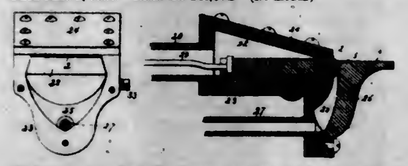
Claim.—1. In an organized cigar-mold, the combination of the two body parts adapted to be locked together, each part having a portion of a cigar-bunch-forming cell located therein, the projecting cutting-blade located in the cigar-bunch-forming cell at the tip or head end, said blade being made fast to one of the body parts, the angle of its cutting-edge coinciding with the angle of the cell Z, substantially as and for the purposes specified.



2. In a cigar-matrix, the combination of the parts A B, each part having cells formed therein, as set forth, the cutting-blades *f*, located in the tip or mouth end of the cells Z, said blades being made fast to the part B, substantially as and for the purposes set forth.

887,797. MANUFACTURE OF RAILROAD-RAILS. THEODORE A. METTENBERG, St. Louis, Mo., and GEORGE WESTERMEIR, Jeffersonville, Ill. Filed May 11, 1888. Serial No. 273,602. (No model.)

Claim.—In the manufacture of railroad-rails from old steel rail-road-rails, the herein-described double series of passes, the vertical dimensions of the passes forming one of said series being equal, or thereabout, to the horizontal dimensions of the passes forming the other of said series, said dimensions of said passes of both of said series being gradually and consecutively diminished in respectively corresponding order and degree, thereby maintaining throughout said series the respective equality of said dimensions of said passes, wherein, consecutively, the rail is compressed transversely, alternately vertically and horizontally, and its cross-sectional area reduced and the rail elongated, substantially as and for the purpose herein set forth.



387,798. MIDDLINGS-PURIFIER. VICTOR MONNIER, Dundas, Minn. Filed June 22, 1888. Serial No. 278,020. (No model.)

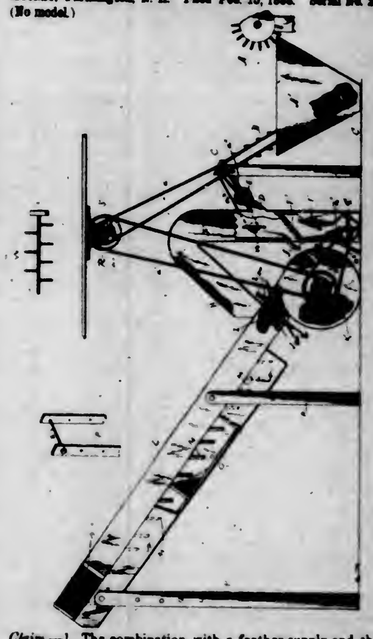
Claim.—1. The combination of the casing divided into upper and lower compartments by a partition, the vibrating screen arranged lengthwise in and subdividing the upper compartment, the endless traveling belt moving transversely of the machine and equal in width to the length thereof, a series of separating-chutes arranged side by side beneath the delivery end of the belt, and a corresponding series of suction-flues communicating with said separating-chutes and with the air-space over the screen, substantially as specified.

2. The combination of the casing divided into upper and lower compartments by a partition, the vibrating screen arranged lengthwise in and subdividing the upper compartment, the endless traveling belt moving transversely of the machine and equal in width to the length thereof, gather-boards arranged to leave air-openings between each side of the screen and each end of the belt, a series of separating-chutes arranged side by side beneath the delivery end of the belt, and a corresponding series of suction-flues communicating with said separating-chutes and with the air-space over the screen, substantially as set forth.

387,799. HYDROCARBON-FURNACE. BENJAMIN A. MOODY, Boston, assignor of three-eighths to Charles C. Sanderson, Dedham, Mass. Filed June 3, 1887. Serial No. 240,174. (No model.)

Claim.—1. A hydrocarbon-burner consisting of a casing having oil and steam chambers with their discharge-passages converging into one elongated orifice, and a sliding valve situated partly in said orifice and forming two independent contracted outlets at an angle to each other, one of which orifices the valve controls, substantially as described.

2. A hydrocarbon-burner consisting of a casing having separate oil and steam chambers with their discharge-passages at an angle to each other, and a sliding valve situated in one of the said chambers and fitting a flat seat terminating at the oil-outlet, the said valve separating the oil and steam outlets and being adjustable, substantially as set forth.



3. A hydrocarbon-burner having a casing provided with separate oil and steam chambers having outlets converging into one elongated orifice, a plate partially closing said orifice and forming separate steam and oil discharge outlets, and a flat horizontal spreading-plate adjacent to the oil-orifice, the steam-outlet being arranged to direct the steam upon the plate in front of the oil-outlet, substantially as described.

4. The combination, with a hydrocarbon-burner casing having steam and oil chambers, the outlet from the latter being entirely below the outlet from the former, of a flat extended plate situated at substantially right angles to and opposite the oil-orifice and below the steam-orifice, upon which plate the oil is adapted to flow and spread in a thin film before being met by the steam, and means for adjusting the said plate toward and from the oil-orifice, substantially as described.

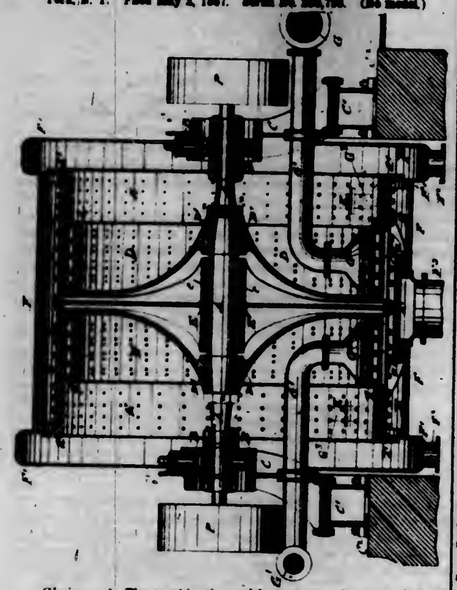
5. A hydrocarbon-burner having a casing provided with a steam-chamber having an orifice leading therefrom, and an oil-chamber inclosed in part by the casing and in part by a plate attached to the casing, having a flat extended upper face in proximity to the orifice leading from the oil-chamber, substantially as described.

6. A hydrocarbon-burner provided with a steam-chamber, 22, contracted toward one end, and with a chamber, 25, inclosed in part by the burner and in part by a plate, 26, having a flat extended upper face, 4, and an adjustable sliding-valve plate, 26, lying in the contracted end of the steam-chamber, which it contracts to form a narrow orifice, 2, and having its end opposite the plate 26, thereby forming a contracted outlet from the chamber 25, substantially as described.

387,800. FEATHER RENOVATOR AND SORTER. HERMAN O. MOONEY, Farmington, N. H. Filed Feb. 15, 1888. Serial No. 264,092. (No model.)

Claim.—1. The combination, with a feather-supply and the long flue having a fan-blower, of an intermediate flue opening into the long flue in front of its blower, said intermediate flue having a fan-blower, a supply-chute, an opposite waste-chute, and a rising and falling screen for removing the coarser materials, as set forth.

2. The combination, with the inclined blast-flue L, the inclined feed-belt B, and feather-bin A', of the upright flue F, located between flue L and belt B, and having feed-chute D, feed-wheel E, fan-blower G, moving screen F' above said blower, waste-chute *f* opposite to feed-chute D, and stationary screen H above the point where flue F opens into flue L, as set forth.



3. The combination, with the intermediate blast-flue, F, of the blast-flue L, the latter being provided below the exit of the former with a screen-chute, I, adjustable slant-boards *j* below said chute, and a fan-blower in the rear of said boards, whereby the feathers do not fall bodily into flue L and the blast may be directed toward chute I, as set forth.

4. The combination, with the blast-flue F, of blast-flue L, having at its outer end escape-screen H', and at the bottom a series of boards, M, inclined forward at an angle and opening into subjacent boxes N, whereby the blast is prevented from eddying into said boxes and removing the feathers deposited, as set forth.

5. The combination, with the shorter blast-flue having a waste-chute, of the rising and falling screen F' and the rotary clearer W above said screen, as set forth.

6. The combination, with the shorter flue, F, having feather-supply chute D and waste-chute *f*, of the fan-blower G, the damper T above the latter, for directing the main force of the blast toward chute D, the rising and falling screen F', and the rotary clearer W, as set forth.

387,801. CENTRIFUGAL MACHINE. THEO E. MILLER, New York, N. Y. Filed May 2, 1887. Serial No. 236,703. (No model.)

Claim.—1. The combination, with a rotary primary basket, of one or more secondary baskets placed loosely on the spindle of the primary basket, said secondary baskets being provided with buckets, so as to be driven by the power stored in the liquid discharged from the primary basket, substantially as set forth.

2. The combination of a spindle and elastic bearings for said spindle with a primary basket secured rigidly to said spindle and one or more secondary baskets placed loosely on the spindle of the primary basket and provided with buckets exterior to said primary basket, substantially as set forth.

3. In a centrifugal machine, a secondary basket composed of a section having interior buckets or other driving means and an independent draining-section sidewise of the same, substantially as set forth.

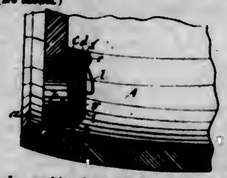
4. The combination of a rotary primary basket with a secondary basket placed loosely on the spindle of the primary basket and provided with buckets or other equivalent means for utilizing the power of the liquid discharged from the primary basket, and with an independent draining-surface, substantially as set forth.

5. The combination of a primary basket having a perforated surface with a secondary basket having driving-buckets and means for discharging the drained liquid from the secondary basket, substantially as set forth.

6. The combination of a rotary primary basket and a secondary basket placed loosely on the spindle of the primary basket and provided with buckets with an exterior casing having annular overflow-gutters, substantially as set forth.

7. The combination of a rotary primary basket with a secondary basket placed loosely on the spindle of the primary basket and concentric therewith, said secondary basket being wider than the primary basket and provided with buckets at that portion encircling the primary basket, substantially as set forth.

8. The combination of a rotary primary basket with a secondary basket of larger diameter supported loosely on the spindle of the primary basket, said secondary basket being provided with buckets at that part encircling the primary basket, and an exterior casing having annular overflow-gutters, substantially as set forth.

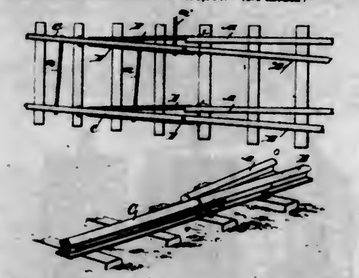


9. The combination, with a rotary primary basket, of a secondary basket placed loosely on the spindle of the primary basket, provided with buckets and driven by the liquid discharge from the primary basket, supply-pipes, and an exterior casing having overflow-gutters and discharge-pipes, substantially as set forth.

10. The combination of a horizontal spindle with a primary basket secured rigidly to said spindle, a secondary basket surrounding the primary basket and extending beyond the same, the secondary basket being provided with buckets at that part concentric with the primary baskets, supply-pipes, and an exterior casing having overflow gutters and pipes and a bottom discharge-pipe, substantially as set forth.

11. The combination of a horizontal spindle, two primary baskets secured rigidly to said spindle, a secondary basket surrounding the primary baskets and supported loosely on the spindle between the primary baskets, buckets at that part of the secondary basket surrounding the primary baskets, rims at the open ends of the primary and secondary baskets, with supply-pipes for said baskets, and a casing surrounding the secondary basket and provided with overflow-gutters and discharge-pipes, substantially as set forth.

12. The combination of a horizontal spindle, two primary baskets secured to said spindle, a secondary basket surrounding the primary basket and supported loosely on the spindle between the primary baskets, buckets on the secondary basket at that part surrounding the primary baskets, an exterior casing having overflow gutters and pipes, with supply-pipes having enlarged seams, a discharge-pipe at the bottom of the exterior casing, and V-shaped current-deflectors at both sides of said discharge-pipe, substantially as set forth.

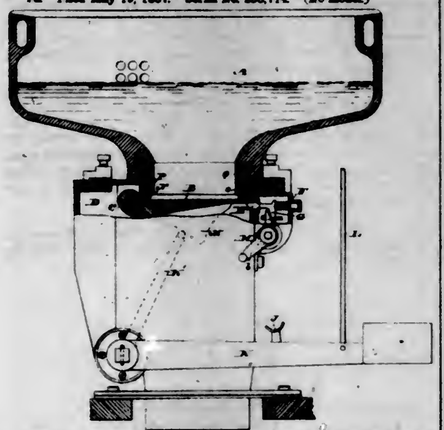


387,802. TAP-VALVE FOR BARRELS. PATRICK F. MURRAY and JERRY F. CORBETT, Syracuse, N. Y. Filed Apr. 21, 1888. Serial No. 271,462. (No model.)

Claim.—1. In combination with the hinged valve and its support on the barrel, a lever hinged to said support at the same side to which the valve is hinged and at a point some distance from the hinge of the valve outward and bearing with its free end on the valve, substantially as and for the purpose set forth.

2. The combination of the bushing *b*, formed with the collar *c* and ears *d' d'* and provided with the notch *n*, the valve *v*, hinged to said ears, the spring *e*, pressing the valve to its seat, and the lever *l*, pivoted to the bushing and having its free end lying in the aforesaid notch, substantially as described and shown.

387,803. GUIDE-BAR FOR STUB-SWITCHES. FRANK HERMANSEN, Appleton, assignor to himself and Fred. G. Pauli, West De Pere, Wis. Filed Oct. 28, 1887. Serial No. 253,207. (No model.)



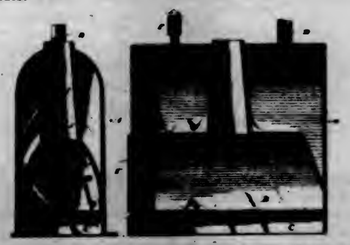
Claim.—1. The combination, with the main rails and the siding-rails of a track, of movable switch-rails adapted to operate in conjunction with said main and side rails and parallel guide-bars attached at one end to opposite sides of the switch-rails, extending longitudinally of the same, and at their other ends to the main and side tracks, respectively, as and for the purposes herein set forth.

2. The combination, with the main rails and siding-rails of a track, of movable switch-rails adapted to operate in conjunction with said main and side rails, and parallel guide-bars having a cylindrical body and flattened apertured ends, said bars attached at one end to opposite sides of the switch-rails and extending longitudinally of the same and at their other ends to the main and side tracks, respectively, substantially in the manner and for the purposes herein set forth.

3. The combination, with the main rails, the siding-rails, and switch-rails of a track, of horizontal guide-bars attached to the outer side of the switch-rails and the outer fixed rail and the inner surface of the switch-rails and the inner fixed rail, substantially as and for the purposes herein set forth.

4. The combination, with the main rails, the siding-rails, and the movable switch-rails of a track, of cylindrical guide-bars having flattened and apertured ends, attached, respectively, to the outer web-surface of the switch-rails and the outer web-surface of the outer fixed rail and to the inner web-surface of the switch and the equivalent web-surface of the inner fixed rails, substantially as and for the purposes herein set forth.

387,804. **WATER-CLOSET.** William F. North, Philadelphia, Pa. Filed May 19, 1887. Serial No. 238,714. (No model.)



Claim.—1. In a water-closet, the combination of a basin, a swinging valve with segmental under face, a spring-bolt adapted to lock said valve, a rocking lever operating said bolt, and a lever having an arm to operate said rocking lever and an arm to close said valve, substantially as described.

2. In a water-closet, the combination of a basin with a swinging valve at outlet thereof, a spring-bolt adapted to lock said valve, a rocking lever adapted to withdraw said spring-bolt, and a lever with an arm adapted to operate said rocking lever, substantially as described.

3. The combination of the basin A with the swinging valve B, having horizontal shaft C and a segmental under face, the spring-bolt E, having the arm G, the rocking lever H, having the arms *a* and *b*, and the weighted pivoted lever K, with the arm K', adapted to close said valve B, and the arm J, adapted to operate said rocking lever H, so as to withdraw said bolt and thereby operate said valve, substantially as described.

387,805. **BOILER.** Elsa Oberwiler and Samuel R. Lascomb, Upper Sandusky, Ohio. Filed Apr. 7, 1888. Serial No. 269,996. (No model.)

Claim.—The portable steam-boiler herein described, consisting, essentially, of the outer case or shell, having its end walls carried down to form part of the fire-box, and also the ash-chamber, and the tapering smoke-flue passing through the boiler and having its lower portion expanded, as shown, and fixed to the top and side wall of the fire-box, the said fire-box having between it and the shell a water-chamber, and also having the front wall carried down on opposite sides of the door to form a chamber, I, whereby the front wall of the boiler may be protected, substantially as specified.

387,806. **HOE.** James H. Parker, Vineland, N. J. Filed Nov. 14, 1887. Serial No. 255,602. (No model.)

Claim.—1. The combination of the hoe-blade, consisting of a flat plate concaved both longitudinally and transversely from edge to edge, with the handle-socket secured at or about the center of the blade, all substantially as described.

2. The combination of the dished triangular blade having two sides plain and the other side serrated, so as to form flat teeth, and intervening V-shaped recesses with sharp angles, and the handle-socket secured to the blade at or about the center of the same, all substantially as specified.

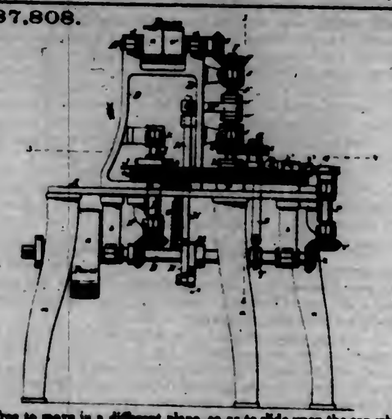
387,807. **CAR-STARTER.** John H. Parmlee, Bridgeport, Conn. Filed Sept. 10, 1887. Serial No. 249,243. (No model.)

Claim.—1. The combination, with the axle and the ratchet-wheel secured thereon, of the backwardly spring-actuated draft-frame carrying a pawl and hung beneath the car, the L-shaped draw-head pivoted at its elbow and connected to the draft-frame, and the stop-lever adapted to engage and uphold the draw-head, substantially as set forth.

2. The combination of the draft-frame, the fulcrumed draw-head, and the stop-lever adapted to engage and uphold said draw-head, as described.

3. In a car-starter, the combination, with the car-axle, of a ratchet-wheel thereon, a draft frame and pawl adapted to engage the ratchet-wheel, and a fulcrumed draw-head whereby motion is imparted to the draft-frame, substantially as specified.

4. In a car-starter, the combination, with the whiffletree-bar, of an L-shaped draw-head adapted to receive said whiffletree-bar and pivotally connected to the car-platform, substantially as set forth.



5. The combination, with the ratchet-wheel on the car-axle and the draft frame and pawl adapted to engage and turn said wheel and axle, of the fulcrumed draw-head, its connection to the draft-frame, and the whiffletree secured in one arm of said draw-head, whereby the upward swing of the whiffletree to the line of draft will impart initial movement to the axle, as shown and described.

387,808. **MACHINERY FOR SECURING LININGS TO JAR-CAPS.** Frank W. Perry, Philadelphia, Pa., assignor to the Hero Fruit Jar Company, same place. Filed May 12, 1888. Serial No. 273,242. (No model.)

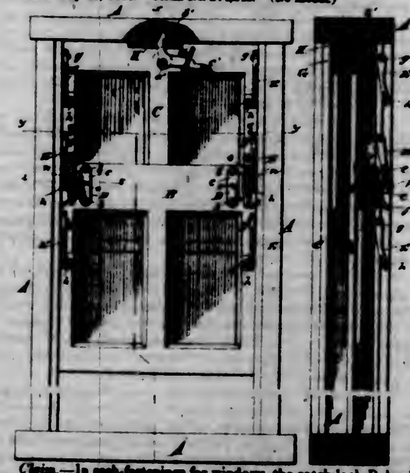
Claim.—1. The combination, in a machine for lining sheet-metal caps, of the clamping-disks and means for rotating the same with a pressing-tool having a beveled seating face, said tool being movable from and toward the cap, but being also free to move in a different plane, whereby it slides upon the cap while pressing the same upon the beveled edge of the lining, all substantially as specified.

2. The combination, in a machine for lining sheet-metal caps, of the clamping-disks, a pressing-tool movable from and toward the cap,

387,808.

but free to move in a different plane, so as to slide upon the cap while pressing the same upon the lining, and gearing for rotating said clamping-disks and the pressing-tool, all substantially as specified.

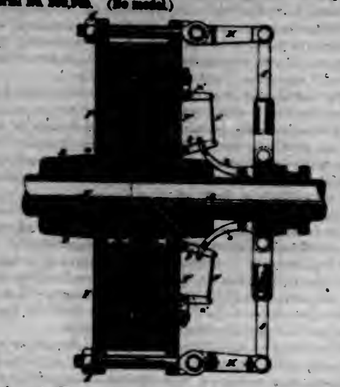
3. The combination of the clamping-disks, a slide, H, made in two parts, the front being free to move across the face of the rear part, and a pressing-tool carried by said front part of the slide, with a cam for moving the slide toward the clamping-disks, all substantially as specified.



4. The combination, in a machine for lining sheet-metal caps, of the clamping-disks, a slide comprising two parts, one of which is free to move across the face of the other, a pressing-tool carried by one part of the slide, a pin carried by the other part thereof, a cam acting on said pin, and an elastic cushion interposed between said pin and a bearing on the slide, all substantially as specified.

5. The combination, in a machine for lining sheet-metal caps, of the clamping-disks, the two-part slide, the pressing-tool carried by one part of the same, a cam acting upon the other part of the slide to move the same toward the clamping-disks, and a cam acting upon the tool-carrying portion of the slide and moving the same in a different plane, all substantially as specified.

6. The combination of the carrying-table and guide-bar, the clamping-disks, and a feed-bar having a hook which engages with a cap on the forward movement of the bar, and a spring-pawl which yields on the backward movement of the bar, all substantially as specified.



7. The combination of the lower supporting-disk, 6, of the cap-holder, with the upper clamping-disk having a projecting elastic pad secured to its under face, all substantially as specified.

387,809. **SASH-FASTENER.** Jesse F. Post, Mount Carmel, Ill. Filed May 18, 1888. Serial No. 274,262. (No model.)

Claim.—In sash-fastenings for windows, the catch-lock D, having a set-off or face-plate, c, projecting outward from its base and provided with a tooth-like catch, *c*, in combination with the suspension hook-catch E, having a lip, *h*, for operation in connection with the catch-lock, window-sash, and window-frame, substantially as specified.

387,810. **FRICTION-CLUTCH.** James G. Price, Berwyn, Pa., assignor of one-half to Joseph H. Coates, same place. Filed Apr. 7, 1888. Serial No. 269,945. (No model.)

Claim.—1. The combination of the two shafts with a clutching device comprising three disks and means for clamping the outer disks upon the intermediate disk, said intermediate disk being carried by one shaft and the outer disks by the other shaft, and the disk structure of one of the shafts being free to move longitudinally in respect thereto, all substantially as specified.

2. The combination of the two shafts, the three disks, one carried by one shaft and the others by the other shaft, bolts carried by the disks of one shaft, and cam-levers for effecting the forcing of the disks together, all substantially as specified.

3. The combination of the two shafts, the three disks, one carried by one shaft and the others by the other shaft, bolts carried by the latter disks, and two sets of cam-levers carried by said bolts, one set acting on one disk and the other on the other disk, all substantially as specified.

4. The combination of the sliding sleeve of a friction-clutch, a fixed collar on the shaft, slip-rings carried by said collar and sleeve, and toggle-arms connecting said slip-rings, all substantially as specified.

5. The combination of the operating-sleeve of a friction-clutch, a fixed collar on the shaft, toggle-arms connecting the collar and sleeve, and a stop-yoke for limiting the movement of said arms, as set forth.

6. The combination of the operating-sleeve of a friction-clutch, a bolt for positively locking the parts of the clutch together, a bell-crank lever connected to said bolt, an arm carried by the sleeve of the clutch, and an intermediate pivoted arm connected to said bell-crank lever and acted upon by the arm of the sleeve as the latter is moved, substantially as specified.

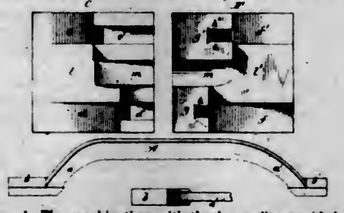
387,811. **DEVICE FOR BURNING CRUDE PETROLEUM AND OTHER OILS.** Jacob T. Raber, Clyde, Ohio. Filed Feb. 4, 1888. Serial No. 263,083. (No model.)

Claim.—1. A device for burning crude oils, consisting, essentially, of an outer casing of reticulated material, an oil-supply pipe located in the upper portion thereof, and a removable and reversible partition-wall or separator placed at an angle therein and forming an oil-vaporizing chamber in the outer casing beneath said partition-wall or separator, substantially as and for the purpose described.

2. In a device for burning oils, an outer casing of reticulated material, an oil-supply pipe at the upper portion thereof, and a removably-secured partition-wall or diaphragm placed at an angle within said casing, in combination with a drip-plate beneath the casing adapted to receive the heavier oil from the inclined diaphragm, and a packing in the outer casing beneath said diaphragm for receiving the lighter oil passing through the diaphragm, substantially as described.

3. In a device for burning oil, an outer casing of reticulated material and a foraminous diaphragm arranged at an angle therein, in combination with a drip-plate beneath the casing for receiving the heavier oil, and a packing in the outer casing beneath the diaphragm for receiving the lighter oils, substantially as herein described.

4. In a device for burning crude oils, an outer casing of foraminous material, in combination with an inclined foraminous diaphragm placed at an angle withie said casing and having a packing of mineral wool between its sides, and a discharge-pipe communicating with the source of supply and discharging upon said diaphragm, whereby a separation of the lighter and heavier oils is effected.



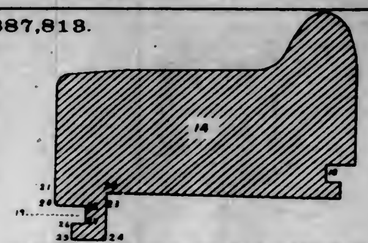
5. The combination of an exterior casing of foraminous material, an internal diaphragm of like material removably placed at an angle therein, a non-conducting packing between said diaphragm and the walls of the exterior casing, and an imperforate drip-plate beneath the lower wall of said casing receiving the oil which passes through said wall, and a pipe or tube discharging the crude oil upon the diaphragm, substantially as described.

6. A device for burning oils, consisting of an exterior casing of foraminous material, an interior removable diaphragm of like material having spaced walls, between which is placed a packing of mineral wool, an angular plate, C, between the diaphragm and casing, and a packing between said plate and diaphragm and walls of the casing, a pipe or tube discharging the oil upon the diaphragm, and an imperforate drip-plate beneath the outer casing upon which the heavier oil is discharged and burned, substantially as described.

7. The combination, with an outer casing of foraminous material having a non-heat-conducting packing at its sides and ends, of a removably-secured diaphragm of foraminous material placed at an angle within the outer casing and a pipe discharging the oil thereon, said diaphragm having perforate walls, between which a packing of mineral wool is placed, whereby a separation of the lighter from the heavier oils is effected, and an imperforate drip-plate beneath the lower wall of the casing upon which the heavier oil is discharged and burned.

8. An exterior casing and a removably-secured inclined diaphragm, said casing and diaphragm being formed of foraminous material, in combination with a pipe communicating with the source of supply, a fixed coupling, and a perforated discharge-pipe loosely connected therewith and extending over the diaphragm, whereby said pipe may be adjusted at an angle approximating the inclination of the diaphragm.

887,812. DIE FOR FORGING TRUCK-EQUALIZERS. James Reilley, Buffalo, N. Y., assignor of one-half to Thomas A. Bissell, same place. Filed May 31, 1888. Serial No. 275,543. (No model.)



Claim.—1. The combination, with the lower die provided with a convex face and a rectangular recess or depression arranged at the base of said convex face, of a punch or upper die provided with a concave face corresponding to the convex face of the lower die and with a flat working-face arranged above said rectangular recess, substantially as set forth.

2. The combination, with the lower die, C, provided with short and long convex faces *d e*, short and long rectangular recesses or depressions *d' d''*, arranged at the lower ends of said convex faces, and with an anvil or flat face, *l*, arranged between said convex faces, of the punch or upper die, F, provided with short and long concave faces *f f'*, corresponding to the convex faces of the lower die, flat working-faces *g g'*, arranged at the base of said concave faces above the recesses of the lower die, a flat face, *l'*, arranged between said concave faces above the anvil *l* of the lower die, and a recess or opening, *m*, formed in the adjacent faces of the upper and lower dies in rear of the faces *l l'*, substantially as set forth.

887,813. CAR-WHEEL. William G. Richards, Brooklyn, N. Y. Filed May 23, 1888. Serial No. 274,692. (No model.)

887,813.

Claim.—1. In a car-wheel, a tire having an outwardly-facing annular groove of less diameter than the wheel-center upon which said tire is seated, located in an internal projection of the tire, said projection or a part thereof forming a shoulder which bears against the outer side of the wheel-center, substantially as described.

2. In a car-wheel composed of an independent center and a tire, 14, seated thereon, an outwardly-facing annular groove, 19, of less diameter than periphery of the wheel-center, located in an internal projection of the tire 14 at the outer side or side opposite the rail-flange, said internal projection, or a part thereof, forming a shoulder which bears against the outer side of the wheel-center, substantially as described.

3. In a car-wheel, a tire seated upon an independent wheel-center and provided with an outwardly-facing annular groove of less diameter than the wheel-center, located at the side of tire opposite the rail-flange, and an annular groove in inner or rail-flange side of tire, in combination with the aforesaid wheel-center, a retaining-ring at outer side of the tire, a retaining-ring or flanged retaining-disk at inner side of the tire, and a series of bolts passing through said retaining-rings and the wheel-center, substantially as described.

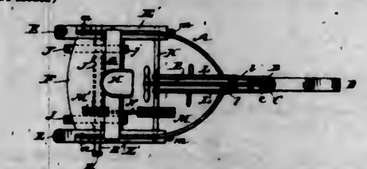
4. In a car-wheel, the combination of an independent wheel-center and a tire, 14, seated thereon, said tire 14 having at outer side, or side opposite the rail-flange, an outwardly-facing annular groove, 19, of less diameter than diameter of the wheel-center, located in an internal projection or shoulder of the tire, an annular groove, 18, in the rail-flange side of tire, an inner retaining ring or disk, 13, fitted to groove 18, an outer retaining-ring, 15, fitted to groove 19, and a series of bolts, 17, passing through said retaining-rings and the wheel-center, substantially as described.

5. In a car-wheel, a metallic flanged annulus inclosing a non-metallic wheel-body, the flange of annulus forming the periphery thereof, in combination with a tire seated thereon, said tire having an outwardly-facing annular groove of less diameter than the wheel-center, upon which the tire is seated, located in an internal projection of the tire at the side opposite the rail-flange, a retaining-ring fitted to said groove, an inner side plate or disk flanged at periphery to enter a groove in rail-flange side of the tire, a series of retaining-ring bolts, and a central hub, substantially as described.

6. In a car-wheel, a metallic flanged annulus, 12, in combination with a non-metallic wheel-body, 11, inclosed therein, hub 10, a tire, 14, having an outwardly-facing annular groove, 19, of less diameter than the periphery of wheel-center, located at side opposite the rail-flange in an internal projection of the tire, and a groove, 18, in rail-flange side of tire, an inner side plate or disk, 13, flanged at periphery to enter groove 18, a retaining-ring, 15, and bolts 17, which pass through retaining-ring 15, annulus 12, non-metallic wheel-body 11, and disk 13, substantially as described.

7. In a car-wheel, a wheel-center composed of a central hub, an integral flanged annulus, a non-metallic wheel-body inclosed therein, and an inner side plate or disk flanged at periphery, in combination with a tire having an outwardly-facing annular groove of less diameter than said wheel-center at the side opposite the rail-flange, a groove located in the rail-flange side, into which the flange of inner disk enters, a retaining-ring fitted to the groove at side opposite rail-flange, and a series of retaining-ring bolts passing through the non-metallic center, substantially as described.

8. In a car-wheel, a tire, 14, having retaining-grooves 18 and 19 in opposite sides, the groove 19 being of less diameter than the seat of tire, in combination with a wheel-center composed of a central hub, inner flanged disk, 13, non-metallic wheel-body 11, inclosed in flanged annulus 12, bolts 16, retaining-ring 15, and bolts 17, passing through non-metallic wheel-body 11, between axis of the wheel and the metallic tire-seat 12', substantially as described.



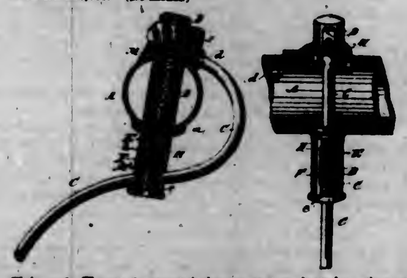
9. In a car-wheel, the combination of a central hub, inner flanged disk, 13, bolts 16, retaining-ring 15, a tire, 14, having a groove, 18, in inner side of greater diameter, and a groove, 19, near the outer side of less diameter, than the periphery of the wheel-center, bolts 17, and flanged annulus 12, the flange 12' of which passes between bolts 17 and the tire 14, which is seated thereon, substantially as described.

10. In a car-wheel, a tire made of less internal diameter at side opposite the rail-flange than the wheel-center upon which it is seated, thereby forming a shoulder which bears against side of wheel-center, a projection of angular cross-section extending from said shoulder inwardly toward axis of the wheel and then outwardly, thereby forming, in conjunction with the said shoulder, an annular groove facing outwardly and provided with a groove in the rail-flange side of tire, a wheel-center, retaining-rings fitted to the aforesaid grooves in tire, and a series of retaining-ring bolts, substantially as described.

11. In a car-wheel, the combination of a central hub, a non-metallic wheel-body, 11, flanged annulus 12, retaining-ring 15, inner flanged disk, 13, bolts 16, bolts 17, and tire 14, having an internally-projecting shoulder, 20 21 22 23, an internally-projecting angular rib, 23 24 25 26 27 28, which forms, in conjunction with shoulder 20 21 22 23, an outwardly-facing annular groove, 19, and in rail-flange side of tire a groove, 18, substantially as described.

12. The combination, in a car-wheel, of a non-metallic wheel-body, 11, integral flanged annulus 12, inner flanged retaining-disk, 13, hub 10, bolts 16, retaining-ring 15, a series of bolts, 17, and a tire, 14, having annular groove 18 in rail-flange side and at opposite side an internally-projecting shoulder, 20 21 22 23, bearing against outer side of the wheel-center, an internal angular projection, 23 24 25 26 27 28, which, in conjunction with shoulder 20 21 22 23, forms an outwardly-facing annular groove, 19, of less diameter than the periphery of the wheel-center, substantially as described, and for the purposes set forth.

887,814. ICE-VELOCIPEDE. George B. M. Riddle and Charles C. Spencer, Cortland, N. Y. Filed Nov. 12, 1887. Serial No. 254,975. (No model.)



Claim.—1. In an ice-velocipede, the main frame A, pivoted to the raves of the rear runner and formed with a bearing, B, at its forward end, in combination with the front runner, D, and rear runners, E E, substantially as described.

2. The combination of shaft J' and wheels J with means for elevating the same, as described.

3. In an ice-velocipede, the rear runners, E, and main frame A, pivoted together, in combination with the springs m, connecting the upper ends of the runners to the main frame A, substantially as described.

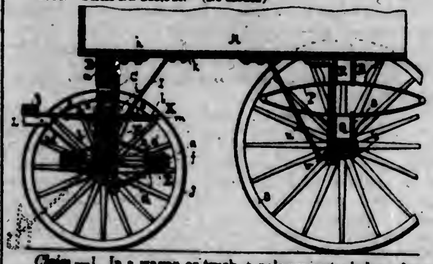
4. The runners E, connected together and pivoted to the main frame A, the posts O, and ways *d'*, secured thereto, in combination with the blocks *d*, held in said ways, the shaft J', journaled in said blocks, the springs *g*, acting on the blocks, and the wheels J, secured upon the shaft, substantially as described.

887,815. RAKE-TOOTH. Albert R. Robbins, Norwalk, Ohio, assignor of one-half to Barnard Curtiss, same place. Filed Feb. 9, 1887. Serial No. 227,003. (No model.)

Claim.—1. The stationary tubular support projected up through the rake-head, with a shoulder beneath the rake-head to limit its upward movement, and a bolt and key at its top for holding it rigidly in place, said tubular support slotted at its lower end for the passage of the tooth and adapted to receive within its interior a plug through which the tooth passes, and a spiral spring to bear upon the plug, substantially as and for the purposes described.

2. The combination, with a rake-head and tooth, of a stationary tubular support projected up through the head, and having a lower extension provided with a slot through which the tooth is passed, a spring and plug within the tubular support bearing upon said tooth, said tubular support provided with a key and bolt at its top, and a shoulder beneath the rake-head and the clamp M, whereby the shank of the tooth is secured to the rake-head, substantially as described.

3. The combination, with a rake-head and a tooth having a right-angular shank at its top, of a clamp engaging said shank, so as to permit the latter to turn therein, and a stationary tubular support slotted at its lower end to receive the rake-tooth, and provided in its interior with a spring and a plug, through the latter of which the said tooth passes and has its bearing, said tubular support passed up through the rake-head and clamp, and provided with a shoulder, *c*, and a single bolt and key, whereby the tooth, its clamp, and the tubular support are all held rigidly in place, substantially as described.



4. The combination, with a rake-head, of a hollow spindle passing transversely therethrough, provided with a key, J, to bear on the top of the rake-head, and shoulder *c*, abutting against the opposite side for its confinement to the rake-head, a yielding tooth-support within said spindle, and a rake-tooth confined at the upper side of the rake-head, and having a bearing intermediate of its length in said yielding support, substantially as described.

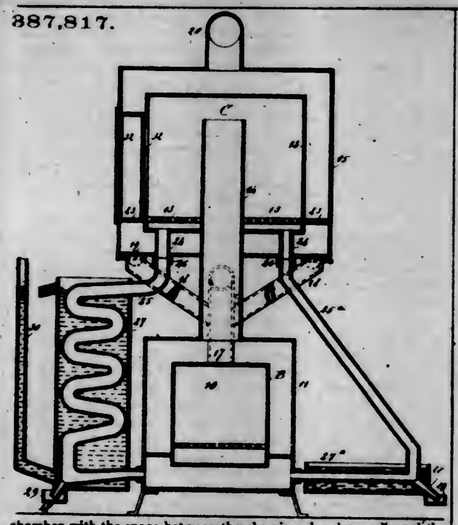
5. The combination, with a rake-head, of a rigidly-attached hollow spindle passing transversely therethrough, provided with a slot and key, J, a shoulder, *c*, to bear on the under side of the head, a slot, E, and an abutment, *c*, a clamp, M, between the key J and the upper side of the head, a plug, F, a spring, H, and a rake-tooth confined in said clamp and passing through said slot E, and having a bearing in said plug, substantially as described.

6. The combination, with a rake-head, of a hollow spindle passing transversely therethrough, provided with a key, J, to bear on the top of the head, and shoulder *c*, abutting against the opposite side for its confinement to the rake-head, a yielding tooth-support within said spindle, and a rake-tooth confined at the upper side of the rake-head, and having a bearing intermediate of its length in said yielding support, substantially as described.

7. The combination, with a rake-head, of a rigidly-attached hollow spindle passing transversely therethrough, provided with a slot and key, J, a shoulder, *c*, to bear on the under side of the head, a slot, E, and an abutment, *c*, a collar, M, between the key J and the upper side of the head, a plunger, F, a spring, H, and a rake-tooth confined in said collar and passing through said slot E, and having a bearing in said plunger, substantially as described.

887,816. WAGON. John A. Roth, Baltimore, Md. Filed Feb. 6, 1888. Serial No. 263,369. (No model.)

Claim.—1. In a wagon or truck, a pole-supporter independent of the fifth-wheel, which consists of a fixed and a movable annular plate, the lower fixed one being secured to the head-block, and the upper movable one provided with a socket for the pole, substantially as and for the purpose specified.



2. In a wagon or truck, the combination, with a pole-supporter which consists of a movable and a fixed plate and a pole-socket, of a cross-tree attached to the said socket and at its ends supported from the axle by means of pivoted braces, substantially as and for the purpose specified.

887,817. APPARATUS FOR THE MANUFACTURE OF CHARCOAL. Jacob Rosenstein, Winona, Minn. Filed Jan. 30, 1888. Serial No. 262,570. (No model.)

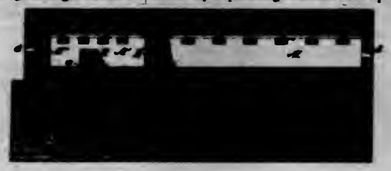
Claim.—1. In an apparatus for producing charcoal, the combination, with the fire-box and a jacket surrounding it and forming a hot-air chamber, of the charring-receptacle 1, receiving air from and returning it to the said hot-air chamber, a jacket surrounding said charring-receptacle and forming a chamber into which the products of combustion are led from the fire-box, and a smoke-outlet for said chamber, substantially as set forth.

2. In an apparatus for producing charcoal, the combination, with a fire-box surrounded by a chamber, B, of a charring-chamber, a jacket surrounding said chamber, a tube leading from the chamber B to a point within the charring-chamber, other tubes leading from the charring-chamber to the lower portion of the chamber B and discharging air therein to be reheated, and tubes connecting the outlet of the fire-

387,817.

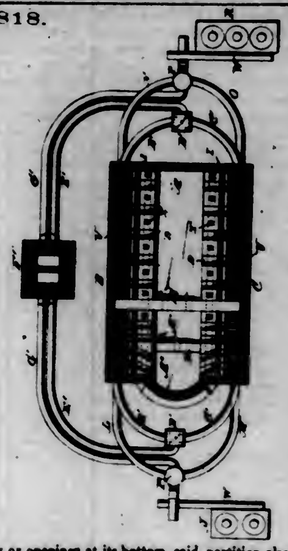
chamber with the space between the charring-chamber walls and the jacket surrounding the same, substantially as described.

3. The combination, with the fire-chamber and a jacket surrounding the same, of a jacketed receptacle above the fire-chamber, a pipe leading from the hot-air space around the fire-chamber into the said receptacle, a smoke-outlet pipe connecting the fire-chamber with space between the receptacle and its jacket, and a pipe leading from the bottom of the receptacle into the jacketed space around the fire-chamber and provided with a water jacket or tank, and a discharge and sealing nozzle entering a pan or tank to discharge the products of distillation and be sealed therein, and thereby prevent the entrance of cold air, substantially as set forth.



4. The combination, with the jacketed fire-box, of the receptacle above the same, a pipe entering the receptacle from said jacketed space, and a return-pipe leading from the bottom of the receptacle and discharging the air into the bottom of the jacketed space, and provided with a sealed discharge-nozzle for the products of distillation, substantially as described.

5. In an apparatus for producing charcoal, the combination, with a fire-chamber, of a charring-chamber, a jacket surrounding said charring-chamber, a space, however, being left between the walls of the charring-chamber and the walls of the jacket, tubes or pipes connecting the outlet of the fire-chamber with the space between the walls of the charring-chamber and its jacket, valves or dampers arranged in connection with said tubes, a smoke-pipe leading from said space between the charring-chamber and its jacket, and a branch smoke-pipe provided with a damper, which said branch smoke-pipe leads from the discharge-opening of the fire-chamber to the main smoke-pipe, substantially as described.



387,818. GLASS-MELTING FURNACE AND REGENERATOR. PHILIPP SIEMAMTER and FRITZ HEEPE, Streator, Ill. Filed Apr. 9, 1888. Serial No. 270,095. (No model.)

Claim.—1. The combination, in a glass-melting furnace provided with regenerators on each side, of two separate tanks, one of said tanks being provided with a partition, a partition-wall extending through said furnace entirely separating said tanks except by an opening or openings at its bottom, said partition also dividing the regenerators into two distinct portions, and separate gas-producers connected by flues and suitable valves to each of said portions, substantially as described.

2. The combination, in a glass-melting furnace provided with regenerators on each side, of two separate tanks, a partition-wall extending through said furnace entirely separating said tanks except by

387,818.

an opening or openings at its bottom, said partition also dividing the regenerators into two distinct portions, and separate gas-producers connected by flues and suitable valves to each of said portions, substantially as described.

387,819. ATTACHING DEVICE FOR CHECK-ROW MACHINES. LEVI SCOFIELD, Grand Haven, Mich. Filed Mar. 5, 1888. Serial No. 266,173. (No model.)

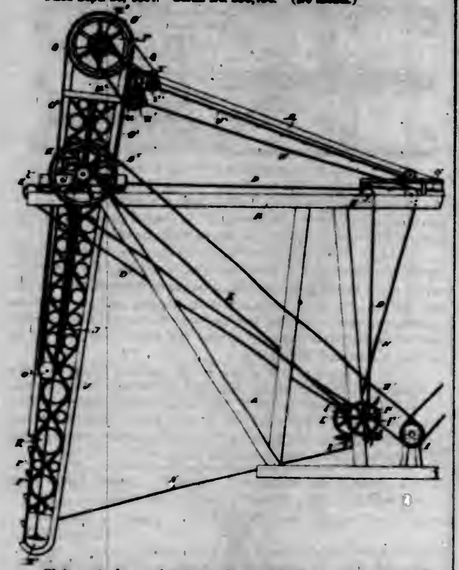
Claim.—1. In a planter, and in combination with the cross-bar or support of the actuating devices and the seed hopes or supports therefor, the brackets, each provided with a plate bolted to the seed-box and carrying a bar, *a*, connected thereto, and the two-part detachable and adjustable clips secured to the cross-bar and holding the bar *a* of the bracket between their members, substantially as described.

2. The improved connection or support for the actuating mechanism of a planter such as described, consisting, essentially, of the bracket provided with attaching-plate and notched bar *a* and the clips formed in two sections and provided with a partible bearing embracing the bar *a* of the bracket, a projection engaging the teeth on said bar, and a bolt for clamping said clip on the cross-bar and closing the partible bearing upon the bar *a*, the whole constructed and combined for operation, substantially as described.

3. The improved clip for connecting the actuating devices or check-row attachment to a planter, consisting, essentially, of the section *b*, having ribs b^2 and recess b^3, and the section b', provided with lug c^4, shoulder c^5, and cap c^6, the two sections being held together and clamped upon the supporting-bracket and cross-bar by a bolt, *d*, passing through or engaging the outer section, substantially as described.

4. In a planter such as described, the combination, with the cross-bar supporting the actuating devices and the clips secured thereto, of the reversible and interchangeable brackets, each provided with an attaching-plate, and a bar, *a*, to which the clip is adjustably applied, substantially as described.

5. The improved bracket for supporting the actuating devices or check-row attachment for a planter, consisting of the toothed bar *a*, two arms, a^4, extending from the ends of the bar, and plate a^5, with inclined face and suited to said arms, substantially as described.



6. In combination with the bracket A, having the toothed bar *a* and secured to the seed-box or equivalent support, the sectional clip B, fastened to the cross-bar and provided with a clamping-bolt and retaining-tooth, substantially as described.

7. In combination with the bracket A, having notched bar *a* and

centrally supported by its plate a^5 upon the seed-box, a clip provided with a sectional socket or bearing for the reception of said bar *a* and a tooth engaging the latter, and a bolt engaging said clip to simultaneously fasten it to the cross-bar and close the section upon bar *a* of the bracket, substantially as described.

8. The hereinbefore described improved attaching device for planters, consisting, essentially, of the bracket A, with bar *a*, arms, and central plate, the clip B, constructed in two sections and provided with retaining-lugs engaging cross-bar E, a partible socket to receive the bar *a* and a tooth to enter notches in the latter, a lug on one section and recess in the other, and a bolt passing through both of said sections and the cross-bar E to clamp these parts together and in position upon the bar *a* of the bracket, substantially as described.

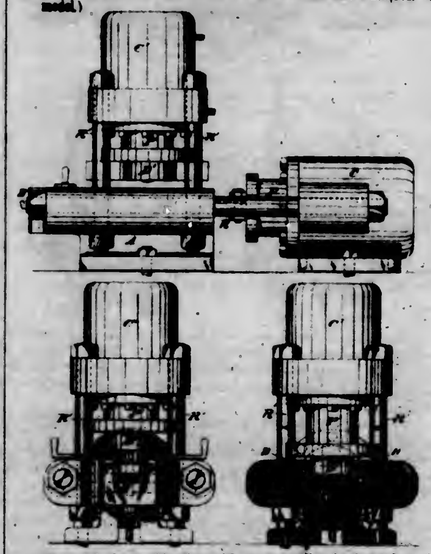
387,820. CONVEYER. JAMES F. SIMMONS, Manistique, Mich. Filed Sept. 26, 1887. Serial No. 250,736. (No model.)

Claim.—1. In an elevator and conveyor, the combination, with a carriage adapted to move forward and backward, of a shaft mounted transversely on said carriage and receiving a rotary motion, an elevator-frame having vertical slots through which said shaft passes, an elevator-belt and buckets mounted on the said frame, and an endless belt for imparting a rotary motion from said transverse shaft to the elevator-shaft, substantially as shown and described.

2. The combination, with the frame A, the horizontal track B, and the windlasses L F at the lower end of said frame, of the carriage C on the track, having a transverse shaft, G, the elevator-frame having slots into which the ends of the shaft pass, the idle-pulleys E E at the front and rear of the track, the rope D, leading from the windlass F over the said idlers to the opposite ends of the carriage, the rope N, leading from the windlass L to the opposite ends of the elevator-frame, a belt connecting the shaft G and the elevator-shaft, and the conveyer R, on which elevator-buckets deliver, substantially as set forth.

3. In an elevator and conveyor, the combination, with a carriage and a shaft mounted transversely on the same and receiving a rotary motion, of an elevator-frame having vertical slots through which said transverse shaft passes, an elevator-belt mounted on said elevator-frame and set in motion by said transverse shaft, a spout into which said elevator-belt discharges, and a conveyor connected with said spout and set in motion from the shaft of the elevator-belt, substantially as shown and described.

387,821. FEED-BUCKET. ALBERT H. SMITH, Westerly, R. I. Filed Dec. 23, 1887. Serial No. 258,511. (No model.)



Claim.—1. In a feed-bucket, the combination, with a frame having inwardly-extending arms, a spring held in said frame, and a feed-receptacle resting upon said spring, of a detachable apertured partition held within the receptacle, substantially as and for the purpose herein set forth.

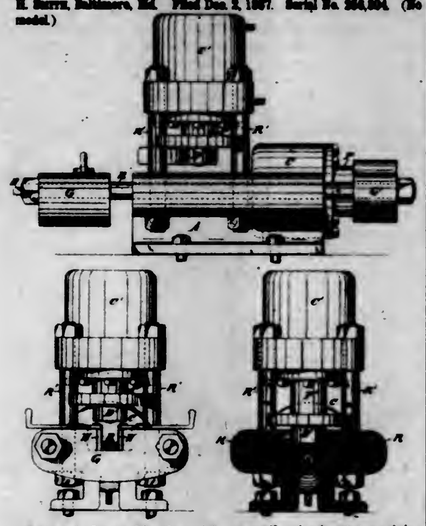
2. In a feed-bucket, the combination, with a frame having integral inwardly-extending perpendicular arms, a spring supported in said frame, and a feed-receptacle provided with a ventilated bottom resting upon said spring, of a detachable partition held within the receptacle provided with a central orifice and a series of peripheral slots, substantially as and for the purpose herein set forth.

3. In a feed-bucket, the combination, with a skeleton frame having the members thereof bent inward at the top and provided with lugs at their extremities, a coiled spring supported in said frame, and a feed-receptacle provided with a ventilated bottom resting upon said spring, of a flanged detachable partition held within said receptacle, provided with a central orifice, a series of peripheral slots, and apertures intervening said slots adapted to receive said lugs, substantially as and for the purpose herein set forth.

387,822. APPARATUS FOR UPSETTING EYE-BARS. FREDERICK H. SMITH, Baltimore, Md. Filed Dec. 3, 1887. Serial No. 256,803. (No model.)

Claim.—1. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with front and rear channels, a vertical compressing male die fitted to slide up and down within the shaping-chamber and the front and rear channels, respectively, of the female die, and a horizontal upsetting-ram fitted to slide endwise within the rear channel of the female die and under the male die.

2. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with front and rear channels, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front and rear channels, respectively, of the female die, a horizontal upsetting-ram fitted to slide endwise within the rear channel of the female die and under the male die, and a rear horizontal cylinder and piston fitted to actuate the horizontal upsetting-ram.



3. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with front and rear channels, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front and rear channels, respectively, of the

female die, a horizontal upsetting-ram fitted to slide endwise within the rear channel of the female die and under the male die, and an overhead vertical cylinder and piston fitted to actuate the vertical compressing male die.

4. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with front and rear channels, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front and rear channels, respectively, of the female die, a horizontal upsetting-ram fitted to slide endwise within the rear channel of the female die and under the male die, a rear horizontal cylinder and piston fitted to actuate the horizontal upsetting-ram, and an overhead vertical cylinder and piston fitted to actuate the vertical compressing male die.

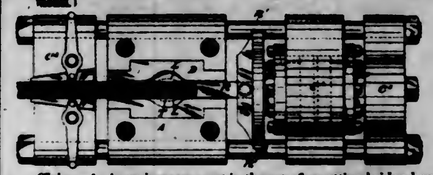
5. The combination of the dies which form the shaping-chamber, provided with a bulbous protuberance projecting from the top or bottom into said shaping-chamber at or about its center, and mechanism for driving the heat-softened end of a stationary metal bar backward and upsetting it into said chamber, for the purpose set forth.

387,823. MACHINE FOR UPSETTING EYE-BARS. Frederick H. Smith, Baltimore, Md. Filed Dec. 2, 1887. Serial No. 256,894. (No model.)

Claim.—1. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with a front channel, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front channel of the female die, and a front gripping cross-head.

2. In combination, with an anvil, a horizontal receiving female die consisting of a shaping-chamber with a front channel, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front channel of the female die, a front gripping cross-head, and a rear cross-head connected therewith by rods.

3. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with a front channel, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front channel of the female die, a front gripping cross-head and rear cross-head connected therewith by rods, a rear horizontal cylinder, and piston fitted to actuate the rear cross-head and connecting-rods and front gripping cross-head.



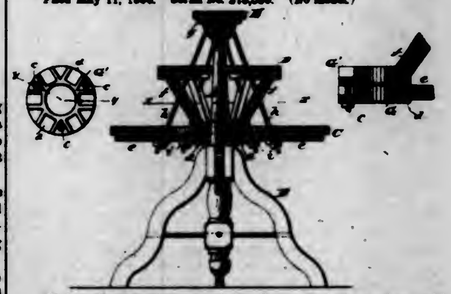
4. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with a front channel, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front channel of the female die, a front gripping cross-head, an overhead vertical cylinder, and piston fitted to actuate the vertical compressing male die.

5. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with a front channel, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front channel of the female die, a front gripping cross-head and a rear cross-head connected therewith by rods, an overhead vertical cylinder, and piston fitted to actuate the vertical compression male die.

6. In combination with an anvil, a horizontal receiving female die consisting of a shaping-chamber with a front channel, a vertical compressing male die fitted to slide down and up within the shaping-chamber and the front channel of the female die, a front gripping cross-head and a rear cross-head connected therewith by rods, a rear horizontal cylinder, and piston fitted to actuate the rear cross-head, an overhead vertical cylinder and piston fitted to actuate the vertical compressing male die, and an overhead vertical cylinder and piston fitted to actuate the vertical compressing male die.

7. In combination with mechanism for ramming endwise a metal bar, and thus upsetting its heat-softened end within a shaping-chamber, a bulbous protuberance in the center of the said shaping-chamber for the purpose of steadying said bar against lateral displacement during upsetting.

387,824. METHOD OF UPSETTING BRIDGE-BARS. Frederick H. Smith, Baltimore, Md. Filed Apr. 26, 1888. Serial No. 272,162. (No model.)

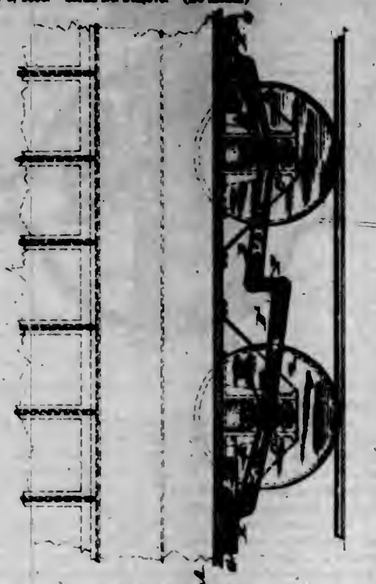


Claim.—1. As an improvement in the art of upsetting bridge-bars, the hereinbefore-described process, consisting of first heating a portion of a metal bar, inclosing the heated portion within a die of any desired shape, and driving both ends of the heated portion of the bar toward the center of the die, for the purposes described.

2. As an improvement in the art of upsetting bridge-bars, the hereinbefore-described process, consisting of inclosing the heated bar within a die, firmly fixing the heated bar at the point where the eye-seat will come, so as to prevent it from bending laterally when the upsetting-pressure is applied, and upsetting the heated portions adjacent to the said fixed point by driving the metal from opposite directions toward said fixed point.

3. As an improvement in the art of upsetting bridge-bars, the hereinbefore-described process, consisting of inclosing the heated bar within a die, penetrating one or both sides of the heated bar at the point where the eye-seat will come, so as to give an initial lateral expansive direction to the metal and driving the metal from opposite directions toward the said penetrated point.

387,825. FLOWER-STAND. Herbert L. Starr, Preston, Conn. Filed May 11, 1888. Serial No. 273,569. (No model.)

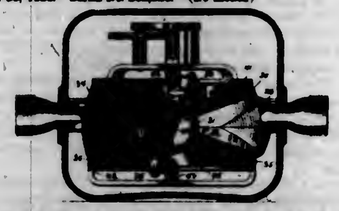


Claim.—In a revolving stand for flowers and plants, the combination, with the post A and socket-piece G G', of the rotating shelves C D and cap E, the diagonal braces *f*, supporting the shelf D, and the diagonal rods A, passing through said braces and connecting said cap and lower shelf, C, all as shown and described.

387,826. HINGED COVER FOR MOLASSES-CUPS. Alvin Taplin, Forestville, Conn. Filed Dec. 14, 1887. Serial No. 257,868. (No model.)

Claim.—The herein-described cover, hinge, and rim for molasses-cups, said hinge being provided with a middle portion secured to the cover, and side lugs, *c c*, which extend downward at a point outside of the cover and then inward through slots in the rim to the pintle *d* at a point within said rim, substantially as described, and for the purpose specified.

387,827. EQUALIZING DEVICE FOR CARS. Henry J. Tate, Philadelphia, Pa., assignor of one-half to Josiah H. Procter, same place. Filed May 3, 1888. Serial No. 272,979. (No model.)



Claim.—1. A device for equalizing weight superimposed upon a car when superior at either end, consisting of radial arms freely connected with the ends of the car and with each other by means of rotatable sleeves and axles on which said sleeves are mounted, whereby both ends of the car are uniformly depressed, substantially as described.

2. The combination, with a car, of a series of radial arms which are connected with each other by means of sleeves mounted on the axles thereof, and with the ends of the floor of the car by means of slides which are fitted in guides connected with said floor, substantially as described.

3. In a car-equalizing device, substantially as described, the guides H, secured to the floor of the car, in combination with sides fitted in and connected with said guides and pivoted to the radial arms of the device, as stated.

4. A car-equalizing device consisting of sleeves mounted on suitable bearings, each sleeve having two arms, one of which projects inwardly, the other outwardly, guides adapted to be secured to the under side of the car, slides pivotally secured to the outwardly-projecting arms and adapted to work in said guides, and links pivotally connected to the ends of the inwardly-projecting arms, said parts being combined substantially as described.

387,828. WATER-METER. John Thomson, Brooklyn, N. Y. Filed Jan. 30, 1888. Serial No. 262,393. (No model.)

Claim.—1. The combination, in a water-meter capable of operation in either direction of flow, of the register driving-gear, as 15, screwed to the spindle, and an engaging-pawl, as 17, the arrangement of the screw and the pawl being such that the pawl will ride freely over the gear when the meter is properly operated, but when improperly operated the said pawl will engage the gear and cause it to unscrew from the spindle, substantially as described.

2. The combination of the internal gear-wheel, 19, fast to the stuffing-box spindle, the final pinion, 20, of the internal gear-train, the said gear being mounted in the upper cap and the said pinion being mounted upon the disk-chamber, and the steady-pin 23, inserted on the outside through the flanges of the cap and disk-chamber, all as shown and described, and for the purpose specified.

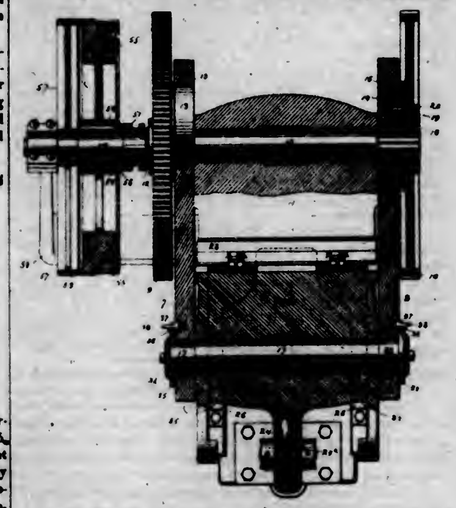
3. The combination, with the disk and disk-chamber, of the conical flanges, the central conical bearings, and the conical rollers mounted upon opposite ends of the disk-shaft and adapted to roll within the space formed between the said center bearings and the conical flanges, whereby the rollers act to receive the thrust of the disk to and from the cone-frusta, substantially as specified.

4. The combination, with the disk-chamber, disk, and disk-shaft, of the conical bearing-sleeve, conical roller, and external bearing upon which the said roller shall act, substantially as and for the purpose described.

5. The combination, with the disk-chamber, disk, disk-shaft, conical roller, and external bearing, of the conical bearing-sleeve capable of being adjusted back and forth upon the disk-shaft, for the purpose of determining the proper position of the said conical roller, substantially as specified.

6. The combination, with the conical roller and disk-shaft, of the conical bearing-sleeve having an upper and a lower flange, as 51 52, for the purpose of maintaining the said conical roller in proper relation with the said bearing-sleeve, substantially as specified.

387,829. CRANK-BEARING FOR OSCILLATING DISKS. John Thomson, Brooklyn, N. Y. Filed Feb. 1, 1888. Serial No. 262,602. (No model.)



Claim.—1. In an oscillating disk-action, the combination of the disk-shaft, rotating crank-block, and outer and inner bearings, 14 16, the acting surfaces of said block and bearings being parallel with the said disk-shaft.

2. A rotating crank-block for oscillating disk-actions, having a bore for the disk-shaft and having bearings formed parallel to the bore at a right angle to the line of thrust of said disk-shaft.

3. The combination of the rotating crank-block having a bore for a shaft and bearing-faces parallel to the bore, the conical bearing 14 for the exterior faces of the block, and a conical bearing, 16, for the interior faces of the block.

387,830. STAMPING OR EMBOSSING PRESS. John Thomson, Brooklyn, N. Y. Filed Feb. 24, 1888. Serial No. 265,170. (No model.)

Claim.—1. In combination, the bed, platen, connecting-rods, and gear-wheels, the said rods located between the outside faces of the bed and the inside faces of the wheels, and the eccentrics projecting inward toward the press, substantially as described.

2. The combination, with the bed having its face inclined at an angle of about forty-five degrees from the perpendicular, of a rocking platen arranged to rock from a practically horizontal position to a position parallel to the bed and to move toward the bed in lines parallel therewith, and a cam for controlling the movement of the platen, substantially as described.

3. The gear-wheels, mounted upon a shaft, having eccentrics formed upon their inner sides and connecting-rods adapted thereto, the main-shaft bearings being within the compass of the eccentrics, whereby the faces of both the eccentrics and the connecting-rods bear directly against the sides of the bed.

4. The gear-wheels having the oil-chamber or recess 18, provided with a central inlet, 20, to the chamber, and outlet channel or channels 21 22, extending from the chamber to the bearing-surface, whereby the lubricant may be applied from the outside of the machine and be fed intermittently to the bearing-surface of the eccentrics at each rotation thereof.

5. The combination of the eccentrics, connecting-rods, platen, rockers, friction-roll, and controlling-cam, the form of the cam being such as to augment the motion of the platen by causing it to slip upon its bearings, substantially as described.

6. The combination of the eccentrics, connecting-rods, platen, rockers, friction-roll, and controlling-cam, the relation and form of the eccentrics, rockers, and cam being such that the lower edge of the platen is caused to travel upward in a line approximately parallel to the face of the bed, substantially as described.

7. The combination, with the platen, main connecting-rods, bed, and gear-wheels, of the eccentric adjusting-sleeves having a flange in which are formed circular recesses, and the semicircular locking-stud, substantially as described.

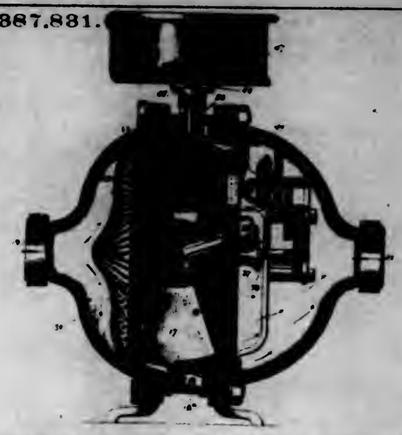
8. The lipped gage having a slot, as 36, in combination with the thumb-screw, steam-blank, and register-blank, for the purpose specified.

9. The combination, with the gear-wheels, pinions, and driving-shaft, of the belt, the driving-pulley keyed to the shaft, the fly-wheel loose on the shaft and having a clutch member fast thereto, a sliding-clutch member, a pivoted clutch-lever, and a cam mounted on the crank-wheel for actuating the clutch-lever, the arrangement and construction being such as to force the clutch into engagement when or after the rotative speeds of the two members of the clutch are equal, substantially as specified.

10. The combination of the fly-wheel having a driving-clutch, the sliding-clutch member having teeth corresponding to those of the fly-wheel, a cam mounted on the crank-wheel, and a pivoted clutch-lever one extremity of said lever being adapted to engage the sliding-clutch member and the other extremity of which is adapted to be engaged and actuated by the cam and having a yielding resistance between the said cam and clutch, for the purpose specified.

11. The combination, with the driving-shaft, clutch, and clutch mechanism substantially such as described, of the fly-wheel loose on the shaft, the pulley tight to the shaft, the belt, and the belt-shifter, the adjustment and operation of the latter being such as to shift the belt on and entirely off from the tight pulley, but never entirely off from the fly-wheel, substantially as described.

12. The combination, with the clutch-lever cam, the pivoted clutch-lever having a yielding resistance, and the sliding-clutch member, of the shoe fast to the crank-wheel, the belt-shifter having an arm adapted to be engaged by the shoe, the belt, the pulley tight to the shaft, and the fly-wheel loose on the shaft and provided with a driving-clutch member, the relative arrangement being such that the said cam first acts to disengage the clutch members, the belt being then drawn from the tight pulley entirely onto the fly-wheel, substantially as described.



13. The combination of the belt-shifter, having suitable connections for manual or pedal operation, with the belt, tight pulley, fly wheel, clutch members, clutch-lever, and clutch-lever cam, the construction and relative arrangement being such that the belt is slid partially across the face of the fly-wheel onto the tight pulley, thereby starting the machine by belt-friction, the clutch-lever cam being thus put in motion by the primary action of the belt to throw the sliding member of the clutch into engagement, substantially as described.

387,831. DISK WATER-METER. JOHN THOMSON, Brooklyn, N. Y.

Filed Apr. 5, 1888. Serial No. 269,720. (No model.)

Claim.—1. In a water-meter, a separate disk-chamber composed of two sections secured together, provided with a disk, a diaphragm and an external cylindrical portion, 18, and having inlet and outlet ports formed equally in both sections of the chamber, and having two pressure-caps, forming separate compartments on either side of the disk-chamber, secured to the said external cylindrical portion, 18, substantially as described.

2. In a water-meter, the combination, with a disk-chamber having a fixed diaphragm and an oscillating disk therein, of inlet and outlet ports formed in said chamber, the area and the circumferential extent of the inlet-port being greater than that of the outlet-port, whereby

387,831.

the impact of the inflowing current upon the disk is decreased, substantially as set forth.

3. In a water-meter, the combination, with a disk-chamber having a diaphragm and an oscillating disk therein, of inlet and outlet ports, the diaphragm being set so as to divide the circumferential extent and area of the ports unequally, whereby the change in the displacement of the disk is carried around within the disk-chamber entirely away from the diaphragm, substantially as described.

4. In a water-meter, the combination, with a disk-chamber having a diaphragm and oscillating disk therein, of inlet and outlet ports divided in unequal extent and area by the diaphragm, the corners 27 28 of the outlet-port being higher than the corresponding corners of the inlet-port, substantially as described.

5. In a water-meter, the combination, with a disk-chamber, of a conical strainer arranged to envelop the inlet side of said disk-chamber, substantially as described.

6. The combination, with the disk-chamber and pressure-caps, of a strainer arranged between the inlet pressure-cap and the inlet side of the chamber, the said strainer being arranged to entirely envelop the inlet side of the disk-chamber, substantially as described.

7. In a water-meter, the combination, with a disk-chamber having a disk and diaphragm therein, and arranged to stand and operate in a vertical position, of a register arranged horizontally on the meter and connected to be operated by the disk at a right angle thereto, substantially as described.

8. In a water-meter, the combination, with a vertical disk-chamber and oscillating disk therein, of a horizontal register and register-operating mechanism, the register and operating mechanism being mounted upon the disk-chamber, substantially as described.

9. In a water-meter, the combination, with a vertical disk-chamber composed of two sections secured together, and an oscillating disk operating therein, of a horizontal register and register-operating mechanism, both the register and operating mechanism being mounted upon one of the sections of the disk-chamber, substantially as described.

10. In a water-meter, the combination, with a vertical disk-chamber and disk therein, of a horizontal register mounted on top of the disk-chamber, register-operating mechanism mounted on the side of the disk-chamber, and beveled-gear connections between the register and operating mechanism, substantially as described.

11. The combination, with a disk-chamber, oscillating disk, and fixed bearing-piece, of the disk-spindle secured to and controlling the normal action of the disk without tension, but capable of yielding elastically within the diameter of the ball upon the introduction of foreign material between the disk and disk-chamber, substantially as described.

12. In a water-meter, the combination, with a disk-chamber and oscillating disk therein, of the disk-spindle, a spherical roller on said disk-spindle, and a grooved bearing for said roller, substantially as described.

13. In a water-meter, the combination of a disk-chamber, an oscillating disk therein, a disk-spindle, a spherical roller mounted thereon, and a grooved bearing adjustable upon its support, substantially as described.

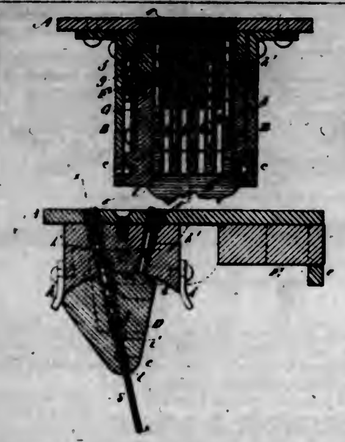
14. In a water-meter, the combination, with a disk-chamber, of a register mounted thereon and a stuffing-box connected to the disk-chamber, the disk-chamber being formed with a pocket, as 53, for the stuffing-box-spindle gear, substantially as described.

15. In a water-meter, the combination, with a disk-chamber and oscillating disk therein, of the pressure-caps having inlet and outlet spuds connected to the disk-chamber, the pressure-caps being of spherical contour, substantially as described.

16. In a water-meter, the combination, with a disk-chamber, of pressure-caps secured thereto, the caps being of sheet metal, and inlet and outlet spuds secured to the caps, substantially as described.

17. In a water-meter, the combination, with a disk-chamber and oscillating disk, of the diaphragm, the disk being provided with a friction-roller bearing upon the diaphragm, substantially as described.

387,832. COMBINATION-BRACKET WASH-STAND. GATEN D. TOLMAN and LEONARD B. BENSON, Rhoades, Wis. Filed Jan. 3, 1888. Serial No. 259,693. (No model.)



Claim.—1. In a bracket wash-stand, a folding wash-bowl support consisting of rod 7, bent to form a circle and secured to a sleeve, 8, with its ends 9 resting in eyes 10 on bracket 1, and the inclined brace-rod 11, substantially as described.

2. In a bracket wash-stand, a removable pitcher-shelf, 14, having hangers 15, formed with loops 16, engaging pins 19 on plate 13, having heads 18, substantially as described.

387,833. LOCK. HENRY VAN HOEVENBERGH, New York, N. Y.

Filed Jan. 17, 1888. Serial No. 261,048. (Model.)

Claim.—1. In a pin-tumbler lock, an oscillating or swinging tumbler-carrier provided with a series of ducts or perforations arranged in transverse relation with the axial center of motion of said tumbler-carrier, and each containing three or more independent pins or tumblers arranged one in advance of the other, and the several pins or tumblers in each duct being of different lengths, in combination with a stationary tumbler-receiver in working or close contact with the oscillating tumbler-carrier and having a corresponding or registering series of ducts or perforations adapted to receive a portion of said independent tumblers by the pushing action of a proper key, springs for operating said tumblers, and a locking-bolt, substantially as specified.

387,833.

2. A pin-tumbler lock provided with a movable tumbler-carrier having a series of ducts or perforations, each containing three or more pins or tumblers, and with a tumbler-receiver having two sets or rows of ducts or perforations, one of which rows or sets is adapted to receive and hold certain of the pins or tumblers from the movable tumbler-carrier, determined by the key of the lock, and the other row or set holding or being provided with separate locking pins or tumblers for the purpose of locking the movable tumbler-carrier when the key is removed, essentially as described.

3. A pin-tumbler lock in which a matrix approximately the shape of the steps of the key as produced by its bits is formed by the united action of the key of the lock, and pins or tumblers moving in ducts, said pins or tumblers in each duct being of different lengths, and suitable springs controlling said tumblers, the whole being organized so that the bolt of the lock cannot be withdrawn excepting said matrix is reproduced by the action of the same key or keys of similar construction as regards its steps, substantially as specified.

4. A lock having a movable pin-tumbler carrier organized to oscillate or rock, and provided with a key-hole intersecting its axis of oscillation, in combination with a bolt connected with said tumbler-carrier, whereby said bolt is shot or withdrawn by the oscillation or lever-like action of a key throughout its length in contradistinction to the whole or partial rotation of the key upon or about its longitudinal axis or center, substantially as specified.

5. In a pin-tumbler lock, the combination of a swinging or oscillating tumbler-carrier, a stationary tumbler-receiver, a key fitting said tumbler-carrier and adapted to be rocked or oscillated with it, and a bolt capable of being shot or withdrawn by such rocking or oscillating movement, essentially as described.

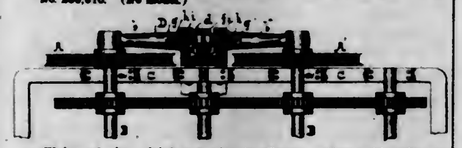
6. In a pin-tumbler lock provided with a swinging or oscillating tumbler-carrier having a series of ducts or perforations in transverse relation with the axial center of motion of said carrier, the combination, with such carrier, of a series of sectionally-constructed sliding pins or tumblers of varying lengths arranged within said ducts or perforations, essentially as herein set forth.

7. In a pin-tumbler lock, the combination of the swinging or oscillating tumbler-carrier having a series of ducts or perforations, sectionally-constructed sliding pins or tumblers arranged within said ducts or perforations, a bolt connected with said oscillating carrier, the stationary tumbler-receiver having two sets or rows of ducts or perforations arranged to register in the oscillation of the tumbler-carrier with the ducts in the latter, and a secondary set of pins or tumblers in the one set or row of ducts in the stationary tumbler-receiver, the whole being organized for operation substantially as specified.

8. In a pin-tumbler lock, the combination, with the swinging or oscillating tumbler-carrier having ducts or perforations in transverse relation with the axial center of motion of said carrier, of a series of sectionally-constructed tumblers arranged to move within said ducts, a stationary tumbler-receiver perforated to receive said tumblers par-

tially within it, and a series of keys differently stepped or having bits of different lengths, each adapted to control said tumblers to open and close the lock, essentially as herein set forth.

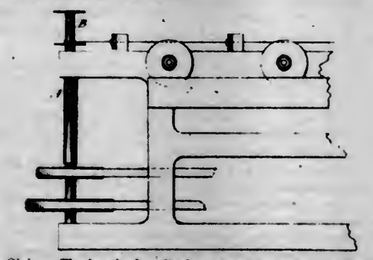
387,884. BLANKET-CLASP. Donald Walker, Caledonia, N. Y. Filed Jan. 13, 1888. Serial No. 260,869. (No model.)



Claim.—1. As an improved article of manufacture, the safety pin or clasp for blankets herein described, having its members provided with aligning downwardly and inwardly extending essentially U-shaped arms, substantially as and for the purpose specified.

2. As an improved article of manufacture, the safety pin or clasp for blankets herein described, having its members provided with approaching outwardly, downwardly, and inwardly curved essentially U-shaped arms, substantially as and for purpose specified.

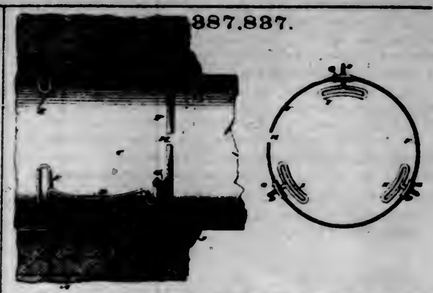
3. The combination, with a blanket and the strape of a harness, of the safety pin or clasp herein described, having its members provided with approaching downwardly, outwardly, and inwardly curved essentially U-shaped arms, substantially as and for the purpose set forth, whereby the blanket is pressed and held over and around a given strap or strape.



387,835. DRIVING MECHANISM FOR ENDLESS-CABLE RAILWAYS. John Walker, Cleveland, Ohio. Filed Apr. 4, 1888. Serial No. 269,610. (No model.)

Claim.—1. In a driving mechanism for an endless-cable railway, the combination of the driving-shafts and a strut in two sections or lengths, threaded at their inner ends and connected by a spindle, the whole being supported by means of a bracket, substantially as and for the purpose specified.

2. In a driving mechanism for an endless-cable railway, the combination of the driving-shafts and a strut in two sections or lengths, threaded at their inner ends and connected by a spindle, the interiorly-threaded parts of the connection being slit and provided with means whereby they may be contracted around the other threaded parts to lock the whole, and a supporting-bracket, substantially as and for the purpose specified.

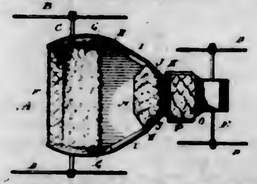


387,836. MODE OF PREPARING SPOOLS OF WIRE FOR THE MARKET. William Wallace, Ansonia, Conn. Filed May 28, 1888. Serial No. 275,274. (No model.)

Claim.—The herein-described mode of preparing spools of wire for the market, consisting in first drawing the wire directly upon a metal spool, then subjecting that same metal spool with the wire still thereon to the annealing operation and without rewinding the wire, substantially as described.

387,837. STOVE-PIPE HOLDER. William S. Webb, Springfield, Ohio, assignor of one-half to Joseph F. Kurtz, same place. Filed Dec. 3, 1887. Serial No. 256,043. (No model.)

387,837.

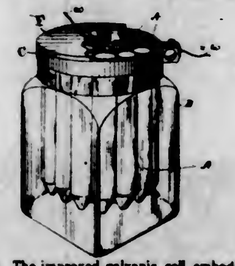


Claim.—1. A stove-pipe holder consisting of a detachable band or ring adapted to encircle a stove-pipe and clamp the outside thereof and a plurality of bars connected to such ring and extending radially from and back to the pipe, whereby said bars are adapted to engage the walls of a pipe-hole and to bear against the pipe when the latter is placed therein to secure the pipe to the hole.

2. A stove-pipe holder consisting of an open band or ring adapted to clamp round a stove-pipe, a plurality of clips secured to it, and a like number of curved spring-bars connected to the clips at one end and having segmental loops at the other end.

3. A stove-pipe holder consisting of a detachable band adapted to encircle a stove-pipe, and a plurality of yielding or spring bars connected to such band and extending radially from and back to the pipe, whereby said bars are adapted to engage the walls of the pipe-hole and bear against the pipe when the latter is placed in position with a constant pressure to secure the pipe in the hole.

387,838. VEHICLE. Wilbur H. Weston, Newburg, N. Y. Filed Apr. 3, 1888. Serial No. 269,413. (No model.)



Claim.—1. In a vehicle of the class described, a carriage-body having the front parts of its sides provided with two inward inclines, a seat located inside the carriage between the inclines, and doors hinged to the rear ends of said inclines, substantially as described.

2. In a vehicle of the class described, a carriage-body having its front parts inclined inwardly, and doors hinged to the rear ends of said inclines, in combination with the rear and front wheels, the latter being of narrower gage than the former, substantially as described.

3. In a vehicle, a carriage-body having the front parts of its sides inclined toward the longitudinal axis of the carriage-body and doors fitted on the said inclined parts, in combination with the rear and front wheels supporting the said carriage-body, said front wheels being of narrower gage than said rear wheels, substantially as shown and described.

387,839. GALVANIC BATTERY. Granville T. Woods, Cincinnati, Ohio. Filed July 9, 1887. Serial No. 243,934. (No model.)

Claim.—1. The improved galvanic cell embodying the negative electrode arranged as an annulus concentrically around the positive electrode, and an intervening insulating-shield, in combination with the containing-vessel and exciting-liquid, substantially as described.

2. In a galvanic cell, the carbon sticks A, insulating-cylinder B, and clamp C, combined and arranged, as shown, to constitute a single structure removable from the containing-vessel, substantially as described.

3. A galvanic cell embodying a carbon or negative electrode, combined with an open insulating-annulus around which it is secured as one removable structure, and the zinc or positive electrode, combined with an insulated bridge which it is suspended upon and within the insulating-annulus, also as a removable structure, the whole combined with and arranged within and upon a containing-jar, substantially as set forth.

387,840. HEATING-ENGINE. Cornelius Arthurson, Loanhead, County of Mid-Lothian, Scotland. Filed Sept. 10, 1887. Serial No. 249,322. (No model.) Patented in England May 3, 1883, No. 5,261.

Claim.—1. The vat A and mid-feather A', in combination with the conical cutting-roll B, arranged transversely to said tank on one side of said mid-feather, and a set of knives arranged under said cutting-roll and parallel therewith, the knives being collectively broader at the end under the broad end of the cutting-roll, substantially as set forth.

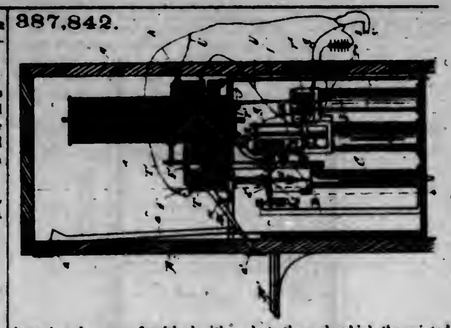
2. A vat, A, mid-feather A', and conical cutting-roll, in combination with a knife-box arranged under it, and a set of long knives and a set of short knives in said box, the knives being arranged to give greater breadth of cutting-surface at the end of the box which is under the larger end of the conical roll, substantially as set forth.

387,841. PHOTOGRAPHIC-PRINT REGISTER. John W. Allbright, Waterbury, Conn. Filed Mar. 30, 1888. Serial No. 268,694. (No model.)

Claim.—1. A register comprising a central stud, an index-plate journaled thereon which denotes the number of prints required, a register-plate carried by the central stud, having ratchet-teeth at its edge and numbers which count the prints as made, and a spring engaging the ratchet-teeth to hold it against backward movement and by friction thereon to hold it against forward movement except when the central stud is rotated.

2. A register comprising a back plate having ears for attachment in place, a face-plate having a flange to inclose the operative parts which is attached to the back plate, openings 5 and 6 in the face-plate, a central stud journaled in the two plates, an index-plate journaled on the central stud and having numbers showing at the opening 6, for the purpose set forth, and a register-plate carried by the central stud and having numbers showing at the opening 5, as and for the purpose set forth.

3. A register comprising a face-plate having openings 5 and 6 and a curved slot, 7, a central stud, an index-plate having numbers showing at opening 6, a stud passing through the slot and a thumb-nut, whereby it is locked after adjustment, a register-plate carried by the central stud and having numbers showing through the opening 5, ratchet-teeth at its edge, a spring engaging said ratchet-teeth, and a knob on the central stud for operating the register-plate.



387,842. AUTOMATIC COIN-CONTROLLED TICKET-PRINTING WEIGHING-SCALE. Edward H. Amet, Chicago, Ill., assignor to himself and Herbert A. Streeter, same place. Filed Feb. 17, 1888. Serial No. 264,262. (No model.)

Claim.—1. The combination, with an automatic weighing and card-printing scale mechanism, of a case or box, A, inclosing the same, a coin-operated device for controlling the delivery of the printed card from said inclosing case or box, and a movable device whereby the printed card may be discharged inside said case or box if no coin is deposited, substantially as specified.

2. The combination of an automatic weighing and card-printing scale with a box, A, inclosing the same, having a chute, N, through which the printed card may issue, and a coin-operated card-delivery-controlling device or lever, P, having a tooth, p', said chute N having an opening, n', into which said tooth may project, substantially as specified.

3. The combination, with an automatic weighing and card-printing scale having a card-feed mechanism, a printing wheel or type adjusted or controlled by the scale, and a printing mechanism, of a box inclosing the same, furnished with a chute through which the printed card may issue after being delivered from the printing mechanism, and a coin-operated lever for controlling the delivery of the printed card from said box, and a pawl for holding said gate-lever open until the weighing, printing, and card-delivery operations are completed, substantially as specified.

387,842.

4. The combination, in an automatic weighing and printing scale, of the scale mechanism and the type-wheel adjusted or controlled by the scale mechanism, with an inking device and mechanism for moving the inking device out of contact with the type-wheel momentarily before the impression is taken, so that the type-wheel may reach its true balance unaffected by the friction of the inking device on the type-wheel, substantially as specified.

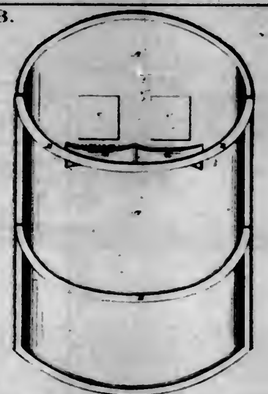
5. The combination, in an electrically-operated automatic weighing and printing scale, of the scale mechanism and a type-wheel adjusted or controlled by said scale mechanism, two or more electric circuits having magnets included therein, a single battery, a movable contact, and two or more stationary contact-pieces in different circuits closed in succession by the movement of said movable contact-piece, substantially as specified.

6. The combination, with the scale mechanism, of an automatic weighing and card-printing scale, its printing-wheel adjusted or controlled by said scale mechanism, an impression-block, and a card-feed slide, a pivoted chute, a link connecting said chute with the card-feed slide, and a coin-operated gate-lever for opening or closing the mouth of said chute, substantially as specified.

7. The combination, in an automatic electric weighing and printing scale, of the scale and its platform B, movable step J', cord j, card-feed slide H, weight J, movable contact R, stationary contacts R' R^2 R^3, electric circuits S, U, and T, having magnets included therein, and a catch-pin, r^4, operated by the magnet in said circuit S, substantially as specified.

8. The combination, in an automatic electric weighing and printing scale, of the scale and its platform B, movable step J', cord j, card-feed slide H, weight J, movable contact R, stationary contacts R' R^2 R^3, electric circuits S, U, and T, having magnets included therein, a catch-pin, r^4, operated by the magnet in said circuit S, and weight r and dash-pot R^4, for controlling the movement of said movable contact R, substantially as specified.

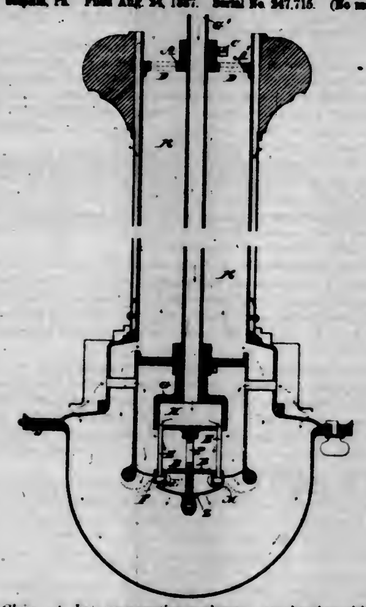
9. The combination, with a weighing and recording scale and its platform and printing mechanism, of a movable step or platform in front of the scale-platform for operating the printing mechanism of the scale by the weight of the person stepping thereon and therefrom onto the scale-platform to be weighed, and a movable pawl or pin, b', mounted on the stationary frame of the machine to hold said movable step in its normal position after the person steps on the scale-platform and until the weighing and printing operation is completed, substantially as specified.



10. The combination of scale-platform B, movable step J', spring-pin b', and mechanism for holding said pin normally retracted, consisting of a cord and a weight, said weight being raised and the cord connecting with said pin slackened during the weighing operation, substantially as specified.

11. The combination of scale-platform B with movable step J', spring-pin b', weight J, cord j, branch cord b^2, and the weighing and printing mechanism of the scale, substantially as specified.

12. The combination, with a weighing and recording scale, of movable step J', weight J, pulleys and a cord connecting said step and weight, a dash-pot surrounding said weight, and a card-feed slide, H, connected with said cord, a branch cord, j^3, and a counter mechanism having an operating pawl-lever connected by said branch cord j^3 with said cord, substantially as specified.



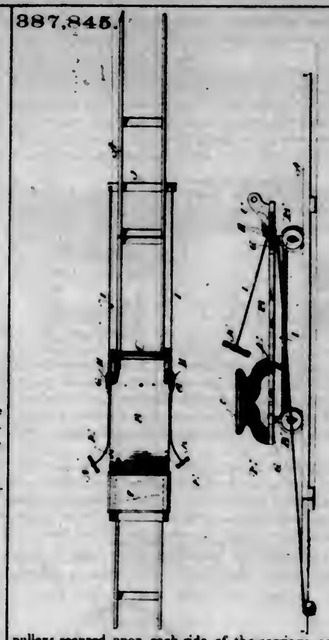
387,843. EYE, FACE, AND LUNG PROTECTOR. Peter Bagsley, Clyde, N. Y. Filed June 21, 1888. Serial No. 277,729. (No model.)

387,843.

Claim.—A protector provided with glasses through which the wearer sees and with rolls or protectors just under the glasses to prevent the breath from rising and condensing upon them, substantially as shown and described.

387,844. REGENERATIVE GAS-BURNER. JOHN W. BAKER, Philadelphia, Pa. Filed Aug. 24, 1887. Serial No. 247,715. (No model.)

Claim.—1. In a regenerative gas-lamp, a gas-chamber with tubes leading therefrom into an annular chamber, the latter having peripheral and base openings, and an adjustable perforated spreader-cup, said parts being combined substantially as and for the purpose set forth.

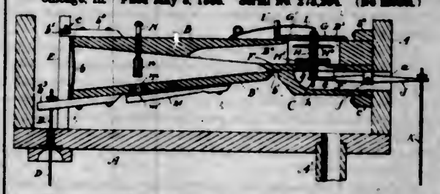


2. The gas-chamber H, the tubes E, leading therefrom, the chamber F, having base-openings M and peripheral openings F, the spreader-cup Z, the button B, and the adjusting-screw P, said parts being combined and arranged substantially as and for the purpose set forth.

387,845. EXERCISING-MACHINE. CARUS M. BARTHOLOMEW, Newark, Ohio. Filed Dec. 14, 1887. Serial No. 257,867. (No model.)

Claim.—1. The combination, with a track, of a carriage, and operating-cords secured to the track about midway of its length and adapted to engage with the carriage with their free ends, said cords being substantially one-half the length of the track, substantially as set forth.

2. The combination, with a horizontal track, of a tie secured thereto, the ends of which project beyond the sides of the track, two



387,845.

pulleys secured upon each side of the carriage, one in front of the other, and an operating-cord secured to each end of the tie and passed between the pulleys upon the carriage, substantially as set forth.

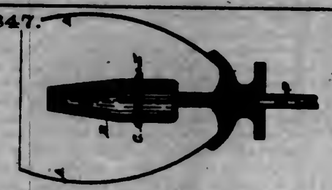
3. The combination, with a track hinged at its middle, of a carriage, and operating-cords secured to the track near the hinged portion and adapted to engage with the carriage, substantially as set forth.

387,846. PNEUMATIC ACTION FOR ORGANS. IRA RAMSEY, Chicago, Ill. Filed May 3, 1888. Serial No. 272,264. (No model.)

Claim.—1. The combination, with the valve H^1, of the flexible diaphragm G and means, as the ring G', for removably securing the same in place, substantially as shown and described.

2. The combination, with the opening *f* and diaphragm G, of the double valves $H' H^2$, spring L, and slotted post L', substantially as shown and described.

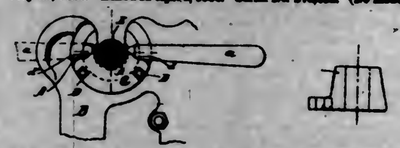
3. In a pneumatic action for organs, the combination, with the chamber *c*, of the outlet *a*, the width of which is gradually decreased in a regular taper from the width of said chamber until the end of the outlet is reached, whereby the air may be noiselessly expelled, substantially as shown and described.



4. The combination, with a pneumatic bellows, of the opening *m*, valve *m'*, spring M, set-screw N, and block *n*, whereby the extent to which the bellows is permitted to collapse may be regulated and adjusted to meet the requirements of the valves in the main wind-chest and air may be admitted to the bellows to serve as an air-cushion until the valve *m'* is closed, substantially as shown and described.

5. The combination, with a series of pneumatic bellows, of the blocks b^4, attached rigidly to said bellows, notches b^5, bars E, and dogs *e*, substantially as shown and described.

387,847. PESTLE FOR MORTARS. JOHN D. BELFOY, New Orleans, La., assignor to George Alfred Lemaux, same place. Filed Feb. 14, 1888. Serial No. 263,904. (No model.)

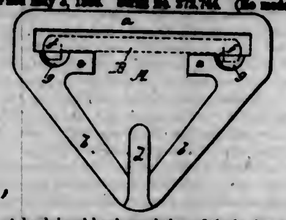


Claim.—The combination, with a pestle, of a ring encircling the

387,847.

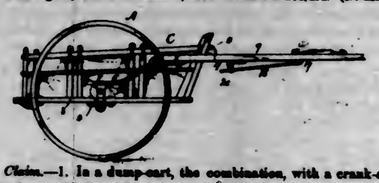
pestle and adjustable along the length thereof, substantially as and for the purpose described.

387,848. TIRE-BENDER. JAMES F. BOWMAN, Columbia, Pa. Filed July 30, 1887. Renewed Apr. 6, 1888. Serial No. 270,022. (No model.)



Claim.—1. In a tire-bending machine, the combination, with the central roller and the frame, of partially-rotating bearing-beams for the upper central-roller journals, said beams being actuated by suitable levers and adapted to fit sockets in said frame, and provided with openings corresponding with similar ones in said frame through which the roller-journals may be removed when so desired, substantially as shown.

2. In a tire-bending machine, the combination, with the frame, of a bearing-beam for the end roller, the same being bolted to the frame and adjustable, substantially as set forth.



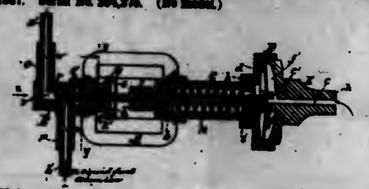
3. In combination with the frame, a bearing-beam for the driving-shaft bolted to the frame, and adjustable, substantially as shown and described.

387,849. BACK-BAND HOOK. ROBERT G. BARRETT, Franklin, Tenn. Filed May 3, 1888. Serial No. 272,744. (No model.)

Claim.—A back-band hook consisting of the horizontal bar *a*, inclined bars *b*, bars *c*, and hook *d*, with the recesses *g*, formed in the short bars *c*, in combination with the pin B, provided with the heads *f f* and the back-band *h*, the whole adapted to operate as and for the purpose set forth.

387,850. DUMP-CART. FREDERICK BIX and EDWARD F. HEUSER, Washington, D. C. Filed Mar. 7, 1888. Serial No. 266,402. (No model.)

Claim.—1. In a dump-cart, the combination, with a crank-axle, of a body provided with bearings arranged on the bail of the axle and to turn thereon, substantially as described.



2. In a dump-cart, the combination, with a crank-axle, of a dumping-body having bearings secured to the under side of the side pieces of the body and mounted on the bail of the axle to turn thereon, substantially as described, and for the purposes set forth.

3. In a dump-cart, the combination of the crank-axle, the body mounted to turn on bearings on the bail of the axle, and shafts having their rear ends secured to the top or side of the crank of the axle, substantially as described, and for the purpose set forth.

4. The combination, with the crank-axle of a dump-cart, of shafts having their rear ends rigidly secured to the top or upper sides of the crank of the axle, substantially as described, and for the purpose set forth.

5. The combination, in a dump-cart, of a crank-axle and shafts having shaft-irons secured on their rear ends and to the upper part of the crank of the axle, said shaft-irons being secured on the upper faces of said cranks and formed to curve upward from said attachment, substantially as described, and for the purpose set forth.

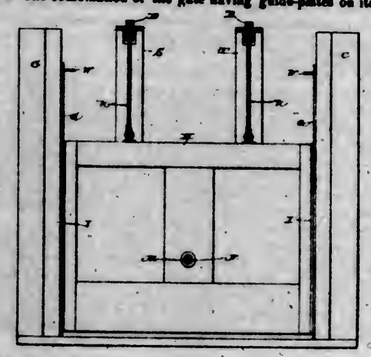
387,851. DEVICE FOR CONTROLLING THE FLOW OF STEAM THROUGH PIPES. SAMUEL BRAGDEN, Rochester, N. Y. Filed Nov. 4, 1887. Serial No. 254,578. (No model.)

Claim.—1. A fluid-pressure regulator having a chamber connected with a generator, said chamber having a yielding side or wall, and a valve in said chamber held to move independently of other parts of the device, in combination with an actuator for said valve outside of said chamber operated by the pressure within said generator.

2. A device for controlling the flow of steam or other fluid, having a chamber connected with a pressure-generator, said chamber being formed with a yielding side, and a valve in said chamber not joined to any part of the device without said chamber, in combination with an actuator for said valve outside of said chamber, said valve and actuator therefor both being urged or operated by the pressure within said generator.

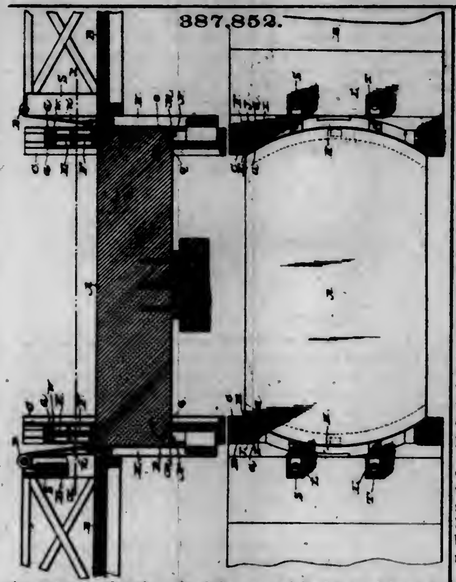
3. A device for controlling the flow of steam, having a steam-chamber connected by a passage for steam with a steam-generator and formed with a valve-seat and a yielding side or wall, and a valve in said steam-chamber in contact with said yielding side or wall, in combination with an adjustable actuator for said valve outside of said steam-chamber, and a flexible diaphragm to operate said actuator.

4. A device for controlling the flow of steam, having a steam-chamber connected by a passage for steam with a steam-generator and formed with a valve-seat and a yielding side or wall, and a valve in said steam-chamber in contact with said yielding side or wall, in combination with an adjustable actuator for said valve outside of said steam-chamber, a flexible diaphragm to operate said actuator, a spring to urge said actuator against said diaphragm, and an adjustable compresser for said spring.



5. A device for controlling the flow of steam, having two separate steam or water chambers, each having a flexible side or wall, a valve-seat and a valve in one of said chambers, an actuator for said valve operated by the flexible wall of the other of said chambers to act upon the flexible wall of said chamber holding the valve.

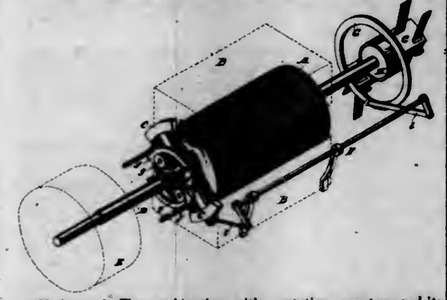
387,852. DRAW-BRIDGE. WILLIAM J. BUSH, South Evanston, Ill. Filed Nov. 8, 1887. Serial No. 254,643. (No model.)



Claim.—1. The combination of the posts, the track-irons secured thereto, the gate having a forwardly-projecting pin at its center near its lower edge, the guide-plates secured to the gate and moving on the track-irons, and the draw having its lower portion cut away to provide a cam-shoulder adapted to contact with the pin at the lower portion of the gate to operate the same, substantially as specified.

2. The combination of the posts, the track-irons secured thereto having a longitudinal groove, the gate, and the guide-plates secured thereto and having a longitudinal rib engaging the groove in the track-iron, substantially as described.

3. The combination of the gate having guide-plates on its ends,



387,852.

the posts erected at the ends of the gate and having track-irons engaged by the guide-plates thereon, the posts erected at intermediate points of the length of the gate and having pulleys in their upper ends, and the weighted cables secured to the top rail of the gate and passing over said pulleys, substantially as specified.

387,853. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. Charles L. Buckingham, New York, N. Y., and Hermann Lemp, Hartford, Conn. Filed June 21, 1887. Serial No. 241,964. (No model.)

Claim.—1. The combination, with a rotating armature and its field-of-force magnets, of a magnetic body arranged adjacent thereto within the magnetic field of the armature and field-of-force magnets, and controlled by the resultant of the forces of the armature and field-magnets, and connections for shifting the commutator-brushes, through the instrumentality of said magnetic body, to correspond with the shifting of said resultant.

2. The combination, in an electric machine, with its rotating armature and field-of-force magnets, of a magnetic bar arranged adjacent thereto about the armature-shaft within the magnetic field of the armature and field-of-force magnets, and controlled by the resultant of the magnetic forces of the armature and field-magnets, connections for shifting the commutator-brushes, through the instrumentality of said bar, to correspond with the shifting of said resultant, and means for supporting said bar independently of the rotating armature-shaft, eliminating the friction between the two, so as to place said bar entirely under the influence of the magnetic resultant.

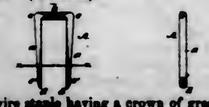
3. The combination, in an electrical machine, with its rotating armature and field-of-force magnets, of a magnetic bar arranged adjacent thereto, within the magnetic field of the armature and field-of-force magnets, and controlled by the resultant of the forces of the armature and field-magnets, and a rock-shaft and connecting-rods for connecting said magnetic bar with the commutator-brushes for shifting them, through the instrumentality of said bar, to correspond with the shifting of said resultant.

4. The combination, in an electrical machine, with its rotating armature and field-of-force magnets, of a magnetic bar arranged adjacent thereto and controlled by the resultant of the forces of the armature and field-magnets, devices for shifting the commutator-brushes, through the instrumentality of said bar, to correspond with the shifting of said resultant, and means for adjusting said bar to or from the armature and the pole-pieces of the field-of-force magnets.

5. The combination, in an electrical machine, with its rotating armature and field-of-force magnets, of a magnetic bar arranged adjacent thereto, within the magnetic field of the armature and field-of-force magnets, and controlled by the resultant of the forces of the armature and field-magnets, intermediate connections for shifting the commutator-brushes, through the instrumentality of said bar, to correspond with the shifting of said resultant, and a dash-pot or other means for steadying the movements of the aforesaid parts, as set forth.

6. The combination, in an electrical machine, with its rotating armature and field-of-force magnets, of a magnetic bar arranged adjacent thereto and controlled by the resultant of the forces of the armature and field-magnets, devices for shifting the commutator-brushes, through the instrumentality of said bar, to correspond with the shifting of said resultant, means for adjusting said bar to or from the armature and the pole-pieces of the field-of-force magnets, and a dash-pot or other means for steadying the movements of the aforesaid parts, as set forth.

7. An apparatus for controlling the commutator-brushes in an electrical machine to keep the same at the maximum point and to prevent sparking, consisting of a magnetic body arranged within the magnetic field of the armature, and field-of-force magnets to follow the polar line and intermediate devices between the said magnetic body and commutator-brushes for effecting the above purpose by the movements of said magnetic body.



8. The method of regulating the position of the commutator-brushes to keep the same at the maximum point in an electrical machine, thereby securing efficiency and preventing sparking, consisting of causing a magnetic body to be governed by the varying resultant of the magnetism of the armature and field-magnets, and thereby controlling the position of the commutator-brushes.

9. In an electrical machine having an armature and field-of-force magnets therefor, the combination of a magnetic bar, as C, arranged adjacent to and within the magnetic field of said armature and the pole-pieces of said field-of-force magnets, and disposed about the armature-shaft, non-magnetic sectors, as *f f*, suitably supported, and guide-wheels, as *g g*, journaled upon extensions from said bar, for supporting said bar independently of the armature-shaft, and intermediate devices between the aforesaid bar and the commutator-brushes for shifting the same in accordance with the movements of the bar.

10. In an electrical machine having an armature and field-of-force magnets therefor, the combination of a magnetic bar, as C, arranged adjacent thereto, a rock-shaft, F, and connecting-links *l* intermediate of said bar and the commutator-brushes and connected therewith for shifting said brushes in accordance with the movements of the bar C.

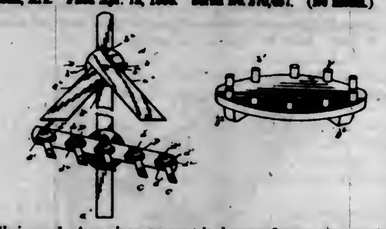
11. In an electrical machine having an armature and field-of-force magnets therefor, the combination of a magnetic bar, as C, arranged adjacent thereto and upon a sleeve about the armature-shaft, sectors, as *f f*, suitably supported, and guide-wheels, as *g g*, journaled upon extensions from said bar for sustaining said bar independently of the armature-shaft, and connecting-rods, as *l l*, and a rock-shaft, as F, intermediate of said bar, and the commutator-brushes for shifting the same in accordance with the movements of said bar C to correspond with the shifting of the polar line.

387,854. STAPLE FOR BOOTS OR SHOES. Edward H. Buckley, Philadelphia, Pa., assignor to the Acme Staple and Machine Company, of New York. Filed Apr. 17, 1883. Renewed Mar. 3, 1888. Serial No. 266,103. (No model.)

Claim.—A wire staple having a crown of greater thickness than the legs, the latter being formed flat on their outer faces and round on their inner faces, the faces being of a double incline or bevel in the direction of their length, substantially as described.

387,855. CAR-WHEEL. Logan M. Bollett, St. Paul, Minn., assignor to the Bain Foundry and Manufacturing Company, Bain, Ill. Filed Jan. 18, 1888. Serial No. 261,350. (No model.)

Claim.—1. The combination, with a body of a car-wheel, of a hub formed separate therefrom, said hub consisting of a perforated annular bearing-plate, *b*², an annular chamber, G, for lubricant, the walls whereof are formed integral with said bearing-plate, said chamber surrounding



387,855.

said bearing-plate and being provided with the division-plates *g*, extending entirely across said chamber and having openings *g'* therein to form a receptacle, G', for cotton waste or like material, said division-plates being located at each side of the perforation through the annular bearing-plate, whereby the cotton waste may be securely retained separate from the lubricating-chamber and above the opening of the bearing-plate, substantially as described.

2. The combination, with a body of a car-wheel, of a hub formed separate therefrom and having its periphery provided with suitable flanges, and having formed integral with said flanges a perforated annular bearing-plate for the car-axle journal, a closed chamber for lubricant surrounding said bearing-plate and having its walls formed integral therewith, said closed chamber being provided with the division-plates *g*, having openings *g'*, to form a cotton-waste receptacle opposite the perforation of said bearing-plate, substantially as described.

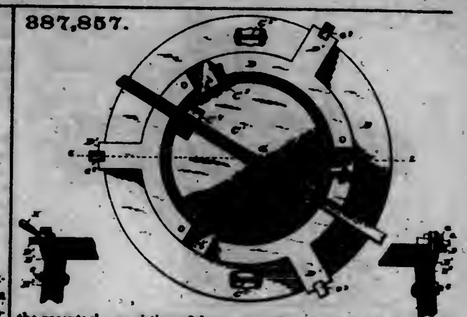
387,856. CULTIVATOR AND HARROW. Henry G. Cary, Pine Bluff, Ark. Filed Apr. 12, 1888. Serial No. 270,457. (No model.)

Claim.—1. As an improvement in harrow-frames, the securing head or plate having a series of upwardly-projecting lugs and the ears or shoulders formed on the under side of said head or plate, substantially as shown and described.

2. As an improvement in harrows, the central bar having holes or apertures in its under side, the securing plate or head having a series of upwardly-projecting lugs, and the central vertical bolt, substantially as shown and described.

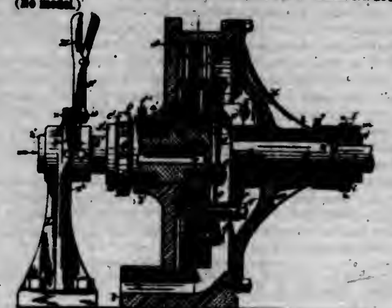
3. In a harrow-frame having draft and cross bars, the securing plate or head having on its under side ears or shoulders, between which are grooves or recesses, and the central bolt passed through coincident apertures in said bars and plate or head, substantially as shown and described.

4. The combination, with the draft and cross bars and the longitudinal bar, of the securing plate or head having a series of upwardly-projecting lugs and ears or shoulders formed on its lower surface, and the securing-bolt, substantially as shown and described.



5. As an improvement in spring-tooth harrows, the heads having each divergent slots, and a slot or aperture through which the end of the spring-tooth projects, substantially as shown and described.

387,857. RECEPTACLE FOR USE IN OUTHOUSES AND LIKE PLACES. Thomas W. Carrere, San Antonio, Tex. Filed July 26, 1887. Serial No. 245,247. (No model.)



Claim.—1. The receptacle proper and its removable perforated head, and the cover for said perforation, having beveled flanges for engagement with flanges formed on a ring secured to the barrel-head, which ring is also formed with flanges extending out beyond the sides of the receptacle, and keys secured to the sides of the receptacle and engaging with the flanges of the ring, substantially as herein shown and described.

2. The receptacle and its removable perforated head, and a cover for said perforation having beveled flanges and formed with lugs having grooves, in combination with a ring secured to the barrel-head and having inwardly-extending flanges for engagement with the beveled flanges of the cover, and having also flanges extending out beyond the sides of the receptacle, and a handle situated within the grooves of the lugs on the cover, and means for securing the head to the receptacle, consisting of keys secured to the receptacle on the barrel-head, and a packing between the head and the receptacle, all arranged and combined to operate substantially as shown and described.

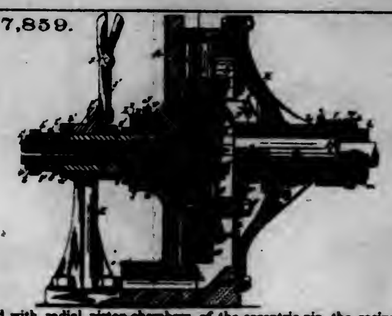
387,857.

387,858. REVERSING-VALVE FOR ROTARY ENGINES. Augustus L. Case, Jr., Bristol, R. I. Filed Oct. 7, 1887. Serial No. 251,772. (No model.)

Claim.—1. In a rotary engine, the combination, with the stationary valve having an inlet and exhaust port, of the rotary head provided with radially-directed piston-chambers and adapted to revolve upon the stationary valve, the reversing-valve arranged within the stationary valve and provided with the eccentric-pin, means for holding the reversing-valve and eccentric-pin in a set position, and connections from the eccentric-pin to the several pistons, substantially as described.

2. In a rotary engine, the combination, with the rotary head provided with radially-directed piston-chambers, of the pistons, the stationary valve having duplicate inlet-ports and a port which exhausts into the chamber of the case at the end of the valve, and an axially-arranged reversing-valve provided with the eccentric-pin operatively connected to the pistons, and the hand-lever for reversing the position of the eccentric-pin and the inlet-port of the reversing-valve, substantially as described.

3. In a rotary engine, the combination, with the outer case and the rotary head provided with radially-directed piston-chambers, of the reciprocating pistons, the stationary valve having an inlet-port, and also an exhaust-port leading into the chamber of the outer case, and a reversing-valve provided with the eccentric-pin and arranged within the stationary valve, substantially as described.



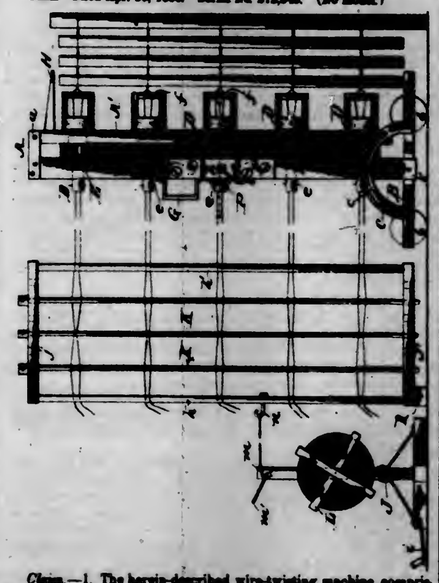
387,859. REVERSING-VALVE FOR ROTARY ENGINES. Augustus L. Case, Jr., Bristol, R. I. Filed Nov. 8, 1887. Serial No. 254,602. (No model.)

Claim.—1. In a rotary engine, the combination, with the rotary head provided with radial piston-chambers, of the eccentric-pin, the reciprocating pistons operatively connected with the eccentric-pin, the stationary valve provided with the inlet and exhaust ports, the reversing-valve provided with duplicate inlet-ports and an exhaust-port leading to the end of the valve, and the supplementary valve arranged within the reversing-valve, substantially as described.

2. In a rotary engine, the combination, with the rotary head provided with radial piston-chambers, of the eccentric-pin, the reciprocating pistons operatively connected with the eccentric-pin, the stationary valve provided with the inlet and exhaust ports, the reversing-valve provided with the projecting segment, and the supplementary valve provided with a segment adapted for engagement with the segment of the reversing-valve, substantially as described.

3. In a rotary engine, the combination, with the rotary head pro-

887,859.



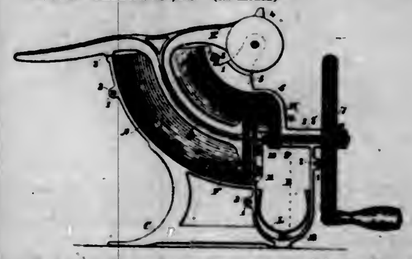
vided with radial piston-chambers, of the eccentric-pin, the reciprocating pistons operatively connected with the eccentric-pin, the stationary valve provided with the engaging-segment, the supplementary valve provided with a segment adapted for engagement with the segment of the reversing-valve, and the hand-lever provided with a holding-catch, substantially as described.

4. In a rotary engine, the combination, with the rotary head provided with radial piston-chambers and the reciprocating pistons, of the stationary valve provided with inlet and exhaust ports, and with the supplementary exhaust-ports, substantially as described.

5. In a rotary engine, the combination, with the rotary head provided with radial piston-chambers and the reciprocating pistons, of the stationary valve provided with the inlet and exhaust ports, the reversing-valve provided with duplicate inlet-ports and an exhaust-port leading to the end of the valve, and the supplementary valve operated by the movement of the said reversing-valve, substantially as described.

6. In a rotary engine, the combination, with the outer case and the rotary head provided with radial piston-chambers, of the reciprocating pistons, the stationary valve, the reversing-valve adapted to exhaust into the chamber of the outer case, and the supplementary valve, substantially as described.

887,860. FENCE-MACHINE. William A. Clary, North Fork, Tenn. Filed Apr. 30, 1888. Serial No. 272,349. (No model.)



Claim.—1. The herein-described wire-twisting machine, comprising the uprights located a suitable distance apart and provided with a vertical series of registering apertures, one or more cross-pieces connecting said uprights, a supporting-frame carried by wheels and upon which the uprights are pivotally mounted, twisters extending through said apertures in the uprights, each of said twisters consisting of a hollow spindle provided with bearing-surfaces to operate in the uprights and having an angular portion between said bearing-surfaces, gear-wheels mounted on said angular portions of the twisters and located in the space between the inner faces of the uprights, gear-wheels meshing with said gears on the twisters and journaled in the space between the uprights, the gear on one of said twisters being also provided with a bevel-gear, and a bevel-gear provided with a crank, whereby the twisters are rotated, as set forth.

2. In a wire-twisting machine, the combination of the uprights suitably secured together and provided with a vertical series of registering bearings, a supporting-frame carried by wheels and on which the uprights are pivotally mounted, twisters provided with bearing-surfaces operating in said bearings, gear-wheels located between the uprights and mounted on said twisters between their bearing-surfaces, gears meshing with and connecting the gears on the twisters, the gear on one of said twisters being also provided with a bevel-gear, an outwardly-bent strap secured to an upright and extending over a recess in the same, and a bevel-gear journaled in said recess and meshing with the bevel-gear on the twister and provided with a crank, as set forth.

3. The herein-described twister, consisting of a hollow spindle provided with a flaring or enlarged discharge end, a cross-piece extending across said end and provided with a pair of apertures for the passage of the wire, said hollow spindle being provided with two bearing-surfaces, and a squared or angular portion located between said bearing-surfaces to receive a gear-wheel, substantially as described.

4. The combination, with a wire-twisting machine, of a tension-frame composed of end and bottom pieces, said end pieces being provided with apertures, and tension-bars extending across the frame and removably held in said top and bottom pieces, the wire passing through said apertures in the end pieces and in and out between the tension-bars, as described.

887,861. MACHINE FOR SHAVING ICE. Clemmey C. Clawson, Newark, N. J., assignor, by direct and mesne assignments, to the United States Machine and Inventions Company, of New York City. Filed Oct. 29, 1888. Serial No. 317,036. (No model.)

Claim.—1. The stationary frame or body of the machine, composed of, first, the tubular curved ice-holder, second, the chamber fixed to and forming a continuation of the said ice-holder and arranged beyond the lower end thereof transversely thereto, in part above and in part below the lower edge of the said ice-holder, and, third, the foot fixed to the said ice-holder and arranged under the same at the side of the lower part of the said chamber, in combination with the removable shaved-ice receiver in the lower part of the said chamber, the vertical knife-disk between the said chamber and the said ice-holder, the follower in the said ice-holder, and the specified means for moving the said knife-disk and the said follower, substantially as described.

2. In an ice-shaving machine, and in combination with the stationary ice-holder, the rotary knife-disk, and the movable follower, the stationary chamber arranged partly below and partly above the lower edge of the said ice-holder beyond its lower end and fixed to the said ice-holder, and the removable shaved-ice receiver set horizontally in said chamber, the chamber being provided with an opening in one of its upright walls for the insertion of the said receiver, with supports for upholding the same above the bottom of the said chamber, and with a drainage-outlet, and the said receiver being provided with a front plate which closes the said opening when the receiver is inserted in said chamber, substantially as described.

3. The combination, with the ice-holder, the follower, and the knife-disk, of the chamber provided with an opening in one of its upright walls and arranged at the lower end of the ice-holder on the opposite side of the knife-disk from the said follower, and the scoop-shaped receiver in said chamber, this chamber being provided with supports for the curved bottom of said receiver, which is nearly of equal width with said chamber, so as to be kept upright by the sides of the same, and whose front plate closes the said opening in the upright wall thereof, substantially as described.

4. The combination, with the rotary disk armed with knives, of the ice-holder in the form of a section of curved pipe, the follower, the lever, and the curved arm between the follower and the lever, substantially as described.

5. The combination, in an ice-shaving machine, with the cutting mechanism, of a curved conduit adapted to receive the ice and direct the same to the cutters, which stand in a plane substantially at right angles to the mouth of the said conduit, as set forth.

887,862. CORN-HARVESTER. William A. Cobbey, Lincoln, Nebr. Filed Feb. 4, 1888. Serial No. 262,932. (No model.)

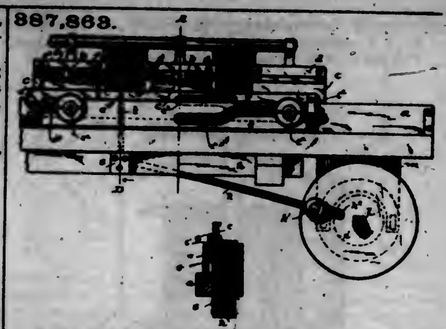
Claim.—1. In a corn-harvester, the combination, with the carrying-frame and its wheels, one of which is a driving-wheel provided with a gear-wheel, of the ice-shaft having gear to mesh with the gear of the driving-wheel and a bevel-gear on its other end, a bevel-gear mounted on a vertical axis and arranged with the gear of the ice-shaft, a circular cutter secured on the bevel-gear with vertical axis and provided with gathering-fingers projecting beyond the edge of the circular cutter, substantially as described.

2. In a corn-harvester, the circular cutter composed of a disk with a circumferential cutting-edge provided with gathering-fingers projected beyond the circumferential cutting-edge thereof, substantially as described.

3. In a corn-harvester, the combination of the bevel gear-wheel D, the cutter D', composed of a disk with a circumferential cutting-edge, secured to the wheel D and provided with gathering-fingers d', projecting beyond the cutting-edge, and a reel, d^2, mounted on the axis of the wheel D, substantially as described.

4. In a corn-harvester, a rotating dropper formed of the bar I, having a crank in its end, and reverse curved fingers i, radially projecting therefrom and oppositely disposed, and pitman J, pivoted at one end to the crank on the bar and at the other end to loop j' on the frame, substantially as described.

5. In combination with the rotary stalk-cutter, the beam G, formed with a V-shaped notch, x, having a plated block arranged on the edge of the wall of the notch farthest from the cutter, and the converging knives m, secured to the lower edge of the beam directly in the rear of the notch x, to cut the stubble, substantially as described.



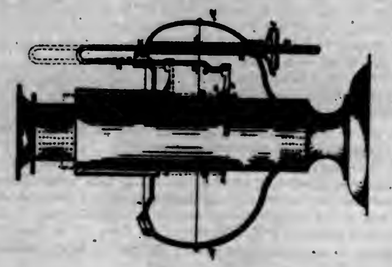
887,863. SHUTTLE AND OPERATING DEVICE THEREFOR FOR HARROW-WARE LOOMS. John Thomas Cooke and James L. Bottomley, Prestwich, near Manchester, County of Lancaster, England; Victoria Lines administratrix of said John Thomas Cooke, deceased. Filed Apr. 21, 1888. Serial No. 268,976. (No model.) Patented in England Aug. 6, 1884, No. 10,966; in France May 5, 1885, No. 168,709; in Belgium May 6, 1885, No. 68,704; and in Italy Oct. 31, 1885, No. 18,009.

Brief.—The front of the shuttle is supported by L-shaped flanges on strips secured to the front of the batten fitting into a correspondingly-shaped groove in the shuttle-body, and the beak is sustained and guided by the engagement of a rib thereon with grooves in rear strips, thereby steadying the shuttle and allowing its size and the amount of weft it carries to be increased. The beam or device which actuates the driving-planks is actuated from a link connected to a disk mounted on a square shaft reciprocated in any convenient manner, an arm on the batten carrying a roller which passes between the disk and a flange connected to the hub thereof, thereby sliding the disk upon the shaft or rotating with the movement of the batten.

Claim.—1. The combination, with the batten a and the grooved strips d and flanged strips c, of the shuttle b, having an angular slot in its under face near the front for the reception of said flanged strips c, and engaging at its rear side in the grooves of said strips d, substantially as described.

2. The combination, with the batten a and the grooved strips d and flanged strips c, of the shuttle b, having an angular slot in its under face near the front for the reception of said flanged strips c, and engaging at its rear side in the grooves of said strips d, and the driving-planks e e, substantially as described.

887,863.

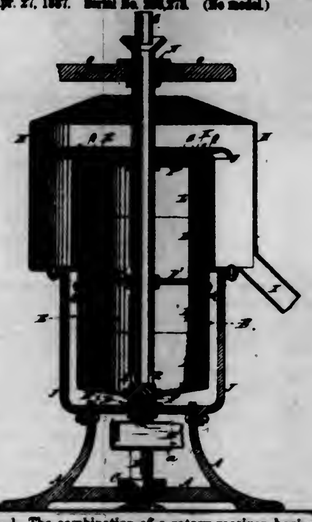


3. The combination, with the batten a and the grooved strips d and flanged strips c, of the shuttle b, having an angular slot in its under face near the front for the reception of said flanged strips c, and engaging at its rear side in the grooves of said strips d, and the driving-planks e, carrying pins d', connecting with the front of the shuttle, substantially as described.

4. The combination, with the batten a, the grooved strips d, supported at the back thereof, and the L-shaped strips c, supported at the front thereof, of the shuttle b, having a right-angular slot in its under face near the front for the reception of said L-shaped strips c, the horizontal portion of said slot extending rearwardly from the vertical portion, said shuttle also engaging at its rear side in the grooves of the strips d, substantially as described.

5. The combination, with the disk i, of the square shaft l, the batten a, having the arm m, the lower driver, h, the rod k, connecting said disk and lower driver, the driving-planks e e, shuttle b, and arm s, carried by said lower driver and engaging one of said planks, substantially as described.

6. The combination, with the square shaft l, the disk i, having hub i', and the flange p, all on said shaft, and means for oscillating the shaft l, of the batten a, arm m, connected thereto and carrying roller m', adapted to fit between said disk and flange, the lower driver, h, crank-pin k' in said disk, rod k, connecting said lower driver with said crank-pin, arm s, carried by said lower driver, the driving-planks e e, operated by said arm s, and shuttle b, driven by said planks, the whole arranged to operate substantially as described.



887,864. WICK-RAISER. Reuben Davis, Cleveland, Ohio. Filed Jan. 21, 1888. Serial No. 261,462. (No model.)

Claim.—1. The combination, in a wick-raiser, of the lamp-bowl having a center-draft tube with a vertically-moving rod having a spring-actuated prong which is provided with an incline and which passes down through an opening in the top of the bowl, and a clamp or grip which is secured to the lower end of the prong and which makes connection with the wick or wick-tube, substantially as described.

2. The combination of the lamp-bowl provided with a center-draft tube and provided with a tube which extends down through one side of the bowl with a vertically-moving rod provided with two prongs, one of which is made screw-threaded and to pass down through the tube in the side of the lamp-bowl and which has its shorter prong made elastic and provided with an incline, and a grip or clamp which is secured to the lower end of the shorter prong, and which clamp, when left free to move, makes a positive connection with the wick or wick-tube, and which is automatically moved back out of contact therewith when the rod is raised to a certain point, substantially as set forth.

387,865. CENTRIFUGAL FILTER. RICHARD L. DE LISSER, Brooklyn, N. Y., assignor to the Centrifugal Filter Company, of New York. Filed Apr. 27, 1887. Serial No. 236,373. (No model.)

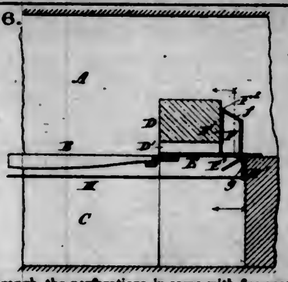
Claim.—1. The combination of a rotary receiver having a solid bottom and walls, a lining of porous material on the inside of the receiver, a flange projecting inwardly and downwardly from the upper edge of the receiver, and a gutter for receiving and conducting away the purified liquid, substantially as set forth.

2. The combination of a rotary receiver having a solid bottom and walls, a lining of porous material on the inside of the receiver, a flange projecting both inwardly and outwardly from the upper edge of the receiver, and a gutter to conduct away the purified liquid, substantially as set forth.

3. The combination of a rotary receiver having solid walls and bottom, and a continuous circumferential flange attached to and projecting both inside and outside of the upper edge of the receiver, substantially as set forth.

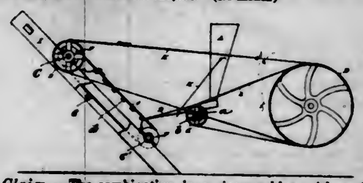
4. The combination of a rotary receiver having solid walls and bottom and a lining of porous material, adapted to catch and retain the sediment, &c., placed on the vertical walls of the receiver and in the lower portion thereof, and a lining of a different kind of porous material, adapted to filter the liquid passing through it, placed at the upper part of the walls of the receiver, substantially as set forth.

5. The combination of a rotary receiver having greater height than diameter, closed at the bottom and having solid walls, a lining of porous material on the inside of the receiver, with a flange at the upper end of the receiver, and means for catching and conveying away the purified liquid, substantially as set forth.



6. The combination of a rotary receiver having greater height than diameter, closed at the bottom and having solid walls, a lining of porous material on the inside of the receiver, and a flange at the upper end of the receiver, having holes in it within the wall of the receiver and outside the inner surface of the lining of the receiver, with means to catch and convey away the purified liquid, substantially as set forth.

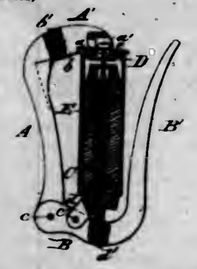
7. The combination of a rotary receiver having solid bottom and walls, with a lining placed within the receiver, and a flange at the upper end of the receiver, the lining having a backing of material less pervious than itself to the passage of the liquids firmly adhering to the back side thereof, substantially as set forth.



8. The combination of a rotary receiver having solid walls and bottom, with a continuous circumferential flange attached to the upper edge of the receiver, and a longitudinally bored or recessed shaft which extends through the receiver and on which it rotates, said shaft being provided with openings near its lower end adjacent to the bottom of the receiver, substantially as set forth.

387,866. SMOKE-CONSUMER. EDWARD DONEGANI, Montreal, Quebec, Canada, assignee of one-half to Daniel McKinnon Brodie, same place. Filed Nov. 18, 1887. Serial No. 255,545. (No model.) Patented in Canada Oct. 3, 1887, No. 27,732.

Claim.—In a furnace, and in combination, the bridge-wall resting upon the dead-plate and perforated at level of same, an air-heating chamber, also resting on dead-plate at rear of bridge-wall, communicating through the perforations in same with fire-grate, so that an amount of hot air, gases, &c., from the fuel can enter it, and having an inclined foraminous top, openings formed in the dead-plate to admit air from the ash-pit into said air-heating chamber, and a damper controlled from the outside of furnace to regulate the flow of air from the ash-pit to said chamber, as set forth.

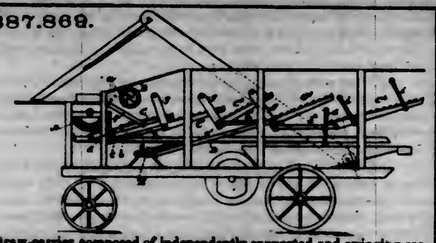


387,867. RICE-MACHINE. BURRE RAMEY, New Iberia, La. Filed Feb. 21, 1887. Serial No. 228,261. (No model.)

Claim.—The combination, in a rice-machine, with an inclined supporting-frame carrying the rollers C C', the pulley E, and the pulley F, of the endless apron having a nap surface, the pulleys D and G, belts K and L, the pulley G, provided with a spur-wheel, the hopper A, and the screen B, connected therewith, substantially as specified.

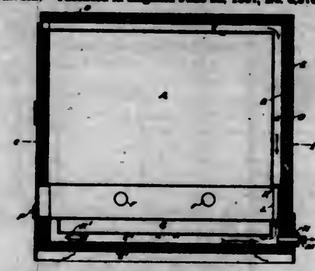
387,868. CARTRIDGE CAPPING AND DECAPPING IMPLEMENT. WILLARD M. FARROW, Holyoke, Mass. Filed Dec. 14, 1887. Serial No. 257,881. (No model.)

Claim.—1. In a device for capping and uncapping cartridge-shells, the pivoted hollow shell-post with an axially-moving plunger arranged therein, in combination with the curved lever and angular recessed body to which said lever is pivoted, the shell-post being pivoted to the lever and adapted to swing the shell into position with relation to the body for capping or uncapping, as described.



2. In a device for capping and uncapping cartridge-shells, the hollow shell-holder having an axially-moving plunger, said shell-post being pivoted to and in combination with the curved hand-lever provided with an adjusting-screw, so arranged that the position of the shell-holder with relation to the lever may be changed to bring the plunger in contact with the screw and force off the cap, substantially as set forth.

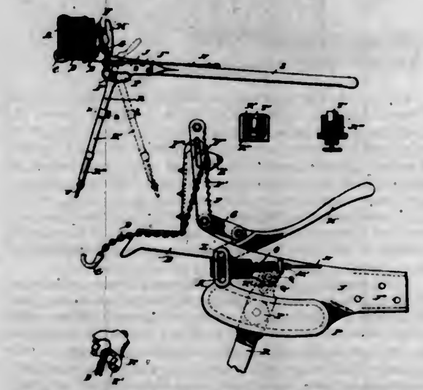
3. In a device for capping and uncapping cartridge-shells, the body provided with a recess to receive the cap when uncapping, and a screw to force the new cap into position, in combination with the oscillating shell-holder and curved lever pivoted together, all the parts being arranged to cap and uncap a cartridge-shell, substantially as set forth.



387,869. GRAIN-SEPARATOR. ELI W. FLAGG, Battle Creek, Mich., assignor to the Nichols & Shepard Company, same place. Filed Feb. 10, 1888. Serial No. 263,895. (No model.)

Claim.—The combination, with the pan of a grain-separator, of a straw-carrier composed of independently-supported and swinging sections, the forward section thereof being pivoted directly to the pan, and the adjustable supporting-links pivoted to said section and to the frame of the machine, substantially as and for the purpose described.

387,869.



387,870. GAS-STOVE FOR DOMESTIC PURPOSES. JAMES GALLI, Leeds, County of York, England. Filed July 12, 1887. Serial No. 244,104. (No model.) Patented in England June 30, 1887, No. 8,870.

Claim.—In combination with the oven A and casing D, having the space C between them, the base H, the boiler G, located therein, and having the space C' between the base and the bottom of the boiler, and the pipe L, connecting the space C to the space C', substantially as shown and described.

387,871. CAR-MOVER. LEWIS R. GUTHRIE, Toledo, Ohio. Filed Feb. 4, 1888. Serial No. 263,627. (No model.)

Claim.—1. In a car-mover, an angle-plate, fulcrum-plates pivoted thereto by means of slotted hangers, being held in adjustment by movable bolts, and a leg pivoted to the fulcrum-plates and adapted to have the direction of its inclination changed by the different adjustments of the fulcrum-plates, as and for the purpose set forth.

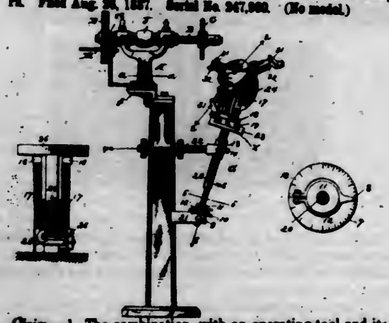
2. In a car-mover, an angle-plate, movable serrated plates connected thereto, a hook connected by a flexible attachment to a block adjustable upon the serrated plates, and a lever pivoted to the angle-plate and connected with the serrated plates, as and for the purpose set forth.

3. In a car-mover, an angle-plate, fulcrum-plates connected therewith, and a leg pivoted thereto, composed of an upper section provided with a spring locking-dog and a lower section sliding within the upper section and provided with perforations into which the locking-dog engages, as and for the purpose set forth.

387,872. BOLTING-REEL. GEORGE A. GRAHAM, Milwaukee, Wis. Filed Dec. 10, 1887. Serial No. 258,262. (No model.)

Claim.—1. The combination, in a bolting-reel, of the division-boards forming longitudinal partitions in said reel and the inclined gather-boards arranged upon the inner edges of said division-boards and projecting in both directions therefrom, and forming the converging pockets upon one side of said partition and the diverging pockets upon the other for receiving and distributing the stock, substantially as described.

2. The combination, in a bolting-reel, of the longitudinal division-boards 12, the inclined gather-boards 14, secured upon the inner edges of said division-boards and projecting therefrom on both sides of the board, converging at one side toward the surface of the reel, and forming the pockets 16 upon that side, and the strips 20, secured to said gather-boards and forming a hopper-shaped opening for the pocket 16, substantially as described.



3. The combination, in a bolting-reel, of the longitudinal ribs 10, the cloth secured over said ribs, the longitudinal division-boards extending inwardly from said ribs toward the center of the reel, and the inclined gather-boards 14, arranged upon the inner edges of said division-boards and forming the converging and diverging pockets 16 and 18 upon the opposite sides of said division-boards, substantially as described.

387,873. WRENCH. HENRY G. T. GLADSTONE, Simcoe, Ontario, Canada. Filed Sept. 20, 1888. Serial No. 285,962. (No model.)

Claim.—In a wrench, a hollow-perforated sliding jaw provided with a movable cam triangular in outline and having one cutting-edge and confined within predetermined limits entirely within the sliding jaw by stops *b* and *d*, and also having a rod provided with a circular loop at its outer end and pivotally secured to said cam at its inner end, and a coiled spring encircling said rod and keeping the cam normally in contact with the handle, in combination with a straight smooth handle which extends through the perforated jaw and has a rigid jaw secured thereto, all constructed and combined to operate substantially as and for the purposes specified.

387,874. GRINDING-MACHINE. FRANK C. HALL, Philadelphia, Pa. Filed Aug. 26, 1887. Serial No. 247,992. (No model.)

Claim.—1. The combination, with an operating-tool and its support, of a vertically-arranged rod pivoted at one end to said support and carrying at its free end a chuck, a nut for elevating and lowering said rod, and an adjusting-arm connected to the rod and to the support, substantially as described.

2. The combination of the rod supporting at one end a chuck, a

pivoted sleeve surrounding said rod, and a nut bearing against said sleeve and supporting the rod, and an adjusting-arm connected to the rod and to the support, substantially as described.

3. The combination of the rod carrying at one end a chuck, a pivoted sleeve and nut supporting the rod at the opposite end, and a sleeve, 13, and arm supporting said rod near its chuck-carrying end, substantially as described.

4. The combination of the rod pivoted at one end, a chuck, and the slide 19, intermediate between the chuck and the pivoted rod, substantially as described.

5. The herein-described rod, pivoted at its lower end and carrying a chuck at its upper end, and adjusting-supports for varying the height of the rod and its vertical position, substantially as described.

6. The combination, with the rod, its pivoted sleeve, and elevating and lowering nut, of a split ring carrying an index and adjustably secured to said nut, substantially as described.

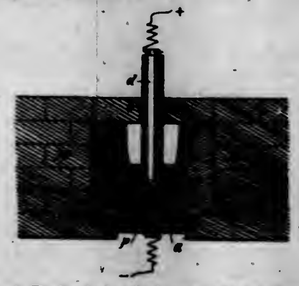
7. The combination of the rod pivoted at its lower end, a chuck, a rotatable plate, and horizontal slide intermediate between the chuck and the end of the rod, substantially as described.

8. The combination, with the chuck and its supporting-flange 36, of the adjustable friction-pawl 39, substantially as described.

9. The combination, with the chuck, its guide-plate, and pivots 16, of the arm 17 and screw-clamps for securing the guide-plate to the arm, substantially as described.

10. The combination, with the bearing 50 and shaft B, of caps 51, supported by the bearing and surrounding the shaft and having annular flanges, as 52, as and for the purpose specified.

11. The combination, with the bearing 50 and shaft B, of the split bushing 55, oil-cup, and set-screw 56, bearing upon said bushing, substantially as described.



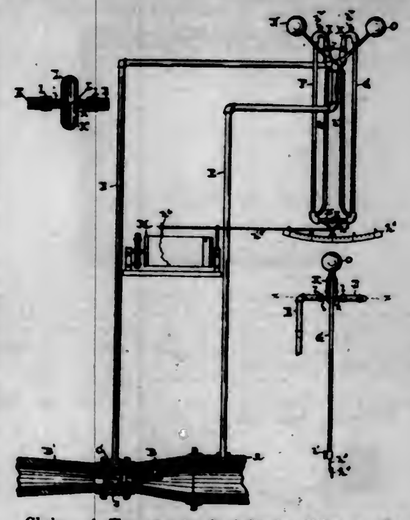
387,875. DEVICE FOR SETTING, GAGING, &c., THE TEETH OF SAWS. William H. Harris, Detroit, Mich. Filed Dec. 1, 1887. Serial No. 256,662. (No model.)

Claim.—1. A sawyer's implement made in flat form, consisting of a plate provided on one edge with a flange, b^1, said flange being recessed to admit the raker-gage B, and on the other edge with saw-sets, a jointer-groove, and an adjustable saw-tooth gage, consisting of a screw, D, moving in and out of a slot, d^5, all substantially as described.

2. A sawyer's implement provided with the flange b^1 and raker-gage B on one edge, and on the other edge with saw-sets, saw-tooth gages, a jointer-groove, and a swage, F, situated in the upper enlarged end of the saw-set C, substantially as described.

387,876. PROCESS OF PREPARING ALUMINIUM-BRONZE AND OTHER ALLOYS. Paul Héroult, Laufen-Uhwiesen, Switzerland. Filed Dec. 27, 1887. Serial No. 258,160. (Specimens.) Patented in France Apr. 15, 1887, No. 170,088; in Belgium Apr. 16, 1887, No. 77,100, and in England May 21, 1887, No. 7,626.

Claim.—1. The herein-described process of producing aluminium alloys by electrolysis in which carbon is the anode, the fused metal to be alloyed with the aluminium the cathode, and the fused alumina without a flux the electrolyte.



2. The herein-described process of producing aluminium alloys by electrolysis in which carbon is the anode, the metal to be alloyed with the aluminium the cathode, and alumina fused without a flux the electrolyte, said cathode and electrolyte being fused and maintained in a state of fusion by the electric current.

3. The herein-described electrolytic process of producing aluminium alloys, which consists in melting and electrolytically decomposing alumina located between a positive electrode of carbon and a negative electrode of the metal with which the aluminium is to be alloyed, said alumina and metal both being melted by the electric current, substantially as set forth.

4. The process of making aluminium alloys, which consists in fusing the metal with which the aluminium is to be alloyed and alumina without a flux to a carbon-crucible, electrically fusing the bath so constituted, and simultaneously electrolyzing the alumina in the presence of the carbon anode and the fused metal.

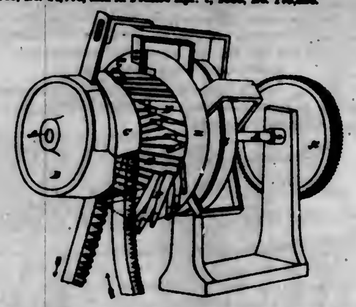
5. The continuous process of making aluminium alloys, which consists in feeding the metal with which the aluminium is to be alloyed and alumina without a flux to a carbon-crucible, electrically fusing the bath so constituted, and simultaneously electrolyzing the alumina in the presence of the carbon anode and the fused metal, and supplying the material and withdrawing the alloy without interruption of the process.

387,877. APPARATUS FOR INDICATING AND RECORDING PRESSURE OR DIFFERENCES OF PRESSURE. Clemens Herschel, Holyoke, Mass. Filed Mar. 30, 1888. Serial No. 268,728. (No model.)

Claim.—1. The apparatus for indicating differences of pressure herein described, consisting of two tubes containing mercury and located upon opposite sides of and equidistant from a common pivotal support, said tubes being in open communication with each other at one end and at their opposite ends being in open communication, respectively, with two sources of pressure, whereby differences of pressure will cause a displacement of the mercury in said tubes, and will thereby cause them to swing upon their pivot, and means, such as a pointer and graduated arc, for indicating the amount of the swinging movement of said tubes, combined and operating substantially as set forth.

2. The apparatus for indicating differences of pressure herein described, consisting of two tubes containing mercury and having open communication with each other at one end, each of said tubes at its opposite end being connected with a tubular trunnion, which trunnions have their axes in one and the same straight line and project laterally in opposite directions, suitable supports for said trunnions, whereby said mercury-tubes are permitted to have a free oscillatory movement thereon, and conduits connecting said trunnions, respectively, with the primary sources of pressure, arranged and operating substantially as set forth.

3. The apparatus for indicating differences of pressure herein described, the same consisting of two tubes containing mercury and having open communication with each other at their lower ends, two hollow arms to which said tubes are rigidly connected at their upper ends, said arms being connected together, but having no internal communication with each other, two tubular trunnions projecting laterally in opposite directions from said arms, respectively, the axes of which trunnions lie in one and the same straight line, two tubes or pipes leading from the respective sources of fluid or liquid under pressure, within the ends of which said tubular trunnions are mounted in such manner as to have a free revolving movement, a pointer connected to said mercury-tubes at or near their lower end, and a graduated arc or



similar device located adjacent to the path of movement of said pointer, combined and operating substantially in the manner and for the purpose set forth.

4. The combination, with two tubes, as D E, having their adjacent ends located in one and the same straight line, of hollow arms I K, shaped substantially as shown and separated internally by partition L, tubular trunnions l^5, projecting laterally in opposite directions from said arms into the ends of said tubes, respectively, stuffing-boxes or similar devices for making a tight joint between said trunnions and tubes, while permitting the former to revolve freely within the latter, tubes F G, depending from said arms I K, said tubes being partially filled with mercury, pipe or tube H, connecting the lower ends of said tubes F G, brace, as A, connecting the lower ends of said tubes with arms I K, pointer k^6, and graduated arc k^7, arranged and operating substantially as and for the purpose described.

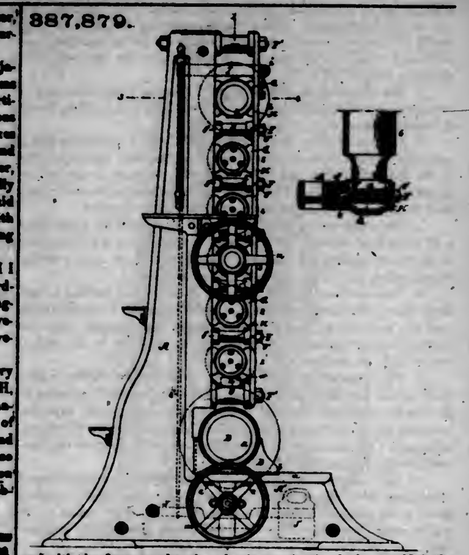
5. The combination, with two tubes, D E, and the gage F G H I K, constructed and operating substantially as described, of a recording apparatus connected to said gage, such as the rod k^5, marking-instrument k^6, and the cylinder M, for imparting a revolving movement to a sheet of paper, whereby a permanent record of the movements of said gage will be made, substantially as set forth.

6. The combination, with two tubes, D E, and the oscillatory gage composed of arms I K, and mercury-containing tubes F G H, applied to and operating in connection with said tubes D E, substantially in the manner described, said gage having the pointer k^6, of graduated arc k^7, having its zero-point located at or near one end thereof, and weights N O, secured to said gage, said weights being so adjusted relatively that said pointer k^6 will stand at the zero-point on said arc when the mercury stands at the same level in tubes F G, substantially as and for the purpose set forth.

387,878. MACHINE FOR MANUFACTURING RUCHING. Charles G. Bell, Arnot Hill, County of Nottingham, England. Filed Sept. 20, 1888. Serial No. 314,962. (No model.) Patented in England Dec. 1, 1885, No. 14,776, and in France Apr. 7, 1886, No. 175,286.

Claim.—1. The combination of the revolving supporting-surface for the frilling or ruching, the cam G, the two sets of fingers, both having a vibrating movement, and the revolving head for carrying the same, one set of the said fingers having also an endwise movement, and means, substantially as described, for causing said endwise movement, whereby the frill is carried down and tucked in beneath the edge of the supporting-surface and so held while it is set in form, substantially as set forth.

2. The combination, in a machine for forming frilling or ruching, of the revolving drum B, the guide C, the revolving head D, the fingers E and F, means for closing the fingers together to embrace the fabric between them, the cam G, and the incline H, substantially as described.



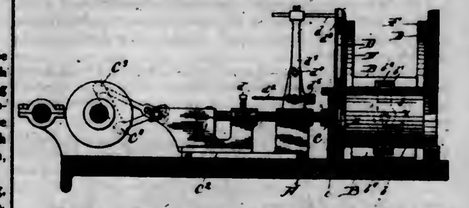
3. The combination of the driving-shaft, the revolving supporting-drum, the guide thereon, the revolving head fixed to the driving-shaft, the fingers F, mounted on the revolving head, means, substantially as described, for giving said fingers a vibratory and an endwise movement relatively to the supporting-drum, the fingers E, mounted on the head, and means, substantially as described, for giving said fingers a vibratory movement relatively to the drum, substantially as set forth.

387,879. CALENDERING-ROLLS. Sylvan A. Hoffman, Wilmington, Del., assignor to the Lobdell Car Wheel Company, same place. Filed Nov. 21, 1887. Serial No. 255,733. (No model.)

Claim.—1. The combination, in a calendering or like machine, of the fixed frames or housings, the series of upper rolls and their boxes, and removable front plates confining said boxes to the frames or housings, all substantially as specified.

2. In a calendering or like machine, the combination of the upper rolls and their supports with the lower roll and its bearing-blocks,

387,879.



and with the frames or housings having projecting beds, on which the bearing-blocks are mounted, said beds being of such length as to allow the roll to be moved outward until it is clear of the upper rolls, all substantially as described.

3. The combination of the vertically-grooved frames or housings, the series of upper calendering-rolls and boxes therefor, plates confining said boxes to the frames or housings, and bolts having heads adapted to the grooves of the frames or housings, and nuts for securing the confining-plates, all substantially as described.

4. The combination, in a calendering or like machine, of the vertical frames or housings, the upper series of rolls, retaining-plates therefor, confining-bolts located between the journals of the rolls, and bearing-boxes having on their under sides flattened faces for the action of lifting-wedges, all substantially as specified.

387,880. CAN-HEADING MACHINE. John G. Rosmus, Haywood, Ill., assignor to Edwin Norton, same place, and Oliver W. Norton, Chicago, Ill. Filed Mar. 30, 1888. Serial No. 268,734. (No model.)

Claim.—1. In a machine for applying the heads or ends to can-bodies, the combination, with a can-body-holding device, of a piston for forcing the head upon the can-body, a can-head-supply chute through the mouth or base of which said piston reciprocates, adapted to guide the can-heads down in front of said piston and between the same and said can-body-holding device, a movable stop for arresting or holding all the can-heads but one in said chute, so that they may feed down one by one, and mechanism for operating said movable stop to release the can-heads in said chute when the piston makes its forward stroke and to arrest or support the can-heads when the piston makes its backward stroke, said piston supporting the can-heads when the same are released by said stop, whereby two or more can-heads are prevented from slipping down at a time between said can-body-holding device and piston, substantially as specified.

2. The combination, with a can-body-holding device, of a piston, a can-head-supply chute, a movable stop, d, a lever, and a pin or projection on the piston for operating said stop d, substantially as specified.

3. The combination, with a can-body-holding device, of a piston, a can-head-supply chute, a movable stop, d, a lever, and a pin or projection on the piston for operating said stop d, and a spring, d^3, substantially as specified.

4. The combination, with a can-body-holding device, of a sliding sleeve at the end thereof projecting to the end of the can-body and adapted to recede as the can-head is forced upon the can-body, substantially as specified.

5. The combination, with a device for forcing a can-head upon a can-body, of a can-body-holding device furnished with a sliding sleeve at its end, substantially as specified.

6. The combination, with a piston for forcing a can-head upon a can-body, of a can-body-holding device furnished with a sliding sleeve at its end, said piston being furnished with a flange or projection adapted to engage said sliding sleeve and push the sleeve in as the can-head is forced upon the can-body, substantially as specified.

7. The combination, with a piston having flanges or projections *c*, of a can-head chute, a can-body-holding device, and a sliding guide or sleeve for guiding the can-head upon the can-body, and a spring for extending said sleeve, substantially as specified.

8. The combination, with a piston or device for forcing a can-head upon a can-body, of a sliding or receding guide, *b*, adapted to fit over the can-body at its end and to recede longitudinally over the car-body as the can-head is forced upon the can-body by the piston, substantially as specified.

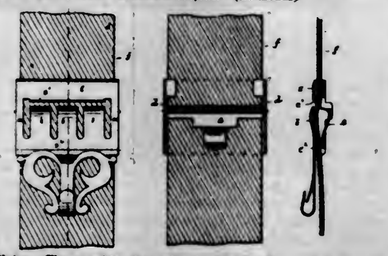
9. The combination, with a piston or device for forcing a can-head upon a can-body, of a sliding or receding guide, *b*, adapted to fit over the can-body at its end and to recede longitudinally over the can-body as the can-head is forced upon the can-body by the piston, said guide *b* having a groove or recess to receive the edge of the can-head flange, substantially as specified.

10. The combination, with a device for forcing a can-head upon a can-body, of a can-body-holding device furnished with a sliding sleeve at its end, said sliding sleeve having a groove or recess at its end to receive the edge of the can-head flange, substantially as specified.

11. The combination, with a two-part mold, B B, of a sleeve, *b*, sliding therein, and a piston, C, substantially as specified.

12. The combination, with a two-part mold, B B, of a sleeve, *b*, sliding therein, and a piston, said sleeve *b* having a groove or recess, *b'*, at its end, substantially as specified.

13. The combination, with a can-body chute, of a two-part mold adapted to open and close, and a movable can-body-supporting finger, as G, for holding the succeeding can while the mold closes upon the same, substantially as specified.



14. The combination, with a can-body-holding device B B, of chute F, movable finger G, rod *g*, having recess *g'*, spring-pin g^2, cam g^4, and spring g^5, substantially as specified.

15. The combination, with a can-body chute, of a two-part can-body-holding device furnished with a movable finger adapted to be retracted to permit the discharge of the can, and furnished with a spring for quickly extending the same to catch the receding can as it falls from the chute, substantially as specified.

16. The combination, with a can-body-holding device, of a piston, C, for applying the heads to the can-body, and a can-head chute, D, said piston C being furnished with a flange or projection, *c*, substantially as specified.

17. The combination, with a can-body-holding device, of a piston for applying the can-head thereto, a can-body chute, F, a movable gate, H, lever-arm *h*, pivoted link *h'*, and cam h^3, substantially as specified.

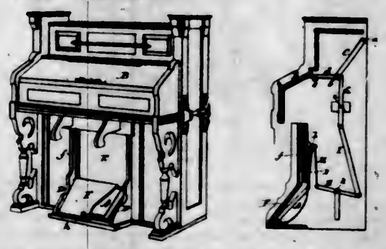
387,881. BUCKLE. FREDERICK W. HOFFMANN, New York, N. Y. Filed June 11, 1883. Serial No. 276,711. (No model.)

Claim.—The combination of a longitudinally and transversely slotted frame, *a*, having an inwardly-turned edge, *c'*, and provided with curved arms *b*, formed on its bar c^2, with the tongue *c*, pivoted to the frame and bearing against the arms *b*, substantially as specified.

387,882. CARPET-FASTENER. ROBERT W. HOWERTON, Dearborn, Mo. Filed May 30, 1888. Serial No. 275,423. (No model.)

Claim.—The molding A, having the groove B in its rear side, the upper edge of the molding being beveled to a sharp edge, C, in combination with the metallic points F, projecting rearward in the groove, the swiveled hooks G, arranged in the groove and having arms H to engage the free ends of the points, and the screws E, passing through downwardly and rearwardly inclined apertures in the molding and engaging the floor near the skirting, whereby the molding is drawn toward the latter and the beveled edge is caused to bite into the skirting to effect a tight joint therewith, substantially as specified.

387,888. AUTOMATIC AXLE-WASHER. CHARLES M. HUBBARD, Columbus, Ohio. Filed Feb. 21, 1888. Serial No. 264,617. (No model.)



Claim.—1. The combination of the spindle, the nut placed upon its outer end, the hub, a box, a sleeve, and a washer, which is operated by the friction of the hub upon the box, and thus made to automatically take up the wear of the parts, substantially as shown.

2. The combination of the spindle provided with a groove, and a nut placed upon its outer end, with the screw-threaded sleeve provided with a stud or projection, the threaded box, and a washer which is operated by the friction of the hub upon the box, substantially as described.

3. The combination of the spindle provided with the flange D, the shoulder B, and a groove in one side of its inner end, the nut, the hub, the sleeve provided with a stud or projection to catch in the groove, and the washer which moves upon the spindle and is operated by the friction of the hub upon the box, substantially as set forth.

387,884. ORGAN-CASE. CHARLES H. RUSSELL, Birmingham, Conn., assignor to the Sterling Company, same place. Filed May 21, 1888. Serial No. 274,480. (No model.)

Claim.—1. In an organ-case substantially such as described, the abutments D D each side the pedal-opening, and between which the pedals A are arranged, the said abutments constructed each with a corresponding groove upon the inner face, said grooves inclined from their lower end to a point near the top of the pedals, thence running vertically outside of and parallel with the front of the case above the pedals, combined with a cover, F, arranged between said abutments, the said cover provided with trunnions *g g* at each end near the upper edge and like trunnions *g g* upon each end near the lower edge, the said trunnions extending into said grooves, and the grooves forming guides in which said trunnions will work, substantially as described, and whereby said cover may be guided in its opening and closing movement.

2. In an organ-case substantially such as described, the combination of the key-board cover B, arranged to slide backward and inward in opening, a pedal-cover, F, arranged between the pedal-abutments of the case, the said abutments each constructed with a groove, *f*, upon its inner face, said grooves inclined from their lower end to a point near the top of the pedals, thence running vertically outside of and parallel with the front of the case, and into which projections from the cover F extend as guides for the movement of the said cover F, a system of levers, substantially such as described, between the said key-board cover B and the said pedal-cover F, substantially as specified, and whereby the opening and closing movement of the key-board cover imparts a corresponding opening and closing movement to the pedal-cover.

387,885. MARBLEIZING WOOD. WILLIAM H. BURNHAM, Bristol, Conn., assignor to The E. Ingraham Company, same place. Filed Apr. 6, 1888. Serial No. 269,852. (No model.)

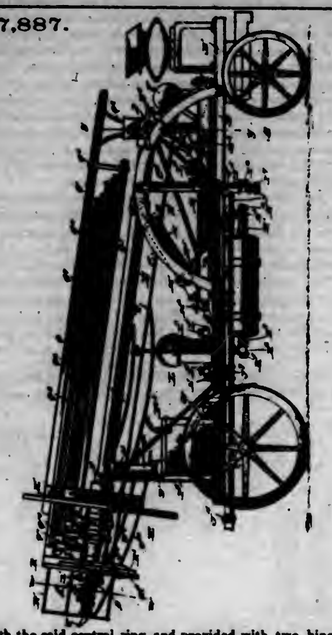
Claim.—1. A process of marbling wood, consisting in first applying a tough and elastic body-coating to the wood and then hardening it by exposing it to intense heat, then superimposing a coat of color upon the said body-coating, with which the colors do not blend, and then applying a coat of transparent varnish over the color, substantially as set forth.

2. A process of marbling wood, consisting in first coating the wood with japan and hardening the same by exposing it to intense heat, then superimposing paints floated upon water upon the said body-coating, with which they do not blend, and finally applying varnish over the paint, substantially as set forth.

3. A process of making marbled wood parts for composite structure, consisting in first coating a blank of wood with japan and then hardening the same by exposing it to intense heat, then superimposing paints floated upon water upon the said body-coating, with which they do not blend, then applying varnish over the marbling-paints, and then cutting the blank into one or more marbled parts, substantially as set forth.

387,886. TRUNK-LID SUPPORT. SUSAN JONES, Oxford, Miss. Filed May 24, 1888. Serial No. 275,015. (No model.)

Claim.—A combined hinge and trunk-lid support consisting of the upper plate, D, having the two end eyes, *d d*, and a middle excision, *d'*, a lower plate, E, having the eye *e* and end strips, *e' e'*, bent at e^2 e^2, and a pintle, F, passing through the eyes *d e d*, all substantially as shown and described.



387,887. COMBINED WATER-TOWER, EXTENSION-LADDER, AND FIRE-ESCAPE. ACHILLES KALMBACH, ROWEN CRIPPEN, and MARION T. CARRIER, New Orleans, La., assignors to said Kalmbach, Crippen, and Joseph Schwartz, same place. Filed Mar. 17, 1888. Serial No. 267,457. (No model.)

Claim.—1. The combination, with telescoping pipes forming a water-tower, of hollow fixed trunnions on which one end of the exterior one of the said telescoping pipes is pivoted, piston-rods pivotally connected with the exterior one of the said telescoping pipes, cylinders containing pistons connected with the said piston-rods, trunnions on which the said cylinders are mounted to swing, and cylinders or tanks charged with a fluid under pressure or chemicals for creating gas, and adapted to be connected with the said cylinders, substantially as shown and described.

2. The combination, with telescoping pipes forming a water-tower, of hollow fixed trunnions on which is pivoted one end of the exterior one of the said telescoping pipes, and pipes provided with valves connected with the said hollow trunnions, substantially as shown and described.

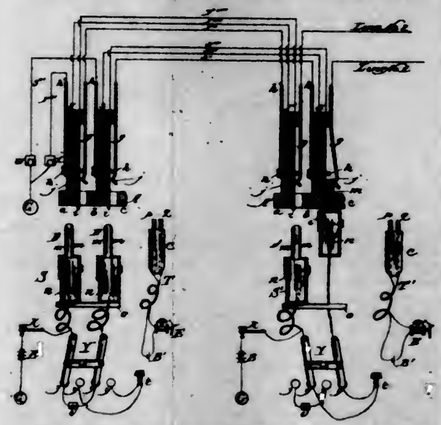
3. The combination, with telescoping pipes forming a water-tower, of hollow fixed trunnions on which is pivoted one end of the exterior one of the said telescoping pipes, piston-rods pivotally connected with the lower end of the exterior one of the said telescoping pipes, cylinders mounted to swing and containing pistons connected with the said piston-rods, pipes provided with valves connected with the said fixed trunnions, and a turn-table on which the said trunnions and the said cylinders are mounted, substantially as shown and described.

4. The combination, with a truck provided with a platform, of a central ring secured on the said platform, an outer ring held concentric with the said central ring and provided with two hinged parts, extension-legs held on the said hinged parts of the exterior ring, and a turn-table mounted to turn on the said concentric rings, substantially as shown and described.

5. The combination, with a truck supporting at its front end two concentric rings and at its rear end a yielding fork, of a turn-table mounted to turn on the said concentric rings, fixed hollow trunnions held on the said turn-table, pipes leading to the said hollow trunnions from the centers of the said concentric rings, telescoping pipes forming a water-tower, of which pipes the exterior one is secured at its lower end on the said trunnions, its upper end resting on the said yielding fork, and an extension-ladder made in sections supported on the said telescoping pipes, substantially as shown and described.

6. The combination, with a truck supporting at its front end two concentric rings and at its rear end a yielding fork, of a turn-table mounted on the said concentric rings, fixed hollow trunnions held on the said turn-table, pipes leading to the said hollow trunnions from the centers of the said concentric rings, telescoping pipes forming a water-tower, of which pipes the exterior one is secured at its lower end on the said trunnions, its upper end resting on the said yielding fork, an extension-ladder made in sections supported on the said telescoping pipes, piston-rods pivotally connected with the exterior one of the said telescoping pipes, and a cylinder mounted to swing on the said turn-table and containing pistons connected with the said piston-rods, substantially as shown and described.

7. The combination, with a truck provided in its front with two concentric rings and at its rear with a yielding fork, of a turn-table held to turn on the said concentric rings, hollow trunnions held on the said turn-table, pipes connected with the said hollow trunnions and extending to the centers of the said concentric rings, telescoping pipes forming a water-tower, and of which pipes the exterior one is fulcrumed on the said trunnions, the upper end of the said exterior pipe resting in the yielding fork, a second fork engaging the upper end of the said exterior pipe, a piston-rod connected with the said second fork and carrying a piston, a cylinder in which operates the said piston, said cylinder being connected by a pipe with a source for supplying a liquid or gas under pressure, substantially as shown and described.



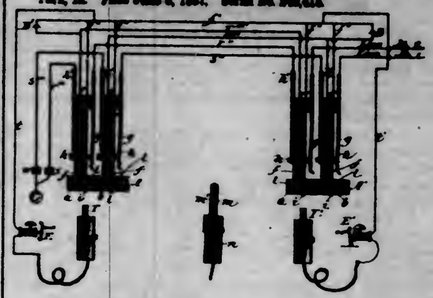
8. Telescoping pipes, of which the exterior one has its lower end fulcrumed, platforms held at the upper ends of the said exterior and the central telescoping pipes, arms secured to the outer ends of the said telescoping pipes, an extension-ladder made in sections supported at their upper ends on the said platforms and the said arms, brackets formed on the fulcrumed end of the said exterior pipe and supporting one of the sections, and an arm secured to the end of the next to lowermost section and sliding on the lowermost section of the said ladder, substantially as shown and described.

9. Telescoping pipes, of which the exterior one has its lower end fulcrumed, platforms held at the upper ends of the said exterior and the central telescoping pipes, arms secured to the outer ends of the said telescoping pipes, an extension-ladder made in sections supported at their upper ends on the said platforms and the said arms, brackets formed on the fulcrumed end of the said exterior pipe and supporting one of the sections, an arm secured to the lowermost section and through which the uppermost section of the said ladder freely passes, staples secured to the sections of the said ladder, and guide-rods passing through the said staples and secured to the succeeding section of the ladder, substantially as shown and described.

10. The combination, with telescoping tubes forming a water-tower, of a T held on the upper end of the central telescoping tube, a valve held on the said T, and a nozzle extending from the said T in such a manner that the said valve controls the outflow of the said T and the said nozzle, substantially as shown and described.

11. The combination, with telescoping tubes forming a water-tower, of a platform held at the outer end of the central telescoping tube, said platform being provided with a hinged part adapted to be folded upon the said platform, and beams held to slide on the under side of the said platform, substantially as shown and described.

387,888. MULTIPLE SWITCH-BOARD. Milo G. Kellogg, Hyde Park, Ill. Filed May 31, 1887. Serial No. 239,942. (No model.)



Claim.—1. A spring-jack switch containing a contact point or piece, a spring-lever normally bearing on said contact-point, and two insulated contact-pieces, all mounted on an insulating-strip, said lever being transverse to the front of said strip, said strip having through its front a transverse rectilinear hole in front of said lever, said insulated contact-pieces being mounted on one of the faces of said hole and adapted to be crossed with each other by the insertion of the switch-plug, substantially as set forth.

2. A spring-jack switch containing a contact point or piece, a spring-lever normally bearing on said contact-point, and two insulated contact-pieces, all mounted on an insulating-strip, said lever being transverse to the front of said strip, said strip having through its front a transverse rectilinear hole in front of said lever, said insulated contact-pieces being mounted on one of the faces of said hole and extending to or near the front of said hole, substantially as and for the purpose set forth.

3. In a multiple switch-board, the combination of a series of line-switches, a series of test-bolts, one pair for each switch, insulated from each other and from the switch, continuous circuit-connections between the similar test-bolts of the different boards, circuit-connections between the switches, plugging devices for connecting the subscribers' lines at the switches and for simultaneously crossing the test-bolts at the plugged switch, the test-plug having double contacts adapted to close the test-circuit through the pair of test-bolts at the tested switch and through both contacts of the test-plug, and a loop-circuit, including a battery and signal, connected with both contacts of the test-plug and adapted to be closed through the contacts of the plug, whereby a test-circuit is established through the test-bolts at both the plugged switch and the tested switch and through both contacts of the test-plug and the signal-circuit connected therewith, substantially as set forth.

4. In a multiple switch-board, the combination of the main lines, a series of switches at each board for each line, a pair of normally-closed contact-pieces at each switch for each line, a pair of test-bolts, *i* and *j*, at each switch, continuous connecting-wires *f''* for the bolts *i*, and continuous connecting-wires *f'''* for the bolts *j*, a switch-plug having two parallel insulated contact-pieces adapted to open the main-line contacts at the plugged switch and connect one of them with one contact-piece of the plug and to cross the test-bolts at the plugged switch, and a test-plug having double contacts adapted to close the test-circuit through the pair of test-bolts at the tested switch, and a loop-circuit connected with the contacts, including a battery and signal, substantially as set forth.

387,889. MULTIPLE SWITCH-BOARD. Milo G. Kellogg, Hyde Park, Ill. Filed June 6, 1887. Serial No. 240,413.

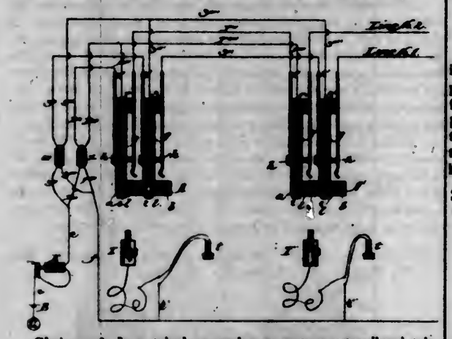
Claim.—1. In a telephone-exchange system, two or more multiple switch-boards to which the same telephone-lines are connected, local test-circuits having a pair of contact-points or test-bolts at the switches, one test-circuit for each line, each test-circuit containing a battery and connected to each board on each side of the battery, and said battery being normally open, and a switch-plug having insulated contacts crossing the test-bolts at the connected switches for automatically shunting the test-circuit around a tested switch through a line of less resistance when the main line is switched for conversation at another switch, in combination with a test-receiving instrument connected on one side to each test-circuit at one side of the battery, and a test-plug whereby the operator may at will connect the test-receiving instrument on its other side to any test-circuit at the other side of the battery, substantially as and for the purpose set forth.

2. In a telephone-exchange system, the combination of two or more multiple switch-boards for telephone-lines with series of switches, one switch for each telephone-line, and one switch of each series being on each board, circuit-closers, one circuit-closer for each switch, each circuit-closer being closed automatically by the insertion of a plug in its switch, local test-circuits, each test-circuit containing a test-battery and two contact-pieces and connected on the two sides of its battery to the two contact-pieces, respectively, of each of its circuit-closers on the several boards, a test-receiving instrument at each board, and switch-testing devices whereby the operator at any board may at will connect her test-receiving instrument into circuit with either of said test-circuits, the connection with said circuit being on the two sides of its test-battery, substantially as and for the purpose set forth.

3. In a telephone-line switch, the combination of the main-line contacts *g* and *h*, a pair of contact-points which are closed on the insertion of a switch-plug and opened on its withdrawal, said contact-points being mounted on one of the inner faces of the plug-hole and insulated from the contacts *g* and *h*, and one of said contact-points being also a test-plate for the line to which a test-plug may be applied, substantially as set forth.

4. A spring-jack switch containing within the plug-hole two main-line contact points or pieces which are normally in contact with each other, in combination with a pair of test-bolts arranged within the plug-hole on one of the inner faces of the plug-hole and insulated from each other and from the main-line contact-pieces, and a switch-plug having two parallel insulated contact-pieces, said plug being adapted, when inserted into the switch, to disconnect the main-line contact-pieces from each other and connect one of them to one of the contact-pieces on the plug and to cross the two test-bolts through the other contact-piece of the plug, substantially as set forth.

5. In a telephone-exchange system, multiple switch-boards provided with series of switches, one switch for each telephone-line, and one switch for each series arranged on each board, local-circuit closers, one circuit-closer for each switch, and each comprising separate contacts, whereby it is closed automatically by the insertion of a switch-plug into its switch, test-plates arranged one for each switch, each test-plate being one of the contact-points of the circuit-closer of its switch, or connected thereto, local test-circuits, one for each line, each test-circuit containing a test-battery and connected on the two sides of its battery to the two contact-pieces, respectively, of each of its



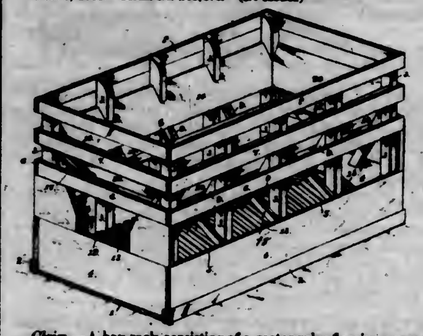
circuit-closers on the several boards, a test-receiving instrument at each board, and a plug for each test-receiving instrument, said plug being connected with a flexible conducting-cord to one side of the test-receiving instrument and adapted at the will of the operator to be brought into connection with any of the test-plates at her board, and the test-receiving instruments being connected on their other side with said local test-circuits with their batteries between the instruments and their test-plates, substantially as and for the purpose set forth.

6. In a telephone-exchange system, the combination of two or more switch-boards, the main lines and main-line circuits between the boards, the test-circuits, one for each line, including all the boards, a battery in every test-circuit, a common test-wire connected with all the test-circuits, test devices connected with said common test-wire, and test-bolts at each switch included in the test-circuits, substantially as set forth.

7. In a telephone-exchange system, the combination of test-circuits, the test-bolts at each switch connected with the test-circuit, a test-plug connected with a signaling device and with all the test-circuits at one end and adapted to close a circuit through the signaling device when the line is not switched, and circuit-connections of comparatively low resistance between the test-circuits at one board with the test-bolts at the other boards, whereby the test-circuit at the tested board is short-circuited when the line is switched at another board.

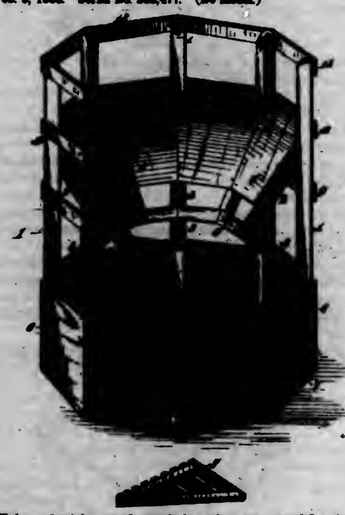
8. In a telephone-exchange system, the combination of the contact-pieces *f f* at the several switches, the common test-wire *f''* and branches *f'''*, which connect them, the contact-pieces *i* at the several switches, electrical connections between all the pieces *i* in a given line, a battery in each test-circuit, and a test plug and signal, substantially as set forth.

387,890. MULTIPLE SWITCH-BOARD. Milo G. Kellogg, Hyde Park, Ill. Filed Aug. 20, 1887. Serial No. 247,948. (No model.)



Claim.—1. In a telephone-exchange system, subscribers' telephone-lines normally grounded at the central office and grounded at their other ends, two or more switch-boards at the central office for said lines, each board having a switching device for each line, each switching device being adapted to temporarily disconnect its line from the office-ground and to connect the line with another line for conversation, a battery, and an automatic vibrator, or their equivalent, in the common ground-wire of said lines, induction-coils, one for each of said lines, one of the coils of each of said induction-coils being in the circuit of its line, individual test-wires, one for each line, in the circuit of each of which is the other coil of the induction-coil of the line, test-bolts, one for each of said lines on each of said boards, to each of which the individual test-wire of its line is connected on one side of its coil, a common or return wire to which said individual test-wires are connected on the other sides of the coils, and branch test-wires, one for each board, each having in its circuit a telephone or other test-receiving instrument, each branch wire being connected on one side of its test-receiving instrument to said common or return wire, and being connected on the other side to a flexible cord with a test-plug or other switch-testing device adapted to be brought into connection with any test-bolt at its board, whereby an operator at any board may connect her test-receiving instrument into a circuit with the test-wire of any line and determine whether the line is in use.

2. In a telephone-exchange system, telephone-lines connected to two or more switch-boards and adapted to be switched at either of them, induction-coils, one for each line, one coil of which is in the circuit of its line and the other coil of which is in an independent test-wire for said line, an intermittent electric-current producer in the circuit of each of said lines when it is not switched for conversation, but not otherwise, test-receiving instruments, one at each board, and switch-testing devices whereby any test-receiving instrument may at the will of an operator be placed in circuit with any of said test-wires, and she may thereby determine whether the line which belongs to said test-wires is switched for conversation.



3. In a telephone-exchange system, a telephone-line, a local test-circuit for said line, an induction-coil for said line, one coil of which is in the main line and has an intermittent current passing through it when it is not switched for conversation, and the other coil of which is in said local test-circuit, a switching device or devices adapted at the will of an operator to switch said line for conversation, and while the line is so switched to cut off said intermittent current from said coil, a test-receiving instrument, and a switch-testing device or devices adapted to close said test-receiving instrument through said local test-circuit, substantially as and for the purpose set forth.

387,891. FEED-RACK. George W. Lisby, Gallatin, Mo. Filed Feb. 9, 1888. Serial No. 263,676. (No model.)

Claim.—A hay-rack consisting of a rectangular flooring supporting upon two of its opposite sides a series of vertical posts, each being provided about midway of its length, upon its inner side, with a bracket formed of two oppositely-inclined and meeting parts, a boarding supported by the inclined parts of said brackets, constituting a rest for the hay and an open throat, and an outer inclosing-boarding secured to said posts and provided with openings beneath the throat of the hay-support, as set forth.

387,892. FEED-RACK. George W. Lisby, Gallatin, Mo. Filed Feb. 9, 1888. Serial No. 263,677. (No model.)

Claim.—1. A hay-rack consisting of an octagonal flooring having vertical posts rising from its angles, a series of brackets composed of inclined arms 2, and diagonal braces 3, mounted on said posts and connected to said arms, a boarding, 5, attached to said arms, and a railing, 4, said boarding forming a downwardly-contracted support for the hay having an open throat raised above the floor, and an outer inclosing-boarding rising to a point below the throat of the rack and forming in conjunction with the vertical posts feed-openings, from which the

hay depending from the throat may be reached by the stock, substantially as described.

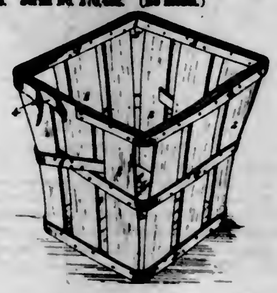
2. In a hay-rack, an octagonal flooring covered by triangular sections of slat-work 8, a series of vertical posts, 1, rising from the angles of the floor, a series of brackets composed of inclined arms 2 and braces 3, supported by the posts, an inner boarding, 5, and railing 4, inclosing the rack and forming a contracted open throat, said rack being raised above the floor, an outer boarding, 6, and rails 9, forming, in conjunction with the posts 1, feed-openings lying partly below the throat of the rack, from which the hay depending from the open throat may be reached by the stock, substantially as described.

387,893. CARRIAGE-TOP-PROP BLOCK. AUGUSTUS A. LINES, Homer, N. Y. Filed Apr. 20, 1888. Serial No. 271,970. (No model.)

Claim.—1. The combination, with the seat-rail arm, of a shell mounted on said arm and provided with a perforated head, a ring having a square perforation, a coil-spring the ends of which are secured, respectively, to the shell and ring, a lever for operating the shell, and the brace E, detachably secured to the head of the shell, substantially as set forth.

2. The combination, with the seat-rail arm and the top-braces, of a shell having a perforated head provided with a rim having a cut-out portion adapted to receive one end of the brace E, a ring provided with a square perforation, said ring fitting into one end of the shell, a coil-spring the ends of which are secured, respectively, to the shell and ring, and a lever for operating the shell to raise and lower the top, substantially as specified.

387,894. COMBINED BITT AND DECK-PIPE FOR VESSELS. FRANK S. MARTON, Providence, R. I. Filed May 14, 1888. Serial No. 273,886. (No model.)

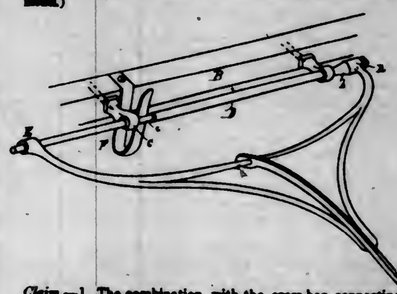


Claim.—1. A cast-iron windlass-bitt provided with a deck-pipe integral therewith, substantially as described.

2. A cast-iron windlass-bitt having a laterally-projecting flange and a deck-pipe rising from said flange and integral therewith, substantially as described.

3. The cast-iron windlass-bitt A, provided with the flange *a*, the deck-pipe E, rising from said flange, and the web E', uniting the deck-pipe and the bitt, substantially as described.

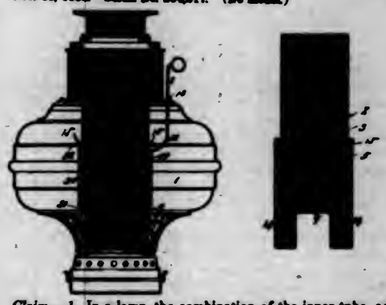
4. The combination, with the deck of a vessel, having the hole F, of a cast-iron windlass-bitt provided with a deck-pipe integral therewith and registering with the hole, the under surface of the bitt and deck-pipe being planed smooth and coated with cement, substantially as described.



387,895. FRUIT-BASKET. JOSHUA H. MARVIL, Laurel, Del. Filed Apr. 12, 1888. Serial No. 270,492. (No model.)

Claim.—1. A polygonal fruit-basket comprising the vertical strips 2, flared outwardly at their upper portions, the top outer rim, 4, having parallel sides and bent corners and composed of a series of thin veneers lying one upon another, and the central hoop, 6, having overlapping portions extended upward in opposite directions and passed between and behind two of the vertical strips, substantially as described.

2. A fruit-basket comprising a wooden bottom block, a series of outwardly-flaring vertical strips nailed to said bottom, the inner and outer top rims and the central hoop having overlapping end portions and each secured to one vertical strip and extended upwardly and bearing upon and each secured to the two adjacent vertical strips, substantially as described.



387,896. SHIFTING-BAR FOR SLEIGHS. ALEXANDER T. MCDONEL, Lansing, Mich. Filed Dec. 12, 1887. Serial No. 257,644. (No model.)

Claim.—1. The combination, with the cross-bar connecting the runners, and the draft-eyes secured thereto and provided with eyes in their free ends, of a combined shifting and coupling rod engaging into the eyes of the draft-irons and into the coupling-eyes of the shafts, and formed with a notch, as shown, the means for detachably securing one of said coupling-eyes to one end of said coupling, and a locking-spring secured to the cross-bar and engaging said notch to hold the coupling-rod in its adjusted position, substantially as described.

2. The combination, in a shifting-bar for cutters, of the draft-irons C, provided with eyes, the combined shifting and coupling rod D, slidingly engaging into the eyes of the draft-irons, the coupling-eyes E of the shafts detachably engaging with said rod, and the nut *a*, and tapered head *b*, for detachably securing one of said eyes, and the spring F, all arranged to operate substantially as described.

387,897. LAMP. FERDINAND MEYBERG, St. Louis, Mo. Filed Feb. 16, 1888. Serial No. 264,317. (No model.)

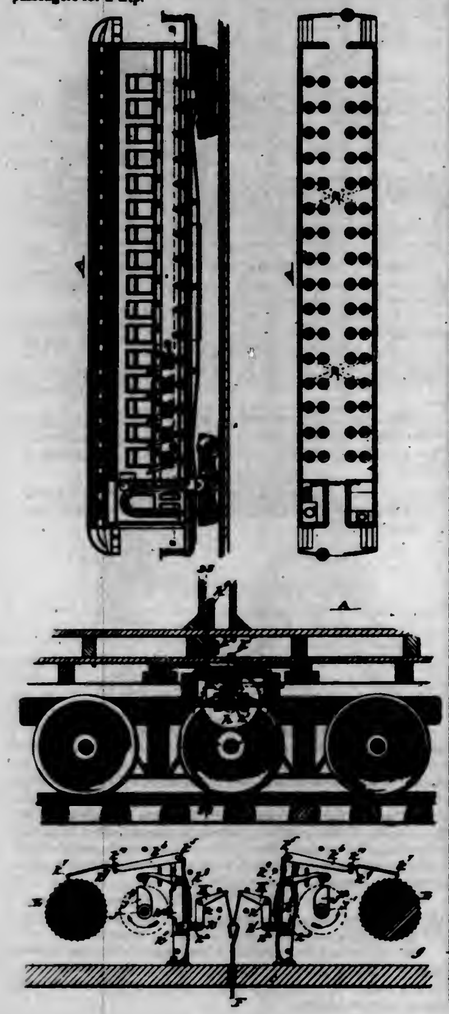
Claim.—1. In a lamp, the combination of the inner tube, adjustable sleeve on the tube, wick secured to the sleeve, and an arm connected to the sleeve and bearing against the body of the lamp to hold the sleeve to its adjustment, substantially as and for the purpose set forth.

2. In a lamp, the combination of the inner tube, sleeve fitting over the tube, wick secured to the sleeve, and a spring-arm secured to the sleeve and bearing against the body of the lamp to hold the sleeve to its adjustment, substantially as and for the purpose set forth.

3. In a lamp, the combination of the inner tube, sleeve fitting over the tube, wick secured to the sleeve, and an arm hinged to the sleeve, the arm having a straight portion above and below a bent portion, 12, substantially as and for the purpose set forth.

4. In a lamp, the combination of the inner tube, sleeve fitting over the tube, wick fitting over the sleeve, a ring provided with a hook and eye for securing the wick to the sleeve, and an adjusting-arm secured to the sleeve, substantially as and for the purpose set forth.

5. In a lamp, the combination of the inner tube, sleeve fitting over the tube, wick fitting over the sleeve, a metallic ring provided with a hook and eye for securing the wick to the sleeve, and an adjusting-arm to which the ring is secured, substantially as and for the purpose set forth.



6. In a lamp, the combination of the inner tube, sleeve fitting over the tube, wicks 14, secured to the sleeve by a ring, 15, and an adjusting-arm secured to the sleeve, substantially as and for the purpose set forth.

7. In a lamp, the combination, with the central tube, 2, of the sleeve 3, wick 4, arm 8, hinged to the sleeve, and ring 5, carried by arm 8, and having hook and eye 6 7, for securing it around the wick, as described.

8. The combination, with the reservoir having central tube, 2, of the sleeve 3, carrying wicks 4 14, and having adjusting-arm 8, hinged on one side and carrying ring 5, for securing wick 4, and arm 20, hinged on the other side, carrying ring 18, for supporting the feed-wicks 14, substantially as set forth.

387,898. RAILWAY-PASSENGER MILEAGE-REGISTER. OSCAR E. HERMANN, St. Louis, Mo. Filed Feb. 20, 1888. Serial No. 264,842. (No model.)

Brief.—Operated by the wheels of a passenger-car and connected with the seats, so as to register the total mileage of full and half fare passengers for a trip.

387,898.

Claim.—1. In a railway passenger-car, the combination of a mileage-register and a car-seat provided with a movable part, and a connection leading from such movable part to said register, substantially as described.

2. The combination of a passenger-car, a mileage-register, and a train of gearing connecting the car-axle with the mileage-register, substantially as described.

3. The combination, in a railway passenger-car, of a mileage-register, a car-seat provided with a movable part, a connection leading from such movable part to said register, and a train of gearing connecting the car-axle with said register, substantially as described.

4. A railway passenger-car seat provided with one or more arms which can be turned downward to narrow the car-seat, in combination with a mileage-register and a connection leading from said register to a movable part in said car-seat, substantially as described.

5. A railway passenger-car seat provided with the arms b^3, in combination with a mileage-register and a connection leading from said register to a movable part in said car-seat, substantially as described.

6. A railway passenger-car seat provided with the arm b^3, in combination with a mileage-register and a connection leading from said register to a movable part in said car-seat, substantially as described.

7. A railway passenger-car seat provided with the arms b^3 and the arm b^4, in combination with the mileage-register and a connection leading from said register to a movable part in said car-seat, substantially as described.

8. The combination of the chair-back, the fixed arm *b*, the arm b^3, and the guard b^4, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

9. The combination of the chair-seat, the chair-back, the arm b^3, and the arm b^4, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

10. The combination of the chair-seat, the chair-back, the arm b^3, and the arm b^4, having the catch b^{20}, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

11. The combination of the chair-seat, the chair-back, the arm b^3, the gears b^9 b^{10} b^{11} b^{17}, the shaft b^{19}, and the rack-bar b^{18}, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

12. The combination of the chair-back, the chair-seat, the arm b^3, the pinion b^{17}, and the rack-bar b^{18}, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as and for the purpose set forth.

13. The combination of the chair-seat, the fixed side arm, *b*, and the adjustable guard b^4, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

14. The combination of the chair-seat, the chair-back, the arm b^3, the pinions b^{17} b^{20}, the rack-bar b^{18}, and the shaft b^{19}, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

15. The combination, in the car-seat, of the notched rack-bars b^{18} and the locking-bar E, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

16. The combination, in the car-seat, of the rack-bars b^{18}, the locking-bar, the key *d*, and the spring *c*, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

17. The combination, in the car-seat, of the arm b^3, the pinion b^{20}, the shaft b^{19}, the lug b^{22}, the arm C, the pinion b^{17}, and the rack-bar b^{18}, and the mileage-register, and a connection leading from said register to a movable part in the car-seat, substantially as described.

18. The combination of the shaft b^{19}, the lug b^{22}, the arm C, the lever *c*, the bearing *c'*, and the rod D, substantially as described.

19. The combination of the car-seat and the vertically-movable rod D, substantially as and for the purpose set forth.

30. The combination of the car-seat, the vertically-movable rod D, and the cord E, as described.

31. The combination of the car-seat, the vertically-movable rod D, and the cord F, substantially as described.

32. The combination of the car-seat, the vertically-movable rod D, and the cords E and F, substantially as described.

33. The combination of the arm h^3, the rack-bar h^{12}, the shaft h^{10}, the lug h^{20}, and the journaled spring-bar c^3, substantially as described.

34. The combination of the shaft h^{10} h^{10}, the lugs h^{20} h^{20}, the journaled spring-bar c^3, the lever c, the arm C, and the rod D, substantially as described.

35. The rod D, held freely in the lever c, to enable the car-seat to be rotated around the said rod, substantially as described.

36. The combination of the car, the car-seat, the rod D, the cord E and its bearings, and the spring c^2, and sign c^3, substantially as described.

37. The combination of the car, the car-seat, the rod D, the cord F and its bearings, and the mileage-register, substantially as described.

38. The combination of the car, the pinions H H, the gears h h, the shaft h', the pinions h^2 h^2, the shaft h^3, the pinion h^7, the gear h^8, and the shaft h^9, substantially as described.

39. The combination of the car-body, the car-truck, the elongated pinion h^7, and the gear h^8, substantially as described.

40. The combination of the shaft h^9, the gear h^{11}, the shaft I, the pinions i' i^2 i^3, and the pinions J j^4, substantially as and for the purpose described.

41. The combination of the car and the mileage-register, said register being in duplicate, as and for the purpose described.

42. The cam-shaft j, provided with the cams j^3, set around said shaft, as described.

43. The combination of the cord F, the bell-crank K, the link k^9, the arm k^4, the cam-shaft j, and the cam j^3, as described.

44. The combination of the bell-crank K, the link k^9, the arm k^4, the spring-hook k^6, the spring k^5, the ratchet-drum L, the cam-shaft, and the cam, substantially as described.

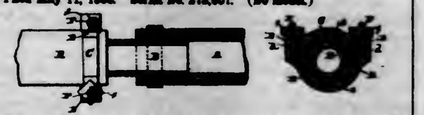
45. The combination of the spring-hook k^6, the bearing k^{10}, and the ratchet-drum, substantially as described.

46. The combination of the bell-crank K, the link k^9, and the pivoted arm k^4, as and for the purpose described.

47. The combination of the ratchet-drum and the spring-hook, substantially as described.

48. The combination of the lever M, the link k^9, the hook m^3, the shoulder m^4, the pivoted arm m^6, the spring m^5, and the cam-shaft and cam, substantially as described.

49. The combination of the arm m^6, the rod m^7, the lever m^8, the link m^{10}, the pawl m^{11}, the ratchet m^{12}, and the ratchet-drum L, substantially as described.



50. The combination of the ratchet-drum L, the ratchet m^{12}, the pawl m^{11}, and the spring-hook k^6, substantially as described.

51. In the mileage-register, the joint k', made movable toward and from the cam-shaft, as and for the purpose described.

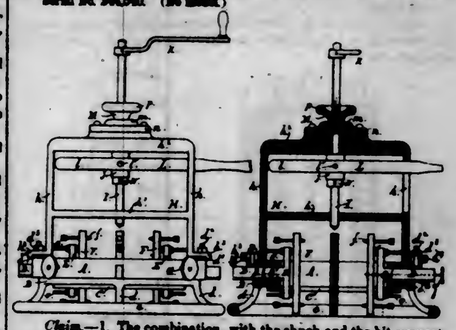
52. The combination of the spring-hook k^6 and the adjustable stop N, as and for the purpose described.

53. The combination of the cam-shaft j, the train O, and the dial o, hands o', and graduations, substantially as described.

387,899. HOSE-COUPLING. James Miller, South Bend, Ind. Filed May 11, 1883. Serial No. 273,607. (No model.)

Claim.—The combination of the hose-sections and the sleeve B, engaging the same, with the yoke C, having perforated shoulders D, the clip E, having a curved portion, e, screw-threaded lugs F, passed through the perforations in shoulders D, and nuts f, all constructed and arranged substantially in the manner and for the purpose described.

387,900. PACKING FOR PISTON-RODS. Chauncey W. Hulls, Rochester, N. Y. Filed Mar. 24, 1888. Serial No. 268,407. (No model.)



Claim.—1. The combination of the piston-rod, stuffing-box, and gland-bushing with the sleeve on said rod, the head F, conically recessed on its front face and radially slotted through the walls of such recessed portion, to permit the expanding thereof, and the interposed packing between said head and bushing, all constructed and arranged substantially in the manner and for the purpose described.

2. In a piston-rod packing, the combination of the gland-bushing, stuffing-box, and piston-rod, with the spring-controlled, conically-recessed, and slotted head F, the sleeve E, extending into the cylinder, and packing I, all constructed and arranged substantially in the manner and for the purpose specified.

3. The combination of head A, box B, rod C, and the gland-bushing, substantially as described, with the sleeve E, projecting into the cylinder, the slotted expansive head F, conically recessed in its front face and united to said sleeve, the spring G, and packing I, all constructed and arranged to operate substantially in the manner and for the purpose described.

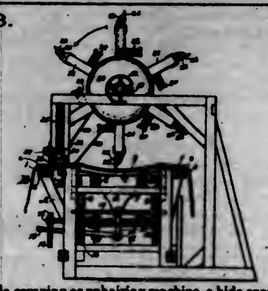
387,901. CENTERING-MACHINE. Simon B. Mumma, Lewisville, Pa., assignor to Jacob M. Grider, same place. Filed July 16, 1887. Serial No. 244,540. (No model.)

Claim.—1. The combination, with the chuck and the bit-supporting frame, of means for adjustably securing said frame to the face of the chuck, for the purpose specified.

2. The combination, with the chuck and the bit-supporting frame projecting in front of the face thereof, of arms h^3, projecting from the bars h of the supporting-frame, channels formed on said chuck and arranged to receive the arms h^3, and means for adjustably securing said arms in the channels, substantially as and for the purpose specified.

3. The combination, with a chuck having a tool-supporting frame attached thereto, of the screws G, passing through the body of said chuck to prevent longitudinal movement of the same, substantially as specified.

387,902. DEVICE FOR VENTING BARRELS. William Hutton and Emil Beyer, Newark, N. J. Filed Nov. 3, 1886. Serial No. 217,763. (No model.)



Claim.—In a vent, the combination of an angular portion, a, having a tapering portion adapted to be driven into a barrel, and a chamber into which the duct in said tubular portion opens, a portion, b, adapted to be secured to said portion a, forming a handle, c, which projects at right angles from said tubular portion, and provided with a raised portion having an opening therethrough and projecting into the chamber in the portion a, leaving a space therein, a valve arranged in said space and covering the opening in said raised portion, a packing-washer, and a fastening device, d, for holding said separable portions together, for the purposes set forth.

387,903. HIDE-SCRAPING MACHINE. August Utz, Milwaukee, Wis. Filed May 9, 1888. Serial No. 273,205. (No model.)

Claim.—1. In a hide scraping or unhairing machine, one or more rotating knives or scrapers, 25, in combination with a laterally-moving hide-supporting carriage, 2, and a vertically-moving bed-plate, 5, substantially as described.

887,903.

2. In a hide scraping or unhairing machine, a hide-supporting carriage, 2, adapted to travel laterally on ways thereof, in combination with an independent vertically-moving bed-plate, 5, for supporting the hide centrally while on the carriage 2, substantially as described.

3. In a hide scraping or unhairing machine, a series of rotating knives or scrapers, in combination with a carriage, 2, for supporting the hide, which carriage travels laterally on ways at right angles to the line of motion of the rotating knives, substantially as described.

4. In a hide-scraping machine, a movable frame, 7, in combination with latches 9 9, the springs 10 10, and means for tilting the latches against the resistance of the springs 10 10, substantially as described.

5. In a hide-scraping machine, the combination of a series of rotating knives and a hide-supporting bed-plate with the horizontal pressure-rollers 28 and 32, the roller 32 having its bearing at one end in a pivoted block, 33, and at the other end in a vertically-moving and adjustable block, 34, whereby said roller may be tilted and adjusted, substantially as described.

6. In an unhairing-machine, a series of radial arms, 21 21, in pairs on a rotating shaft, and the yokes 22 22, one yoke being secured adjustably to each pair of arms, substantially as described.

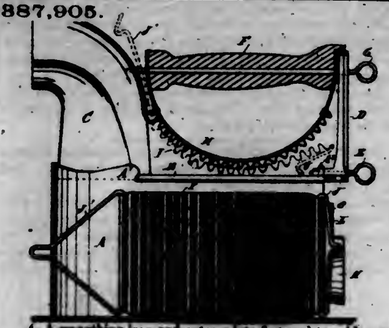
7. In a hide scraping or unhairing machine, the scraper carrying yokes 22 22, pivoted to the radial arms of a shaft and secured adjustably thereto by the bent arms 23 23 and set-screws 24 24, substantially as described.

8. In a hide scraping or unhairing machine, the frame 7 and lever 15, the inner end of which is connected to the bed-plate, in combination with the latches 9 9, springs 10 10, rods 11 11, tilting levers 12 12, rock-shaft 13, and pedal 14, all substantially as described.

9. In a hide scraping or unhairing machine, the combination of the bed-plate 5, springs 6 6, movable frame 7, and latches 9 9, substantially as described.

387,904. VACUUM-APPARATUS COUPLING. Hollan H. D. Parker, Chicago, Ill. Filed May 10, 1887. Serial No. 237,787. (No model.)

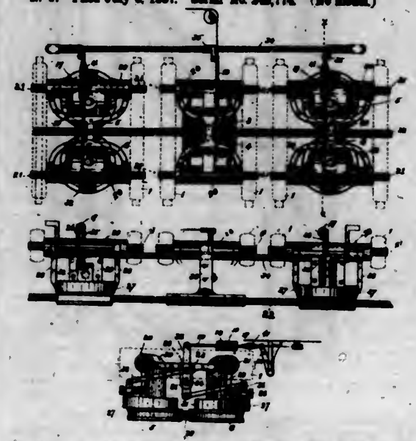
Claim.—In an apparatus for vacuum treatment, the combination of beveled ring A, having web a thereon extending to ring A' and secured thereto, with beveled ring B, having a like bevel and fitting into beveled ring A, all substantially as described, and for the purpose set forth.



387,905. SAD-IRON. Horace S. Pease, Cincinnati, Ohio. Filed Oct. 4, 1887. Serial No. 251,422. (No model.)

Claim.—1. The combination, with the smoothing-iron A, having the detachable handle F, provided with a fluter, of the detachable transversely-corrugated elastic sheet-metal plate I, having hooks at its ends, one hook to engage the smoothing-iron at its heel, and the other hook adapted to snap around the wedge-shaped toe of the iron, the elasticity of the plate when in use drawing the two hooks toward each other and holding it in place, substantially as set forth.

2. In a smoothing-iron, the removable transversely-corrugated sheet-metal plate I, having pivoted hooks J J' at its ends, the elasticity of the plate serving when in use to draw the hooks toward each other, substantially as set forth.



3. The combination, with the end-iron of the character described, having a pivoted draft-plate at its rear end provided with cross-bars, of the sheet-metal fluting-plate having hooks at its opposite ends to engage one of said cross-bars and the front end of the iron, substantially as set forth.

887,905.

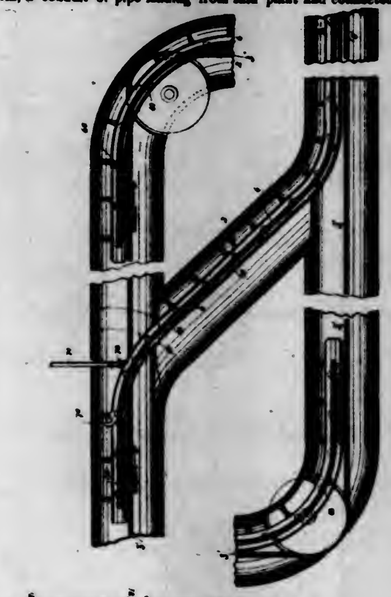
4. A smoothing-iron and a top plate fastened to said smoothing-iron, in combination with a handle carrying a curved fluter, a pin for securing said handle to said plate, and a fluting-plate provided with hooks at each end, of which one extends over the front end of the handle, substantially as shown and described.

387,906. CABLE-GRIP FOR RAILWAY-CARS. John H. Pendleton, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed July 5, 1887. Serial No. 243,774. (No model.)

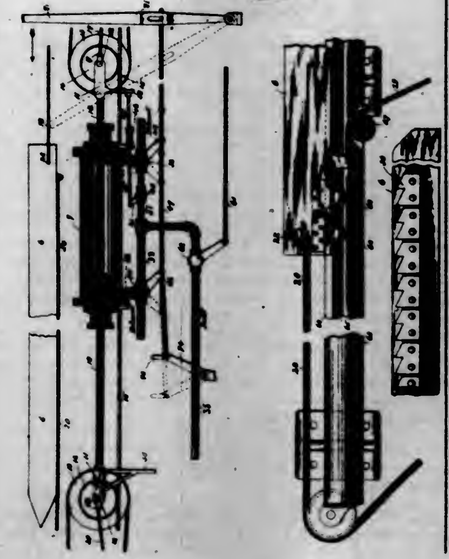
Claim.—1. The combination of a roller-grip and a positive grip, separate operating-levers therefor connected to the same source of operation, and the roller-grip provided with an elastic medium in its operating mechanism, whereby the rollers are held normally in advance of the jaws of the positive grip.

2. The combination of one or more positive grips, one or more roller-grips, a rock-shaft, crank-arms on the rock-shaft, rigid operating connections between the positive grip or grips and crank-arms, and shorter elastic connections between the roller grip or grips and crank-arms, whereby the said roller grip or grips are brought into play first, and the further movement of the rock-shaft causes the operation of the positive grip or grips, as set forth.

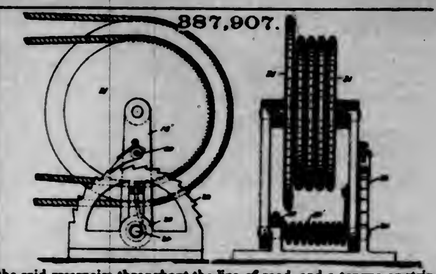
3. The combination, with a roller or auxiliary grip and a positive grip, each having suitable operating mechanism, of an elastic medium in the mechanism of the roller-grip, whereby its rollers are held in advance of the jaws of the positive grip, brakes for engaging said rollers, and springs of less inertia than said elastic medium for holding said brakes normally aloof, substantially as set forth.



4. The combination, with the operating mechanism of a roller-grip and of a positive grip, of a rock-shaft, a rod connected at one end with the mechanism of the positive grip and at the other with the rock-shaft for operating the grip, a rod connected at one end with the mechanism of the roller-grip, a box on the other end of said rod, a rod having one end mounted in said box and the other connected with the rock-shaft, a follower on said rod, and a spring between said follower and the end of the box, whereby the roller-grip is brought to bear before the other, and means for rocking said shaft.



5. The combination, with the positive grip and one or more roller-grips, of a rock-shaft, crank-arms on said shaft, a rod connected with one of said crank-arms and with the mechanism of the positive grip,



whereby the latter is operated, rods connected with the mechanism of the roller-grips, cylinders 19 on said rods, followers in said cylinders, rods connected with said followers and with the said crank-arms, a spring between said followers and the end of the cylinders, whereby the rods are held together, brakes to which the grip-operating mechanism is connected, and springs between said brakes and the rollers, whereby the latter are held in advance of the jaws of the positive grip, and the brakes held inoperative.

387,907. CABLE RAILWAY. JOHN H. PRESLETON, Brooklyn, engineer to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 19, 1887. Serial No. 258,344. (No model.)

Claim.—1. In a cable railway, the combination, with the main plant for compressing fluid and with engines having reciprocating pistons located at curves, crossings, and cross-over tracks, of auxiliary reservoirs located in the vicinity of said engines and connected therewith, a conduit or pipe leading from said plant and connected with

the said reservoirs throughout the line of road, and a tongue or strip guided by suitable ways and being connected with said pistons, whereby the motion of the latter is imparted thereto, substantially as and for the purposes set forth.

2. In a cable railway, the combination, with the plant for supplying fluid under pressure, of cylinders located at the curves, crossings, and cross-over tracks, having valves and ports and suitable mechanism for operating said valves, pistons in said cylinders, having their rods projecting from both ends of the latter, guideways arranged parallel with the tracks, tongues or strips arranged in said guideways, stationary pulleys, cables running over said pulleys and connected with said piston-rods and the tongues or strips, and a pipe or conduit leading from said plant and having communication with the valves of all of said cylinders, substantially as and for the purpose described.

3. The combination, with a pawl secured to the car, of the tongue or strip having means for engaging with said pawl, cables connected to one end only of said tongue, and means for drawing said cables in opposite directions, whereby the tongue is reciprocated, substantially as described, and for the purposes set forth.

4. The combination, with the cable-grip of the car, of a pawl pivoted thereto, a tongue or strip, a ratchet or rack on said tongue for engaging with said pawl, a suitable track for guiding said tongue, two cables secured to one end of said tongue and running in opposite directions, and means for imparting motion to said cables, whereby the tongue may be reciprocated, substantially as and for the purposes set forth.

5. The combination, with the cylinder having a piston and a rod projecting from both ends, of valves for communicating with the ports of said cylinder, an operating-rod connected with both of said valves, whereby one is closed when the other is opened, a tongue or strip, guides for said tongue, fixed pulleys at each end of said cylinder, and cables passing around said pulleys and connected with the said piston-rods and to the said tongue or strip, substantially as and for the purposes set forth.

6. In a cable railway, the combination, with the cylinder having ports with valves therefor, of a piston in said cylinder, a tongue or strip connected with said piston, a track or guide for guiding said tongue parallel with the rails, and an operating-rod pivotally connected with said valves and extending around the curve and pivoted to an operating-lever, said rod consisting of a number of sections connected together, as and for the purpose set forth.

7. In a cable railway, the track 63, having a hinged section, substantially as shown, and for the purposes set forth.

8. In a switch or branch track in a cable railway, the combination, with the main track and branch track or switch, of the guide-track 63, extending from one of said railway-tracks up the other and having a removable section hinged at 70 at the point where it passes from one track to the other, and a rod, 74, connected to said section and to the switch mechanism, whereby said section will be vibrated in unison with the switch, substantially as and for the purposes set forth.

9. The combination, with the cable-tunnel, of a grooved track extending parallel therewith and supported therein by means of brackets, a tongue, and wheels or rollers journaled to both sides of said tongue and fitting in said grooved track, substantially as and for the purposes set forth.

10. The tongue or strip having plates bolted to both sides and having journals and wheels mounted on said journals, substantially as and for the purposes set forth.

11. The combination, with the track 63, having upwardly-projecting edges with longitudinal grooves therein, of a tongue or strip, journals secured vertically on said tongue, and beveled-edge wheels mounted on said journals and fitting in said grooves, substantially as and for the purposes set forth.

12. The combination of the tunnel, the brackets secured therein, and the track 63, supported by said brackets.

13. The combination, with the tongue 6, having journals secured vertically thereto, of a track having projecting edges with longitudinal

grooves therein, wheels mounted on said journals and fitting in said grooves, and a ratchet on said tongue, substantially as set forth.

14. The combination, with the cylinder having a reciprocating piston, of a cable, 20, attached to said piston, a grooved track having a channel in its bottom supported above said cylinder, a flexible tongue supported on its edge in said track by horizontal wheels journaled to both sides of said tongue and fitting in said grooved track, a pulley mounted in said track below the tongue, and a cable, 19, connected with said piston and extending over said pulley and up said channel and secured to the end of said tongue, substantially as and for the purposes set forth.

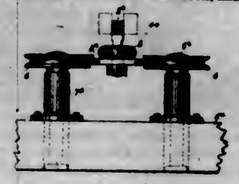
15. The combination, with two piston-rods, of a tongue, a track for said tongue, fixed sheaves, sheaves carried by said piston-rods, pulleys mounted in said track, cables secured to said tongue and passing over said pulleys, and said traveling and fixed sheaves being reeved with the cables, and the cables being also connected to the pistons, substantially as and for the purposes set forth.

16. In a cable railway, the combination, with the engine having a reciprocating piston-rod and an inlet or supply pipe, and with the grip of the car, having a pawl pivoted thereto, of a longitudinal track extending parallel with the rod and a tongue or strip supported by said track and connected with said piston, whereby it is reciprocated therewith, a ratchet on said tongue for engaging said pawl, a valve in said supply-pipe, and a governor operated by the piston and adapted to actuate the said valve, substantially as and for the purposes set forth.

17. The combination, with the cylinder having a piston therein, of piston-rods in both ends of said cylinder, sheaves 13 on said rods, a tongue or strip, a track for said tongue, the sheaves 21 beyond both ends of said cylinder, cables attached to said tongue and passing around said sheaves 13 21, a supply-pipe, valves 33 34, adapted to communicate with the cylinder-ports, pipes 37 38, leading from said supply-pipe to said valves, a valve in each of said pipes 37 38, an operating-rod connected with said valves and springs for holding the same normally open, an operating-rod connected with the valves 33 34, whereby one is opened and the other is closed, and lugs or arms 56 on the pistons for alternately forcing the valves closed in the pipes 37 38 as the piston reciprocates.

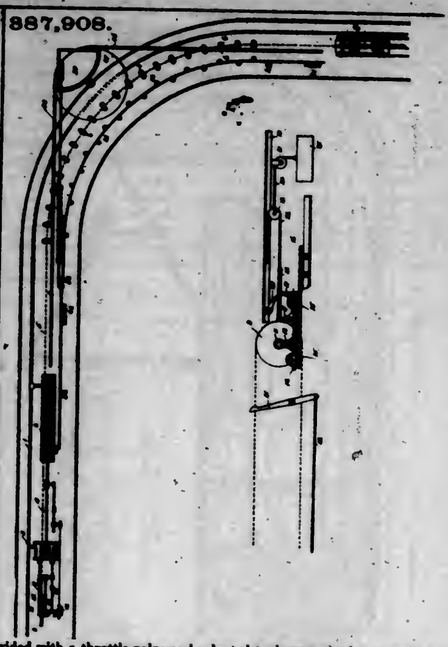
18. The combination, with the strip or tongue, the car, and the engine having a throttle-valve, of a cable connected to said strip and engine for imparting motion to the former and a governor operated by said cable for actuating said throttle-valve, substantially as set forth.

19. In a cable-tightener, the combination, with the cable and pivoted standards 16', of sheaves on which the cable is rove mounted in said standards, a stationary ratchet, a pawl pivoted to said standard and adapted to engage with said ratchet, and a spring for forcing said standards in one direction, substantially as and for the purposes set forth.



20. The combination, with the traveling sheaves 13 and the sheaves 21, of pivoted standards in which the latter sheaves are mounted, a tongue, 6, a cable rove on said sheaves and secured at one end to the tongue 6 and at the other to the piston 12, a stationary ratchet, a pawl pivoted to the standard and adapted to engage said ratchet, and a spring adapted to bear against said standards and tend to increase the distance between the sheaves 13 21, substantially as and for the purposes set forth.

387,908. CABLE RAILWAY. JOHN H. PRESLETON, Brooklyn, engineer to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 19, 1887. Serial No. 258,345. (No model.)



Claim.—1. In a railway, the combination, with the auxiliary traction device located at the curves, and the engine having a throttle-valve for operating said device, of an upwardly-projecting lever pivoted near one end of the curve, and a cable connecting said lever with said throttle-valve, whereby the latter may be operated, substantially as set forth.

2. The combination, with the endless traction-belt located at a curve, and a suitable engine provided with a throttle-valve and adapted to impart motion to said belt, of two upwardly-projecting levers, one pivoted near each end of the curve, a cable connected to one of said levers below its fulcrum and to the other above its fulcrum, and a rod connecting the latter lever with said throttle-valve, substantially as and for the purposes set forth.

3. In a railway, the combination, with a sprocket-wheel located at each end of a curve, a chain belt on said wheels, and an engine pro-

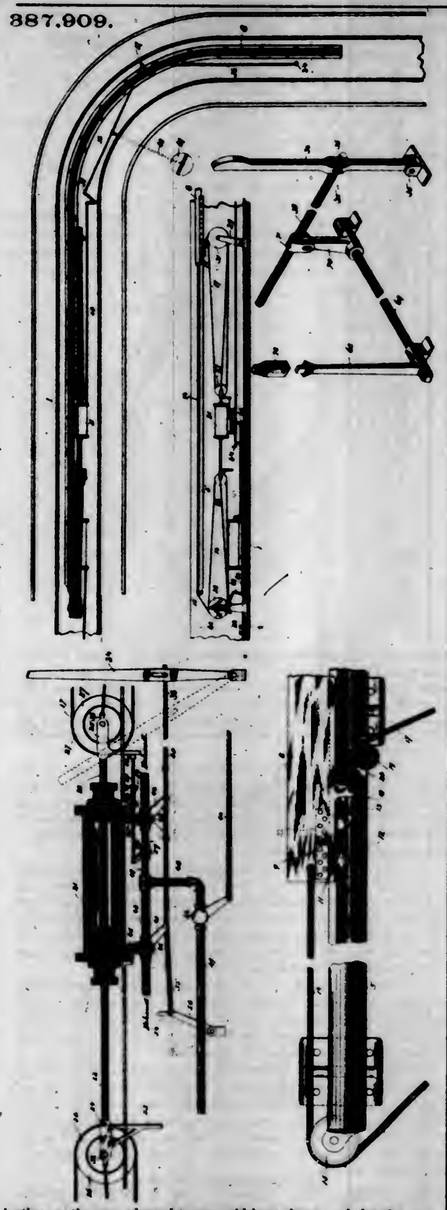
887,908.

vided with a throttle-valve and adapted to impart motion to one of said wheels, of two levers, 41 45, one near each end of said curve, a cable secured at one end to the former lever below the fulcrum, a link to which the other end of said cable is attached, and a rod pivoted to the throttle-valve and to lever 45 above its fulcrum, and attached to said link and the rod 34, having its end secured in said link, substantially as set forth.

4. The combination, with the valve 31 in the feed-pipe, of the push-rod 32, adapted to operate said valve, a link or slot in said rod, a stud adapted to slide in said link, a rod secured to said stud, a lug on said rod, and two springs bearing equally against both sides of said lug, whereby the stud is held normally in the center of said link or slot, substantially as set forth.

5. The combination, with the sprocket-wheels 8 9, arranged one at each end of the curve with their axes horizontal, of a chain belt adapted to travel over said wheels and having projecting edges, wheels arranged around the curve and having grooves for the reception of said edges, an upwardly-projecting tie on said chain for the attachment of a grip, and a suitable engine for imparting motion to said sprocket-wheels, substantially as set forth.

6. The combination, with the cross-ties and the chain 5, having projecting edges, of journal-boxes mounted on said cross-ties, vertical spindles in said boxes, and pulleys or rollers mounted on said spindles and having grooved peripheries for the reception of the projecting edges of said chain, substantially as set forth.



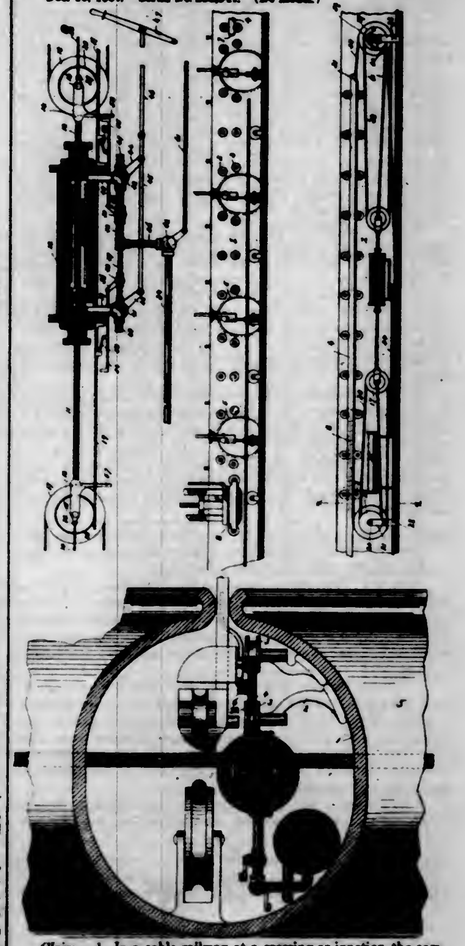
7. In a railway, the combination, with the engine and a reservoir for containing fluid under pressure, of a feed-pipe extending from said reservoir to the engine, a valve in said pipe, two levers, 41 45, pivoted below and extending above the track, a cable attached to the lever 41 below its fulcrum and connected with the lever 45 above its fulcrum, and a rod pivoted to the latter lever and to said crank-valve, substantially as set forth.

387,909. CABLE RAILWAY. JOHN H. PRESLETON, Brooklyn, engineer to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 19, 1887. Serial No. 258,346. (No model.)

Claim.—1. The combination, with the engine having valves for admitting pressure thereto and a reciprocating piston and with the car, of a track, a tongue or strip guided by said track and connected at one end with said piston, whereby it is reciprocated, a pivoted lever, a rod connecting said lever with the said valves of the engine, and a projection from said car for striking said lever whereby the valves are operated, and a grip on the car having means for engaging said tongue, substantially as set forth.

2. The combination, with the car and with the reciprocating piston, of valves for admitting pressure against said piston, a rod for operating said valves, a lever pivoted to said rod, piston-rods, a pro-

387,909.



jection on the car adapted to run said lever down, and thereby operate the valves in one direction, and an arm carried by said piston-rod, adapted to contact with the said rod for operating the valves, and thereby operate the valves in the opposite direction.

3. The combination, with the car and the reciprocating piston, of valves for admitting pressure against said piston, having pipes leading thereto, a normally-open valve in one of said pipes, rods for operating said valves, a lever pivoted to one of said rods, a projection on the car adapted to run said lever down, and thereby operate the valves in one direction, and arms carried by said piston-rods and adapted to contact alternately with said valve-operating rods as the pistons reciprocate, and thereby operate the valves in the opposite direction, for the purposes described.

4. The combination, with the engine having valves, of a rod for operating said valves, an upwardly-projecting lever pivoted to said rod, a crank-arm pivoted to said rod and secured to a rock-shaft, and a lever extending upward from said shaft, substantially as set forth.

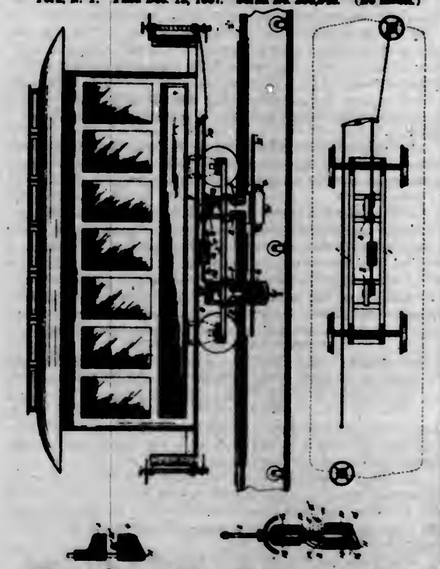
5. The combination, with an engine having a reciprocating piston and with the grip of the car having a pin, 52, of the tongue 8, having the guide-track 5, a ratchet on said tongue, valves 43 44, having operating-levers for admitting pressure to said engine, rods 36, 38, and 40, connected together by bell-cranks, and connected to the operating-levers of said valves and extending around the curve, the vertical lever 54, pivoted to one of said rods around the curve, for engaging with said pin 52, the man-hole, an upwardly-projecting lever in said man-hole, a rock-shaft secured to said lever and connected with the rods 36, 38, and 40 by means of a crank-arm, arm 53, link 55, connected to rod 40 and supported by a pivoted arm, a lug, 54, on said link for engaging with the arm 53, an inlet-pipe, a valve having an operating-crank in said pipe, a spring for holding said valve open, an arm, 56, carried by the piston-rod, for compressing said spring and closing the said valve, the governor 62, bell-crank 63, operated by said governor, a valve, 65, in the inlet-pipe, and a rod, 64, connected with said valve and bell-crank, all substantially as and for the purposes set forth.

387,910. CABLE RAILWAY. John H. Pershing, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 19, 1887. Serial No. 258,347. (No model.)

Claim.—1. In a cable railway at a crossing or junction, the combination, with the cable-tunnel of the lower cable and the tunnel of the upper cable, of pulleys or rollers supported in the tunnel of the lower cable in a line across the upper cable, and a tongue or strip supported and guided by said rollers and adapted to project across the upper cable, as set forth.

2. The combination, with the tunnel, of a series of grooved pulleys supported one above the other in said tunnel, a tongue or strip supported between said pulleys, and a ratchet or rack on said tongue, substantially as set forth.

3. The combination, with the tunnel, of brackets secured one above the other therein, and grooved pulleys mounted vertically on said brackets, a tongue or strip supported by said pulleys and guided by said grooves, and a ratchet-bar secured to the side of said tongue, the said tongue being pointed, substantially as and for the purposes set forth.



4. The combination, with a cylinder having a piston-rod projecting from both ends thereof, of the grooved pulleys, a tongue or strip supported by said pulleys, a ratchet-bar secured to said tongue near its end, fixed sheaves fore and aft of said cylinder, cables connected with the piston-rods, passing around said sheaves and secured to the tongue, and a groove or channel in the said tongue for the reception of one of said cables, substantially as and for the purposes set forth.

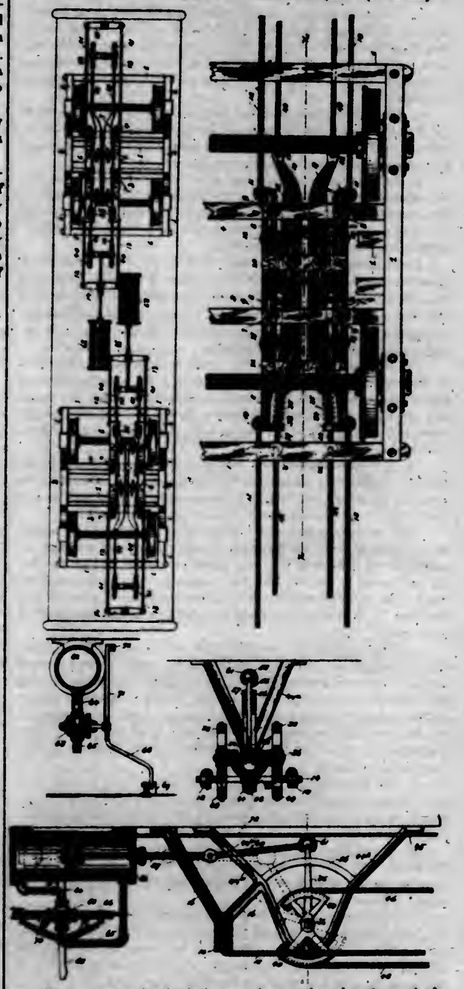
5. The combination, with the tunnel, of pulleys or rollers supported therein, and a rigid tongue or strip supported and guided by said pulleys or rollers, cables secured to the same end of said tongue, and sheaves arranged out of the plane of said pulleys and remote from each other, over which the said cables pass, substantially as set forth.

6. The combination, with the grip of a cable-railway car, and a reciprocating tongue, 4, having a rack thereon, of a pawl pivoted to said grip and adapted to engage said rack, a counter-balance for holding said pawl normally aloof, and a rod connected to said pawl, whereby it may be caused to engage and disengage said rack, substantially as set forth.

7. The combination, with the cylinder having a piston and a piston-rod projecting from both ends thereof, of brackets on the ends of said rods, a series of sheaves mounted in said brackets, stationary sheaves located fore and aft of said cylinder and in number equal to the sheaves in said brackets, a track, a tongue or strip supported by said track, and cables connected with each piston-rod and to the tongue and rove on the fixed and traveling sheaves at both ends of the cylinder, substantially as and for the purposes set forth.

387,911. GRIP FOR CABLE-RAILWAY CARS. John H. Pershing, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 19, 1887. Serial No. 258,348. (No model.)

Claim.—1. The combination, with two or more positive and roller or auxiliary grips, of a draw-bar for bringing all of them to bear and having an elastic or yielding medium, whereby one grip is brought to bear before the other.



2. The combination, with the roller or auxiliary grip and a positive grip, of a draw-bar for causing the grips to engage the cable, brakes, springs between said brakes and the rollers, mechanism connected to said brakes and draw-bar for causing them to engage with the rollers, and an elastic medium in the draw-bar of greater inertia than the aforesaid springs.

3. The combination, with the roller or auxiliary grip and a positive grip, of a draw-bar connected with the operating mechanism of said grips and an elastic medium in said draw-bar between the points of connection with said grips, substantially as set forth.

4. The combination, with a roller-grip and a positive grip, of a draw-bar connected with the operating mechanism of said grips, an elastic medium in said draw-bar between the points of connection with the grip mechanism, and springs or cushions for holding the rollers normally in advance of the jaws, substantially as set forth.

5. The combination, with the fixed roller 5 and jaw 3 of the sliding shanks 2, having slots 8, of a cushioned roller, 6, and a jaw, 4, secured to said shanks respectively, a draw-bar, 10, pivoted bell-cranks having one arm secured to said bar 10 and the other in the slots 8, and an elastic medium in said draw-bar between the said bell-cranks substantially as set forth.

387,912. GRIP FOR CABLE-RAILWAY CARS. John H. Pershing, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 19, 1887. Serial No. 258,349. (No model.)

Claim.—1. A pair of grip jaws or shoes anchored to the car-body and adjustably secured to the car-truck, substantially as set forth.

2. A grip consisting of one or more sliding shoes or jaws having their adjacent end surfaces beveled or rounded to receive the cable

and cam-surfaces and stationary rollers bearing upon said cams, substantially as set forth.

3. The combination, with fixed rollers, of grip-jaws located between said rollers and having their adjacent faces beveled or rounded at the ends and inclined or cam surfaces, substantially as and for the purposes set forth.

4. The combination, with the track and the car-body, of longitudinally-adjustable blocks 5 6, secured to the track and car-body, the rollers 27 28, journaled in said blocks, and the grip-shoes located between said rollers and having their adjacent end faces beveled or rounded, and inclined or cam surfaces adapted to contact with said rollers, substantially as set forth.

5. The combination, with the blocks 5 6, of the rollers 27 28, journaled therein, the grip-shoes having inclined or cam surfaces 25 26 and slots 22 23, extending parallel with said cam-surfaces, and suspension-bolts in said slots, substantially as and for the purposes set forth.

6. The combination, with the blocks 5 6, of the rollers journaled therein, cross-bars on said blocks, and the grip-shoes having inclined or cam surfaces 25 26, adjustably secured to said cross-bars, substantially as set forth.

7. The combination, with the rollers 27 28, having fixed journal-bearings, of the grip-shoes located between said rollers and having slots 23 23 and cam-surfaces 25 26 in juxtaposition to said rollers, supports extending through said slots, and springs for forcing said cams in engagement with the rollers, substantially as and for the purposes set forth.

8. The combination, with the shoes having cam-surfaces 25 26 and slots extending parallel with said surfaces, of the stems 29 30, secured to said shoes, the arms 33 34, and springs between the shoes and said arms, substantially as and for the purposes set forth.

9. The combination, with the car-body and with the cross-bars 3 4, secured to the truck-frame, of the blocks 5 6, having longitudinal slots, supports secured to the bars 3 4 and extending through the said slots, and cables secured to said blocks and to the car-body, substantially as and for the purposes set forth.

10. The combination, with the rollers 27 28, of the shoes 18 19, located between said rollers and having cams 25 26 and slots parallel with the faces of said cams, supports for said shoes extending through said slots, and cables or rods connected to both ends of said shoes for forcing the cams into and out of engagement with the rollers, substantially as and for the purposes set forth.

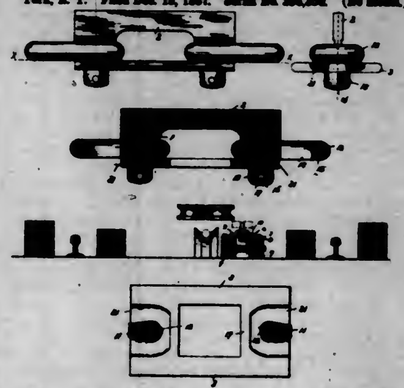
11. The combination, with the truck having the cross-bars 3 4, of the blocks 5 6, having longitudinal slots, bolts extending through said cross-bars and slots and having washers upon which the blocks rest, pivoted levers secured to the car-body, and cables secured to said levers and to the ends of the blocks 5 6, substantially as and for the purposes set forth.

12. The combination, with the car-body and the truck, of the blocks 5 6, adjustably secured to the truck, brackets secured to the car-body, levers pivoted to said brackets, and cables secured to said blocks and to the pivoted levers, substantially as set forth.

13. The combination, with the truck, of the shoes 18 19, adjustably secured thereto, cam-surfaces on said shoes, fixed bearings for said cams and between which said shoes are located, springs for forcing said cams in contact with their bearings, a pivoted rock-shaft, crank arms or levers on said shaft, cables connecting said levers with the shoes 18 19, and suitable means for rocking said shaft, substantially as set forth.

14. The combination, with the truck, of the shoes 18 19, adjustably secured thereto, cam-faces on said shoes, fixed bearings for said cams and between which said shoes are located, springs for forcing said cams in contact with their bearings, pivoted rock-shafts, sectors extending upwardly and downwardly from said shafts, cables connecting the sectors of one side of the shafts with each other, and cables connecting the sectors of the opposite side with the shoes 18 19, substantially as set forth.

15. The combination, with a rock-shaft, of a pivoted journal-bearing in which said shaft is mounted, a lever, and a pivot extending transversely through said shaft and pivoting said lever thereto, substantially as set forth.



16. The combination of the pivoted piece 42, a rock-shaft mounted therein, a lever having a bifurcated end straddling said shaft, and a pivot extending through said bifurcated end and shaft, substantially as and for the purposes set forth.

17. The combination, with the bracket 44^, of the Y-shaped piece 42, pivoted thereto, a rock-shaft journaled in said piece, a lever having a bifurcated end straddling said shaft, a pin extending through said bifurcation and shaft, and a guide for restricting the oscillations of said lever to a vertical plane, substantially as set forth.

18. The combination, with the bracket 44^, of the piece 42, pivoted thereto, a rock-shaft journaled in said piece 42, a lever pivoted to the center of said shaft, and guide-rails at both sides of said lever for limiting its oscillations.

19. The combination, with the cylinder having a piston-rod and with the grip-shoes, of a rock-shaft connected to said grip-shoes and pivoted at its mid-length and a lever attached to said piston-rod and pivoted to said rock-shaft, substantially as set forth.

387,918. TRACTION-CABLE FOR RAILWAYS. John H. Pemberton, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 12, 1887. Serial No. 258,292. (No model.)

Claim.—1. The combination, with the link 13, of a link consisting of the fin 2 and lugs 11, substantially as and for the purpose set forth.

2. The combination, with the link 13, of a link consisting of the fin 2, lugs 11, made integral with said fin, and the plate 17, connected with said lugs, substantially as described.

3. The combination, with the lugs 11 and links 13, of flat bearing-surfaces 14 15 on said link, substantially as and for the purpose set forth.

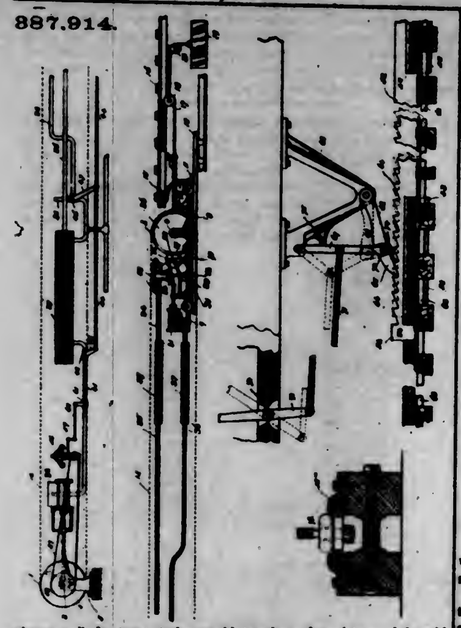
4. The combination, with the links 13, of the fin 2, lugs for engaging with said links at each end of said fin, a projection from each of said lugs, and a plate having a cut-away portion fitted over said projections, substantially as and for the purposes set forth.

5. The combination, with the links 13, having flat bearing-surfaces 14 15, of a fin, 2, a lug at each end of said fin for engaging with links 13, bolts 16, projecting from said lugs, and having screw-threaded extremities with a hole therethrough, a plate, 17, having its central portion cut away, and holes for fitting over the bolts 16, and a tap, 18, and pin 16, for holding said plate in position, substantially as described.

6. The combination, with the grooved tracks, of a chain whose links have projecting edges for engaging in said grooves, and fins forming a continuous ridge along said chain, substantially as and for the purposes set forth.

7. The combination, with the links 13, of the wedge-shaped lugs 11, having rounded surfaces 12, a fin, 2, connecting said lugs together and made integral therewith, a bolt having a perforation and a screw-threaded portion projecting from said lug, a plate having its central portion cut away, a hole in each end of said plate for the reception of said bolts, nuts or taps on said bolts, edges 3 3 on said plate, projecting beyond the sides of the links 13, and inclined surfaces 21 on the ends of said plate, substantially as and for the purposes set forth.

387,914. CAR-STARTER. John H. Pemberton, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 13, 1887. Serial No. 258,351. (No model.)



Claim.—1. The combination, with the friction-drum 26 and a pump, of a pivoted standard, a shaft journaled in said standard, a friction-wheel and a crank on said shaft, and a sucker-rod in said pump connected with said crank, substantially as set forth.

2. The combination, with the friction-drum 26 and a pump having a sucker-rod, of pivoted standards, a shaft journaled in said standards, a friction-wheel and a crank on said shaft, a pitman connecting said crank and sucker-rod, and a toggle pivoted at one end to said standards, substantially as set forth.

3. The combination, with the friction-drum 26 and a pump having a sucker-rod, of pivoted standards, a shaft mounted in said standards, a crank and a friction-wheel on said shaft, a pitman connecting said crank and sucker-rod, a toggle fixed at one end and pivoted to said standards at the other, and a spring for holding said toggle normally straight, substantially as set forth.

4. The combination, with the friction-drum and the pivoted standards, of a shaft mounted in said standards, a friction-wheel on said shaft, a toggle fixed at one end and pivoted to the standards at the other, a cylinder located above said toggle, and a piston-rod in said cylinder and connected to said toggle, substantially as and for the purposes set forth.

387,914.

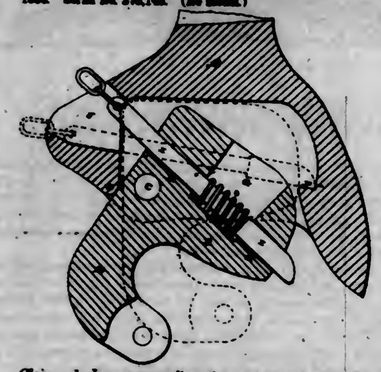
5. The combination, with the pump and the endless belt, of a carriage, journal-boxes on said carriage, a shaft in said boxes, a sprocket-wheel and a friction drum or wheel on said shaft, standards, a shaft journaled in said standards, a crank and friction-wheel on said shaft, a sucker-rod in said pump, a pitman connected to said rod and crank, a stationary pulley, a cable passing over said pulley and connected at one end with said carriage, and a weight at the other end of said cable, substantially as set forth.

6. The combination, with the endless belt 12, a carriage mounted upon wheels, and a wheel mounted on said carriage and over which wheel said belt travels, of a ratchet-bar secured to said carriage, a stationary pawl for engaging with said ratchet, a stationary pulley, a cable passing over said pulley and connected with said ratchet, and a weight on said cable, substantially as set forth.

7. The combination, with the pipes 35 36, and the cylinder 33, and pump 21, having pipes leading therefrom, of the couplings or sleeves 37, connecting said pipes with the pipes 35 36, respectively, substantially as and for the purposes set forth

8. The combination, with the sprocket-wheels 1 2, an endless-chain belt adapted to travel over said wheels, shafts to which said wheels are keyed, and a friction-drum on one of said shafts, of a friction-wheel for engaging with said drum and having a crank for operating a pump, a reservoir, a pipe leading from said pump to said reservoir, an engine having a piston-rod and adapted to receive pressure from said tank, a crank connected with the wheel 1, and a pitman connecting said crank with said piston-rod, substantially as and for the purposes set forth.

9. The combination, with the reservoir for containing fluid under pressure, of the pivoted standard, a toggle pivoted at one end and hinged at the other to said standard, the cylinder 33, having a piston, a rod connected to said piston and toggle, and a pipe, 34, communicating with the reservoir and cylinder, substantially as and for the purposes set forth.

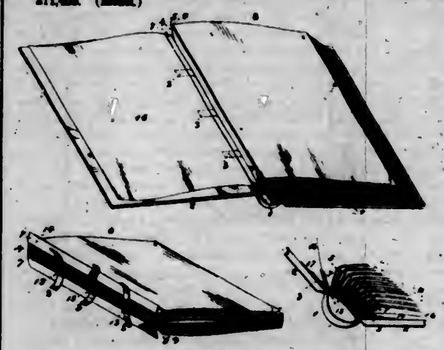


10. The combination, with the engine and the reservoir 39, of a pipe, 41, from said reservoir to the engine, the cylinder 33, having a piston, a toggle, 30, attached to said piston by a piston-rod, the pipe 35, communicating with said reservoir and cylinder, valves 43 44, having crank-arms in pipes 41 36, respectively, and a push-rod attached to said crank-arms, substantially as and for the purposes set forth.

11. The combination, with the reservoir 39, of the pipes 35 41, leading therefrom, a valve, 42, having a crank-arm in pipe 41, a valve, 44, having an exhaust-duct, 51, and a crank-arm in pipe 36, a push-rod attached to said cranks, a lever for operating said rod, and a spring for holding said valves normally closed, substantially as set forth.

387,915. FIRE-EXTINGUISHING COMPOUND. Ellen G. Peirce, Harvey S. Hughes, and William H. Shute, Texas, Iowa. Filed Oct. 20, 1887. Serial No. 252,633. (No specimens.)

Claim.—The herein-described fire-extinguishing compound, composed of two parts saleratus, one part saltpeter, two parts salt, one part sulphate of iron, and one part alum, as stated.

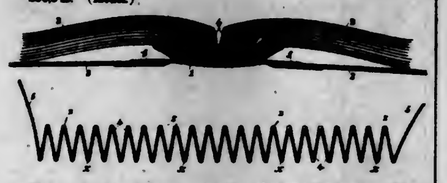


387,916. CAR-COUPLING. Gilbert W. Pike, West New Brighton, N. Y., assignor of one-half to R. B. Clark, same place. Filed May 26, 1888. Serial No. 275,142. (No model.)

Claim.—1. In a car-coupling, the combination of a pivoted hook with an automatic latching-bolt which passes through the hook and moves therewith, substantially as shown and described.

2. The combination of the draw-head, the pivoted hook placed therein, and the spring-actuated bolt which passes through the hook and engages with the shoulders upon opposite sides of the draw-head, whereby the strain upon the hook is transferred to the bolt, substantially as set forth.

387,917. BOOK. Thomas C. Ramsaw, Cincinnati, Ohio, assignor to Carpenter & Ramsaw, same place. Filed Aug. 20, 1888. Serial No. 282,488. (Model.)

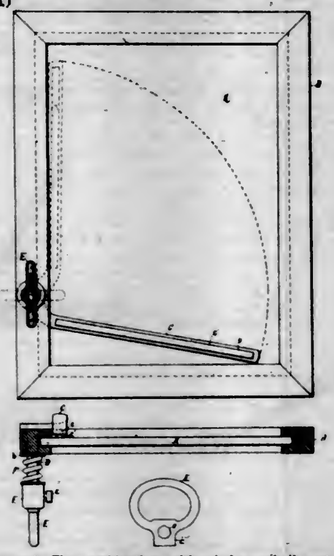


Claim.—1. A book having two or more folios or signatures, a continuous stub-strip crimped or folded alternately in opposite directions, and a strip to which each of the bent, curved, or creased portions which form the rear extremities of the stub or stub-strip is secured, the front crimps being left free, the signatures or folios of the book being separately secured to the several bent, curved, or creased portions which form the front extremities of the folds of the stub or stub-strip, the strip to which the rear extremities of the said folds are secured being in turn secured to the cover-leaves of the book, substantially as described.

2. In a book, the combination of the following elements, to wit: two or more folios or leaf-groups, 5, a strip, 4, crimped or folded alternately in opposite directions, so as to form a stub-strip, to the front extremities of which—that is, the bent, curved, or creased portions 5, which form or constitute the front edges or extremities of the several folds—are severally secured the said folios or signatures, the bridge-strips 3, to which the rear extremities of said stub-strip—that is, the bent, curved, or creased portions 6, which form or constitute the rear edges or extremities of the several folds—are secured, and the wing 7 of the stub-strip secured to the cover, substantially as set forth.

3. A book having two or more folios, signatures, or leaf-groups,

a continuous stub-strip crimped alternately in opposite directions, and a bridge-piece to which all of the crimped edges at the rear of the stub-strip are secured, the front crimps being perfectly free and each leaf-group being attached to a separate front crimp, substantially as set forth.

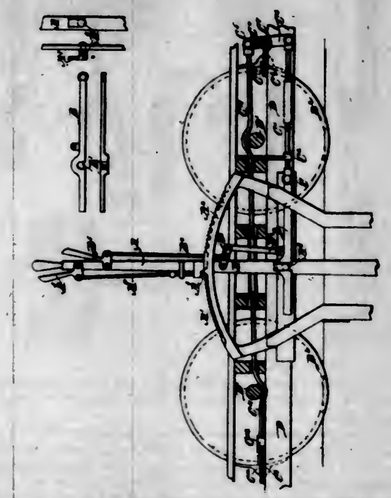


387,918. **BOOK.** Thomas G. Ramshaw, Cincinnati, Ohio, assignor to Carpenter & Ramshaw, same place. Filed Apr. 27, 1887. Serial No. 236,245. (Model.)

Claim.—1. A book having a back, a number of stubs formed from a single strip of material crimped or folded alternately in opposite directions, and a series of folios, signatures, or leaf-groups, the rear crimps of said stub-strip being stitched directly to the back, leaving the front crimps free, and each leaf-group being stitched to a separate front crimp, substantially as set forth.

2. A book having a back, a number of stubs formed from a single strip of material crimped or folded alternately in opposite directions, said stubs being secured to the back of the book by stitches passing directly through the bent or curved portions which unite the rear extremities of said folds, and the folios, signatures, or leaf-groups secured to the bent or curved portions which unite the forward extremities of the folds, substantially as and for the purpose set forth.

387,919. **WINDOW-CLEANING APPARATUS.** David G. Rhoads, Cleveland, Ohio. Filed Jan. 30, 1888. Serial No. 262,332. (No model.)



Claim.—1. The combination, with window, spindle extending through and journaled in the window frame or sash, and handle located inside the window and connected with the spindle for operating the same, of arm mounted on the spindle outside the window, said arm being adapted to sweep across the window-pane when actuated by the spindle, substantially as set forth.

2. The combination, with window, spindle, handle, and arm, substantially as indicated, of longitudinal recess on the inner face of such arm, a strip or pad, of rubber or other suitable material, seated in such recess, said pad being in position to engage the outer side of the window-pane, substantially as set forth.

3. The combination, with window, arm, spindle, and handle, substantially as indicated, of spring mounted on the spindle and located between the handle and window-frame, the tension of the spring tending to draw the spindle endwise and inward, so as to press the arm against the outside of the window-pane, substantially as set forth.

4. The combination, with window-frame, arm, and spindle, substantially as indicated, of handle mounted on the spindle, and spring located between the handle and window-frame, said handle being adjustable lengthwise of the spindle, whereby the tension of the spring may be regulated, substantially as set forth.

387,920. **GRIP AND BRAKE GEAR OF CABLE TRAM-CARS.** Howell H. Richards, Richmond, assignee of one-third to George Wilson Selby, Jr., Melbourne, Victoria. Filed Dec. 8, 1887. Serial No. 257,242. (No model.) Patented in Victoria Feb. 17, 1887, No. 4,936; in Tasmania Oct. 20, 1887, No. 883/9; in New South Wales Oct. 21, 1887, No. 209; in South Australia Oct. 21, 1887, No. 803; in New Zealand Oct. 26, 1887, No. 2,653; in England Nov. 26, 1887, No. 16,305, and in Queensland Feb. 6, 1888, No. 345.

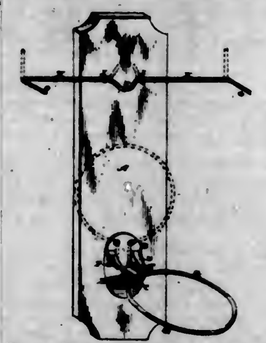
Claim.—1. The combination, with the gripper hand-lever, of a pin or stud which is arranged at its side, and a gap-bar, which is attached to the wheel-brake mechanism, substantially as herein described and explained, and as illustrated in my drawings.

2. The combination, with the gripper hand-lever having a pin or stud at its side and the gap-bar which engages with it, of the tongue-lever, the connections of which are attached to the gap-bar to raise it clear of the stud when so desired, substantially as herein described and explained, and as illustrated in my drawings.

3. The combination, substantially as herein described and shown, with the gripper hand-lever provided with a pin or stud projecting from one side thereof, of a gap-bar, adjustable as to length, connected with the wheel-brake mechanism, for the purposes specified.

4. The combination, substantially as herein described and shown, with the gripper hand-lever provided with a stud or pin projecting from one side thereof, of a gap-bar resting on the stud, a connection between said bar and the gripper-lever, whereby the bar may be lifted off the stud, a connection between the bar and the brake mechanism at one end of the car, a cross-bar connected with the gap-bar, and connecting-rods for connecting said cross-bar with the brake mechanism at the other end of the car, as shown, and for the purposes specified.

5. The combination, substantially as herein described and shown, with the gripper hand-lever provided with a stud or pin projecting from one side thereof, of a gap-bar resting on the stud and adjustable as to length, a connection between the gap-bar and hand-lever, whereby said bar may be lifted off the stud, a connection between the bar and brake mechanism at one end of the car, a cross-bar connected with the gap-bar, and connecting-rods connecting said cross-bar with the brake mechanism at the other end of the car, for the purposes specified.



387,921. **COFFIN-LID.** John D. Ryder, Toronto, Ontario, Canada, assignor to Edward George Kelly, same place. Filed Dec. 24, 1887. Serial No. 258,997. (No model.)

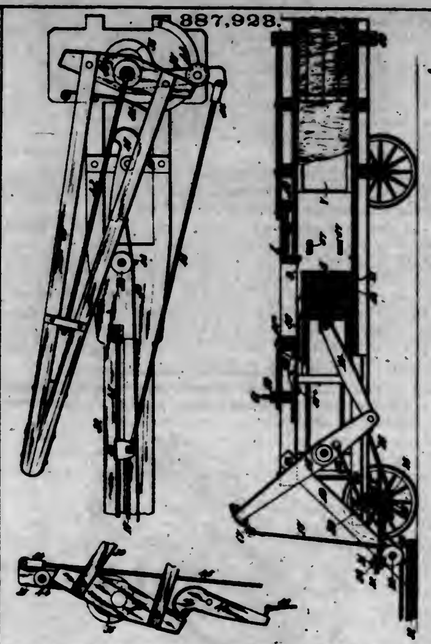
Claim.—The combination, with a spring glass-stop, of a lug connected to the bottom of the lid or panel in such a position that it will come in contact with and press the glass-stop behind the edge of the glass when the lid or panel is adjusted in position, substantially as and for the purpose specified.

387,921.

387,922. **COMBINED WASH-STAND AND BRACKET.** George W. Smedley, Alliance, Ohio. Filed Apr. 16, 1888. Serial No. 270,814. (No model.)

Claim.—1. The combination of the support, the casting or forging B, secured thereto and provided with the horizontal shoulder C, and the bearings D, with the basin-holder, formed from a metallic rod which has its ends F turned outward, so as to catch in the bearings, substantially as shown.

2. The combination of a support, A, with the holding devices I, and the rod H, having a curved portion, J, at its center, and its ends O turned outward, substantially as set forth.



387,923. **BALING-PRESS.** Henry W. Schwarzburg, Henry F. Blank, and Joseph H. Altheide, Quincy, Ill. Filed Apr. 11, 1888. Serial No. 270,333. (No model.)

Claim.—1. The combination, with the press-frame and the reciprocating plunger having the laterally-projecting rib 56 extending longitudinally along its length, of the rocking friction-dog 55, pivoted intermediate its ends in the press-lining to form the tail-piece 55* to strike the rib, and thereby rock the dog and force its opposite end against said rib to ease the rebound of the plunger by friction, substantially as described.

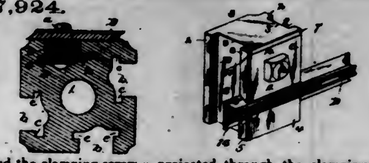
2. The combination, with a portable wheeled press-frame having

387,928.

the upper and lower longitudinal side sills, of the braces having their upper ends pivoted to the upper side sills and adapted to be turned down to the ground and rest against the forward ends of the lower side sills and to be turned back to a position above the top of the press-frame, and a horse-power comprising a sill having a rabbeted end to pass between and bear against the lower ends of the braces when they rest on the ground, substantially as described.

3. The combination, with a baling-chamber and a horizontally-movable plunger supported in a press-frame mounted on wheels, of a pair of inclined braces pivotally attached to the forward end of the press-frame and extended to the ground, a cross-bar connecting the lower ends of said braces, a brace-plate attached to the under side of the press-frame, detachable rods connecting said brace-plate with the cross-bar of the inclined braces, a horse-power sill abutting against the lower ends of said inclined braces, and a horse-power mechanism for actuating the plunger in a direct line, substantially as described.

4. The combination, with a press having a horizontally-movable plunger, of a horse-power sill located in line with the press, an eccentric post attached to said sill, an eccentric-lever pivoted on said post and provided with a friction-roller, a rod pivoted to said eccentric-lever, a horizontally-movable slide connected to the other end of said rod, a cable connecting said slide with the plunger-lever, a double-armed lever mounted on the eccentric post, a sweep attached to said double-armed lever, and a retracting-lever having a cable connected with the plunger-lever, substantially as described.

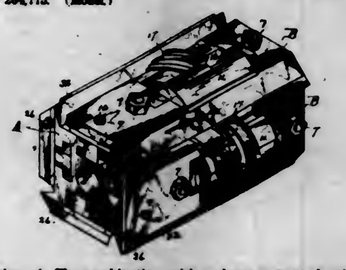


5. The combination, with the plunger 13 and its lever 15, of a horse-power comprising an eccentric post, 34, an eccentric-lever, 37, provided with friction-roller 44, the spring-stop 51, the double-armed lever 38 and sweep 39, the rod 45, pivotally connected with the eccentric-lever, the slide 46, connected to said rod, the guide-rod 47, the cable 18, connecting the slide and plunger-lever, the retracting-lever 48, and the retracting-cable 50, substantially as described.

6. The combination of the plunger 13 and its lever 15, the cables 18 and 50, guide-pulleys 30, 31, and 52, the retracting-lever 48, the eccentric post 34, eccentric-lever 37, rod 45, slide 46, guide-rod 47, double-armed lever 38, and sweep 39, substantially as described.

387,924. **TOOL-HOLDER FOR CUTTER-HEADS.** Samuel J. Shiner, Milton, Pa., assignor to Samuel J. Shiner & Sons, same place. Filed Dec. 14, 1887. Serial No. 257,844. (No model.)

Claim.—1. The tool-holder herein described, consisting of the body-section B, formed with a stem, 3, having side flanges, 2, to set in a T-shaped slot, an outer projecting dovetailed jaw, 4, on one end, a projecting flange, 7, on the other end, and a threaded bolt-hole, 9, the clamping-plate 6, formed with flaring edges 10 11, to set flush in its bed formed by the jaw 4 and flange 7, and an elongated bolt-hole,



387,924.

12, and the clamping-screw *a*, projected through the clamping-plate into the threaded hole of the stem to force the clamping-plate on the bit and under the jaw, substantially as described.

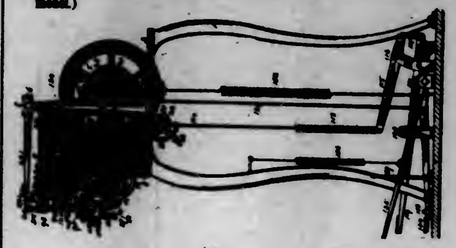
2. The combination, with a cutter-head formed with T-shaped slots in its faces, of an adjustable tool-holder consisting of a body-section, B, having a stem with side flanges to fit the T-shaped slots of the cutter-head, and having a projecting clamping-jaw, 4, on one end and a projecting flange, 7, on the other end, and a threaded bolt 9, through its stem, a clamping-plate, 6, formed with flaring edges, and an elongated bolt-hole, 12, a clamping-screw, *a*, to hold the parts together, and a cutter-tool between the jaw of the part B and the clamping-plate, substantially as described.

387,925. CUTTER-HEAD. SAMUEL J. SHIMER, Milton, Pa., assignor to Samuel J. Shimer & Sons, same place. Filed Feb. 21, 1888. Serial No. 264,775. (Model.)

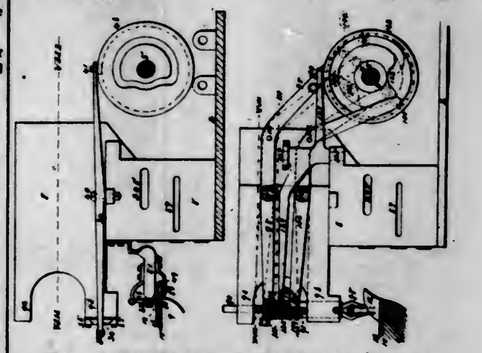
Claim.—1. The combination, with a planer or cutter-head stock, of a holding-plate removably secured to the said stock and formed with an adjusting-plate seat, and adapted to receive a knife under the adjusting-plate, an adjusting-plate, shorter than the holding-plate and knife, formed with parallel diagonal slots, an adjusting-screw let in the end of the holding-plate and engaging with the adjusting-plate, and a knife formed with studs to engage the diagonal slots of the adjusting-plate, substantially as described, and for the purpose stated.

2. The combination, with a planer or cutter-head stock, of a holding-plate removably secured to the said stock and formed with a seat to take an adjusting-plate, and a knife between the adjusting-plate and the face of the stock, an adjusting-plate, shorter than the knife, arranged to slide lengthwise in the plate-seat of the holding-plate, an adjusting-screw held in a bearing in the end of the holding-plate against retraction and progression, and with its threaded stem engaging a threaded receptacle in the adjusting-plate, and a knife on the adjusting-plate formed with studs to engage the diagonal slots of the adjusting-plate, substantially as described.

3. The combination, with a cutter-head stock formed with countersinks 3, a holding-plate having studs to set in the countersinks of the head, and having a seat to receive a knife-adjusting plate, and a knife having studs, of an adjusting-plate arranged over the knife and formed with diagonal slots to engage the studs of the knife, an adjusting-screw to reciprocate the adjusting-plate, a plate to hold the screw in its bearing, and a clamping-screw to clamp the end of the holding-plate, the plate over the neck of the screw, and the end of the knife, substantially as described.



4. The combination, with a cutter-head stock, its surface-cutting knife, and the holding-plate, of a beader-bit mounted on the exterior of the holding-plate, substantially as described.



5. The combination, with a cutter-head stock, the knife, and the holding-plate, of a beader-bit seat rigidly secured to the exterior of the holding-plate and formed with a bit-bed having a curved surface and inclined edge flanges, a sectional annular beader-bit arranged on a bit-bed, and a clamping-piece to hold the beader-bit in the bed in inclined position, substantially as described.

6. The combination, with the holding-plates and the surface-planing knives of a cutter-head, of two or more sectional annular bits mounted on the back of the holding-plate and arranged to incline lengthwise in alternation to provide clearance-space, substantially as described.

7. In a cutter-head, the combination, with the holding-plates of the surface-knives, of a beader-bit seat, 11, of hard metal, secured to the exterior of the holding-plate, and formed with a knife-seat, 12, a clamping-plate, 19, and a bolt, 20, to hold the clamp on a bit in the seat, substantially as described.

387,926. LASTING-MACHINE. CHARLES SUMNER and JOHN T. AVERY, St. Louis, Mo. Filed Feb. 2, 1888. Serial No. 262,903. (No model.)

Claim.—1. In the herein-described lasting-machine, the combination of two rollers adapted to bear against the side of the upper upon the last and two wheels adapted to bear upon the top of the down-turned edge 12 of the upper, thus forming points of bearing for the work.

2. The combination, in the herein-described lasting-machine, of the two rollers bearing upon the side of the work, two wheels bearing upon top of the work, and a device, substantially as described, adapted to give intermittent rotary motion to one of the wheels, for the purpose set forth.

3. In the herein-described lasting-machine, the combination of the two rollers and two wheels bearing, respectively, against the side and top of the work and the fixed finger bearing upon the insole in advance of the folded part of the edge 12, substantially as set forth.

4. The combination, in the herein-described lasting-machine, of the side bearing-roller, 14, supported on a sliding bar, and a spring having bearing against the bar to keep the roller in contact with the work and allow the necessary horizontal movement of the work at this point.

5. The combination of the sliding bar 16, carrying a side bearing-roller, 14, and an adjustable spring, 19, bearing against the inner end of the bar, for the purpose set forth.

6. The combination of the roller 14, supporting slide-bar 16 therefor, spring 20, with end 19 bearing against the bar 16, spur-wheel 21 on the spring, and locking-bolt 24, securing the wheel in position, substantially as and for the purpose set forth.

7. The combination of the slide-bar 16, carrying bearing-roller 14, the spring 20, with end 19 resting against the end of the slide-bar 16, the spur-wheel 21, arm 23, with jointed end 26, segment rack or quadrant 25, a tooth on the jointed end 26 engaging the quadrant, and a bolt, 24, on the arm 23 engaging the spur-wheel, substantially as and for the purpose set forth.

8. In the herein-described lasting-machine, the top bearing feed-wheel, 28, supported on a slide, 34, and arranged to rotate on the backward movement of the slide, and a device, substantially as described, adapted to prevent the rotation of the feed-roller on the forward movement of the slide.

9. In the herein-described lasting-machine, the combination, with the feed-wheel, arranged to operate as set forth, the slide 34, on which the wheel is supported, actuating-lever 39, and spring-connection 37 between the slide and free end of the lever, substantially as and for the purpose set forth.

10. In the herein-described lasting-machine, the feed-wheel 28, slide 34, bearing the wheel, lever 39, spring 37, connecting the free end of the lever and the slide, and adjustable stop-bar 45, limiting the backward movement of the slide, substantially as set forth.

11. In the herein-described lasting-machine, the combination of the feed-wheel 28, ratchet-wheel 30, fixed to said roller, pawl 31, engaging the ratchet-wheel, and slide 34, upon which the roller has bearing, all substantially as and for the purpose set forth.

12. In the herein-described lasting-machine, the combination of the feed-wheel having capacity for rotating in only one direction and having reciprocating motion in the direction of the feed of the work, and the toothed wheel 52, bearing on the edge 12 of the upper, with pawl 53, preventing its backward rotation, for the purpose set forth.

13. The combination of the two guide-rollers 14 and 40, the feed-wheel 28, the wheel 52, reciprocating slide 34, supporting the feed-wheel, slide-actuating lever 39, spring-connection 37 between the lever and slide, and adjustable stop device 44 45, substantially as set forth.

14. The combination of the pusher 54, bearing intermittently against the side of the work, and the reciprocating folder 67, working over the pusher and adapted to force the edge 12 over the insole and fold it down on the insole, substantially as set forth.

15. The combination of the folder, a tilting block, 70, giving bearing to the folder and provided with an extension or tail, 84, and the cam 197, having a projecting part, 86, acting on the tail 84, substantially as and for the purpose set forth.

16. The combination of the pusher, the folder, the side guide-rollers, 14 40, and combined guide and feed wheels 28 and 52, acting to hold the upper in position on the last, substantially as set forth.

17. The combination, with the gripper-shaft 90, of a single lever, 98, having a pin, 100, at one end, said lever engaging at the other end the collar 94 on the shaft, a rotary cam, 102, whereby the lever is actuated directly by engagement with pin 100 to lower the shaft, and a spring, 113, attached to said lever to raise the shaft, substantially as shown and described, and for the purpose set forth.

18. The combination, with the shaft 90, carrying the grippers, of the sleeve 91, having on it a cog-wheel, 128, and a lever having a fixed segment-rack engaging the cog-wheel, and a spring connecting said lever to a fixed point and adapted to draw it to one side to cause the rotary motion of the gripper, substantially as and for the purpose set forth.

19. The combination, with the shaft 90 and sleeve 91, of the levers 96, 106, and 127, each having positive movement in one direction by means of cams and movement in the other direction by means of springs, substantially as and for the purpose set forth.

20. The combination of a shaft carrying pivoted gripper-jaws at its lower end and forced downward by a cam-lever and cam and carried upward by a spring, and a sleeve on the shaft having positive upward motion by a lever and cam and downward motion by a spring, substantially as and for the purpose set forth.

21. The combination of a shaft carrying grippers, having pivoted jaws and a spring for pressing them outwardly or opening them, said shaft and grippers being capable of vertical and rotary motion, and a sleeve capable of vertical motion on the shaft, but not of independent rotation, and constructed to force the jaws of the gripper together by downward movement on the shaft, substantially as set forth.

22. The combination of the shaft 90, the lever 96, engaging a collar fixed on said shaft, the actuating-cam 102, having a cam-groove, 101, receiving a stud, 100, on said lever, and having an enlargement, 122, and the spring 113, acting to draw the stud 100 aside in the enlargement, as and for the purpose set forth.

23. The combination of the sleeve 91, a lever, 106, whose free end engages in a circumferential groove of the sleeve, the actuating-cam 102, having a cam-groove, 103, receiving a stud, 108, on the lever, and having an enlargement at 123, and a spring, 124, drawing the stud upward in said enlargement of the cam-groove; as and for the purpose set forth.

24. The combination of the cog wheel or gear 126 on the sleeve 91, the lever 127, having a cog-segment engaging with the gear, a cam moving the lever in one direction, and a spring moving it in the other, substantially as and for the purpose set forth.

25. The combination of the crimping-lever 127, the spring 132, by which it is drawn in one direction, the lever 133, rod 134, and treadle 135, substantially as and for the purpose set forth.

26. The combination of the sleeve 91, shaft 90, gripper 87, gear and segment 126 and 128, lever 127, cam 102, and spring 132, substantially as and for the purpose set forth.

27. The combination, in a lasting-machine, of a gripper with a spring opening the jaws of the same, a rod or shaft carrying the gripper, a lever and cam adapted to depress the shaft, and a spring adapted to lift the shaft, a sleeve turning with the shaft and having vertical motion thereon and adapted to close the jaws of the gripper, as set forth, a lever and cam adapted to lift the sleeve, a spring adapted to lower the sleeve, a cog-gear on the sleeve, a lever having a cog-segment engaging the cog-gear on the sleeve, a cam adapted to swing the lever in one direction, and a spring adapted to swing the lever in the other direction, substantially as set forth.

28. A lasting-machine having a tack-hopper with an inclined trough-chute, with inclines 168 at each side of the chute and slot 170 in the bottom, substantially as and for the purpose set forth.

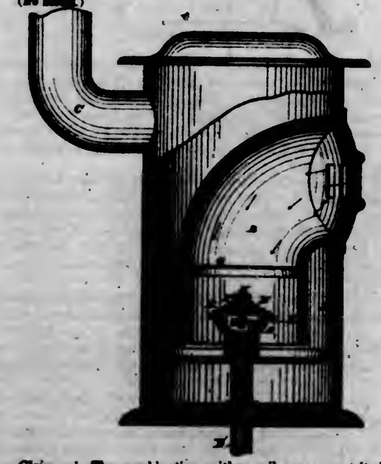
29. The combination, in the tack-hopper of a lasting-machine, of the hopper with narrow mouth, an inclined chute with side inclines, 168, and slot 170, the lower end, 171, with aperture 172 for the heads of the tacks, and the tack-race forming an extension of the chute and slotted throughout its length for the shank of the tack, substantially as set forth.

30. In a lasting-machine, the combination of the tack-race 173 with slot 170, adapted to receive the shank of the tacks, and the tack-deliverer 175, with its marginal recesses 176 and guard-lip 177, for the purpose set forth.

31. In a lasting-machine, the combination of the tack-deliverer 175, having marginal slots or recesses 176, the guard-lip 177, and the jointed section 179, allowing the escape of the tack from the front slot of the deliverer, substantially as set forth.

32. In a lasting-machine, the combination, with the rotary tack-deliverer, of the ratchet-clutch 185 187, cog-wheel 186, held down by spring 189, and fixed cog-rack engaging with the cog-wheel, substantially as set forth.

33. In a lasting-machine, the combination of the rotary tack-deliverer and the tack-guide 178, receiving the point of the tack as the deliverer moves downward with the tack-hopper and removing the tack from the slot as the deliverer moves backward with the hopper.



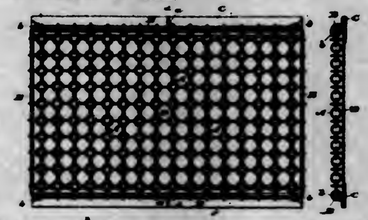
34. The combination, in a lasting-machine, of the tack-carrier composed of spring-jaws, a slide-bar, 207, to which the jaws are pivoted, and a cam adapted to actuate the slide-bar, substantially as set forth.

35. In a lasting-machine, a tack-driver, 215, a spring, 216, acting to force the driver downward, a spring-catch, 220, engaging the driver when in its lower position, a lever-arm, 221, in which the catch has bearing, and a suitable device to retract the catch and release the driver, substantially as shown and described.

36. The tack-driver, a spring pressing the driver down, a lever having a retractible latch, a cam imparting to the lever a reciprocating motion, and a slide-bar with a finger adapted to retract the latch and actuated by a cam projection, substantially as and for the purpose set forth.

37. A lasting-machine having the following combination: guide-rollers and combined guide and feed wheels for the work; a gripper and crimper on a rotary shaft having positive downward motion and upward motion by means of a spring, a sleeve upon and turning with the gripper-shaft, having independent positive upward motion and downward motion by means of a spring, a cog-gear on the sleeve engaged by a cog-rack on a lever having positive motion in one direction and moved in the other direction by a spring, a spring-pusher and a folder, and means, substantially as set forth, to feed and drive the tack, as set forth.

387,927. OIL-CUP FOR BURNING CRUDE PETROLEUM-OIL. ROBERT W. SMITH, Toledo, Ohio. Filed Sept. 19, 1887. Serial No. 250,105. (No model.)

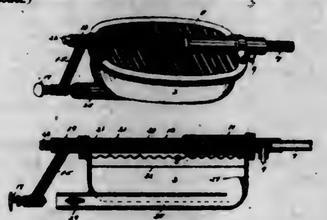


Claim.—1. The combination, with an oil-cup open at its bottom and provided there with an oil-inlet pipe, of a series of disks, one resting on another above the top of the cup and clamped down to place, substantially as set forth.

2. In a stove, the combination, with a downdraft-flue, the lower

end of which is a combustion-chamber, of a screen or perforated diaphragm, G, between the flue and combustion-chamber, and an overflow oil-cup below the screen open at its bottom and provided there with an oil-inlet pipe, and a series of disks at the top of the cap clamped down to place, substantially as set forth.

387,928. DOOR-MAT. William Smith, Toronto, Ontario, Canada, assignor to James Wilson, trustee, same place. Filed Feb. 28, 1887. Serial No. 229,172. (No model.)



Claim.—1. A wire mat composed of a series of rings, A, linked together, in combination with the plate C, having lugs *b*, and the frame B, inserted through the outer rings of the mat and through lugs *b*, formed in the plates C, substantially as and for the purpose specified.

2. A wire mat composed of a series of rings, A, linked together, in combination with the grooved plates C, having lugs *b*, and a frame, B, inserted through the outer rings of the mat and through lugs *b*, formed in the plates C, substantially as and for the purpose specified.

3. A wire mat composed of a series of rings, A, linked together, in combination with the plates C, jointed at *d* and formed with lugs *b*, and a frame, B, jointed at *a* and inserted through the outer rings of the mat and through lugs *b* in the plates C, substantially as and for the purpose specified.

4. A wire mat composed of a series of rings, A, linked together, combined with a bottom, D, arranged beneath said mat, with a space between the two, and a cocoa matting, E, attached to said bottom, substantially as and for the purpose specified.

387,929. HYDROCARBON VAPORIZER AND BURNER. Wilbur F. Steele, Steele, Dakota. Filed May 7, 1888. Serial No. 273,108. (No model.)

Claim.—1. In a hydrocarbon vaporizer and burner, the combination, with a burner and a valve for regulating the supply of vapor or gas thereto, of a superheater or retort which is straight from end to end, arranged horizontally over and close to said burner and provided with a closely-fitting internal core, whereby the vapor or gas is spread out in a thin sheet or film and adapted to be readily superheated, substantially as described.

2. In a hydrocarbon vaporizer and burner, the combination, with the mingling-chamber 3, provided with the perforated metal plate 5, of the superheater or retort arranged horizontally over said chamber and provided with a closely-fitting core, 19, the tube 15, the needle-valve 17, and the tube 25, arranged opposite said valve and communicating with the lower part of said mingling-chamber, substantially as described.

3. In a hydrocarbon vaporizer and burner, the combination, with the mingling-chamber 3, provided with the perforated metal plate 5, of the vaporizer 11, and the superheater or retort 13, communicating with said vaporizer and provided with an internal closely-fitting core, 19, and arranged horizontally over said chamber, substantially as described.

4. In a hydrocarbon vaporizer and burner, the combination, with the mingling-chamber 3, provided with the perforated plate 5, the vaporizer 11, formed of an enlarged piece of pipe, the superheater or retort 13, formed of a smaller pipe than that of said vaporizer and arranged horizontally over said chamber and provided with an internal closely-fitting core, 19, substantially as and for the purpose described.

5. A hydrocarbon vaporizer and burner provided with a mingling-chamber, 3, a tube, 25, arranged horizontally beneath and communicating with the interior of said chamber, and the curved abutment or deflecting-surface 27, arranged within said chamber near the inner end of said tube, substantially as and for the purpose described.

6. In a hydrocarbon vaporizer and burner, the combination of the mingling-chamber 3, the tube 25, arranged horizontally beneath and communicating with said chamber, the perforated retarding-plate 31, arranged within said chamber and formed with perforations decreasing in size toward the end of said chamber which is nearest the inner open end of said tube, substantially as described.

7. In a hydrocarbon vaporizer and burner, the combination of a mingling-chamber provided with a curved abutment or deflecting-surface on its interior surface, a tube communicating with said chamber and arranged with its open inner end in proximity to said abutment, and a perforated retarding-plate formed with perforations decreasing in size toward the end of said chamber which is nearest the end of said tube, substantially as described.

8. A hydrocarbon vaporizer and burner provided with a mingling-chamber, 3, a tube, 25, a spreader, 29, an abutment or deflecting-surface, 27, a retarding-plate, 31, formed with different-sized perforations, and a perforated burner-plate, 5, substantially as described.

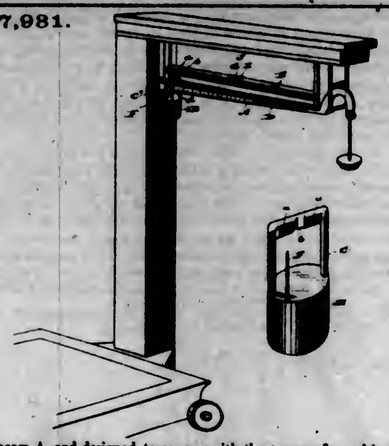
9. In a hydrocarbon vaporizer and burner, the combination of the mingling-chamber 3, the vaporizer 11, the superheater or retort 13, arranged horizontally over said chamber, the tube 15, provided with the valve 17, the tube 25, arranged horizontally beneath and communicating with said chamber and having its outer open end arranged opposite said valve, and the spreader 29, arranged within said tube, substantially as and for the purpose set forth.

10. In a hydrocarbon vaporizer and burner, the combination, with the mingling-chamber 3, of the superheater or retort 13, which is straight from end to end and arranged horizontally over said chamber, and provided with the core 19, having the series of rings 21, substantially as and for the purpose described.

387,930. CARPET-STRETCHER. John Story, Goderich, Ontario, Canada. Filed Apr. 2, 1888. Serial No. 269,402. (No model.)

Claim.—1. The herein-described carpet-stretcher, composed of the two bars A and C, the one having the slotted end *d* and the other a slotted end, *c*, so that their ends form a male and female joint, the one part fitting into the other and the two pivoted together by a pin, and the curved ratchet-bar E, pivoted in the slot *f*, substantially as shown and described.

2. A carpet-stretcher composed of two members, A and C, the first having at its lower end the stretcher-point B and at its upper the slotted part *d*, the latter having the needle-point D at its lower end and the slotted part *c* at the other, the two slotted parts forming a male and female joint, the said male and female joint fitting the one part upon and over the other and the two hinged together by a pin, and the ratchet-bar E, pivoted in one of the slotted joints and engaging in the beveled edge of the opposite slotted joint, all substantially as and for the purpose set forth.

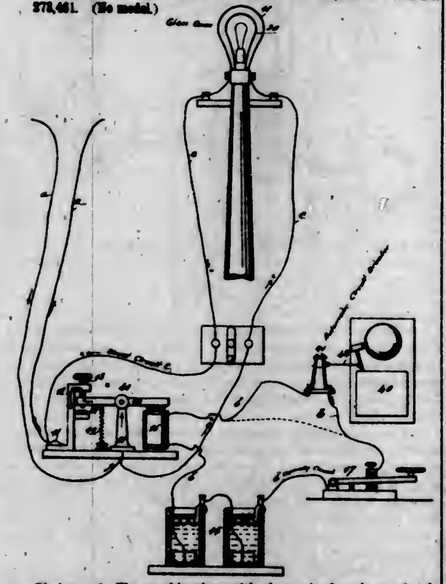


387,931. WEIGHING-SCALE. Arthur Taylor, Toronto, Ontario, Canada, assignor of one-half to William Stone, same place. Filed Oct. 20, 1887. Serial No. 252,913. (No model.)

Claim.—1. In a beam-scale, an adjustable weight suspended on an inclined plane formed in the balance-beam, in combination with a stationary bar having notches formed in it to correspond with the indicating-marks in the beam, and a bail carrying the weight and having a tongue, substantially as and for the purpose specified.

2. An inclined scale-beam, A, and an adjustable weight, B, provided with a bail, C, having one or more rollers, *a*, journaled in it and designed to rest upon an inclined plane formed in the beam A, in combination with the stationary bar D, having notches *d* formed in it to correspond with the indicating-marks in the beam A, and designed to engage with the tongue *b*, formed in the bail C, substantially as and for the purpose specified.

3. An inclined scale-beam, A, an adjusting weight, B, provided with a bail, C, having a tongue, *b*, and designed to rest upon an inclined plane formed in the balance-beam A, and a pointer, F, to indicate the indicating-points on the beam A, in combination with a stationary bar, D, notched to correspond with the indicating-points in

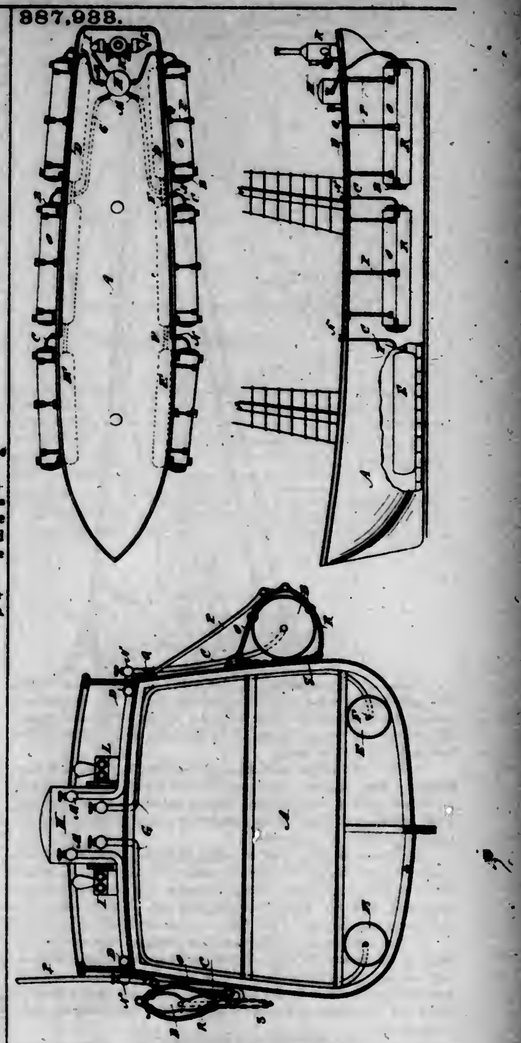


387,981.

the beam A, and designed to engage with the tongue formed in the bail C, substantially as and for the purpose specified.

4. A plate, I, the double-hinged plates J, and a plate, G, connected to the plate I by the double-hinged plates J, and having pivots *e* formed on it, in combination with the bar K, the lugs *g*, made in the plate I, which is adjustably supported by the bar K, having raised marks formed on its surface, substantially as and for the purpose specified.

387,982. FLASH-LIGHT SIGNAL. William H. Thompson, Richmond, Va. Filed Apr. 19, 1887. Renewed June 20, 1888. Serial No. 278,461. (No model.)



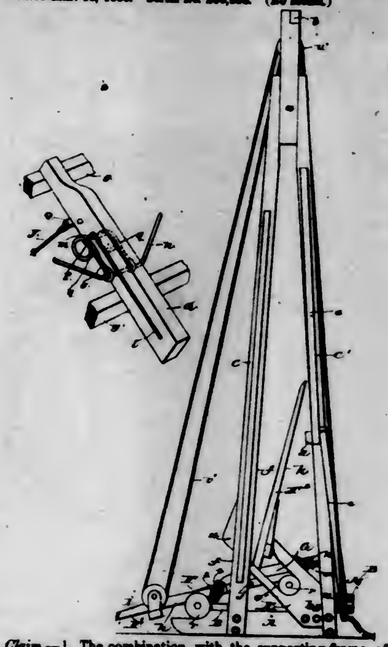
Claim.—1. The combination, with the main fire-alarm circuit *a a*, of the main circuit-breaker 20, forming a shunt, the extended circuit *c c*, the incandescent lamp 30, included in the latter, the local circuit, and the breaking-key 17, all connected and operating substantially as described, and for the purpose set forth.

2. The combination of the automatically-operated gong 40, the automatic circuit-breaker 41, and rod 42 connecting them with the local circuit *b b*, main-circuit breaker 20, main circuit *a a*, extended main circuit *c c*, and incandescent lamp 30, all as shown and described.

387,988. MEANS FOR BOOTING UP VESSELS. William D. T. Travis, Burlington, N. J. Filed Mar. 20, 1888. Serial No. 268,775. (No model.)

387,988.

Claim.—1. The combination, with a vessel, of a collapsible gas-buoy arranged on the outside of the vessel, a folding cap adapted to cover the top of the buoy, and a folding shield to protect the under side of the buoy, the said cap and shield being attached to the vessel, substantially as described.



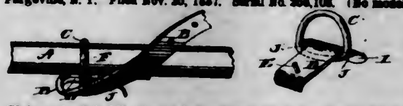
2. The combination, with a vessel and a collapsible buoy arranged on the outside of the same, of a pointed protector for the buoy hinged to the vessel, and a brace hinged to the protector and adapted to engage an abutment on the vessel, substantially as herein shown and described.

3. A protector for collapsible buoys for vessels, consisting of a cap-plate adapted to be hinged to the vessel, and a shield or bottom plate hinged to the cap-plate and having its free end connected to said cap by a flexible connection, substantially as described.

4. The combination, with a vessel and a collapsible gas-buoy connected to the same, of a buoy-covering cap hinged to the vessel, a buoy-shield hinged to the cap, a flexible connection between the cap and shield, and means for adjusting and supporting the cap and shield, substantially as described.

5. The combination, with a vessel, of a curved cap and shield connected to the vessel and adapted to fold together and to embrace a collapsible buoy, substantially as described.

387,934. HAY-STACKER. James J. Wabaman, Carrollton, Mo. Filed Mar. 10, 1888. Serial No. 266,826. (No model.)

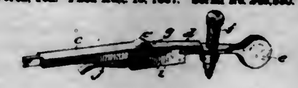


Claim.—1. The combination, with the supporting-frame, of the fork consisting of main portion and pivoted section, the slotted and notched bar G, the pivoted link connected to said section and engaging said slot and notch, and devices for disengaging the link from the slots and notch, as set forth.

2. The combination, with the supporting-frame, of the fork consisting of main portion and pivoted section, the slotted and notched bar G, the pivoted link connected thereto and engaging said slot and notch, a bell-crank lever having a portion in said notch, and a cord for operating said lever, as set forth.

3. The combination, with the supporting-frame, of the fork consisting of main portion and pivoted section, the slotted and notched bar G, and the pivoted link connected thereto and engaging said slot and notch, said link being provided with side guide portions and devices for disengaging the link from the slot and notch, as set forth.

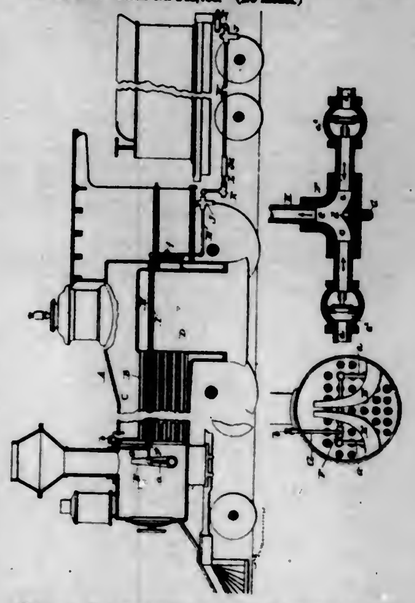
4. The combination of the base, the converging standards erected thereon, the inclined block E, secured on the base between the standards and having the slots *d'*, the blocks *x*, secured to the front standards and having inclined faces, the fork having rollers adapted to move in the slots *d'* and against the blocks *x*, and the cable controlling the fork, as set forth.



387,935. HOLDBACK FOR VEHICLES. Edward Walrath, La Fargeville, N. Y. Filed Nov. 26, 1887. Serial No. 256,103. (No model.)

Claim.—1. A holdback-catch consisting of an oval ring adapted to be secured upon the shaft and the sliding wedge-plate having the tongue near its forward thick end, substantially as set forth.

2. The combination, with the shaft having the longitudinal groove formed in its lower side, of the oval ring secured upon the shaft by the screws and the sliding wedge-plate having the upwardly-projecting tongue near its forward thick end and the wide outwardly-curved rear end, substantially as set forth.



387,936. PASSENGER MILEAGE-RECORDER. Samuel M. West, Fort Worth, Tex. Filed Aug. 13, 1887. Serial No. 246,893. (No model.)

Claim.—1. The combination, with a roller mounted in a suitable case and winding thereon a sheet of paper fed from beneath, of a series of crayon-holders supported above the roller, the same being constituted of the part *c*, having lip *c'*, and the part *d*, weighted and formed with the portion *g*, the two parts being united by a link, to which a spring is secured, which bears against the part *d*, and means connecting with the seat of the coach for operating said holders, substantially in the manner described.

2. The combination, with a roller mounted in a suitable case and winding thereon as it turns a sheet of paper fed from beneath, of a series of crayon-holders supported above the roller, the same being constituted of the part *c*, having lip *c'*, and the part *d*, weighted and formed with the portion *g*, the two parts being united by a link, to which is secured a spring bearing against part *d*, the rods and bell-cranks, the spring-seats, means for operating the roller from the axle of the car, and the spring bearing upon the roller, by which the paper or other sheet is prevented from slipping, substantially as described.

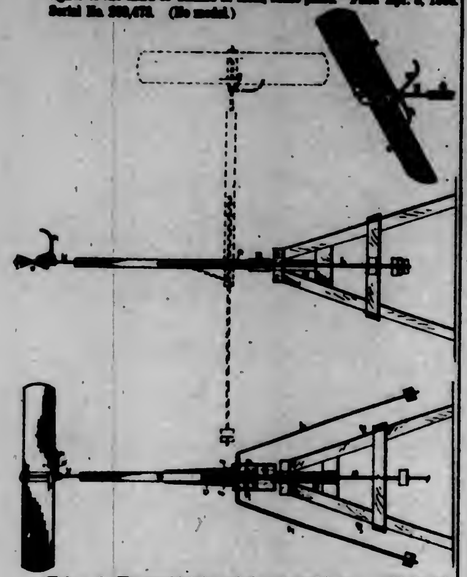
387,937. CAR-HEATER. Robert Weslar, Chicago, Ill. Filed June 18, 1887. Serial No. 241,756. (No model.)

Claim.—1. In a car-heating apparatus, the combination, with a locomotive and its exhaust-nozzles E E, of a hollow box or casing, F, located within the smoke-box, pipes *a a*, communicating with the exhaust-nozzles and entering the box F from opposite sides, a discharge-pipe, H, and a live-steam pipe, G, also connected with the box in line with the discharge-pipe.

2. In a car-heating apparatus, the combination, with the locomotive and its boiler and exhaust-nozzles, of a hollow box, F, located within the smoke-box of the locomotive, pipes *a a*, each connected with one of the nozzles and entering the box F from opposite sides, passages *c c* within the box F, extending from pipes *a a* toward each other and merged to form an outlet, *e*, a pipe, H, extending from said outlet, and a live-steam pipe, G, connected at opposite ends with the boiler and the box F and arranged in line with the outlet.

3. In combination with a locomotive and its exhaust-nozzles, a hollow box, pipes connected at opposite ends with the hollow box and the nozzles, valves located in the said pipes and adapted to open inwardly toward the box, a live-steam pipe, and a discharge-pipe also connected with the box, all substantially as shown.

4. The herein-described trap J, comprising a steam inlet and outlet, *g*, a water-chamber, *h*, a hollow plug, *j*, secured to the lower end of chamber *h*, a plug, *i*, secured to the upper end of the trap, a valve-stem, *k*, and a valve-plug, *l*, loosely connected to the stem *k*.



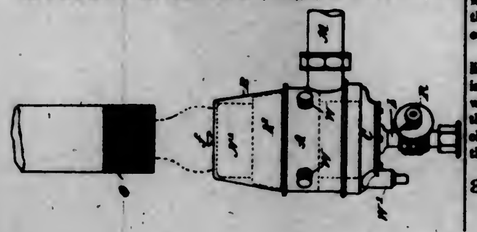
5. In combination with the trap-casing having a through steam-passage and a water-chamber, an expansible rod or stem, *k*, secured at one end to the casing, and a valve-plug loosely connected with the stem and adapted to close the water-outlet.

6. In combination with the trap-casing having a through steam-passage and a water-chamber communicating therewith, plugs *i* and *j* at the upper and lower ends of the casing, and valve-stem *k*, screwing at its upper end into the plug *i*, and provided at its lower end with a valve-plug, *l*, adapted to close the water-discharge outlet.

7. In combination with the trap-casing having steam-passages *g g* and a water-chamber, *h*, plugs *i* and *j*, screwing at opposite ends into the casing, a valve-stem, *k*, secured to plug *i*, and provided at its lower end with socket *m* and slot *n*, and a valve-plug, *l*, provided with stem *o* and pin *p* and adapted to fit within the end of the valve-stem.

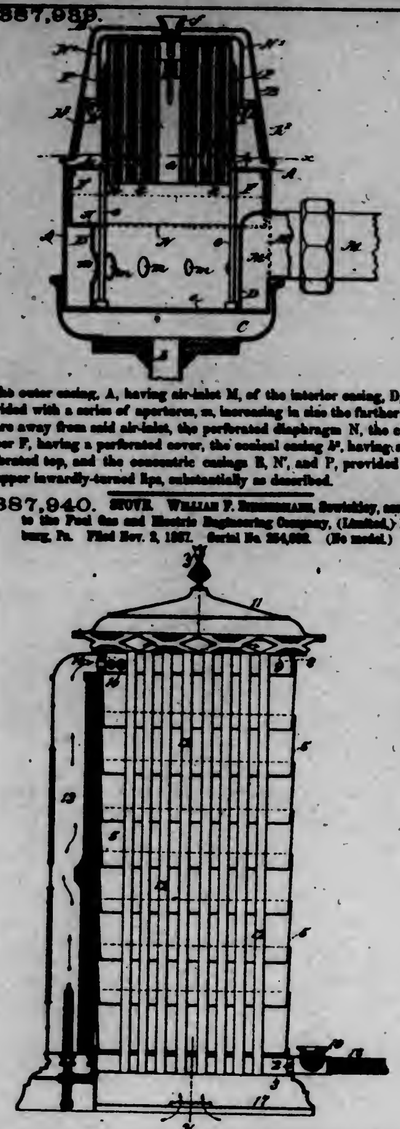
8. In a car-heater, the combination, with one or more cars, of a main steam-supply, a distributing-pipe, a supplemental steam-generator located within one of the cars and connected with and adapted to supply steam to the main distributing-pipe, and a water-tank surrounding and forming a part of the supplemental generator, all substantially as shown.

387,938. WINDMILL. David A. Wermuth, Anthony, Kans., assignor of one-third to Elmore B. Reid, same place. Filed Apr. 3, 1888. Serial No. 269,672. (No model.)



Claim.—1. The combination of the pivoted lever provided with counterbalancing-weights at its lower end, connecting-rods for connecting the pump-rod to the lever, the fan placed upon the upper end of the lever and adapted to be revolved by the wind through a portion of a circle at right angles to the length of the lever, and stops secured to the lever for limiting the turning movement of the fan, substantially as shown.

2. The combination of the pivoted lever provided with weighted rods at its lower end and connected to the pump-rod, the fan placed upon the upper end of the lever and adapted to be revolved by the wind through a portion of a circle at right angles to the length of the lever, and two stops secured to the upper end of the lever and projecting therefrom at different angles in the rear of the fan, so as to limit its turning movement, substantially as described.

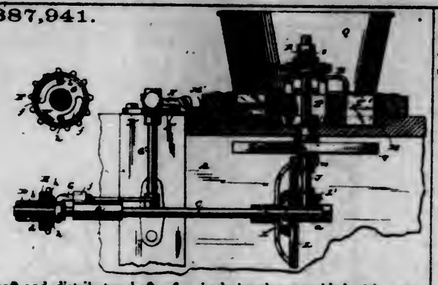


387,939. OIL-LAMP FOR LIGHT-HOUSES. John R. Wigham, Monkstown, County of Dublin, assignor to the Rees Patent Lighting Company, (Limited,) Dublin, Ireland. Filed Apr. 4, 1887. Serial No. 233,594. (No model.) Patented in England Nov. 6, 1884, No. 14,666.

Claim.—In a multiple-wick lamp having several concentric wick-tubes and intermediate concentric air-passages, the combination, with

the outer casing, A, having air-inlet M, of the interior casing, D, provided with a series of apertures, *m*, increasing in size the farther they are away from said air-inlet, the perforated diaphragm N, the chamber F, having a perforated cover, the central casing A^2, having a perforated top, and the concentric casings B, N', and P, provided with upper inwardly-turned lips, substantially as described.

387,940. STOVE. William F. Zimmermann, Sewickley, assignor to the Peal Gas and Electric Engineering Company, (Limited,) Pittsburg, Pa. Filed Nov. 2, 1887. Serial No. 254,602. (No model.)



Claim.—1. In a stove, a heating-chamber composed of two or more cup-like sections, the bottom of each being provided with an opening, said sections being adapted to be fitted together telescopically, whereby the sides of said sections form the walls of the chamber and the bottoms form baffle-plates, in combination with two or more open-ended tubes traversing the cup-like sections, substantially as set forth.

2. In a stove, a heating-chamber composed of two or more cup-like sections, the bottom of each section being provided with an opening, said sections being adapted to be fitted together telescopically, whereby the sides of said sections form the walls of the chamber and the bottoms form baffle-plates, in combination with a combustion-chamber connected to the top section and an escape-flue connected to the bottom section, substantially as set forth.

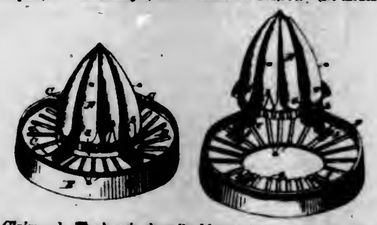
387,941. SEED-SOWER. Hans Andersen, Racine, Wis. Filed Aug. 20, 1887. Serial No. 248,042. (No model.)

Claim.—1. In a seed-sower, the combination, with the main drive-

387,941.

shaft and distributer-shaft, of a single bracket provided with a step for said distributer-shaft and having each of its ends in the form of a bearing for said main shaft, substantially as set forth.

2. In a seed-sower, a distributer having the outer ends of its wings provided with right-angle flanges, substantially as set forth.



3. In a seed-sower, the combination of a distributer, a seed-box having delivery-openings and a central circular flange having one side thereof provided with vertical seed-passages, a series of vertical cut-offs for the seed-passages, an annulus provided a series of radial flanges and arranged adjacent to the cut-offs, and suitable mechanism for rotating the distributer and annulus, substantially as set forth.

4. In a seed-sower, the combination of a drive-shaft, a hub keyed thereto and provided with clutch-teeth, a shell loose on the shaft and interiorly provided with lugs *e*, a sprocket-wheel secured to the shell and having lugs *g* that enter the same, springs arranged between the lugs on said shell and those on the sprocket-wheel, and suitable means for actuating the loose section of the clutch mechanism, substantially as set forth.

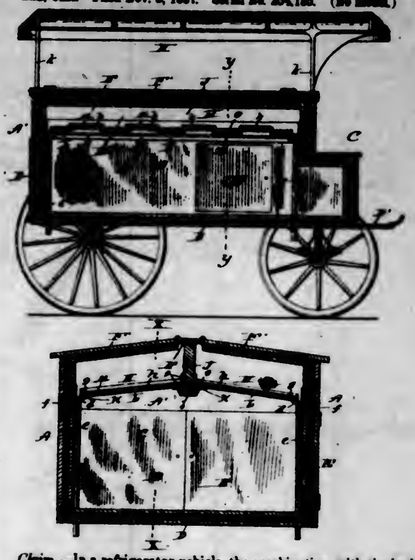
5. In a seed-sower, the combination of the feed-box M, provided with the arm M', flange P, and spouts *p*, the pivoted dog N, rack N', distributer K, shaft J, sleeve R, having depending arms R', cut-offs S, annulus T, provided with the radial flanges T', the lever U, and suitable means for driving said distributer and shaft, substantially as set forth.

6. In a seed-sower, the combination of the shaft C, hub D, provided with clutch-teeth *b*, the shell E, having lugs *e*, sprocket-wheel F, having the slots *f* and lugs *g*, the spiral springs *i*, spanner-arm G, crank-shaft G', hand-lever H, spring-dog H', and serrated bracket B', substantially as set forth.

387,942. LEMON-JUICE EXTRACTOR. Edwin Baldrey, Philadelphia, Pa. Filed May 2, 1888. Serial No. 272,583. (No model.)

Claim.—1. The herein-described lemon-juice extractor, composed of a cone having ribs which are sharpened and having arms extending therefrom and forming a prolongation of some of the ribs, substantially as and for the purpose described.

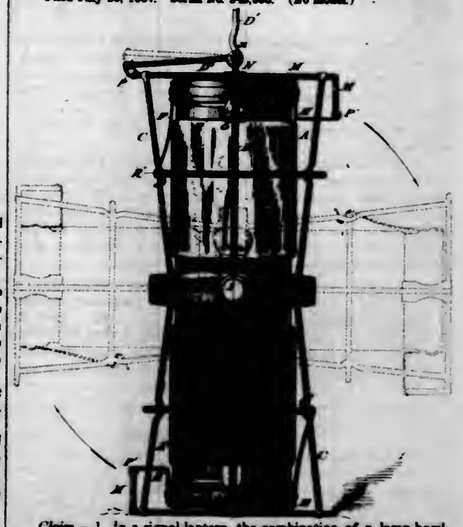
2. The herein-described lemon-juice extractor, comprising the cone having a well-defined margin at its lower edge, and having the ribs and the channels between the ribs extending from the said margin to the apex of the cone, and having juice-channels formed in the face of the margin only and extending from the top to the bottom of the said margin, substantially as shown.



3. The combination, with the cone having the ribs *a* and arms C integral with the cone, of the drainage-plate, substantially as and for the purpose described.

4. The combination, with the cone having the ribs *a*, and the bed or drainage-plate having a central opening which is about equal to the diameter of the base of the cone, the bed being set below the cone to form a slot for the egress of the juice, of the arms extending from the cone, substantially as and for the purpose described.

5. The combination, with the cone having the ribs *a* and arms C, of the flaring drainage-plate having the channels *c*, substantially as and for the purpose described.



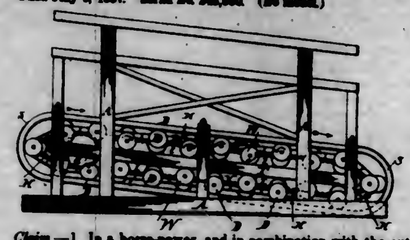
6. The herein-described lemon-juice extractor, composed of the cone having the ribs *a*, and having a margin at its base which is provided with juice-channels, the flaring bed having the channels *c* and having a depending rim, and the arms interposed between the bed and cone and forming base-cutters, substantially as and for the purpose specified.

387,948. REFRIGERATOR-VEHICLE. Wilbur R. Beard, Cincinnati, Ohio. Filed Nov. 3, 1887. Serial No. 254,185. (No model.)

Claim.—In a refrigerator-vehicle, the combination, with the body of the vehicle, which forms a refrigerating-chamber, G, of the central longitudinal partition, J, inserted in the vehicle over the refrigerating-chamber and removable therefrom, ice-pans supported directly over the refrigerating-chamber by the partition J, and the sides of the vehicle-body and drip-pipes attached to these pans and leading outside of the vehicle, substantially as described.

387,944. LASTING. John H. Burrell, Jr., Philadelphia, Pa. Filed July 20, 1887. Serial No. 245,036. (No model.)

Claim.—1. In a signal-lantern, the combination of a lamp-bowl provided with hollow filling-tubes, a bail rigidly secured to said tubes and having pivotal arm attachments, a ring pivotally mounted on said tubes, and a frame carried by said ring and provided with globes of different colored glass, substantially as and for the purpose set forth.



2. In a signal-lantern, the combination of a lamp-bowl with tubes, a bail rigidly secured thereto, a ring pivotally mounted on said tubes and having the globes A A', the wire frame C, formed with the rib R', hinged cage E, and catch F, the latter adapted to catch with said rib R', substantially as described.

3. In a signal-lantern, the combination of a lamp-bowl with tubes, a bail rigidly secured thereto, one of the arms of said bail having an extension, D^2, a rotary frame having an upper rib, M, and a catch, P, adapted to bind said rib M and extension D^2, substantially as described.

4. In a signal-lantern, the combination of a lamp-bowl, a bail rigidly secured thereto, a rotary frame having the notches N N in the side of its upper rib, M, whereby said rotary frame is locked to said bail, substantially as described.

5. In a signal-lantern, the combination of a lamp-bowl, a bail rigidly secured thereto, a rotary frame pivotally secured to said lamp-bowl and carrying globes, the said frame having the cage E, and catches Q Q, secured to the upper rim, M, substantially as described.

387,945. HORSE-POWER. George R. Bent, Harvard, Mass. Filed July 6, 1887. Serial No. 243,003. (No model.)

Claim.—1. In a horse-power, and in combination with the outer track having upper and lower portions, B C, and the track T between the same, the chain, the lugs, and the wheels pivoted to the ends of the lugs on different horizontal planes, substantially as described.

2. In a horse-power, the combination of the lugs H, the links L and V, the wheels W and D, the bolts N, and nuts *o* and *o'*, substantially as described.

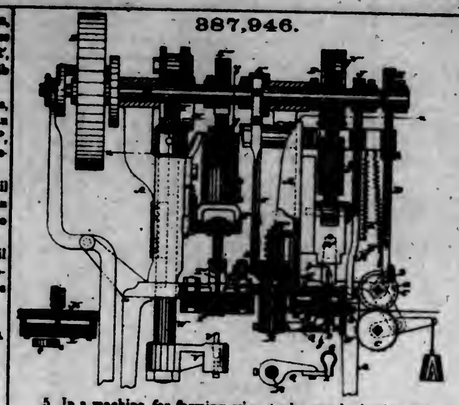
3. In a chain horse-power, the combination of the wheels, each set pivotally secured to the lugs of the tread in different horizontal planes, with the tracks having upper and lower portions, B and C, and the central track, T, between them, whereby one set of wheels moves its entire circuit on the outside track and the other moves its entire circuit in a different plane and on an inner track, substantially as described, and the frictionizing of the wheels and their reversion are prevented.

4. In a horse-power, in combination with the track-wheels and the tread, the angle-bolts N, substantially as and for the purposes set forth.

5. In a horse-power, the combination of the following elements, namely: the track having upper and lower portions, B and C, and a central track, T, between them, and the track-wheels securely pivoted to the lugs of the tread, one set of wheels moving its entire circuit on one track and the other set moving on the other track, whereby reversion and frictionizing of the wheels in passing from the upper to the lower part of the track are avoided.

6. In a horse-power, in combination with the wheels pivoted in different horizontal planes, the tracks arranged on different planes, the outer track adapted for the wheels pivoted in one plane and the inner track for those pivoted on another plane, whereby any reversion in the revolution of the wheels is prevented.

387,946. STAPLE-MACHINE. Horace R. Cunningham, Bridgewater, Pa., assignor to the Acme Staple and Machine Company, of New York. Filed May 16, 1884. Renewed June 22, 1888. Again renewed Mar. 3, 1888. Serial No. 265,163. (No model.)



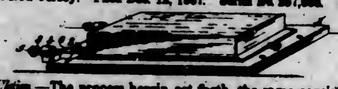
Claim.—1. In a machine for forming wire staples, the die L, having a vertical opening, in combination with a plunger, M, movable arm Q, having opening *c*, and oscillating shaft R, substantially as described.

2. In a machine for forming wire staples, a holder for the wire, and a bending and reducing plunger, in combination with a movable arm, Q, for carrying the bent wire to the staple-shaping dies, substantially as and for the purpose set forth.

3. In a machine for forming wire staples, a support for the wire, a bending-plunger, and shaping-dies, in combination with an oscillating holder, having adjustable arm, carrying the bent wire as it leaves said die to the shaping-dies, substantially as and for the purpose set forth.

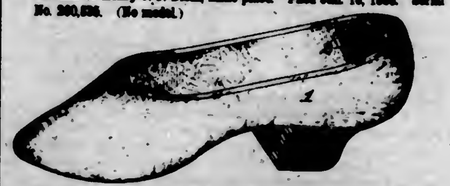
4. In a machine for forming wire staples, a holder or carrier for the primarily-shaped staple, in combination with an oscillating shaft, a pinion, toothed segment, and returning-spring, substantially as and for the purpose set forth.

387,946.



5. In a machine for forming wire staples, staple-shaping dies, a plunger between the dies, and a punch for forcing the primarily-shaped staple into said dies and completing the shape thereof, combined and operating substantially as and for the purpose set forth.

6. In a machine for forming wire staples, feed-rollers, a cutter, a support for the wire, a bending-plunger, a die, a holder and carrier for the bent wire, staple shaping and pointing dies, a plunger within the dies, and a punch for forcing the bent wire into said dies, said parts being combined and operating substantially as and for the purpose set forth.

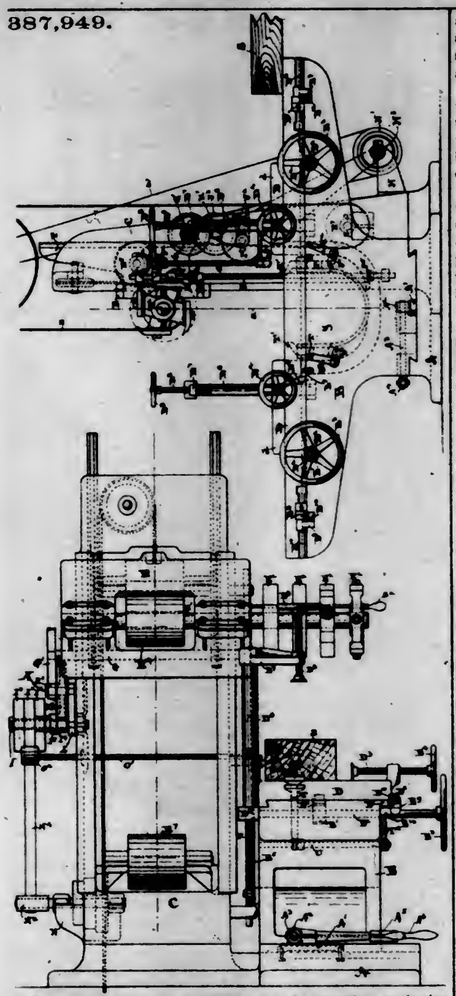


7. Feed-rollers, a cutter, a support for the wire, a bending-plunger, a die, a holder, and carrier for the bent wire, staple shaping and pointing dies, a plunger within the dies, and a punch for forcing the bent wire into said dies, in combination with connected arms and heads, and eccentrics and a cam, said eccentrics and cam being on the same shaft, substantially as and for the purpose set forth.

387,947. METHOD OF SECURING BLOCKS OF PLASTIC MATERIAL WHILE PLANING THEM INTO SHEETS. Frazer Green, Newburyport, Mass., assignor to the Arlington Manufacturing Company, of New Jersey. Filed Dec. 12, 1887. Serial No. 257,602. (No model.)

Claim.—The process herein set forth, the same consisting in imposing a block of plastic material upon the smooth surface of a suitable bed-plate, applying heat and pressure thereto to expel the air and effect intimate contact, forming a flange upon one or more edges of the block, and applying pressure to said flange or flanges, substantially as described.

387,948. SHOE. Charles R. Dubbs, Pittsburg, Pa., assignor of one-half to Henry J. P. Diehl, same place. Filed Jan. 16, 1888. Serial No. 260,836. (No model.)



Claim.—A shoe or slipper provided with a strip of elastic material connected at its ends to the inside of the upper portion of the shoe, forming a band that is normally in front of the counter, and adapted to be expanded when in use to lie against said counter and to hold the shoe to the foot, substantially as set forth.

387,949. TENONING-MACHINE. William H. Doane, Cincinnati, Ohio. Filed Feb. 17, 1888. Serial No. 264,416. (No model.)

Claim.—1. In a tenoning-machine having power-driven cutters cutting vertically in relation to the timber and feed mechanism for moving the cutters vertically by the driving-power to cut tenons during each movement, in combination with mechanism, substantially as described, for automatically controlling and confining the feed motion within upper and lower limits of action, substantially as set forth.

2. In a vertical tenoning-machine, in combination with the cutter-gateway and its feed mechanism for moving the same vertically by the driving-power to cut tenons during each movement, a con-

387,949.

ating connection, an actuating dog or dogs upon said shaft, and mechanism actuated by the gateway in its vertical movement to rotate said shaft and actuate said belt-shifter in both directions to control and limit the feed movement, substantially as set forth.

6. In a vertical double-acting tenoning-machine, in combination with the vertically-moving cutters and horizontally-moving platen, a table or supporting-frame having a central gap or depression, into which the cutters descend, or supporting-frame adjustable upon the base-plate or supporting-pedestal horizontally in the axial line of the cutter-mandrel, substantially as set forth.

7. The combination, in a vertical double-acting tenoning-machine, with the sole-plate, the column, and the gateway vertically guided upon said column, of a table or supporting-frame having a central gap or depression, into which the cutters descend, guided upon the sole-plate, and a rack-and-pinion device connecting said sole-plate and table, whereby the table may be moved and adjusted laterally in the line of the cutter-mandrel, substantially as set forth.

8. In a vertical double-acting tenoning-machine, in combination with the vertically-moving cutters and a table or supporting-frame having a central gap or depression, into which the cutters descend, a platen or platens for carrying the work, adjustable longitudinally upon said table in a horizontal plane of the cutter-mandrel toward and from the gap, substantially as set forth.

9. In a vertical double-acting tenoning-machine, in combination with the vertically-moving cutters and a table or supporting-frame having a central gap or depression, into which the cutters descend, two platens or work-holding surfaces adjustable longitudinally upon said table at opposite sides of said depression, and connected across the same outside the limits of the cutters, substantially as set forth.

10. In a vertical double-acting tenoning-machine, a table or supporting-frame having a central gap or depression, into which the cutters descend, adjustable in the line of the cutter-mandrel, in combination with a work-carrying platen or platens adjustable longitudinally upon said table perpendicularly to the cutter-mandrel, substantially as set forth.

11. In a vertical double-acting tenoning-machine, a table or supporting-frame having a central gap or depression, into which the cutters descend, provided with longitudinal surface guides, a work-carrying platen adjustable on said guides toward or away from the cutters, and a rack-and-pinion device interposed between said table and platen for moving the latter, substantially as set forth.

12. The combination, in a vertical double-acting tenoning-machine, of a relatively-fixed table having surface guides, a work-supporting platen movable on said guides, a stop between the table and platen limiting the movement of the platen toward the cutters, and a stop projecting upward at or near the central depression of the table in the path of the platen, above the line of the platen-surface, and downward below the limit of interference with the platen, as a gage to determine the position and adjustment of the work upon the platen, substantially as set forth.

13. In a vertical double-acting tenoning-machine embodying vertically-fed cutters and a relatively-fixed table having a central depression, into which the cutters pass, through and below the work, a double platen with an interval between its platen-surfaces corresponding with said depression, said platen being adjustable longitudinally at right angles with the cutter-mandrel, stops limiting the movement of the platens in either direction toward the cutters, and two gage-stops, arranged one at each side of the table-depression and adjustable from a lower limit of non-interference upward into or above the plane of the platen-surfaces, respectively, to determine the adjustment of a sill or joint timber from either end upon either platen-surface, substantially as set forth.

14. In a vertical double-acting tenoning-machine, the combination, with the vertically-fed cutters, of a relatively-fixed table and a platen movable thereon toward and from the cutters, and a catch between said platen and table, adjustable longitudinally on said platen and acting to allow the platen to pass without engagement backward, but to engage in the forward movement and limit the same, substantially as set forth.

15. In a vertical double-acting tenoning-machine, in combination with a relatively-fixed supporting-table, a work-carrying platen provided with a fixed stop limiting its movement toward the cutters, and an adjustable stop limiting its movement in the opposite direction, substantially as set forth.

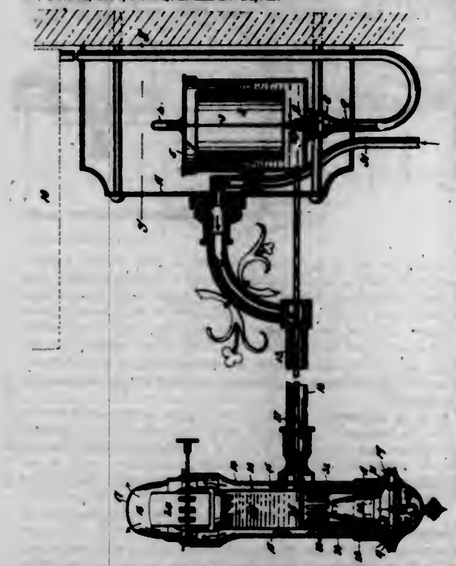
trolling device for governing said feed, and connecting mechanism between the gateway and controlling device, whereby the movement of the gateway automatically controls the feed at and within the proper limits of its own action, substantially as set forth.

3. In a vertical tenoning-machine embodying, in combination, a cutter-head and gateway, power feed mechanism and connections between the same, whereby the feed is controlled and automatically stopped at proper limits of its action, and a hand-lever connected with said feed mechanism, whereby the feed may be controlled by hand, as desired, independently of the power-connection, substantially as set forth.

4. In a vertical tenoning-machine embodying a cutter-head and gateway, power-feed mechanism, and an adjustable driving-belt connection with said feed, whereby the shifting of the belt upon and between fast or loose pulleys operates to control and limit the action of the feed, the combination of a bell-crank having one arm attached to and actuating the belt-shifter and the other extended as a hand-lever for the operator, and mechanism connecting said bell-crank with the cutter-gateway, whereby the movement of the latter near its extreme limits rotates said bell-crank from either limit back to a central or normal position where the belt is held upon its idler, substantially as set forth.

5. In a vertical tenoning-machine embodying a cutter-gateway, power feed mechanism, and a feed-belt adjustable upon fast and loose pulleys to control and limit the action of the feed, the combination of a belt-shifter, a vertical pivot-shaft with which said shifter has an actu-

387,950. SLEIGH-KNEE. Owen L. Dodge, Corinth, Mich. Filed Apr. 11, 1888. Serial No. 270,266. (No model.)

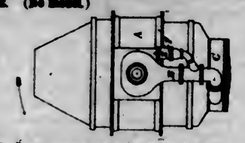


Claim.—1. In a sleigh-knee, the combination, with a bracket for attachment to the runner, provided with a trunnion formed integral with the bracket and extending clear across its upper end, of a bracket for attachment to the beam, provided with the flanges C on its upper edge, the semicircular bearing B for the trunnion, and the retaining-leg *b* at one end, and the cap provided with the retaining-leg *d*, and the flanges *d'*, which form a continuation of the said flanges on the bracket, substantially as and for the purpose set forth.

2. In a sleigh-knee, the combination, with a bracket provided with flanges *c* for attachment to the runner, the trunnion at its upper end formed integral with said bracket and extending clear across it, and the stop *f* for limiting the rocking and end movements of the said trunnion, of a bracket for attachment to the beam, provided with the flanges C on its upper edge, the semicircular bearing B for the trunnion, and the retaining-leg *b* at one end, and the cap provided with the retaining-leg *d*, and the flanges *d'*, which form a continuation of the said flanges on the bracket, substantially as and for the purpose set forth.

3. In a sleigh-knee, the combination, with a bracket for attachment to the runner, provided with a trunnion formed integral with and extending across the upper end of the bracket with its ends projecting on each side of said bracket, of a second bracket for attachment to the beam, provided with a long semicircular bearing for the said trunnion, and a lug at one end for retaining one of the projecting ends of the trunnion, and a loose cap bolted to the said beam-bracket for retaining the other projecting end of the trunnion, substantially as and for the purpose set forth.

387,951. RESERVOIR-LAMP. William A. Evans and John H. Ross, Dublin, Ireland, assignors to the Ross Patent Lighting Company, (Limited,) same place. Filed Mar. 16, 1887. Serial No. 231,015. (No model.) Patented in England Feb. 13, 1886, No. 2,022, and May 19, 1887, No. 7,291; in India July 15/28, 1887, No. 111/1869; in Victoria July 19, 1887, No. 5,136; in South Australia July 28, 1887, No. 942; in Queensland July 26, 1887, No. 899; in New South Wales Aug. 2, 1887, No. 30; in Italy Aug. 6, 1887, XLII, 247; in Brazil Aug. 11, 1887, No. 494; in Spain Nov. 11, 1887, No. 7,122/11,722, and in Austria-Hungary Dec. 23, 1887, No. 34,949 and No. 56,749.



Claim.—1. The combination, with a lamp provided with a burner and burner-cap, an inner tubular casing, 23, having an oil-chamber, 25, and apertures 30 below said chamber, an apertured drip-cup, 18, and a cone, 22, within said tubular casing at the base, of the vertical air-pipe 32, having an injector-nozzle, 28, furnished with a needle-valve, 29, at its lower end, the tubular connections 13 and 27, the reservoir 1, and compressed-air pipe 31, substantially as shown and described, and for the purposes set forth.

2. The combination, with a lamp provided with a burner and burner-cap having an outer slotted tubular casing, 14, an inner tubular casing, 23, provided with an oil-chamber, 25, apertures 30 below said chamber, and a cone attached at the base, and the detachable apertured drip-cup 18, of the vertical air-pipe 32, provided at its end with a valve-controlled injector-nozzle, 28, the compressed-air pipe 31, and reservoir 1, together with means for connecting the oil-chamber 25 with the reservoir and the air-pipe 32 with the compressed-air pipe 31, substantially as shown and described.

3. The combination, with a burner, of a tube extending below said burner, an oil-chamber being formed in said tube, and said tube being apertured below the reservoir, an outer casing for said tube and burner, a cone in the lower end of said tube, an injector-nozzle at the base of said cone, a pipe connecting said injector-nozzle with an air-compressor, and a pipe connecting the oil-chamber with an oil-reservoir substantially as shown and described.

387,952. APPARATUS FOR INTRODUCING SAND OR OTHER POWDERED OR GRANULATED SUBSTANCES INTO BESSEMER CONVERTERS. James J. Fessenden, Johnstown, Pa., assignor to the Cambria Iron Company, of Pennsylvania. Filed May 11, 1883. Serial No. 273,882. (No model.)

Claim.—1. In an apparatus for introducing sand or other powdered or granulated substances into a Bessemer converter with the blast, the combination of a wind-box, a blast-pipe with a tangential passage to the wind-box, and an inclined deflecting-plate located in the bottom of the wind-box, substantially as set forth.

2. A sand-receptacle located on the side of the blast-pipe of a Bessemer converter, in combination with a passage connecting the sand-receptacle with the blast-pipe at some point between the converter-trunnions and the wind-box, a controllable valve located between the sand-receptacle and the blast-pipe, and an opening for introducing the sand, provided with a tightly-fitting lid or cover, substantially as set forth.

3. The combination of a sand-receptacle located on the side of a Bessemer converter, a controllable valve located in the outlet of the aforesaid sand-receptacle, a passage connecting the aforesaid sand-receptacle with the blast-pipe of the converter at some point between the trunnion and the wind-box, a blast-pipe entering the wind-box in a tangential direction, and a deflecting-plate located in the bottom of the wind-box, substantially as specified and set forth.

387,953. MACHINE FOR MAKING AND PRINTING TUBES OR SHUCKS FOR PAPER BOXES. George M. Griswold, New Haven, Conn. Filed Aug. 3, 1883. Serial No. 203,914. (No model.)

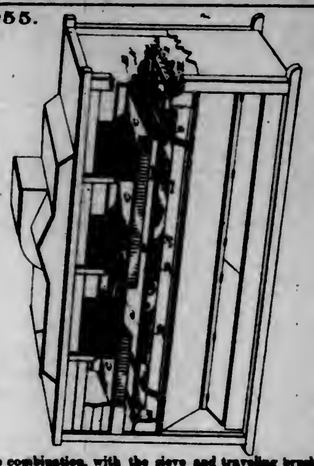
Claim.—1. In a paper-box machine, the combination, with folding and gumming mechanism, substantially as described, to fold the edges of a stock-strip over upon its upper face and to gum one of its edges which are overlapped, of a vertically-reciprocating type-bed car-

rings located below the strip in position for printing the folded and gummed end thereof, whereby the type is isolated from the gum, a movable cutter located outside of the said carriage and below the strip, inking apparatus located below the strip, and a platen and a stationary cutter located above the strip, substantially as set forth.

2. In a paper-box machine, the combination, with folding and gumming mechanism, substantially as described, to fold the edges of a stock-strip over upon its upper face and to gum one of its edges which are overlapped, of a vertically-reciprocating type-bed carriage located below the strip in position for printing the lower face of the folded and gummed end thereof, whereby the type is isolated from the gum, a platen located above the strip and over the said bed, a vertically-reciprocating-cutter located below the strip and outside of the said carriage which intermittently lifts it, a stationary knife located above the strip and outside of the platen and co-operating with the said movable knife, and means, substantially as described, located above the strip for depressing the cutter to let the strip pass over it, substantially as set forth.

3. In a paper-box machine, the combination, with folding and gumming mechanism, substantially as described, to fold the edges of a stock-strip over upon its upper face and to gum one of its edges which are overlapped, of a vertically-reciprocating type-bed carriage located below the strip in position for printing the lower face of the folded and gummed end thereof, whereby the type is isolated from the gum, a platen located above the strip and over the said bed, a vertically-reciprocated frictionally-supported cutter located below the strip, a stationary cutter located above the strip and outside of the platen, frames connected with the movable cutter, and cams located above the strip and engaging with the said frames to depress the movable cutter to allow the printed strip to pass over it, substantially as set forth.

387,954. PORTABLE COOLING APPARATUS FOR HOUSES. Ramsom F. Hounsom, Boston, Mass. Filed Feb. 20, 1888. Serial No. 265,737. (No model.)



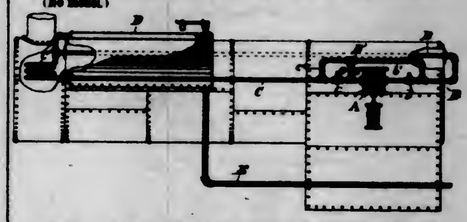
Claim.—1. An air-cooling apparatus adapted to be located in an upper plane of a room or apartment, and consisting of an outer inclosing shell or casing provided with an ice-chamber in its upper interior and a cold air and water chamber in its lower interior, and having perforations opening into the ice-chamber, and also perforations opening into the cold-air chamber, and water-tubes communicating with the ice-chamber and extending into the cold-air chamber, whereby the heated and impure air of the apartment passes into contact with the ice and cold surfaces of said tubes and is cooled and purified thereby.

2. In an air-cooling apparatus, the combination, with an outer inclosing perforated shell, of a perforated transverse partition forming an ice-compartment and a cold-air chamber within the shell, a nest of cold-water tubes communicating with the ice-chamber and with each other and depending from said partition into the cold-air chamber, and a main discharge-tube, which receives from said nest of tubes the water from the melting ice and discharges it into any suitable receptacle.

387,955. MIDDLINGS-PURIFIER. James Bentable, Hornby's Mills, Ontario, Canada. Filed Sept. 2, 1886. Serial No. 212,497. (No model.)

Claim.—1. The combination of the sieve, the traveling brush-ways constructed in relatively-movable sections or parts for holding said brush in contact with said sieve, and means for adjusting portions of said ways, whereby the brush may be allowed to fall out of contact with a portion of said cloth and allow it to become obstructed, substantially as set forth.

387,955.



2. The combination, with the sieve and traveling brush, of the ways A, provided with grooves *a*, and hinged gates D, substantially as and for the purpose specified.

3. The combination, with the sieve and traveling brush, of the pivoted knocker G, having its tail end projected above the plane of the head of the brush, substantially as and for the purpose specified.

4. The combination, with the sieve and ways A, of the cross-bar O, the forked arm N, secured thereto, the knocker G, pivoted between the forks of said arm, and the traveling brush, all substantially as shown and described, and for the purpose specified.

387,956. RAILWAY-CAR HEATER. Joseph B. Lamson and Joseph Young, Oakland, Cal. Filed July 6, 1887. Serial No. 243,403. (No model.)

Claim.—1. In a railway-car heater, a three-way valve to the spindle of which is attached a wing or vane, in combination with pipes *b'* and *c'*, which lead into and are connected, respectively, with the pipes B and C, and the pipe S, connecting the inlet of the three-way valve with the outlet of the compressor, said three-way valve being located at the junction of the pipes *b' c'* S, and being suitably connected to the three pipes to receive air from the compressor and convey it into pipes B C, according to the position of the wing or vane, substantially as described.

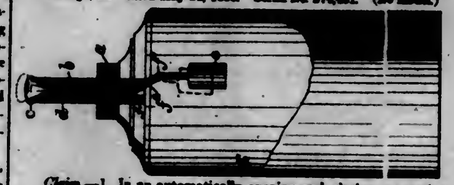
2. In a railway-car heater, the compressor A, actuated by steam from the locomotive, the pipes B and C, for conducting air from the compressor, and the pipes *b', c'*, and S, connecting the pipes B and C to the compressor, in combination with a three-way valve, to the spindle of which is attached a wing or vane, located at the junction of the pipes *b' c'* S, substantially as described.

3. In a railway-car heater, an air-compressor actuated by the locomotive to which it is attached, having pipes C B, for conveying air into and through the smoke-box and steam-space of the boiler, and a discharge-pipe, E, suitably connected to the pipes B C to receive the heated air and convey it to the train, in combination with a three-way valve to the spindle of which is attached a wing or vane, and the pipes *b' c'*, which connect the three-way valve, respectively, with the pipes B C, the pipe S, connecting the discharge of the compressor with the inlet of the three-way valve, the three-way valve being located at the junction of the pipes *b', c'*, and S, and suitably connected to the three pipes for conveying air from the compressor through the three-way valve and pipes *b' c'* into pipe B or pipe C, substantially as described.

4. In a railway-car heater, a receiver provided with a suitable discharge-pipe, a pipe or coil of pipes located in the smoke-box, connected to the receiver, and suitably connecting the coil with the compressor, of a pipe or coil of pipes located in and passing through the boiler and suitably connected to the compressor for conveying air from the compressor through the boiler to the receiver, in combination with a three-way valve to the spindle of which is attached a wing or vane, and the pipes *b' c'*, which connect the three-way valve, respectively, with the pipes B C, the pipe S, connecting the discharge of the compressor with the inlet of the three-way valve, the three-way valve being located at the junction of the pipes *b', c'*, and S, and suitably connected to the three pipes for conveying air from the compressor through the three-way valve to the pipes B and C, substantially as described.

5. In a railway-car heater, the combination of an air-compressor, a receiver having a suitable discharge-pipe, the smoke-box of a locomotive, pipes or coils of pipes located in and passing through the smoke-box, the boiler of a locomotive, and pipes or coils of pipes located in and passing through the boiler, the pipes and coils located in the smoke-box and boiler being suitably connected to the compressor for conveying air through the smoke-box and boiler to the receiver, in combination with a three-way valve to the spindle of which is attached a wing or vane, and the pipes *b' c'*, which connect the three-way valve, respectively, with the pipes B C, the pipe S, connecting the discharge of the compressor with the inlet of the three-way valve, the three-way valve being located at the junction of the pipes *b', c'*, and S, and suitably connected to the three pipes for conveying air from the compressor through the three-way valve to the pipes B C, and a stop cock or valve located on the pipe B between pipe *b'* and the compressor, and another stop cock or valve located on pipe C between its connection with pipe *c'* and the compressor, substantially as described.

387,957. APPARATUS FOR FACILITATING THE READING OF GEOGRAPHICAL GLOBES. Pierre René Meunier and Claude Durand, Lyons, France. Filed Oct. 24, 1887. Serial No. 252,372. (No model.) Patented in France Apr. 7, 1887, No. 182,672, and in Belgium Apr. 7, 1887, No. 77,698.



Claim.—The combination, with a geographical or school globe, of the graduated arc G, pivoted at points in the prolonged axis of the globe, and provided with an index-slide, M, and a pointer, E, and the graduated circle H, fixed with respect to and concentric with the axis of the globe, said pointer E being adapted to move over said ring H, substantially as set forth.

387,958. POCKET FOR GARMENT-STAYS. Louis Mendelowitz, New York, N. Y. Filed Apr. 7, 1888. Serial No. 269,973. (No model.)

Claim.—A pocket for removable stays, consisting of an outer textile tape having one side surfaced with cement, a paper strip cemented on one side along said tape, and an inner textile tape cemented at its longitudinal edges to the edges of the outer tape, leaving an unobstructed longitudinal opening between the paper strip and the inner tape to receive a removable stay, with the cemented edges of said textile tapes projecting laterally for sewing the pocket to a garment, substantially as described.

387,959. AUTOMATICALLY-CLOSING CAN. George A. Poole, Chicago, Ill. Filed May 21, 1888. Serial No. 274,661. (No model.)

Claim.—1. In an automatically opening and closing can or bottle, a tube, in combination with a cork and a weight within the can, which are united by a rod having an inclined part or parts, *f'*, to operate upon the end of said tube, substantially as specified.

2. In an automatically opening and closing can, a tube, in combination with a cork and a weight within the can, arranged eccentrically to the axis of the tube, and connected to the cork by a rod having an inclined part, *f'*, to operate upon the end of the tube, substantially as specified.

387,960. AUTOMATICALLY-CLOSING CAN. George A. Poole, Chicago, Ill. Filed June 30, 1888. Serial No. 278,060. (No model.)

Claim.—1. In an automatically opening and closing can or bottle, a tube, in combination with a cork and a weight within the can, which are united by a chain or like flexible connection, substantially as specified.

2. In an automatically opening and closing can or bottle, a tube, in combination with a cork and weight within the can, which are united by a chain or like flexible connection, and means whereby the contents of the vessel may be discharged through said tube, substantially as specified.

387,961. RETURN-VENT PROTECTOR FOR PLUMBERS' TRAPS. William B. Ryan, Boston, Mass. Filed Feb. 20, 1887. Serial No. 228,260. (No model.)

Claim.—1. In a plumber's trap, the combination, with the return vent-pipe, of a buoyant ball placed within a cage beneath the open mouth of the vent-pipe and adapted to close the same when the outlet-pipe becomes obstructed and the water rises within the trap, substantially as set forth.

2. In a plumber's trap, the combination, with the vent-pipe D and the screw-cap C, through which it passes, of the cage G, depending from the under side of the cap C, and the buoyant ball *b*, inclosed within said cage and supported thereby beneath the open mouth of the vent-pipe, substantially in the manner and for the purpose described.

3. The combination, with a plumber's trap provided with a casing or receptacle, B, connected therewith, of the screw-cap C, fitting within the top of the casing B and having the cage G secured to and depending from its under side, the vent-pipe D, passing through the cap C, and the ball *b*, inclosed within the cage G and supported thereby beneath the open mouth of the vent-pipe, substantially as and for the purpose set forth.

387,962. CLEARING ATTACHMENT FOR PLOWS. Melvin R. Butler, Rockland, Pa. Filed Feb. 3, 1888. Serial No. 262,940. (No model.)

Claim.—1. In a plow attachment, the combination of the standard having a forwardly-extending arm provided with fingers, the lever pivoted to the standard having a wrist-pin, the wheel having a cam-groove in which the wrist-pin works to vibrate the lever, and a cutter-bar suspended from the lever, having knives working against the fingers, substantially as described.

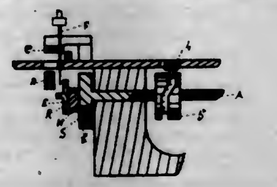
2. The combination, with the plow and beam, of the standard

387,962.

having fingers, the lever pivoted to the standard having a wrist-pin, a cutter-bar suspended on the lever, having knives working over the fingers, and a wheel journaled to the standard, having a cam-groove in which the wrist-pin works to vibrate the lever, substantially as described.

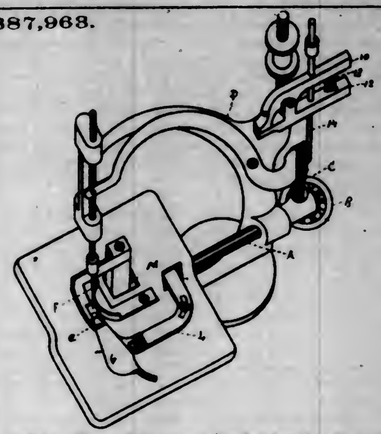
3. In a plow attachment, the combination of the standard having a forwardly-extending arm provided with fingers and formed with a cutter-recess, the lever pivoted to the standard having a wrist-pin, the wheel having a cam-groove in which the wrist-pin works to vibrate the lever, a cutter-bar suspended from the lever, having knives, and the retaining-plate, substantially as described.

4. In a plow attachment, the combination of the standard having a forwardly-extending arm provided with fingers and formed with a cutter-recess, the lever pivoted to the standard, having a wrist-pin, the wheel having a cam-groove in which the wrist-pin works to vibrate the lever, a cutter-bar suspended from the lever, having knives, the bearing-plate, and the retaining-plate, substantially as described.



5. The combination of the standard having a socket and fingers a cutter-bar having knives, a lever on which the cutter-bar is suspended, having a collar occupying the socket, a pivot-pin by which the lever is hinged to the standard, and a wheel, by which the lever is operated to reciprocate the cutter-bar, substantially as described.

6. In a plow attachment, the combination of the standard, a sweep secured to the standard, and a carrying-wheel supporting the attachment and sweep at the proper height, substantially as described.



7. The combination of the standard having forwardly-extending arm formed with fingers, guard-extension secured to the upper finger, cutter-bar, lever, wheel, and mechanism by which the wheel is caused to operate the lever, substantially as described.

8. The combination of the standard having fingers, the cutter-bar, the lever pivoted to the standard, the link by which the cutter-bar is suspended on the lever, a wheel having a continuous serpentine groove, and a wrist-pin by which the lever is connected with the cam-groove, substantially as described.

387,963. **WELT-GUIDE FOR SEWING-MACHINES.** Rollin D. Tucker, Lynn, Mass. Filed June 24, 1885. Serial No. 169,631. (No model.)

387,968.

Claim.—In a sewing-machine, a welt or braid guide arranged to permit movement up to and back from the needle-hole, and a pivoted lever adapted to impart said movements to the guide, said lever being held adjustably upon its pivot-pin, whereby it is adapted to regulate the amount of movement of the guide relatively to the movement of the feed-clamps, substantially as described.

387,964. **BELT OR ENDLESS APRON FOR ORE-CONCENTRATORS.** Isaac A. Woodbury, East Cambridge, Mass. Filed Mar. 9, 1887. Serial No. 230,215. (No model.)

Claim.—1. A belt or endless apron for ore-concentrators, having overflow-apertures through it the mouths or edges of which are elevated above the pulp-holding surface, substantially as hereinbefore described.

2. An endless apron or flexible traveling concentrating-surface with raised sides, having overflow-apertures the mouths or edges of which are above the surface and below the line of said raised sides, substantially as hereinbefore described.

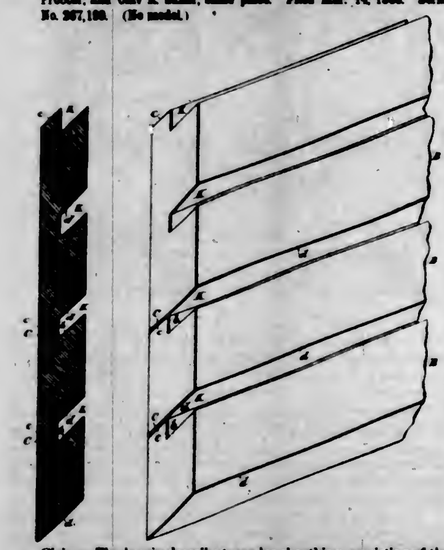
3. In a wet-ore concentrator, a belt or traveling concentrating-surface with dividing strips or partitions and overflow-apertures through said partitions, substantially as hereinbefore described.

4. A belt or traveling concentrating-surface for ore-concentrators, having raised sides, intermediate dividing strips or partitions, and overflow-apertures, substantially as hereinbefore described, for operation as set forth.

5. A belt or endless traveling concentrating-surface composed of independent compartments with overflow-apertures adapted to discharge the water or fluid matter from each compartment through their bottoms and independently of the other compartments forming the said concentrating-surface.

387,965. **POCKET-BOOK CLASP.** Simon Zeh, New York, N. Y. Filed June 7, 1888. Serial No. 276,382. (No model.)

Claim.—The combination, in a clasp for pocket-books and similar articles, of the base-plate stamped from sheet metal integral with the stud and the radial spring, and slitted on converging lines at each side of the spring to form radial spurs located respectively between the edges of the spring and the outer edges of the base-plate, said spurs having their inner edges parallel with the edges of the spring and extending from the point of junction of the spring with the plate about the center of the latter, with a cap-plate pivoted to the base-plate and having a tail-piece to act on the spring, substantially as described.



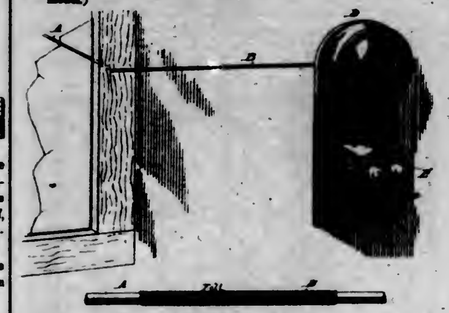
387,966. **COMBINED GAGE AND SQUARE.** Robert K. Benwell, Hamlin, Conn., assignor of one-half to George P. Hill, same place. Filed Apr. 12, 1888. Serial No. 270,658. (No model.)

Claim.—1. As an improved article of manufacture, the device herein set forth, consisting of a square having a T-headed flange provided at intervals on opposite sides of its center with jogs *c c*, the arms A and member B, a mortise-opening, F, the opening D, having jogs *d d*, and the miter-opening E, having walls of different angularity, substantially as described.

2. The combination, in a device for laying off lumber, of a square having a T-headed flange, said flange being provided at intervals on opposite sides of its center with jogs *c c*, substantially as shown.

387,967. **COMBINED WOODEN SHEATHING AND LATH.** Theodore H. Brown, Viroqua, Wis., assignor to Henry C. Forsyth, H. P. Proctor, and Clay B. Sinner, same place. Filed Mar. 14, 1888. Serial No. 267,199. (No model.)

Claim.—The herein-described wooden sheathing, consisting of the lathe B, grooved at a uniform angle on one edge and on the edge proper, and likewise cut or beveled on the rear edge at the same angle, whereby the rabbets K are formed when the lathe are fitted together, substantially as and for the purposes set forth.

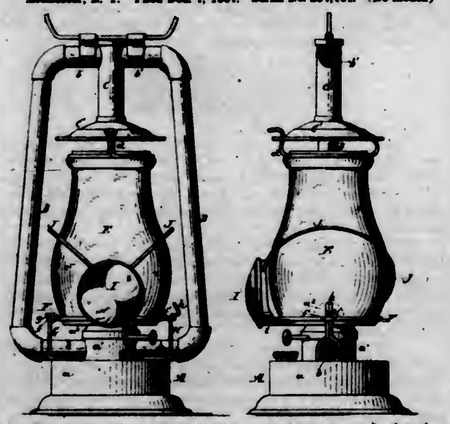


387,968. **ROLLER-BLOTTER.** Moses B. Campbell and James Shaw, Renton, Wn., assignors to the Shaw Manufacturing Company, same place. Filed Apr. 17, 1888. Serial No. 270,982. (No model.)

Claim.—1. The combination, with a suitable support, of springs secured at one end to said support, and a frame carrying a roller blotting-pad secured to the other end of said springs, substantially as described.

2. The combination, with hollow blocks, of spiral springs secured therein at one end, and a frame carrying a roller blotting-pad secured to the other end of said springs, substantially as described.

387,969. **INSULATION FOR MECHANICAL-TELEPHONE CONDUCTORS.** Frances R. Clark, New York, N. Y., assignor, by direct and mesne assignments, of one-fourth to Charles A. Hess and William J. Townsend, same place. Filed June 22, 1888. Serial No. 277,300. (No model.)

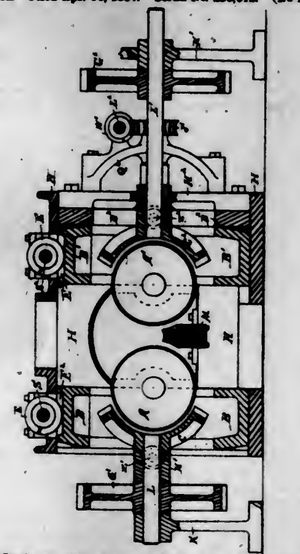


Claim.—1. In a mechanical or acoustic telephone conductor, the combination of a covering of felt upon the conductor at points where the same comes in contact with any substance with said conductor, substantially as described and shown.

2. In a mechanical or acoustic telephone conductor, the combination, with the conductor, of felt interposed between the conductor and any substance with which such conductor may come in contact, substantially as shown and described.

3. In a mechanical or acoustic telephone conductor, the combination, with the conductor, of a support or guard covered with felt, substantially as described and shown.

387,970. **TUBULAR LANTERN.** Frederick Dietz, New York, N. Y., assignor, by direct and mesne assignments, to The R. E. Dietz Company, same place, and the Steam Gauge and Lantern Company, Rochester, N. Y. Filed Dec. 7, 1887. Serial No. 257,161. (No model.)



Claim.—1. The combination, with a tubular lantern, of a detachable globe-supporting plate having its margin provided with an upwardly-projecting frame and a lens secured in said frame, substantially as set forth.

2. The combination, with a tubular lantern, of a detachable globe-supporting plate having its margin provided with an upwardly-projecting frame and a lens secured in said frame, and fastenings secured to the base of the lantern and engaging with the detachable plate,

whereby the latter and its lens are held against displacement in the frame, substantially as set forth.

3. The combination, with the globe-supporting plate, of a lens-frame secured to said plate, a lens seated in said frame, and guard wires secured to the lens-frame and to the globe-supporting plate, substantially as set forth.

387,971. MACHINE FOR STRAIGHTENING, GRINDING, AND POLISHING METAL BARS. JOHN FARMER, Glasgow, County of Lanark, Scotland. Filed Apr. 30, 1887. Serial No. 236,612. (No model.)

Claim.—1. In the machine shown and described for treating metal bars, as specified, the combination of the feed-rolls A A', rolls R R', straightening-rolls O O', grinding and polishing wheels D D', table T, anvil-bar M, and index-pointer a^2, having the adjustable rods a a', substantially as and for the purpose set forth.

2. In the machine shown and described for treating metal bars, as specified, the combination of the feed-rolls A A', rolls R R', straightening-rolls O O', grinding and polishing wheels D D', table T, and anvil-bar M, substantially as and for the purpose set forth.

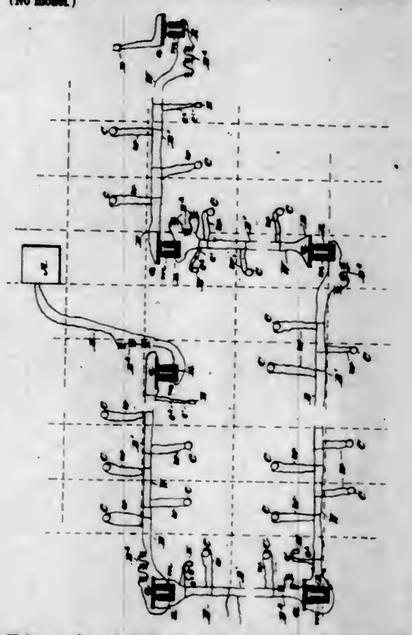
387,972. THILL-COUPLING. WILLIAM B. POLSON, Salt Lake City, Utah, assignor of one-half to William H. Folsom, same place. Filed Mar. 30, 1888. Serial No. 268,983. (No model.)

Claim.—1. The combination, in a thill-coupling, of a clip having ears provided with internally-threaded perforations and adapted to receive between them the shaft-loop, a bearing pin or bolt, consisting of two portions adapted to engage each other, and sleeves embracing the ends of said bolt or pin and engaging the threads in the said ears, substantially as set forth.

2. The combination, in a thill-coupling, of a clip provided with parallel ears having perforations internally threaded and adapted to receive between them the shaft-loop, a bearing pin or bolt having a central depressed portion and bearing-shoulder c, and sleeves embracing the ends of said pin or bolt and engaging the threads of the said ears, substantially as set forth.

3. The combination, in a thill-coupling, of a clip provided with parallel ears having perforations internally threaded, a bearing pin or bolt, sleeves embracing the ends of said bolt and engaging the threads in the said ears, and nuts embracing said sleeves to bear against said ears, substantially as set forth.

387,973. WATCH-BALANCE. CHARLES K. GILES, Chicago, Ill. Filed Dec. 2, 1887. Serial No. 256,632. (No model.)



Claim.—1. In a balance-wheel, the combination, with the main cross-bar and the divided rim attached thereto, of the S-shaped cross-bar secured centrally to the main cross-bar and having its ends attached to the arms of the rim, substantially as and for the purposes specified.

387,978.

2. In a balance-wheel, the combination, with the main cross-bar A, and the arms B B', attached thereto and each composed of a single piece, of the S-shaped cross-bar C, attached centrally to the cross-bar A and consisting of two symmetrical halves, each composed of a member, C', and a member, C^2, the latter being of a material expansive to a degree equal to or less than the material of the former, substantially as and for the purposes specified.

387,974. ELECTRIC CLOCK-SYNCHRONIZING SYSTEM. CHARLES J. HENAHEE, Philadelphia, Pa., assignor to the Philadelphia Time Telegraph Company, same place. Filed Jan. 10, 1887. Serial No. 223,860. (No model.)

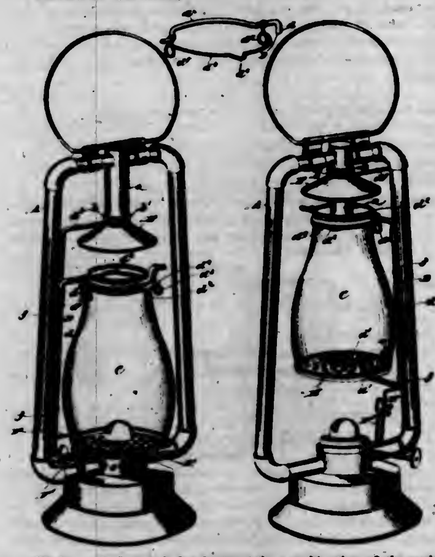
Claim.—1. In a clock-synchronizing system, the combination of the regulator, the main sectional circuit, the relays connected to the respective sections of said circuit, the local batteries, the synchronizers, and the clocks, together with the electric bells connected to said sections and the switches, the parts being combined, constructed, and adapted to operate substantially as and for the purpose set forth.

2. In a clock-synchronizing system, the combination of the regulator, the main circuit composed of a series of sections, the relays connected to said sections, the local batteries, the synchronizing devices, and the clocks, together with the recorder at the end of the main circuit and the electric bells connected to said sections and provided with switches, substantially as and for the purpose set forth.

387,975. LINE OR CORD FOR SUSPENDING PICTURES, &c. GEORGE HOOKHAM, Birmingham, County of Warwick, England, assignor of one-half to William Henry Tonks, same place. Filed Nov. 2, 1887. Serial No. 254,193. (No model.) Patented in England June 9, 1886, No. 7,933, and Sept. 16, 1886, No. 10,982.

Brief.—The object of the invention is to produce an improved cord which shall possess the qualities of strength, durability, and pliability, and which shall be water-proof.

387,975.



Claim.—1. A line or cord for suspending pictures and other articles, consisting of a core of waterproofed vegetable fiber having wound thereon a helical wire covering, substantially as described.

2. A line or cord for suspending pictures and other articles, consisting of a solid core of vegetable fiber, a waterproofed strip of woven fabric covering said core, and a helical coil of wire wound upon said strip, substantially as described.

3. A line or cord for suspending pictures and other articles, consisting of a core of waterproofed vegetable fiber and a helical coil of wire convex in cross-section wound upon said core, substantially as described.

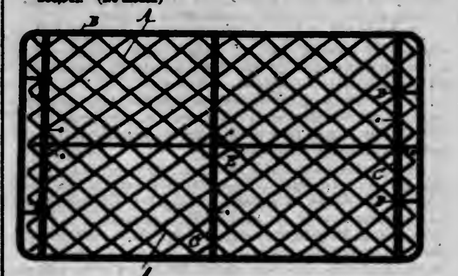
4. A line or cord for suspending pictures and other articles, consisting of a core of waterproofed vegetable fiber and a helical coil of wire wound upon said core, the convolutions of which are slightly separated, substantially as described.

387,976. LANTERN. WILBUR W. HOUGHTON, Newport, Vt., assignor to William C. Whitney, same place. Filed Nov. 15, 1887. Serial No. 255,243. (No model.)

Claim.—1. In a tubular lantern, the combination of the main frame and the sliding globe-frame capable of vertical and lateral movement and composed of a side wire extending along the sides of the main frame and having each end turned at an angle and bent into semicircular form, a globe-cost secured to the lower end, and a semicircular piece of spring-wire secured to the other end, substantially as and for the purpose described.

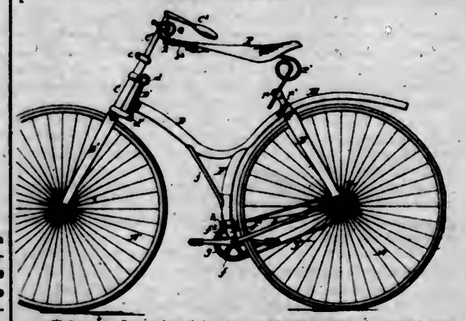
2. The combination of the main frame and a sliding globe-frame composed of the side wire having its ends of semicircular form bent at an angle, a globe-cost secured to the lower end, and a semicircular piece of spring metal hinged to the upper end and forming with the upper end a clamping device, said semicircular piece of spring metal being adapted to be swung up and down to release or clasp the globe, substantially as described.

3. The combination of the main frame and a sliding globe-frame provided at its lower end with a globe-cost and at its upper end with a clamping device composed of a portion of the sliding globe-frame bent into semicircular form and a semicircular piece of spring metal hinged to said semicircular portion of the sliding globe-frame and adapted to be swung up and down to release or clasp the globe, substantially as described.



4. In a tubular lantern, the combination of the main frame, the sliding globe-frame capable of lateral and vertical movement, and a bracket and spring-catch composed of a single piece of wire and adapted to hold the globe in an elevated or depressed position, substantially as described.

387,977. MARBLEIZED WOOD. WILLIAM S. BURHANS, Bristol, Conn., assignor to The E. Ingraham Company, same place. Filed Apr. 6, 1888. Serial No. 269,897. (No specimens.)



Claim.—Marbled wood consisting of a form or base of wood and a coating composed of a body of japan hardened by heat after its application to the wood, a superimposed coat of marbling-colors which are not blended with the said coating of japan, and an exterior coat of transparent varnish.

387,978. MAT. EDWIN R. LAMBE, Chicago, Ill., assignor of two-thirds to John Roth, same place. Filed Mar. 24, 1888. Serial No. 268,241. (No model.)

Claim.—A strip of crimped metal doubled upon itself, so as to form the mesh of a mat, in combination with retaining-rods, frame, and the strengthening-bar E, substantially as described herein.

387,979. VELOCIPEDE. BENJ. G. LAFFIN, Friendship, N. Y., assignor to the Pope Manufacturing Company, Portland, Me. Filed Feb. 3, 1888. Serial No. 263,247. (No model.)

Claim.—1. In a velocipede, the combination, with the main frame, a rear driving-wheel, and a front steering-wheel, of a bracket or support secured to the main frame, a bar or frame adjustably secured to said bracket and supporting the driving-gear, and a brace or braces pivoted with their rear ends to the frame of the driving-wheel, near the center of the latter, and secured with their front ends to said adjustable supporting-bar, the latter and its supporting-bracket being curved concentric with the pivot of said brace or braces, substantially as set forth.

2. The combination, with the front steering-wheel, the rear driving-wheel, and the reach D, provided with a backward extension, E, forming a mud-guard for the driving-wheel, of a depending tube or bracket, F, secured with its upper end to the reach, and a supporting-bar, f, adjustably secured to said depending tube and supporting the driving-gear, substantially as set forth.

3. The combination, with the front steering-wheel, the rear driving-wheel, and the reach, of a depending bracket, F, secured to the reach, a bar arranged in said bracket and supporting the crank-shaft and provided with a series of notches or recesses, and a transverse bolt attached to the depending bracket and engaging in one of said notches or recesses, substantially as set forth.

4. In a velocipede, the combination, with a journal bearing or box and its supporting-frame, of a screw-bolt held against longitudinal movement in one of said parts, and a screw-threaded lug or projection arranged on the other part and made laterally adjustable on the screw-bolt by turning the latter, substantially as set forth.

5. In a velocipede, the combination, with the fork or frame and a screw-bolt held against longitudinal movement in the fork, of a bearing-box provided with a lug having a threaded opening engaging with said screw-bolt, and means whereby the screw-bolt is held against turning after being adjusted, substantially as set forth.

6. In a velocipede, the combination, with the fork provided with perforated lugs *f f*, and a split lug, *l*, having a clamping-bolt, *m'*, of a bearing-box provided with lugs *k k*, and having screw-threaded openings, a screw-bolt, *m*, passing through the lugs of the fork and bearing-box and provided with an annular groove in which the clamping-bolt *m'* engages, substantially as set forth.

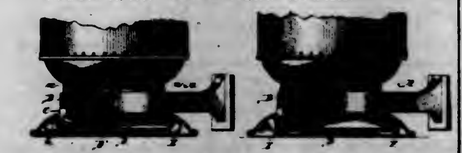
7. The combination, with the fork or frame and a screw-bolt held against lengthwise movement in said fork, of a bearing-box provided with a screw-threaded lug or lugs traversing said screw-bolt and arranged eccentrically on one side of the center of the bearing-box, whereby the position of the bearing-box on the bolt is changed upon reversing the box in the fork, substantially as set forth.

8. In a velocipede, the combination, with the two jointed or pivoted parts of the main frame, of a flexible saddle attached with one end to the front part of the main frame and with its opposite end to the rear part thereof, substantially as set forth.

9. In a velocipede, the combination, with the jointed or pivoted front and rear wheel-frames, of springs attached, respectively, to said front and rear frames, and a saddle suspended at both ends from said springs, substantially as set forth.

10. In a velocipede, the combination, with the pivoted or jointed front and rear wheel-frames, of a saddle attached with its ends to said front and rear frames, respectively, and capable of independent vertical adjustment at either end, substantially as set forth.

11. In a velocipede, the combination, with the two jointed or pivoted parts of the main frame, of a saddle attached at its rear end to the rear part of the main frame and at its front end to the front part of the main frame by a joint or coupling capable of adjustment toward and from the axial line of the pivot connecting the two parts of the main frame, substantially as set forth.



12. The combination, with the two jointed or pivoted parts of the main frame, of a saddle attached at its rear end to the rear part of said main frame, and a scroll or volute spring connecting the opposite end of the saddle with the front part of the main frame, substantially as set forth.

13. The combination, with the jointed or pivoted front and rear frames of a velocipede and a saddle, of a coiled spring supporting the rear end of the saddle and having its lower branches adjustably secured to the rear part of the main frame, and a volute or coiled spring supporting the front end of the saddle and adjustably secured to the front part of the main frame, substantially as set forth.

14. The combination, with the main frame, the inclined steering-head, and handle-bar post made vertically adjustable in the steering-head, of a saddle provided at its rear end with a coiled spring having inclined branches arranged parallel with the handle-bar post and adjustably secured to the main frame, a volute or coiled spring adjustably secured to the handle-bar post, and a universal joint or coupling connecting the front end of the saddle with said volute spring, substantially as set forth.

15. The combination, with the main frame, the steering-head, and the adjustable handle-bar post, of a saddle provided at its rear end with a coiled spring adjustably secured to the main frame and at its front end with a strap, a volute spring adjustably secured in a clamp secured to the handle-bar post, a coupling connecting said volute spring with the strap at the front end of the saddle and composed of a frame carrying a vertical bolt to which the branches of the volute spring are attached, and a horizontal bolt to which the strap of the saddle is attached, substantially as set forth.

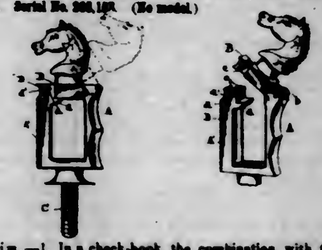
387,980. ROTATABLE SIGNAL-LANTERN. Gustave Madsen, Chicago, Ill., assignor to the Adams & Westlake Company, same place. Filed Feb. 18, 1888. Serial No. 264,695. (No model.)

Claim.—1. In a rotatable signal-lantern, the combination of a ring supporting the lantern and having recesses in its edge, a yielding cross-handle secured in the bottom of the lantern and having at one end a catch engaging in said recesses in the supporting-ring, and a spring tending to hold said catch in engagement with said recesses.

2. In a rotatable signal-lantern, the combination of a ring supporting the lantern and having recesses in its edge, a yielding cross-handle at one end, a catch engaging in said recesses in the supporting-ring, a spring tending to hold said catch in engagement with said recesses, and a fixed cross-handle extending beneath the yielding cross-handle.

387,981. ROTATABLE SIGNAL-LANTERN. Gustave Madsen, Chicago, Ill., assignor to the Adams & Westlake Company, same place. Filed Feb. 18, 1888. Serial No. 264,696. (No model.)

Claim.—1. In a rotatable signal-lantern, the combination of a ring supporting the lantern and having a series of recesses in its edge, a cross-handle rigidly secured in the bottom of the lantern, a vertically-sliding catch, and a spiral spring surrounding the catch and holding it in engagement with said recesses in the supporting-ring, substantially as set forth.

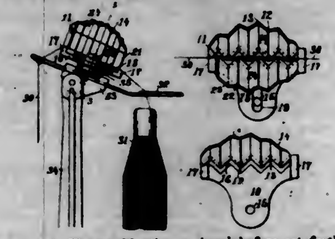


2. In a signal-lantern, the combination of a ring supporting the lantern and having a series of recesses in its upper edge, a cross-handle rigidly secured in the bottom of the lantern, a vertically-sliding catch having a downwardly-projecting thumb-piece, and a spring tending to keep said sliding catch in engagement with said recesses in the supporting-ring, substantially as described.

387,982. CAN FOR LIQUID GLUE. Charles M. Martin, Gloucester, Mass., assignor to the Le Page's Liquid Glue and Cement Company, same place, and Portland, Me. Filed Dec. 8, 1887. Serial No. 257,260. (No model.)

Claim.—The combination, in a can for adhesive material, with the removable sheet-metal screw-cap, of a flat strip of sheet metal bent to form a bow and soldered at its ends to the outside of the cap, a separate metallic handle passing vertically through a hole in the cap and in contact with the bow and soldered to the cap and to the bow, and a brush at its lower end, substantially as set forth.

387,983. CHECK-HOOK. James S. Matherette, Sherman, Tex., assignor to Edward H. Winchester, Dorchester, Wis. Filed Mar. 22, 1888. Serial No. 268,169. (No model.)



Claim.—1. In a check-hook, the combination, with the frame having the lugs *a a* and the spring, of the cross-bar pivoted at one end and having side depressions near its other end to receive the said lugs, and having its end adapted to be engaged by the said spring, substantially as described.

2. The herein shown and described check-hook, composed of the U-shaped frame having a threaded stem projecting from its lower end, and having the lugs *a a* and *b b* extending from its vertical branches,

the spring D, and the cross-bar pivoted at one end between the lugs *b b*, and having side depressions near its other end to receive the lugs *a a*, and having its end adapted to be engaged by the spring D, and provided with the thumb-piece or horse-head E, substantially as specified.

387,984. THREAD-TENSION DEVICE. Arthur W. Matthews, Fall River, Mass., assignor of one-half to William H. Goldsmith, same place. Filed Apr. 13, 1887. Serial No. 234,561. (No model.)

Brief.—The object of the invention is to produce an improved device for imparting to the thread a certain degree of tension in order to prevent its too free delivery.

Claim.—1. The combination, as hereinbefore set forth, with a pair of corrugated presser-plates having capacity of relative adjustment and each formed with a flaring lip, the device for holding the plates in adjustment, the said plates disposed with the ribs or elevations of one opposite the depressions of the other plate, means for supporting said presser-plates in operative positions, substantially as described.

2. The combination, as hereinbefore set forth, with a frame provided with an upright corrugated presser-plate and formed with a transverse slot near the basal line of the presser-plate for the lint to fall through, of a frame provided with a similar upright corrugated presser-plate and mounted upon the said first frame and having capacity of adjustment thereon, and provided with the device for holding the movable plate in adjusted position, substantially as herein described.

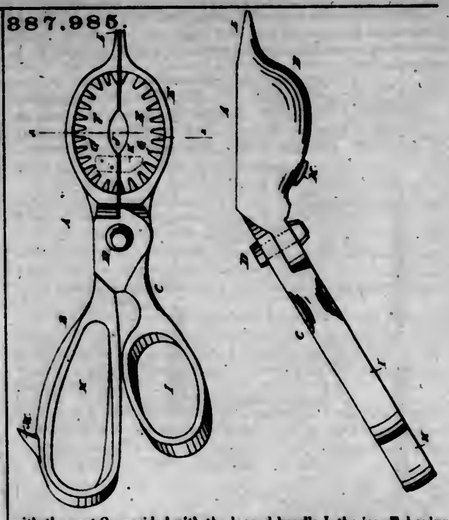
3. The combination, with the swiveled thread-guide holder 33, provided with an arm 35, of the frame 10, formed with the perforation 15 and provided with the presser-plate 11, the frame 18, formed with slot 19 and provided with the presser-plate 21, the bolt 20, for holding the said frames in adjustment, substantially as and for the purpose herein described.

4. The combination, with the frame 10, provided with the corrugated presser-plate 11, of the frame 18, provided with the presser-plate 21 and having capacity of adjustment, and means for holding the same when adjusted, substantially as herein described.

5. The combination, with the frame 10, formed with the discharge-opening 16 and provided with the corrugated presser-plate 11, of the frame 18, provided with the corrugated presser-plate 21 and having capacity of adjustment and provided with the device for retaining it in adjustment, substantially as herein described.

6. The combination, with the frame 10, formed with the perforation 15 and provided with the presser-plate 11, of the frame 18, formed with the slot 19 and provided with the presser-plate 21, the set-screw 20, for holding the frames together, substantially as herein described.

387,985. CORN-HUSKER. Theodor H. Meseke, Elsbrara, Nebr. Filed Aug. 6, 1887. Serial No. 246,261. (No model.)



Claim.—1. A corn-husker consisting of parts B and C, pivoted together and provided with handles, and having the curved jaws E and F, which are constructed with inwardly-projecting teeth and cut away on the lower side, as shown, whereby when the said jaws are closed they form together a cup-like device having an aperture, J, as shown and described.

2. In a corn-husker, the part B, having the curved or hollow jaw E, provided with the teeth G and cut away at J, and the pointed prong L, in combination with the part C, having a similar jaw, F, provided with teeth G and cut away at J, the guide K, the pointed prong L, and the pivot D, substantially as shown and described.

3. In a corn-husker, the part B, provided with the looped handle H, the curved or hollow jaw E, cut away at J and having the teeth G, the pointed prong L, and the sharp-edged lug M, in combination

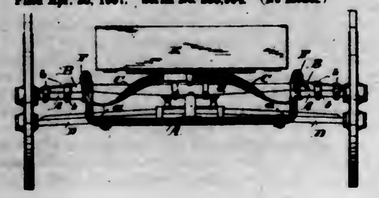
387,985.

with the part C, provided with the looped handle I, the jaw F, having teeth G and cut away at J, the pointed prong L, the guide K, and the pivot D, substantially as shown and described.

387,986. MOLD FOR CASTING TEETH OF DIAMOND SAWS. Willard F. Myer, New York, N. Y., assignor to David Tulloch, same place. Filed Feb. 18, 1888. Serial No. 264,691. (No model.)

Claim.—1. The combination, with the two sides of the mold, of the overhanging clamping-strips having apertures between them to admit the metal and the bolts for securing said clamping-strips together, substantially as set forth.

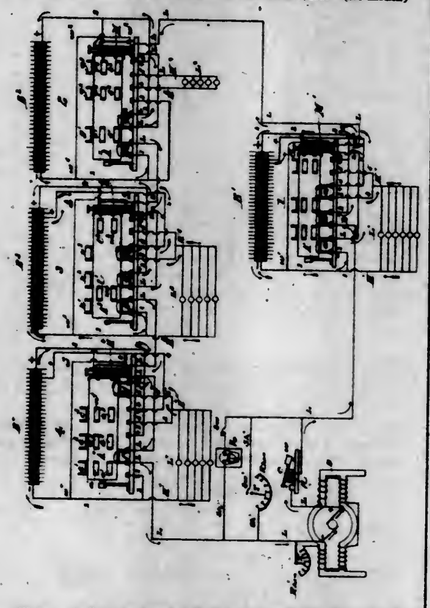
2. The combination, with the mold consisting of upper and lower sections, of the clamping-plates and bolts for removably holding together the sides of the lower section, said plates extending above the lower section to assist in holding the upper section, substantially as set forth.



3. The combination, with the mold, of the inclined pins passing through the sides thereof for holding the diamonds, substantially as set forth.

4. The combination, with the mold, of the hollow screws passing through the sides thereof and the wires projecting from said screws to hold the diamonds, substantially as set forth.

5. The combination, with the mold, of the hollow screws with wires projecting therefrom, extending through the sides of the mold in an inclined position to hold the diamonds, substantially as set forth.



6. The combination, with the mold formed of parts divided vertically and horizontally, of lateral clamping-bolts and vertical clamping-bolts, such vertical clamping-bolts passing through the parts at their adjoining faces, whereby the vertical bolts are released by loosening the lateral bolts, substantially as set forth.

387,987. SIDE-BAR VEHICLE. Edwin D. Olin, Avondale, Ohio. Filed Apr. 25, 1887. Serial No. 235,994. (No model.)

Claim.—The combination of the boot rear axle, the rigid side bars clipped upon the rear axle and front bolster, the wagon-body, and the cross-springs connecting the body and side bars, substantially as shown and described.

387,988. APPARATUS FOR CHARGING AND DISCHARGING SECONDARY BATTERIES. Mathias Pfatteicher, Philadelphia, Pa., assignor of one-half to William T. Brown and William Kirk, Jr., both of same place. Filed Nov. 18, 1887. Serial No. 255,469. (No model.)

Claim.—1. In a system for charging and discharging secondary batteries, the combination of a charging-generator having leads running to two or more independent stations with circuit-controlling apparatus at each station under the control of an operator at the charging-station, said circuit-controlling apparatus consisting of rotatable cylinders having electrical contacts for cutting the batteries into the charging-circuit and additional contacts for cutting the lamps into the battery-circuit, substantially as described.

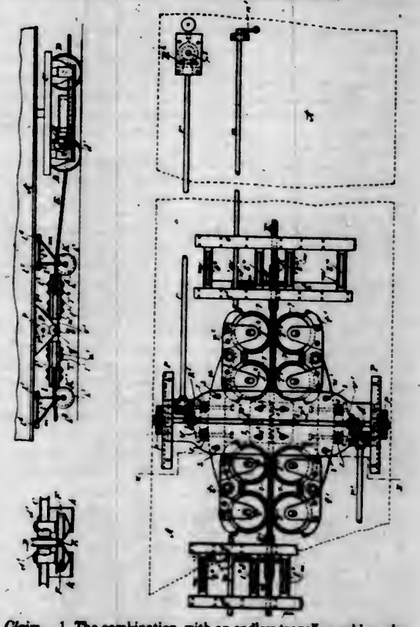
2. In a system for charging and discharging two or more secondary batteries, the combination of a charging-generator having mains leading to the batteries at outlying stations, with means at each station for cutting out the batteries in any desired order, and lamps or other translating devices in loop-circuits having connections for cutting them into the battery-circuits, substantially as described.

3. In an apparatus for charging and discharging secondary batteries, the combination of two or more switch-drums having electrical contacts arranged in a prearranged order, and means, as described, for rotating said drums together, substantially as described.

4. In an apparatus for charging and discharging secondary batteries, the comination of switch mechanism for cutting the battery into the charging-circuit with shunts for cutting out a portion of the battery during the process of charging, substantially as described.

5. In an apparatus for charging and discharging secondary batteries, the combination of two or more circuit-changing drums having circuit-making contacts for connecting the charging-generator or the lamps to the batteries at pleasure with electro-magnets or solenoids, one for each drum, said magnets or solenoids being in circuit with the charging-generator and adapted to control the rotation of the drums, substantially as described.

6. In an apparatus for charging and discharging secondary batteries, the combination of a charging-generator having two shunts about its poles, one containing a variable resistance and the other a voltmeter, with one or more secondary batteries located at outlying stations, each having a circuit-changing device adapted to cut out the charging-generator and to cut in the lamps on insertion of the proper resistance in the first-named shunt, substantially as described.



7. In an apparatus for charging and discharging secondary batteries, the combination of the following elements: a charging-generator having two normally-open shunts about its poles, leads or mains running to one or more outlying points having secondary batteries to be charged, lamps or other translating devices to be supplied with electricity, switch mechanism consisting of a rotatable cylinder or cylinders carrying contacts adapted to cut in the battery or batteries and lamps at will, and electro-magnets or solenoids located in the main circuit, substantially as described.

8. In an apparatus for charging and discharging secondary batteries, the combination of a charging-generator having mains leading to one or more outlying stations containing secondary batteries and lamps or other translating devices, with a switch mechanism at each station for cutting in the batteries or lamps at will, and a differential solenoid or electro-magnet having one differential branch in the charging-circuit and the other in a normally-closed shunt through the batteries, substantially as described.

9. A switch for controlling the relation of a charging-generator, a secondary battery, and a consumption-circuit, consisting of a series of contacts arranged on a variable surface, one set for connecting and disconnecting the charging-generator to the battery, another set for connecting and disconnecting lamps, and a third set for connecting both the charging-generator and the battery to the lamps or translating devices, substantially as described.

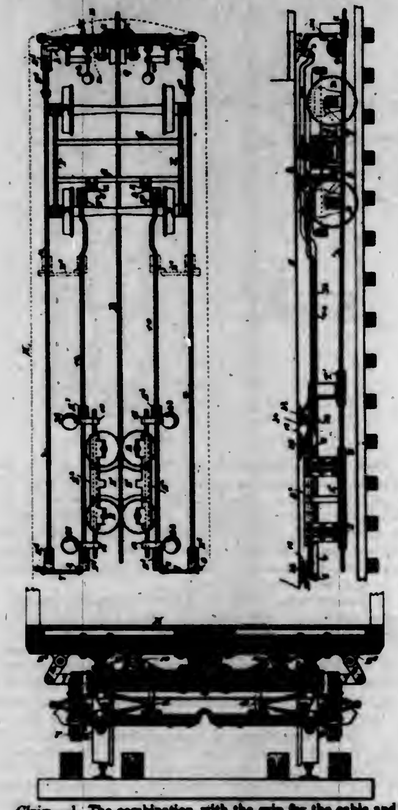
10. A switch for controlling the relation of a charging-generator, a secondary battery, and a consumption-circuit, consisting of movable contacts arranged to connect the secondary battery and the consumption-circuit in circuit with the charging-generator, with an additional set of contacts for cutting out part of the battery during the process of charging, substantially as described.

387,989. TRACTION DEVICE FOR CABLE RAILWAYS. John H. Pendleton, Brooklyn, assignor, by direct and mesne assignments, to the Rapid Transit Cable Company, New York, N. Y. Filed Aug. 6, 1883. Renewed June 13, 1888. Serial No. 276,992. (No model.)

Claim.—1. The combination, with an endless traveling cable and a gripping apparatus for the same upon the under portion of the car, of the wheel D upon a horizontal axis, the wheels F upon a vertical axis and having conical projections upon their under sides, and the frame d', connected with the car-truck, substantially as and for the purposes set forth.

2. In combination with the car and its trucks, a gripping apparatus upon the bottom of the car, the guide-plates k k, inclined upwardly at their ends and connected with the truck-frame and the guide-roller D above such guides k, and the frame d' for the same, connected with the truck-frame, substantially as set forth.

3. The wheel K, formed in two parts, each of which is provided with a supporting-shaft, in combination with tubular bearings for the shaft, the links for sustaining said tubular bearings, and mechanism, substantially as specified, for swinging the bearings to separate the two parts of the wheel or to bring the two parts of the wheel together and sustain the cable, substantially as set forth.



4. The combination, with the two parts of the wheel K and the shafts for the same, of the bearings J^2 J^2, supporting-links l l P P, the bearing-bars P P, the shafts P, the bronze m, and the links n^2 n^2 n^2, the shaft n, and crank n^2, substantially as specified.

5. The combination, with the gripping-blocks s s', of the screws f f', for actuating the same, the wheels p and p, the shaft P^1, the frames F, and plate F', and the gearing for giving motion to the respective parts, substantially as set forth.

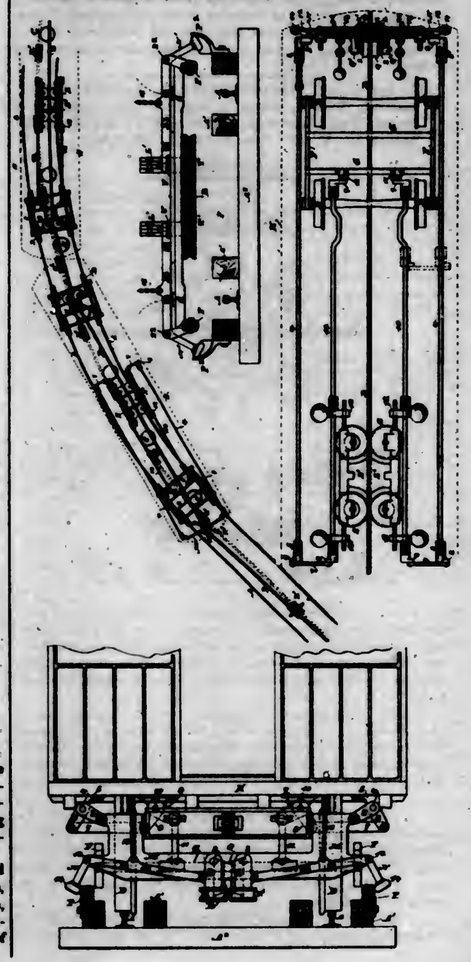
6. The gripping-wheels in pairs and the respective yokes for the same adapted to bear upon the cylindrical portions of the wheel, the equalizers v v', connecting the respective pairs of yoke, the followers, and the springs between the followers and the equalizers, substantially as set forth.

7. The combination, with the gripping-blocks and the screws for actuating the same, of the clamping-wheels, the yokes and the equalizers for the same, the followers, and the springs between the followers and the equalizers, and mechanism, substantially as specified, for rotating the screws, substantially as set forth.

387,990. ATTACHMENT FOR CARS ON CABLE RAILWAYS. John H. Pendleton, Brooklyn, assignor, by direct and mesne assignments, to the Rapid Transit Cable Company, New York, N. Y. Filed Nov. 5, 1888. Renewed June 13, 1888. Serial No. 276,993. (No model.)

Claim.—1. The combination, with the grip for the cable and the truck-wheels for the car, of shafts supported in hanging brackets below the car-platform, cranks and connection for suspending the gripping devices and the frames for the same, and a crank and link resting at its end upon a portion of the truck that does not rise or fall, substantially as set forth.

2. The combination, with the car-truck and car, of shafts and hanging brackets beneath the car-platform for supporting the shafts, rollers for guiding the cable and a frame for supporting the same, cranks upon the shafts for supporting the frame and rollers, and crank-connections between the shafts and the cross-bearer or other part of the truck that does not rise or fall in relation to the truck, substantially as set forth.



3. The combination, with a traction-cable, of guide-rollers for the same supported by the car, and a gripping device and cranks and shafts and hanging brackets beneath the car-platform, and a connection from one or more of the cranks to a portion of the truck that does not rise or fall, whereby the respective parts of the guide-roller frame and gripping devices are sustained at a definite distance from the truck regardless of the rise and fall of the car in consequence of varying loads upon the same, substantially as set forth.

4. The combination, with the gripping device, of the independent horizontal grooved guide-wheels T T' for supporting the cable and allowing it to move freely, substantially as set forth.

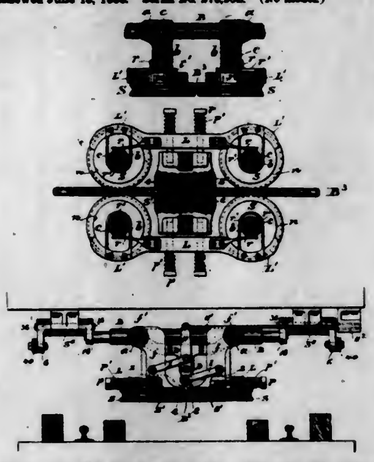
5. The combination, with the guide-wheels for the cable, of a frame for supporting such guide-wheels, mechanism for suspending the said frame and guide-wheels beneath the car, and a counterpoise tending to raise the said frame and guide-wheels, substantially as set forth.

6. The combination, with a traction-cable, of a grip for the same, a frame for supporting the grip mechanism for suspending the grip and its frame beneath the car at a uniform height in relation to the track, and a counterpoise tending to lift the frame and grip, substantially as set forth.

387,991. CABLE RAILWAY. John H. Pendleton, Brooklyn, assignor, by direct and mesne assignments, to the Rapid Transit Cable Company, New York, N. Y. Filed Nov. 5, 1888. Renewed June 13, 1888. Serial No. 276,991. (No model.)

Claim.—1. The combination, with a gripping device upon a car, of the guide-rollers K K′ at or near the end of the car, whereby the cable occupies nearly a straight line from end to end of the car and said guide-rollers also carry the cable in its proper relation to the stationary guide-rollers in passing around a curve, substantially as set forth.

2. The combination, with the traveling cable and the stationary guide-rollers for the same, of a grip upon the car, the guide-rollers K K′ near the end of the car, and the roller Q, adjacent to the guide-rollers and limiting the upward movement of the cable, substantially as set forth.



3. The combination, with the traveling cable and the stationary guide-rollers for the same, of a grip upon the car and the horizontal guide-rollers T T′ upon the truck of the car near the king-bolt of the same, for the purposes and substantially as set forth.

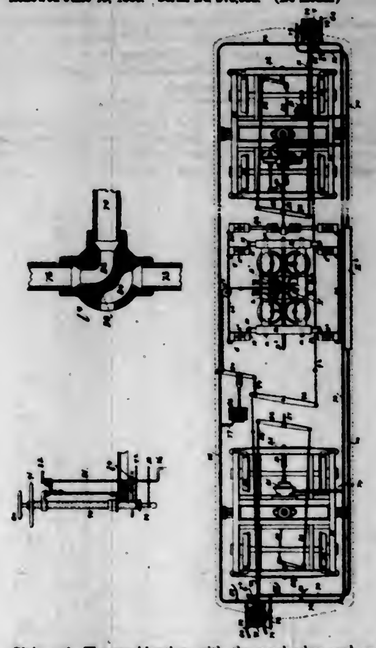
4. The combination, with the traveling cable, of guide-roller upon the truck, bearings for the axis of the same, levers for supporting the bearings, stationary cams upon the track, levers pivoted upon the truck and against which the stationary cams act, and links connecting the said levers with the bearings for the guide-rollers, substantially as set forth.

5. The combination, with the guide-rollers K, K′, and Q, of the cross-frame M, the stocks L, receiving the axles of the rollers K K′, the pivots connecting the stocks to the cross-frame, levers pivoted upon the cross-frames, and connecting-rods between the levers and the stocks, substantially as set forth.

6. The combination, with a traveling cable, the track, and guide-rollers for the same, of two or more cars forming a train, a gripping device for the cable upon each car, horizontal guide-wheels T T′ upon the trucks of the cars near the king-bolts, and guide-rollers K K′ at the extreme ends of the train, for the purposes and substantially as set forth.

387,992. GRIPPING DEVICE FOR CABLE RAILWAYS. John H. Pendleton, Brooklyn, assignor, by direct and mesne assignments, to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 13, 1886. Renewed June 13, 1888. Serial No. 276,982. (No model.)

Claim.—1. The combination, with a rigid grip and mechanism for moving the same, of grip-wheels, pendent journal-boxes for the same, brakes for applying friction to the wheels, yielding connections between the grip and the brakes, and springs upon the brakes pressing upon the pendent journal-boxes of the grip-wheels, substantially as set forth.



2. The combination, with the rigid gripping devices and the arms by which they are suspended, of pivot-bolts, a frame extending across between the pivot-bolts, a lever pivoted to the said frame, links between the lever and the gripping devices, supports for the pivot-bolts, and a connection to the lever for moving the same, substantially as set forth.

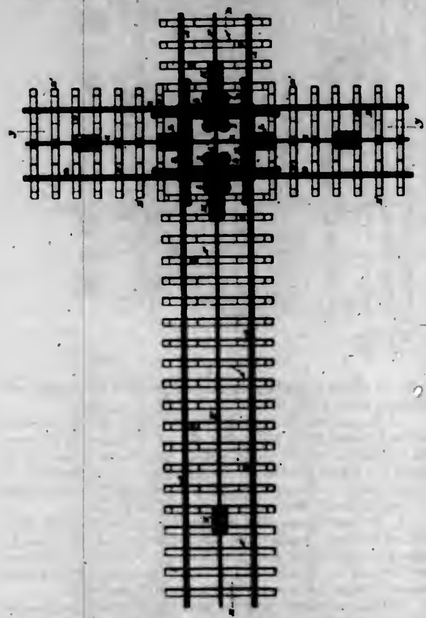
3. The combination, with the gripping-jaws and the arms for suspending the same, of pivot-bolts passing through the arms, grip-wheels, a separate pendent journal-box for suspending each grip-wheel from the pivot-bolts, and mechanism substantially as specified, for acting upon the gripping-wheels and jaws to grasp the traction-cable, substantially as specified.

4. The combination, with the grip-wheels B, of the brake-bars L, the hanging journal-boxes *b* and frames A, the springs *r*, the loops *r′*, and mechanism, substantially as specified, for acting upon the brake-beams L to move the grip-wheels toward the traction-cable and to apply friction to such grip-wheels, substantially as set forth.

5. The cross-bars E, cranks 18, shafts 36, and hanging standards S′, and mechanism for moving such shafts and cranks, in combination with the pivot-bolts *c*, passing through the cross-bars E, the frames A, journal-boxes and grip-wheels B, the grip-jaws S′ and their suspending-arms to the pivot-bolts, the frame D, extending across between the pivot-bolts, the lever H, links I, and brake-bars L, substantially as set forth.

387,993. GRIPPING DEVICE FOR CABLE RAILWAYS. John H. Pendleton, Brooklyn, assignor, by direct and mesne assignments, to the Rapid Transit Cable Company, New York, N. Y. Filed Dec. 13, 1886. Renewed June 13, 1888. Serial No. 276,983. (No model.)

Claim.—1. The combination, with the car-brakes and an independent pneumatic device for applying the brake or releasing it, of the grip mechanism, a cylinder or bellows for actuating the grip pneumatically or releasing the same, and the connecting pipes or tubes and a four-way cock that directs the pneumatic action in applying and releasing the brake and grip, respectively, and in unison, whereby the brake cannot be applied without releasing the grip, and vice versa, substantially as specified.



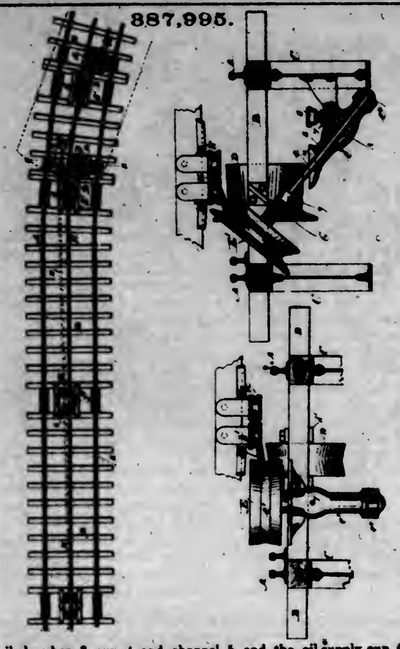
2. The combination, with the car, of a pneumatic reservoir or vessel containing air under pressure or from which the air is exhausted, a four-way cock having one opening to the atmosphere, a pipe connecting the said cock with the pneumatic vessel, grip mechanism and brake mechanism, and separate pneumatic appliances for actuating each grip and brake mechanism, respectively, a pipe leading from the pneumatic grip mechanism to the four-way cock, and a pipe leading from the pneumatic brake mechanism to the four-way cock, so that the cock directs the pneumatic action in applying and releasing the brake and grip, respectively, and in unison, whereby the brake cannot be applied without releasing the grip, and vice versa, and a hand-wheel and staff for operating the brake-mechanism when necessary, substantially as specified.

3. The combination, with the car, of a pneumatic reservoir or vessel containing air under pressure or from which air is exhausted, a four-way cock having one opening to the atmosphere, a pipe connecting the said cock with the pneumatic vessel, grip mechanism and brake mechanism, and separate pneumatic appliances for actuating each grip and brake mechanism, respectively, a pipe leading from the pneumatic grip mechanism to the four-way cock, and a pipe leading from the pneumatic brake mechanism to the four-way cock for applying the grip and releasing the brake, or the reverse, by one movement of the cock in one direction or the other, and a hand-wheel, staff, chain, and connection for applying the grip mechanism by hand, substantially as set forth.

4. The combination, with the car, of a pneumatic reservoir or vessel containing air under pressure or from which air is exhausted, a four-way cock having one opening to the atmosphere, a pipe connecting the said cock with the pneumatic vessel, grip mechanism and brake mechanism, and separate pneumatic appliances for actuating each grip and brake mechanism, respectively, a pipe leading from the pneumatic grip mechanism to the four-way cock, and a pipe leading from the pneumatic brake mechanism to the four-way cock, whereby the brake can be applied and the grip released, or the reverse, by the movement of the cock, a staff, hand-wheel, and chain for operating the brake mechanism by hand, and a hand-wheel and tube surrounding the staff, and a chain connecting such tube with the grip mechanism, substantially as set forth.

5. The combination, with the brake and its pneumatic actuating mechanism, of a cable-gripping mechanism and pneumatic device for actuating the same and a cock and mechanism for actuating the same and regulating the pneumatic action automatically for dropping the cable or in grasping said cable, substantially as set forth.

387,994. CABLE RAILWAY. John H. Pendleton, Brooklyn, assignor, by direct or mesne assignments, to the Rapid Transit Cable Company, New York, N. Y. Filed Jan. 26, 1887. Renewed June 13, 1888. Serial No. 276,984. (No model.)



Claim.—1. The combination, with the intersecting tracks and the respective cables, of frog-plates or rails that are separated at 3, for allowing the cable F to be raised through such separation or opening, and pairs of guide-rollers to guide the cable and prevent contact with the frog-plates or rails, substantially as set forth.

2. The combination, with the intersecting tracks and frog-plates or rails having openings at 3, of the guide-rollers I in pairs, the supporting-wheels, the cables F and K, the rollers L, for holding down the cable K at the crossing, and the blocks for supporting the inclined rails of the track, the intersection being elevated, substantially as set forth.

387,995. CABLE RAILWAY. John H. Pendleton, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Apr. 13, 1887. Renewed June 13, 1888. Serial No. 270,988. (No model.)

Claim.—1. The combination, with the track, the traction-cable, the car, and the guide-wheels *b b′* near the end of the car, of the wheels between the center and the inner rail of the curved track, against which the cable travels in passing the curve, and adjacent wheels to support the weight of the cable, substantially as specified.

2. The combination, with the guide-wheel having inclined or conical faces for the traction-cable, of the tubular bearing *c*, having an oil-chamber, 3, cup 4, and channel 5, and the oil-supply cup 6 and pipe 7, substantially as set forth.

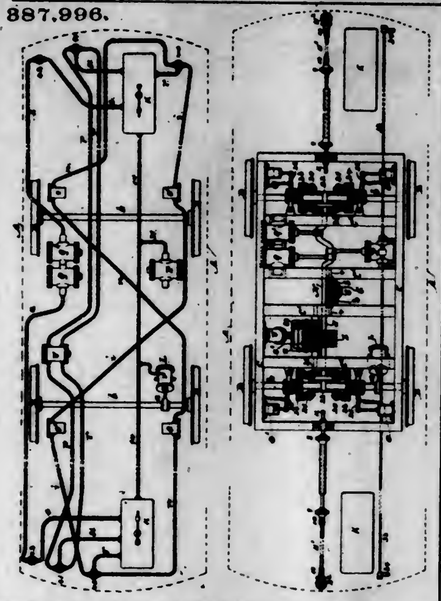
3. The combination, with the railroad structure and traction-cable, of the guide-wheel F, having a long conical surface at the side of the wheel toward the outer rail of the track at the commencement of a curve, substantially as and for the purposes set forth.

4. The combination, with the guide-wheel D upon a horizontal axis, and having the long conical surface, of the grooved guide-wheel E, the inclined axis for the same, the bearing G, and the collar 9, substantially as and for the purposes set forth.

387,996. GRIPPING DEVICE FOR CABLE RAILWAYS. John H. Pendleton, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Apr. 13, 1887. Renewed June 13, 1888. Serial No. 270,986. (No model.)

Claim.—1. The combination, with the car wheels and axles and a frame supported by the axles, of the vertical plates 3 4 4, the gripping-jaws at the lower ends of the plates, the screw G, screw-wheel, worm-pinion, and shaft for actuating the worm-pinion, the bevel-gears and hand wheels or cranks, and the couplings, substantially as set forth.

2. The combination, with the cable and grip and the car wheels and axles, of a pump and a reservoir into which air is pumped, and frictional gearing upon the axle by which the inertia of the car in stopping is availed of in compressing atmospheric air into the reservoir, substantially as set forth.



3. The combination, with the traction-cable, grip, car wheels and axles, of a reservoir containing air under pressure, an air-engine operated thereby, and mechanism connecting the same with the axle, substantially as specified, whereby the air-engine is employed to start the car gradually before gripping the cable, substantially as set forth.

4. The combination, with the cable, car wheels and axles upon a cable railway, of a reservoir upon the car for holding air under pressure, a pump for forcing air into the reservoir while the car is in motion, a pump that is brought into action when the car is to be stopped, and mechanism connecting the pump with the axle, so that the resistance of the air in the pump overcomes the momentum of the car, substantially as set forth.

5. The combination, with the traction-cable, grip, car wheels and axle, of an air-reservoir, a pump operated from one of the axles for forcing air into the reservoir, bevel-gearing and frictional connections between the same and the axle, a crank-shaft connected with the

387,996.

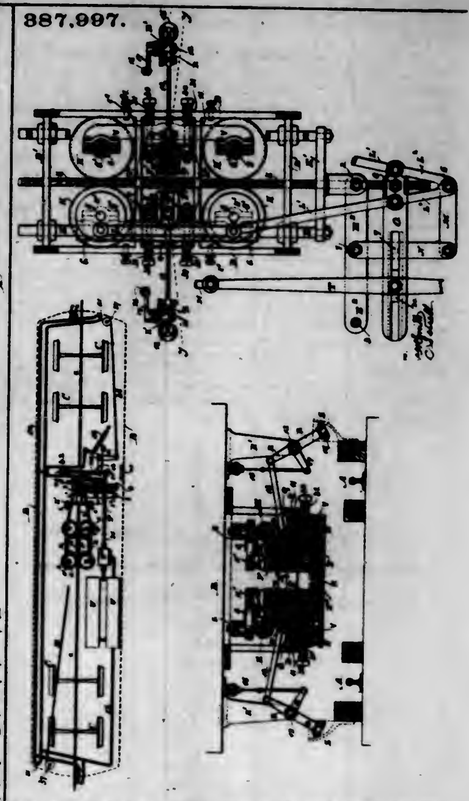
bevel-gearing, and an air-pump that forces air into the reservoir, and serves also as a brake to stop the car, and a cock for bringing the air-pump into action or disconnecting it, substantially as set forth.

6. The combination, with the car wheels and axles, of bevel-gearing and a shaft driven by the gearing, frictional connections between the bevel-gearing and the axle, levers and air-cylinders, and air-reservoir and cock for bringing into action either one of the frictional connections between the gearing and the axle, substantially as specified.

7. The combination, with the car wheels and axles, of a reservoir for containing air under pressure, air-engine cylinders, the crank-shaft, and bevel-gearing between the same and the axle, a frictional connection between the axle and gearing, and an air-cylinder, piston, and lever, and a pipe and cock to admit air from the reservoir and operate the frictional connection thereby, substantially as set forth.

8. The combination, with the cable and grip and the car-wheels and axles, of bevel-gearing and a frictional connection between the same and the axles, an air-cylinder and lever to actuate the frictional connection, a screw-pinion and wheel to actuate the gripping device, and a frictional connection for rotating the worm-pinion and gripping-screw, substantially as set forth.

9. The combination, with the cable-grip, the car-wheel and axles, and a friction-wheel revolved by a connection to the axle, of friction-pinions geared together, a swinging frame carrying the same, an air-reservoir, an air-cylinder and connecting-pipes, and a four-way cock, by which air under pressure is caused to press one of the frictional pinions into contact with the revolving friction-wheel, and thereby open or close the cable-grip, substantially as set forth.



387,997. GRIPPING DEVICE FOR CABLE RAILWAYS. JOHN H. PRENDERGAST, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Apr. 28, 1887. Renewed June 13, 1888. Serial No. 276,987. (No model.)

Claim.—1. The combination, with the grooved wheels H for grasping the cable and the cranks and connecting-rods moved by the same, of slides for supporting the wheels and their journal-boxes, and a frame fixed to the under side of the car and supporting the slides, substantially as set forth.

2. The combination, with the grooved wheels H for the cable, their shafts and boxes, of the slide-rods E, from which the boxes are suspended, the stocks F, hanging from the rods E, the frame for supporting the slide-rods E, and the double-inclined grip-blocks Q, supported by the frame, and the rollers P upon the stocks F, substantially as set forth.

3. The combination, with the grooved wheels H and their shafts and boxes, of the slide-rods E, from which the boxes are suspended, the stocks F, also suspended by the rods E, the double-inclined grip-blocks, the yoke-bars V, extended from one box to the other, and the

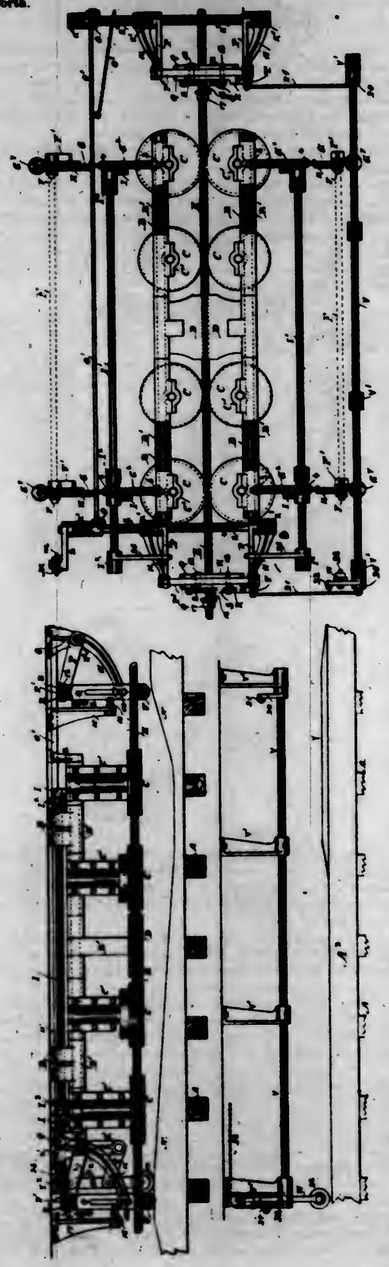
387,997.

bolts and springs connecting the yokes to the stocks of the grip, substantially as set forth.

4. The combination, with the wheels H, their shafts and boxes, of the slide-rods E, the frame upon the car for supporting the same, the hanging stocks, the double-inclined grip-blocks pivoted to the frame, the swinging levers and connecting-rods for moving the grip-blocks, and the rollers upon the stocks adjacent to the double inclines of the grip-blocks, substantially as set forth.

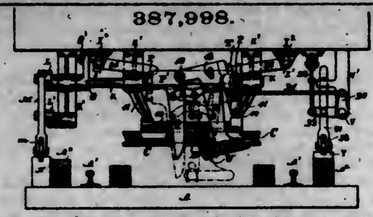
5. The combination, with the wheels H, against which the cable acts, of the shafts, cranks, links, and connecting-rods, the frame L^2, links M N, link P^2, and pivot 3, for connecting the link P^2 to the car, the slide-rods E, and cross-head E', connected to the link P^2, and the frame for supporting the rods P^2, substantially as set forth.

6. The combination, with the lever O and the wheels H, cranks and connections for moving said lever O, of the connecting-rod T, having a pivot-block sliding in a slot in the lever O, the air-pump and reservoirs, and mechanism, substantially as specified, for moving the connecting-rod T and varying the stroke of the pump, substantially as set forth.



7. The combination, with the reservoir, air-pump, and connecting-rod, of the slotted lever O, the wheels H, against which the cable acts, the cranks and connecting-rods for moving the lever O, the three-armed lever W, and connections to the hand-wheels and shafts for moving the connecting-rod and varying the stroke of the pump, substantially as set forth.

8. The combination, with the pump and reservoir and the wheels against which the cable acts, of the cranks, connecting-rods, and levers for moving the air-pump and an air cylinder and piston, and the pipes and cocks for varying the stroke of the pump by the action of the air-pressure and for applying a resistance to the rotation of the wheels for causing the cable to start the car, substantially as set forth.



9. The combination, with the wheels between which the cable passes and the cranks and connecting-rods, of the lever O, the lever W, the connections between the same, the shoe 44 and the stationary segment 45, to apply friction as resistance to the rotation of the wheels for giving motion to the car, substantially as set forth.

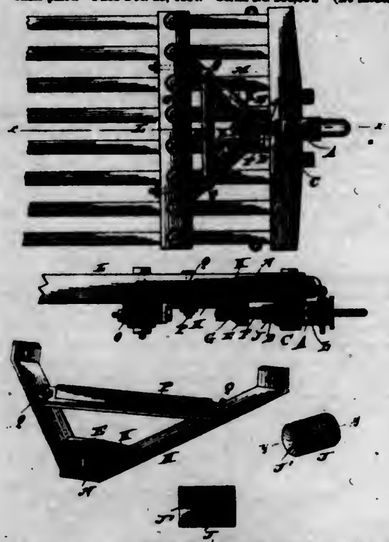
387,998. BRAKE FOR PICKING UP AND DROPPING CABLES IN CABLE RAILWAYS. JOHN H. PRENDERGAST, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Apr. 28, 1887. Renewed June 20, 1888. Serial No. 277,063. (No model.)

Claim.—1. The combination, with the hangers and shafts B', of the wheels C, the bearings C', through which the shafts B' pass, the levers G and toggle-bars G^2, and stationary cams or inclines H', for moving the wheels C apart and dropping the cable, substantially as set forth.

387,998.

2. The combination, with the wheels C, their hanging bearings and shafts B', of the levers G, toggle-bars G^2, hooks I, and shafts I', substantially as set forth.

3. The combination, with the wheels or cable-grip, of the pick-up mechanism composed of the fixed side Q, swinging side R, and cross-head P', the arms P, and shaft K, substantially as set forth.



4. The shaft K and hangers and the arms P, in combination with the cross-head P' and fixed side Q, of the pick-up hanging from the same, the swinging side R, pivoted at 12 to the cross-head P', the lifting-roller U, the toggle-links S, connecting the parts Q and R, and the pawl T, for holding up the swinging side R' of the pick-up, substantially as set forth.

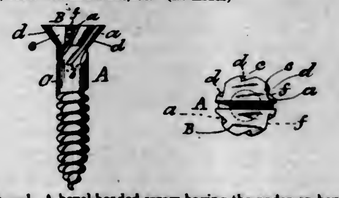
5. The combination, with the shaft K and hangers, of the arms L L', roller-bar M, and roller *m*, the arms P, cross-head P', fixed side Q and swinging side R, of the pick-up, and mechanism, substantially as specified, for opening the pick-up and for swinging the same beneath the cable, and the incline N, for moving the parts and lifting the cable, substantially as set forth.

6. The cable-grip and levers for opening and closing the same, in combination with the pick-up, having two arms that are closed below the cable, and levers for moving the same up and down, and stationary inclines on the track to actuate the levers that raise the cable and close the grip, or the reverse, substantially as specified.

7. The cable-lift composed of the fixed side Q, swinging side R, and roller U, in combination with the lever-arms for raising and lowering the same, substantially as specified.

387,999. CAR-COUPLING. JAMES RIBLE, Pittsburg, Pa., assignor of two-thirds to Sylvester A. Cosgrove and Charles W. Sorrel, both of same place. Filed Dec. 29, 1887. Serial No. 259,504. (No model.)

Claim.—1. In a car-coupling, the combination, with a draft-plate fixed to the car-body, a sliding draw-head, a draw-bar working loosely in the draft-plate and the draw-head and having end stops, cushioning-springs on the draw-bar between its rear end stop and the draft-plate and between the draw-head and the draft-plate, respectively, of a spool placed loosely on the draw-bar between the draw-head and the draft-plate, substantially as described.



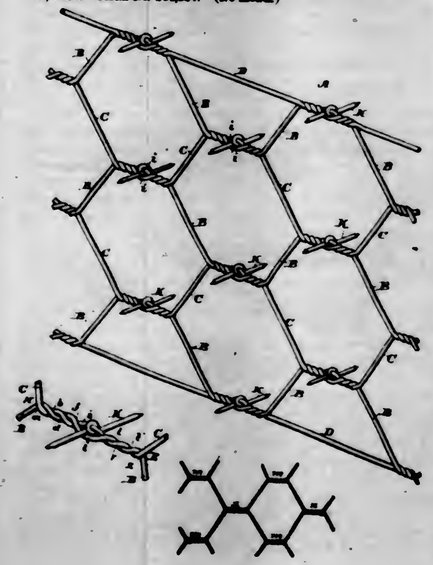
2. In a car-coupling, an angular metallic draft-sustaining brace having its end at the apex of the angle bent downward at a right

angle and apertured to form a transverse draft-plate, and the metal at opposite sides of said draft-plate bent downward to form parallel strengthening-brackets at right angles thereto, substantially as described.

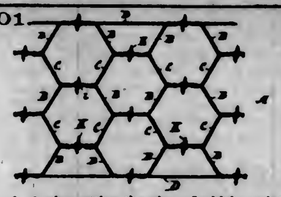
3. The combination, with the longitudinal beams of a car-bottom and the bolster, of an angular brace carrying a draft-plate, bolts connecting the ends of said brace with the bolster, a rigid transverse bar bridging the angular brace, and bolts each passing through an end of the transverse bar, the corresponding arm of the brace, and the longitudinal car-beam thereabove, substantially as described.

4. In a car-coupling, an angular draft-sustaining brace having its forward angle end bent down to form a draft-plate, in combination with a re-enforcing plate welded or riveted to the outer face of the draft-plate, substantially as described.

388,000. **COUNTERSINKING-SCREW.** JOHN T. RIDER, South Oil City, Pa., assignor of one-half to Charles H. Dumon, same place. Filed Dec. 12, 1887. Serial No. 258,206. (No model.)



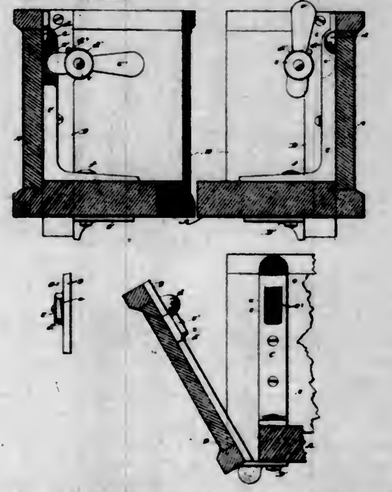
Claim.—1. A bevel-headed screw having the under or beveled side of its head provided with one or more grooves extending from the top to the bottom of the beveled surface of said head, said grooves continuing some distance down the smooth stem of said screw and terminating in said stem below the head of said screw, substantially as and for the purpose described.



2. A screw having the under side of its head provided with one or more slots or grooves extending diagonally across the under surface of said screw-head and across a portion of the smooth surface of the stem of said screw, and terminating in said stem below the head of said screw, one side of said grooves or slots being provided with cutting or grinding edges, whereby when said screw is screwed into wood said cutting-edges will countersink a place for the head of said screw, substantially as set forth.

3. The screw A, having the under side *c* of its head provided with a groove and a cutting or grinding edge, said groove extending below said screw-head and along the stem C of said screw, and gradually running out and terminating on said stem C, substantially as shown and described.

388,001. **WIRE-NETTING.** BENJAMIN STARLIN, Clinton, Mass., assignor to the Clinton Wire Cloth Company, same place. Filed Aug. 19, 1886. Serial No. 211,267. (No model.)



388,001

Claim.—1. A wire-netting the wires of which are interlocked between the meshes by twists, severally comprising a right-hand turn, a left-hand turn, and an intermediate eye, in combination with a wire barb composed of a separate piece of wire provided with pointed ends, said wire barb being passed through said eye and turned around one of the wires thereof, substantially as described.

2. A barbed-wire netting composed of straight selvage-wires and intermediate warp-wires, the warp-wires being united at intervals by twists which severally comprise a right-hand turn, a left-hand turn, and an intermediate eye, one of said warp-wires at each side of the netting being united at intervals with the adjacent selvage-wire by twists which severally comprise a right-hand turn, a left-hand turn, and an intermediate eye, said netting being provided with wire-barbs which are passed through said eyes and twisted around one of the wires thereof, substantially as described.

388,002. **END-GATE.** FERDINAND BELLE, Akron, Ohio, assignor to the Belle Gear Company, same place. Filed Dec. 5, 1887. Serial No. 257,022. (No model.)

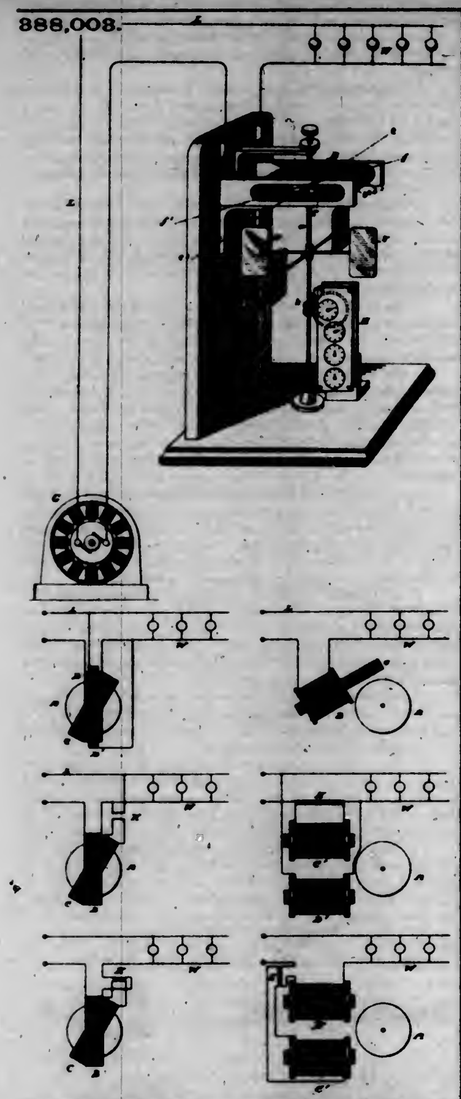
Claim.—1. The combination, with a vehicle-body and an end-gate hinged to the body, of metal knees secured inside the body next the end-gate, and securing bolts or rivets extending through the knees and through the wood-work and lower member of the hinge, substantially as set forth.

2. The combination, with a vehicle-body, end-gate, hinge, and knee, substantially as indicated, of loops on the knees, and ears on the straps of the hinges for entering such loops to hold the body sides from spreading, substantially as set forth.

3. The combination, with a vehicle-body, end-gate, hinge, and knee, substantially as indicated, of loops on the knees, and ears on the hinge-straps, said ears having conical sides adapted to draw the vehicle sides inward, substantially as set forth.

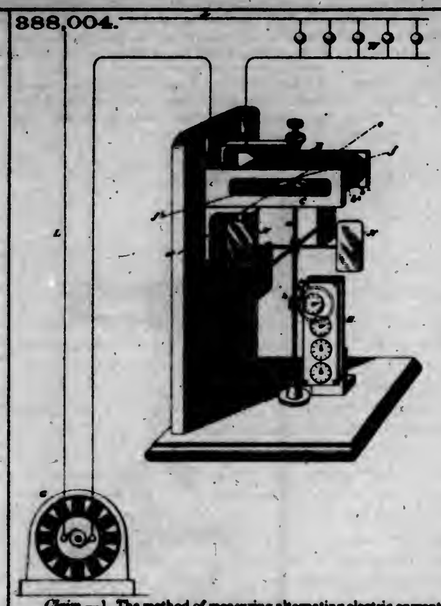
4. The combination, with a vehicle-body, end-gate, knees, and hinges, substantially as indicated, of latches pivotally secured to the hinge-straps, recesses in the knees for receiving the latches, and stops to hold the latches in their latched or unlatched position, the parts being arranged substantially as set forth.

388,003. **METER FOR ALTERNATING ELECTRIC CURRENTS.** OLIVER B. SHALLENBERGER, Rochester, Pa. Filed June 6, 1888. Serial No. 276,277. (No model.)



Claim.—1. The combination of a rotating armature, an inducing-circuit polarizing said armature when traversed by alternating electric impulses, a second inducing-circuit receiving currents from the first circuit and polarizing said armature in a different direction, and a counting, registering, or indicating device actuated by the movements of the armature.

2. The combination of a rotating armature, an inducing-circuit polarizing said armature when traversed by alternating electric impulses, a second inducing-circuit receiving currents by induction from the first circuit and polarizing said armature in a different direction, a retarding device applied to the armature, and a counting, registering, or indicating device actuated by the movements of the armature.

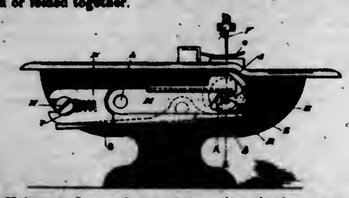


3. The combination of a rotating armature, an inducing-circuit polarizing said armature when traversed by alternating electric impulses, a magnetic medium acted upon by the same current and establishing a line of polarization intersecting the first line, and a counting, registering, or indicating device actuated by the movements of the armature.

388,004. **METHOD OF MEASURING ALTERNATING ELECTRIC CURRENTS.** OLIVER B. SHALLENBERGER, Rochester, Pa. Filed June 6, 1888. Serial No. 276,278. (No model.)

388,003.

388,004.

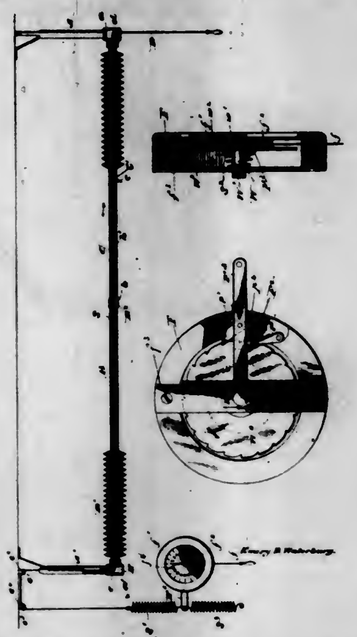


Claim.—1. The method of measuring alternating electric currents, which consists in establishing by such currents two distinct lines of alternating polarization, establishing thereby in a movable armature two corresponding lines of alternating polarization of non-synchronous phases, causing the armature to rotate by the mutual attractions of the lines of polarization and registering or indicating the movements of the armature.

2. The hereinbefore-described method of measuring alternating electric currents, which consists in establishing by such currents lines of magnetic force of varying intensity, deriving from said currents other currents, the phases of which differ in time therefrom, establishing thereby polarization in the movable body, producing mechanical motion by the mutual attractions between the different lines of polarization, and measuring the amount of such motion.

3. The method of measuring alternating electric currents, which consists in producing by such currents a line of polarization traversing the movable element of an electric meter, establishing by induction from the same current a second line of polarization at an angle to the first, thereby causing the movable element to revolve by the attraction between the second line of polarization and the portion of the first contained in the movable element, and in registering the rotations of the movable element.

388,005. **FEEDING MECHANISM FOR SEWING-MACHINES.** ROLLIN D. TURNER, Lynn, Mass. Filed Sept. 28, 1886. Renewed Dec. 3, 1887. Serial No. 256,941. (No model.)



Brief.—The invention is an improvement upon that shown in Patent No. 320,896, granted June 23, 1885. The clamping feed device has an upper jaw and a lower jaw or feed-dog, which jaws are operated by the two cams on the rotary shaft, whereby they are caused to grasp and feed, intermittingly, the goods as they are being stitched. This is particularly adapted for feeding when two or more pieces are lapped or folded together.

Claim.—1. In a sewing-machine, a clamp having upper and lower jaws supported on a block, cams for lifting and depressing said clamps and for moving the block forward, a spring-lever adapted to give a yielding pressure to the said clamps, and means for returning the block, substantially as described.

2. In a sewing-machine, the combination of the block M, having upper jaw, *c*, the block H, having lower jaw, *a*, the spring-lever *b*, and cams on the main shaft, all substantially as described.

388,006. BILLIARD-TALLY. Henry D. Watrous, Denver, assignor of two-thirds to Stephen W. Keene, Aspen, and Silas R. Hastins, Denver, Colo. Filed Feb. 16, 1888. Serial No. 264,206. (No model.)

Claim.—1. The combination of the tubular hangers or brackets having hollow T-connections on their lower ends, in which the two ends of a tube are secured, the sliding rod within said tube having a gravity pawl or pin working in a slot in the lower portion thereof, the pull-cord connected to one end of said sliding rod, and the cord and spring secured to the opposite end of said rod and in connection with a register, substantially as described.

2. The combination, with the tubular hangers having hollow T-connections on their lower ends to support a tube, B, of a sliding rod, C, having a gravity-pawl, a lower depending pin working within a slot within said tube, and central collar, B^2, a pull-cord connected to one end of said rod, the resisting-spring connected to the opposite end, and the cord E, also connected to the opposite end of the rod C at one end, and at its opposite end in connection with and operating a register, substantially as described.

3. The combination, with the tube B, supported as set forth, of the rod C, moving therein, having the gravity-pawl and stop-pin playing in the slot in said tube, and the connection with said rod, substantially as and for the purpose set forth.

4. The combination, with the tube B, supported as set forth, of the rod C, moving therein and having the connections, and retractile spring, as set forth, provided with a gravity-pawl which prevents the backward return of the counters after passing thereover, substantially as described.

5. The combination, with the tube B, supported as set forth, and carrying the counters, of the rod C, having the connections, as set forth, and a stud or pin, *b*, playing in a slot in the said tube B and adapted to force the counters back to their normal position, substantially as described.

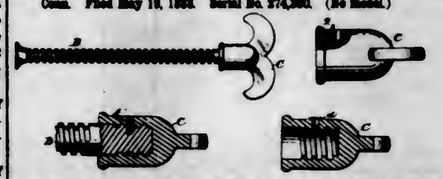
6. The combination, with the tube B, supported as set forth, adapted to have the point-counters mounted thereon, of the rod C, having the connections, as set forth, and the stud or pin *b*, playing in the slot in the lower portion of said tube for the purpose of returning the point-counters to their normal position, and a collar, B^2, surrounding the tube B, against which said stud or pin *b* engages, for the purpose set forth.

7. The combination, with the tube B, supported as set forth, of the rod C, having the stud *b* and gravity-pawl *c*, a pull-cord, D, connected to one end of said rod, a retractile spring, S, secured to the opposite end thereof, and a cord, E, secured to the opposite side of the said rod C, the springs S' and S^2, and the arm or lever F^2 of the register, substantially as described.

8. The combination, with the tube B, a rod, C, therein and its connections, as set forth, of the springs S' and S^2, the arm or lever F^2 of the recorder, the ratchet-wheel W^2 and its hub, the dial-plate, the spindle W, and the hand *f'*, secured thereto, substantially as described.

9. The combination, with the point-counting mechanism, of a game-register consisting of a dial, a hub mounted in rear of the dial and carrying a ratchet-wheel, an actuating-lever fulcrumed on the hub and carrying a pawl to engage the teeth of the ratchet-wheel, a spindle connected frictionally with the ratchet-wheel and protruding beyond the dial, and a hand carried by said spindle, substantially as described.

10. In a register, in connection with the point-tally, as set forth, the arm F^2, the block or supporting-piece W', having the shoulder, as set forth, the spindle W, the spring S^2, the ratchet-wheel W^2, the pawls P and P', having the springs *p* and *p'*, arranged as set forth, the pulley w^2, the dial-plate f^2, the hand or indicator *f'*, and the pull-cord *f*, connected to the pulley w^2, substantially as described.



11. In a billiard-counter, the combination of the tube, supported as set forth, having the point-counters marked thereon, of a rod within said tube having mechanism in connection therewith for returning the point-counters to their normal position and preventing their return when once adjusted, the said rod having suitable connections with a game-register, substantially as described.

12. In a billard-counter, a tube supported as set forth, having a rod therein relatively acting with the point-counters upon said tube, and having an operating pull-cord and a cord in connection with the game-register, substantially as described.

13. The combination, substantially as before set forth, of the point-counters mounted to slide on a slotted tubular support, the rod mounted to slide in said support and provided with a fixed pin, pull-cords D and E, connected to the ends of said rod, a game-register provided with an actuating-lever, and a spring interposed between cord E and said lever.

14. The combination, with a tube carrying point-counters, of a rod therein, constructed as set forth and having cord-connections, as described, a spring, S, secured to said rod, and the springs S' and S^2, secured to the lever-arm of a game-register in connection with one of the cords attached to the said rod, substantially as described.

888,007. CLAMP-SCREW. Parden A. Whitney, Southington, Conn. Filed May 19, 1888. Serial No. 274,260. (No model.)

Claim.—The herein-described clamp-screw, consisting of the screw B and the separately-formed head C, of malleable metal, and the fastening-pin *f*, with a portion of the metal in the screw-head set over the end of said pin, substantially as described, and for the purpose specified.

NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

Ex parte Gillette.

Decided July 25, 1888.

1. Rejection of Combination Claim—To whom Appealable.

An applicant whose claim for a combination has been rejected on the ground of illegitimacy and that it covers a mere aggregation of devices or elements has the right to appeal to the Examiners-in-Chief. Although such rejection is a vital formal objection, it also relates to the merits, and applicant has the right by appeal to all the tribunals provided by law to test the validity of such claim.

2. Readmission of Claim Voluntarily Erased Irregular.

Should applicant not avail himself of this right but eliminate his claim for the combination, his drawings and specification should also be amended by canceling all reference thereto. The admission of a subsequent amendment restoring such a claim for the combination was erroneous and irregular.

3. Practice of Requiring Division Instead of Treating the Combination Claim Disapproved.

The practice of selecting one of the elements of a combination claim, as if it were claimed separately, and some other element which is claimed specifically outside of the combination and requiring division *disapproved*. Such practice denies an applicant the legal right to an appeal on his combination claim. (*Ex parte Hyams*, MS., v. 36, p. 260; *ex parte Gessner*, *Ib.* 277.) By taking such appeal applicant forfeits no right, nor is his status changed with reference to the remaining claims in his application.

4. Examiners-in-Chief—No Jurisdiction over the Question of Division.

A recommendation or statement incorporated in the decision of the Examiners-in-Chief touching the question of division, which is a matter appealable to the Commissioner and not to the Examiners-in-Chief, is unwarranted, and in effect would contravene the practice settled by the present Commissioner. Such practice should not be challenged or repudiated by a subordinate tribunal.

5. Under Rule 139—Duty of Board.

Under the organization of the various tribunals of this Office and the system in force it follows as a necessity that the recommendation which the Examiners-in-Chief may make under Rule 139 must relate exclusively to the particular matter brought before them on appeal, or over which they have jurisdiction.

On petition.

BED-SPRINGS.

Application of Wilbur L. Gillette filed July 11, 1887, No. 244,001.

Mr. Thomas P. Simpson for the applicant.

Hall, *Commissioner:*

Applicant petitions for relief from the action of the examiner refusing to admit an amendment.

As originally filed the application showed and described a bed-spring placed loosely on a bed-slat, and a so-called "key" for clasping the spring closely onto the slat. Three claims were made—one for the bed-spring, another for the so-called "key," and a third for a combination of the bed-spring and the key.

Pursuant to the practice existing at the time of the filing of the application the examiner referred the application to the Committee on Division, with his opinion that it contained two different and separate subjects of invention—to wit, the bed-spring and the key. Respecting the combination claim, the examiner stated that there was no proper combination, but simply an aggregation of the two separate devices—the spring and the key. The Committee on Division, without giving reasons, advised the examiner that division should be required. The examiner accordingly required the applicant to divide, for the reasons which he had given to the Committee. At this stage in the proceeding applicant, whose combination claim had been practically rejected, although the rejection was in the nature of a vital formal objection, was not bound to submit to such rejection, but had the right to insist that a combination did exist and that his claim was in proper form.

In this connection I desire to repeat what has heretofore been said with reference to the practice upon this subject. As stated by me in *ex parte Hyams*, (MS. Dec., 36, p. 260,) there has existed in the Office a practice of requiring division between an element of a combination and some other element whenever, in the opinion of the examiner, the combination claimed did not exist or was illegitimate.

In other words, refusing to recognize the claim for a combination, the examiner selects one of the elements thereof, as if it were claimed separately, and some other element which is claimed specifically, outside of the combination, and requires division. I am advised that a practice of this character exists to greater or less extent in the Office; but I have not been able to ascertain that it is general, or that it has been specifically recognized in any of the decisions. * * * The examiner in the present case, by ignoring applicant's claim for a combination and treating it as a claim for the blower, in effect requires a division between the claim for the carburetor and another subject of invention which applicant does not claim at all. I am of opinion that applicant has a right to present his claim for the combination, and that such claim cannot be legally disposed of in any other way than by either allowing or rejecting it. He has the right to appeal from a rejection of the claim and to obtain the judgment of the Examiners-in-Chief and the Commissioner, and if the practice alluded to were followed in this case it would practically deny him that right, because if he is required to divide he is deprived of the right to take this appeal, for the reason that the Office refuses to give him a second rejection until this formal and vital requirement of division is first carried into effect.

In the case of *ex parte Herr*, I had occasion to use the following language with reference to claims which were in the same condition as those in the present case: "The applicant has a claim for a combination between the several parts of his machine. The question of the validity of this claim is not before me, and he has the same right to assert the claim that he has that of his process claim. The case will go back to the examiner for reconsideration. * * If there be no combination between different parts of the mechanism, the examiner will apply the principles hereof to the mechanism also."

This view of the question was also recognized in the later case of *ex parte Wilhelm Gessner*, (MS. Dec., 36, p. 277.) In this case the applicant, when

notified that division was required for the reason that the Office recognized no combination, was at liberty, if he believed the combination did exist, to request reconsideration by the examiner, and to insist that his claim should be allowed or rejected the second time, and upon the second rejection he would have been entitled to an appeal, and of course could have carried such appeal to the Supreme Court of the District of Columbia before he would have been deprived of any right.

It must be remembered that by appealing from the adverse decision of the Primary Examiner an applicant does not forfeit any right nor deprive himself of his status in the Office with reference to his application or the remaining claims. He pays an appeal fee, and has the unquestioned right to take the ultimate decision of the highest tribunal as to the validity of a claim. Had this applicant taken an appeal and the decision of the Primary Examiner been reversed on the question of the legitimacy of his combination, of course the other requirement of the examiner relating to division, which was based upon that question, would have been obviated, the vital objection removed, and the examiner would have been required to act upon the merits of the claims, the combination claim having been passed upon so far as its legitimacy was concerned.

This question has been presented to me in other relations—as, for instance, when an applicant claims the right of uniting claims for a new process and a new product under the exceptional clauses recognized in *ex parte Blythe*. In such case, if the examiner be of opinion that either the process or the product is not new, and that therefore the case is taken out of the exceptional clauses in that decision, and applicant is required to divide his application, he still has the right to insist that the process and product are both new and that the one cannot be executed without the other, &c. If, instead of complying with the requirement for division and yielding to the opinion of the examiner, he persists in his claim, he has the right to a second action, from which he can take an appeal, in the same manner as above indicated. Applicant in taking such appeal forfeits no right, and when the appeal has been determined he is entitled to further consideration, to be explained.

In *ex parte Hyams* I called attention to the inconvenience which would arise in many instances:

> I am well aware that it would be improper to permit an applicant to include in an application a dozen different and distinct claimed inventions for the purpose on his part of requiring the Office to make a separate examination for each one found to be patentable, or to procure such an examination upon each of the separate inventions by the payment of a single fee. Such a practice would be in distinct violation of the spirit of the law, and would not be tolerated. (*Ex parte Rice*, 1874, C. D., 44.) But I know of no rule or practice of the Office that can deny to an applicant the right to present a claim for a combination in connection with a claim for an element in that combination, claiming each to be new and himself to have been the inventor thereof.

It may be said that a difficulty lies in the way of this view of the subject growing out of Rule 64, which requires that after formal questions are disposed of an examination on the merits shall extend to all the claims, and the examiner—

> must if possible, in his first letter to the applicant, state all his objections, whether formal or otherwise, and until the formal objections are disposed of further action will not be taken upon the merits without the order of the Commissioner.

But in explanation of this apparent difficulty, which is only apparent and not real, it must be remembered that the action of the Primary Examiner in rejecting the claim to a combination under these circumstances, which he believes has no existence, is in fact the presentation of a vital objection to the consideration of the case upon the merits, and the rejection of the combination claim may be regarded as a preliminary examination and rejection of the question of legitimacy independent of the entire merits. Should this action be overruled and the ultimate decision hold the combination to be a legitimate one, then the case goes back to the examiner for general examination upon the merits, the vital objection having been removed. This view of the subject not only harmonizes with the rule just cited, but is also in full accord with the general practice of the Office and the principles of the statute which allow to every applicant the right to appeal a question of merits to the Supreme Court of the District of Columbia. But in the case now before me the applicant, instead of insisting upon the validity of his combination and requiring further action upon it, complied with the requirement of the examiner by canceling two of the claims—one for the combination of the spring and the key, and the other for the key—retaining only the claim for the spring. This action on his part was more than a mere amendment to the claim or specification, for the effect of it was to eliminate from the specification everything that was not necessary to a proper understanding of the claim for the spring. I see no reason why the examiner at that stage of proceedings ought not to have required a cancellation of the drawing of the key and any reference to it. If he allowed it to remain, it could only have been done with a view to explaining the nature or character of the spring and how it could be applied to the bed-slat. After this action by the applicant the claim for the spring was rejected on references for want of novelty. Applicant then presented another claim for the spring, and also one for a more specific combination of the spring and the key. The latter claim was admitted to the application erroneously and irregularly, in my judgment, for the applicant had once elected not to prosecute a claim for this combination. No reason is stated by the examiner for the admission of the claim. It may have occurred to him that the applicant should have an opportunity to test his former decision declaring the combination illegitimate. However that may be, the amendment was admitted, the claim for the spring was rejected on references for want of novelty, and the combination claim was rejected for the reason that no proper combination existed. The reason given by the examiner for the rejection of the combination claim was as follows:

> No co-operation exists between the key and the peculiar form of spring.

After this action applicant changed the title of his application to "Improvements in Bed-Spring Keys," canceled the claims for the combination and for the spring, and presented one for the bed-spring key alone. This claim the examiner refused to enter, holding in effect that the applicant had elected to retain the spring and eliminate the key, and, having secured an examination on the merits of the claim for the spring, the spring must remain the subject of this application and the key could not be restored to it to form part of the invention. Instead of insisting upon his right or taking such steps as would bring the matter before the Commissioner, the applicant expressly acknowledged that the examiner was right in requiring him to eliminate the claim for the key, and that the claim for the spring was met by the references. He canceled the claim for the key and retained and argued the validity of the claim for the combination, which, as stated, he had previously voluntarily withdrawn from his application, but was permitted by the examiner to reintroduce it. The examiner rejected the combination claim for the same reasons heretofore stated, this being the only claim in the application. Applicant appealed from this decision to the Commissioner. The appeal was dismissed as being one relating to the merits of the application, and the applicant was advised that the appeal must go to the Examiners-in-Chief. Following this, applicant offered an amendment canceling his sole claim, that for the combination of the spring and the key, and although he had expressly admitted that the examiner was correct in refusing to admit and consider a claim for the key again presented such a claim as the only one in the application. Although the subject-matter of this claim had been previously eliminated, the examiner readmitted the claim, but refused to consider it, and put the applicant to his petition to the Commissioner. Thereupon applicant erased the claim for the key, and restored the claim for the combination of spring and key, which had been rejected on the merits, as just stated, and took an appeal to the Examiners-in-Chief from the second rejection of that claim by the examiner. In my judgment, this last amendment restoring the combination of spring and key ought not to have been permitted, the applicant having elected to amend his case and change the status of his application; but that question is not before me.

The appeal went to the Examiners-in-Chief, where the action of the Primary Examiner in rejecting the claim for a combination of the spring and key was affirmed. The Examiners-in-Chief in their opinion say:

> The examiner has correctly held that the spring and the key do not form a legitimate combination. But the seating or clamp part of the spring being novel, and the key solely adapted to attach and detach the same being also novel, we think that claims for each might be allowed under Rule 40 of the Revised Rules of April 13, 1885, as they are dependent upon each other, the clamp-lock requiring the key and the key not being of any earthly use except to act upon the lock. They both relate to the same subject-matter, and belong together, and it would be bad policy and poor practice to issue separate patents for each, which in the hands of different holders would control each other.
>
> We therefore recommend that applicant be allowed to amend and claim both.

I am glad to say that this expression of the opinion of the Board was not unanimous. Examiner-in-Chief Fisher, while properly concurring in the decision as to the want of combination, declined to join in the suggestion as to amendment. It is apparent at this point that if the applicant had in the first instance appealed to the Examiners-in-Chief from the requirement of the Primary Examiner as to division, founded upon the illegitimacy of the combination claimed, and had then gone back to the examiner, he could have elected either of the claims, for the spring or for the key, as he saw proper; but he has had innumerable actions and has repeatedly canceled the claim for the spring and for the key, and at last, after all this indulgence, was permitted to reintroduce the combination claim which he had previously canceled, upon which he has taken an appeal to the Examiners-in-Chief. They have rejected the claim upon its merits; applicant has acquiesced in that decision, and now returns to the Primary Examiner, and, gladly following the friendly recommendation of the majority of the Examiners-in-Chief, presents two claims, one for the spring and another for the key. The examiner refused to enter and consider this amendment for the following reasons: *First*, because the amendment seeks to reinstate a subject of invention which applicant had by election removed from the application; *second*, because the recommendation of the Examiners-in-Chief was beyond their jurisdiction, and therefore imposed upon him no duty.

The question presented is whether applicant, after having had these various actions and voluntarily canceling his claims to the key and to the spring, shall be admitted to the same position he would have originally occupied if, before canceling any of his claims, he had insisted upon the validity of his combination claim and taken an appeal to the Examiners-in-Chief, had been rejected there, had then gone back to the examiner in obedience to the requirement of division, and had elected which of the claims—that for the key or that for the spring—he would prosecute. It will be seen that he could not be permitted to claim both, because division was required. He, however, insists upon restoring claims for both the key and the spring and ignoring the requirement of division, and in this respect he has the indorsement of the Board of Examiners-in-Chief.

It appears to me that the question is hardly open to serious consideration. If applicant had presented an amendment at this stage of the proceeding, claiming the key alone or the spring alone, it would have had more merit and been entitled to more consideration than to present claims for both under these circumstances. But unquestionably the applicant can have no right to insist upon a consideration of both of these claims, for, as I think the examiner has correctly held, they are separate and independent subjects of invention in every essential particular. The Examiners-in-Chief have themselves held that there is no combination whatever between them, and, finally, the applicant has voluntarily canceled them from the application, which is quite as conclusive a reason why they ought not now be considered by the Office, except when presented in a new application. There is nothing to show that the applicant may not successfully prosecute a claim to either one of these alleged inventions, so far as public use or any other question of that character is concerned.

In noticing the recommendation of the Examiners-in-Chief in their decision, I am not unmindful of the variableness of the practice on the subject of division heretofore, and that various tribunals of the Office entertain distinct opinions and settled convictions on that point, and I am aware that it is difficult when rendering decisions or expressing official opinions to avoid leaning in the direction of personal views and convictions; but it is evident that uniformity of action and harmony of practice require that such views

and opinions shall yield to the settled practice of the Office, at least for the time being. The effect of the recommendation made by the majority of the Examiners-in-Chief distinctly contravenes the practice of division as settled by the present Commissioner and verges upon an assumption of his jurisdiction. No one will question that the matter of division relates to form and not to merits, subject, of course, when the division depends upon the illegitimacy of a combination, to the right of appeal, as hereinbefore explained. An appeal from the action of the examiner requiring division, such action being a vital objection to form, comes directly before the Commissioner, and his decision is final upon that subject. If the Board of Examiners-in-Chief can recommend that distinct subjects of invention be admitted which the examiner has required to be eliminated, or which applicant has elected to eliminate, then they verge upon the original jurisdiction of the Primary Examiner. Under the organization of the various tribunals of this Office and the system in force it must follow as a necessity that the recommendation the Examiners-in-Chief may make under Rule 139 must relate to and embrace some part or feature of the particular invention which the applicant has chosen or elected to make the subject of his application, and which is brought before that tribunal by appeal.

As previously stated, it is not only evident, but the Examiners-in-Chief have unanimously held that no combination exists between the key and the bed-spring. While they have not declared that the two are wholly separate and distinct subjects of invention, they have expressed the belief that they may properly be united in a single application, and that to require them to be covered by separate patents would be "bad policy and poor practice." Their language is as follows:

We think that claims for each might be allowed under Rule 40 of the Revised Rules of April 18, 1888, as they are dependent upon each other, the clamp-lock requiring the key and the key not being of any earthly use except to act upon the lock. They both relate to the same subject-matter and belong together, and it would be bad policy and poor practice to issue separate patents for each, which in the hands of different holders would control each other.

It is to be observed that Rule 40 was not changed in any respect in the last edition of the Rules of Practice, (April 18, 1888,) although in decisions of the present Commissioner a construction has been placed upon it which prevents two inventions being examined in a single application. The policy and practice in this particular have been settled, for the present at least, and when so settled they ought not to be challenged or repudiated by the subordinate tribunals of the Office, and especially in the manner above indicated.

The spring when attached to the slat becomes part of a bed or bed-mattress. Until it is attached it is simply an article of manufacture, made so not only by manufacturers, but by inventors themselves, and constitutes a distinct class of invention in the Office. The key is in no sense—physical, mechanical, or patentable—a part of such spring in either its free or attached condition. The spring may be fastened to the slat by other means, but perhaps not so conveniently as by a key or implement adapted to that purpose. The key is a simple tool of limited use. It is scarcely correct to say that it possesses "no earthly use" except to act upon the lock, because it can have a hundred other uses: but undoubtedly its principal or more important use is to fasten or lock such spring to the slat whenever it is desired to accomplish that purpose. It is an article of manufacture, and has no other patentable quality any more than a nail or pin. The two articles are no more dependent upon each other in a patentable sense than a tack and a tack-hammer, one being the thing driven, the other the thing by which it may be driven. Even were it true that the key had no other earthly use than to lock this slat, it would not therefore necessarily become dependent in a patentable sense upon the spring. It would be a simple tool, so simple that it has but a single use. Its commercial value would be limited to that use, as no person would purchase it except when it was desired for that particular purpose to which it could be applied. This, however, is a case of adaptation, which may be illustrated in an infinite variety of ways without ever approaching a patentable dependency or combination.

The only serious question I have had in the matter is whether the applicant ought not to be permitted to present an amendment containing a claim for one or the other of these articles; but in view of the fact that he has voluntarily eliminated these inventions from his application and has had such numerous actions from the Office, I think I shall not recommend anything of that character in the case.

I affirm the action of the Primary Examiner in refusing to enter and admit for consideration the last amendment offered by applicant.

EX PARTE GENTRY.

Decided July 26, 1888.

SIGNATURES TO SPECIFICATIONS.

The law knows but one Christian name. The middle names are mere matters of ornament or of social distinction; hence the omission of the middle name, or of the initial of the middle name, is wholly immaterial. But an omission to write the Christian name in full is fatal.

APPEAL from the Primary Examiner.

COMPOSITION OF MATTER FOR REMEDIAL COSMETIC OR CREAM.

Application of N. Kate Gentry filed March 13, 1888, No. 267,107.

Mr. R. M. McDermott for the applicant.

HALL, *Commissioner:*

When the Primary Examiner took this application up for consideration he found that the applicant had signed her name to the petition, specification, and oath as "N. Kate Gentry," which he held to be incomplete and defective, and he required that applicant should furnish a new oath signed with her full name.

There is no reference in the statute to the subject; but Rule 40 provides that—

The specification must be signed by the inventor * * * and the signature must be attested by two witnesses. Full names must be given, and all names, whether of applicants or witnesses, must be legibly written.

There is no doubt but that the Commissioner of Patents, under the direction of the Secretary of the Interior, has authority to adopt such a rule.

Applicant has appealed from this requirement of the examiner, and insists that "N. Kate Gentry" is her full name. The argument is that persons having two or three Christian names are not required, under the designation "full name," to write out all of their given names, and that it is just as proper to write "N. Kate Gentry" as it would be "Norah Kate Gentry," if *Norah* be her given name.

This view of the subject is erroneous, because it fails to comprehend the legal meaning of the term "full name." The law knows but one Christian name. The middle names are mere matters of ornament or of social distinction, and hence it is well settled that an omission of the middle name, or of the initial of the middle name, is wholly immaterial. (See *Gaines et al.* v. *Stiles*, 14 Peters, 322.)

In the execution of deeds and other instruments, where there is no law requiring parties to execute by their full names, such parties may sign their names by initials or in the manner in which they ordinarily sign them. The question of identity always arises with regard to such instruments. It does not follow because names are identical that they were signed by the same person, although identity of names is *prima facie* evidence of the identity of persons. (See *Stebbins* v. *Duncan et al.*, 108 U. S., 32.) In the present case the presumption is that the applicant has a full name, and that such full name consists of the first Christian name and the surname *Gentry*. She can write Norah, or whatever name may be represented by the initial N. with the other Christian name "Kate" in full, followed by her surname Gentry, or she could write "Norah Gentry," either of which would be the full name; but in view of the fact that the law knows but one Christian name, and that is the first one, an omission to write that in full is fatal to all the rest.

The action of the Primary Examiner is affirmed.

DECISIONS OF STATE COURTS.

Supreme Judicial Court—State of Massachusetts.

RUSSIA CEMENT COMPANY *v.* LE PAGE.

Decided June 19, 1888.

1. TRADE-MARK—CHANGED BY ADDITIONAL WORDS.

The mere addition of the word "improved" will not justify the use of a Trade-Mark otherwise objectionable on the ground of resemblance to a trade-mark in use by another person.

2. SAME—USE OF REGISTRANT'S OWN NAME.

A person cannot make a trade-mark of his own name, and thus debar another having the same name from using it in his business honestly and without any intention to wrongfully appropriate the good-will of a business already established.

3. SAME—SAME.

But although one may honestly use his own name as a Trade-Mark, although the incidental result may be to injure the business of another, he cannot resort to any artifice, or do any act calculated to mislead the public as to the identity of the business or article, and thus produce injury to such other person beyond that which results from the similarity of name.

4. SAME—SAME—DEPRIVED OF RIGHT TO USE BY SALE OF TRADE-MARK.

One may so sell or part with the right to use his own name as a description of a manufactured article as to deprive himself of the right to use it as such, and confer such right upon another, and in such case he will be enjoined from such use of his own name.

5. SAME—SAME.

Where one Le Page had used the Trade-Mark "Le Page's Liquid Glue" to indicate a particular kind of glue manufactured by him, and had thereafter formed a corporation to which he sold his business, with the right to use the Trade-Marks belonging to or in use by him, which corporation continued to manufacture the same glue under the same name, and he subsequently left the corporation and engaged in the manufacture of glue in the same town, using the name "Le Page's Improved Liquid Glue" to advertise the article produced by him, *Held* that he should be enjoined from so using such name and from describing his business as "Le Page's Liquid Glue Co.," whether with or without any addition, without deciding that he may not use the words "liquid glue" or other appropriate words to describe his product, or state in that connection that he is himself the manufacturer of it.

ON report.

Mr. E. R. Hoar and *Mr. Causten Browne* for the complainant.

Mr. William Gaston, *Mr. Francis Forbes*, and *Mr. Frank L. Washburn* for the defendant.

STATEMENT OF THE CASE.

The action was brought to enjoin defendant from using a certain alleged Trade-Mark claimed to be the property of the plaintiff. The case comes on to be heard before Judge Gardner, who refused the injunction and ordered the bill dismissed. The plaintiff appealed, and at his request the case was reported for the consideration of the full court.

Judge DEVENS delivered the opinion of the court.

The plaintiff and defendant are manufacturers of liquid glue, and the defendant, whose name is Le Page, uses the same name as that used by plaintiff to describe his glue and by which to advertise it, except that he introduces therein the word "Improved." The introduction of this word into the name of the article manufactured by him does not justify its use if in other respects the plaintiff has just ground to object to it. (Sebast. Tradem., 52; *Frazer* v. *Frazer Lubricator Co.*, 18 Ill., App., 462, On App., 9 West. Rep., 768; *Gillis* v. *Hall*, 2 Brewst., 342.)

A person cannot make a Trade-Mark of his own name and thus debar another having the same name from using it in his business if he does so honestly and without any intention to appropriate wrongfully the good-will of a business already established by others of the name. Every one has the absolute right to use his own name honestly in his own business for the purpose of advertising it, even though he may thereby incidentally interfere with and injure the business of another having the same name. In such case the inconvenience or loss to which those having a common right to it are subjected is *damnum absque injuria*. But although he may thus use his name, he cannot resort to any artifice or do any act calculated to mislead the public as to the identity of the business, firm, or establishment, or article produced by them, and thus produce injury to the other beyond that which results from the similarity of name. (*Holloway* v. *Holloway*, 13 Beav., 209; *Meneely* v. *Meneely*, 62 N. Y., 427; *Gilman* v. *Hunnewell*, 122 Mass, 139; *Rogers* v. *Rogers*, 1 New Eng. Rep., 411; 53 Conn., 121.) While this is the general rule, it is also true that one may so sell or part with the right to use his own name as a description or designation of a manufactured article as to deprive himself of the right to use it as such and confer this right upon another. A name used as an adjective of description is not nec-

essarily understood by the public as any assertion that the person whose name is used is the maker of the articles. One who has carried on a business under a trade-name and sold a particular article in such a manner by the use of his name as a Trade-Mark or a trade-name as to cause the business or the article to become known or established in favor under such name may sell or assign such trade-name or Trade-Mark when he sells the business or manufacture, and by such sale or assignment conclude himself from the further use of it in a similar way. (*Horton Mfg. Co.* v. *Horton Mfg. Co.*, 18 Fed. Rep., 816; *McLean* v. *Fleming*, 96 U. S., 245; 24 L. ed., 828; *Joseph Dixon Crucible Co.* v. *Guggenheim*, 2 Brewst., 321; *Probasco* v. *Bouyon*, 1 Mo. App., 241; *Oakes* v. *Tonsmierre*, 4 Woods, 555; *Celluloid Mfg. Co.* v. *Cellonite Mfg. Co.*, 32 Fed. Rep., 94; *Ainsworth* v. *Walmsley*, L. R., 1 Eq., 524; *Shaver* v. *Shaver*, 54 Iowa, 208; 37 Am. Rep., 194; *Frazer* v. *Frazer Lubricator Co.*, 9 West Rep., 763; 18 Ill., App., 462.)

A person may be enjoined, therefore, from using his own name as a description of an article of his own manufacture and from selling the article under that particular name when he has parted with the right thus to apply it. (*Gillis* v. *Hall*, 2 Brewst., 342: *Kidd* v. *Johnson*, 100 U. S., 619; 25 L. ed., 770.) It is not upon the ground of the invasion of the trade-name adopted by another but by reason of the contract he has made that he is deprived of the right himself to use his name as all others of the same name may use theirs.

The recent case of *Hoxie* v. *Chaney*, (8 New Eng. Rep., 709; 143 Mass., 592,) which has been decided since the decree orignally made in the case at bar was rendered, is quite conclusive in regard to it. It was there held that "A. N. Hoxie's Mineral Soap" and "A. N. Hoxie's Pumice Soap" were trade-marks, and assignable as such, and that they did not necessarily mean that the soaps were made by A. N. Hoxie. Where one who had adopted these trade-marks, or, more properly, trade-names, for his manufacture, entered into a partnership with another under articles by which he contributed the good-will of the business he was carrying on, with the tools, implements, and fixtures, and on the dissolution of this partnership conveyed to his partner "all my right, title, and interest in and to all and singular the partnership property belonging to the firm, meaning hereby to sell and convey all my interest in the entire assets of the firm." It was further held that these trade-names became by the articles of copartnership a part of the property of the firm, and that the right to use them as such passed by the bill of sale, and that the partner so conveying had parted with his own right so to do. Upon the evidence in the case at bar it appears that "Le Page's Liquid Glue" was the name adopted by Brooks & Le Page for the light glues manufactured by them, a special word—such as "straw," "carriage," &c., indicating for what especial use the particular light glue was designed—being inserted before the word "Glue;" that they manufactured glues under this name, and that at a subsequent period, in 1882, they formed the plaintiff corporation, to which they sold their business, and which continued the manufacture of these glues under the same name. The defendant was a member of the corporation and a director thereof until February, 1886, when he left it, and shortly after engaged in the manufacture and sale of glue at Gloucester, where the plaintiff's business has always been carried on, using the name "Le Page's Improved Liquid Glue" to advertise the article produced by him. When Brooks & Le Page sold their business to the plaintiff, they in express terms sold "the right to use the Trade-Marks belonging to or in use by said copartnership." When Le Page (with Brooks) sold to the corporation, and when he left the corporation, it must be held that the name "Le Page's Liquid Glue" was a trade-name or trade-mark—and it is not important which term is used—indicating the liquid glue which the plaintiff was manufacturing. The right to use it as such was necessarily an exclusive use, as it was intended thus to distinguish the plaintiff's goods from those of others. As a Trade-Mark belonging to the corporation, the defendant, while an officer thereof, had himself sought to obtain registration for it at the United States Patent Office.

We are of opinion, therefore, that the defendant should be enjoined from using the words "Le Page's Improved Liquid Glue," or "Le Page's Liquid Glue," to describe the article manufactured by him, and from describing the company under whose name he conducts his business as "Le Page's Liquid Glue Company," whether with or without any addition thereto.

While the plaintiff has not sought to prevent the defendant from manufacturing glue, in order to avoid misunderstanding we add that while the defendant cannot use the words adopted as a trade-name for the article manufactured by him, we do not decide that he may not use the words "liquid glue," or other appropriate words, to describe his product or to state in that connection that he is himself the manufacturer of it.

Decree for the plaintiff.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGlehan, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

DESIGNS.

18,539.—COLLAR.—*Gates H. Barnard*, New York, N. Y. Application filed July 30, 1888. Serial No. 281,479. Term of patent 7 years.

18,540.—CANE-HEAD.—*Jacob Eichel*, Evansville, Ind. Application filed March 20, 1888. Serial No. 267,907. Term of patent 7 years.

18,541 to 18,546, inclusive.—CARPET.—*Edwin Fisher*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed July 23, 1888. Serial Nos. 280,816, 280,817, 280,820, 280,821, 280,823, and 280,825. Term of patents 3½ years.

18,547 and 18,548.—HOT-WATER HEATER.—*Edward Gurney*, Toronto, Ontario, Canada. Applications filed June 23, 1888. Serial Nos. 278,049 and 278,050. Term of patents 14 years.

18,549.—BEVELED GLASS.—*Obed Charles Hawkes*, Birmingham, county of Warwick, England. Application filed July 11, 1888. Serial No. 279,670. Term of patent 14 years.

18,550.—CAMPAIGN-CARD.—*Frank E. Houst*, Brattleborough, Vt. Application filed July 18, 1888. Serial No. 280,336. Term of patent 7 years.

18,551.—CAR-TRUCK FRAME.—*John Stephenson*, New York, N. Y. Application filed July 20, 1888. Serial No. 280,573. Term of patent 14 years.

18,552 to 18,557, inclusive.—CARPET.—*Charles W. Sweapp*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed July 23, 1888. Serial Nos. 280,810 to 280,815, inclusive. Term of patents 3½ years.

18,558.—HANDKERCHIEF.—*S. Bowen Turpin*, Washington, D. C. Application filed July 9, 1888. Serial No. 279,470. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,786.—PRINTS AND COTTON PIECE-GOODS.—*Arnold Print Works*, North Adams, Mass. Application filed July 3, 1888. Used since June 25, 1888.

"The figure of a yellow seal having a notched edge and associated with the words and figures 'YELLOW SEAL 2400 CLOTH.'"

15,787.—PRINTS AND COTTON PIECE-GOODS.—*Arnold Print Works*, North Adams, Mass. Application filed July 3, 1888. Used since June 25, 1888.

"The figure of a silver seal having a notched edge and associated with the words 'SILVER SEAL MOURNINGS.'"

15,788.—WHISKY.—*Blake, Bruce & Co.*, Omaha, Nebr. Application filed July 6, 1888. Used since January, 1885.

"The representation of a medallion with the letters 'S. T.' thereon and surrounded by a wreath of rye or other cereal, and the words 'SWEET THORN.'"

15,789.—MEDICINE FOR THE TREATMENT OF GONORRHŒA AND GLEET.—*John S. Broas*, Jersey City, N. J. Application filed March 29, 1888. Used since January 1, 1888.

"The figures '4-11-44.'"

15,790.—METALLIC PAINT MANUFACTURED FROM THE RED OXIDE OF IRON.—*Clinton Metallic Paint Company*, Kirkland, N. Y. Application filed April 19, 1888. Used since April 1, 1887.

"The representation of a barrel having on its head the words 'METALLIC CLINTON PAINT.'"

15,791.—CANDLES.—*The Dearborn Manufacturing Company*, Chicago, Ill. Application filed August 4, 1887. Used since March, 1887.

"The word 'LUMEN.'"

15,792.—CLEANSING SOAP OR COMPOUND OF AN ABRASIVE CHARACTER.—*Electron Manufacturing Company*, Philadelphia, Pa. Application filed July 6, 1888. Used since June 1, 1887.

"The word 'ELECTRON.'"

15,793.—GINGHAMS, TICKINGS, AND COTTON GOODS.—*John Farnum & Co.*, Philadelphia, Pa. Application filed July 17, 1888. Used since July 1, 1888.

"The word 'WICO.'"

15,794.—TEA.—*Joseph Friess*, New York, N. Y. Application filed April 28, 1888. Used since April 5, 1888.

"The representations of caravans consisting of camels and sledges, respectively, transporting packages of merchandise."

15,795.—CIGARS.—*Gumersindo Garcia Cuervo*, Havana, Cuba. Application filed June 18, 1888. Used since 1867.

"The words 'LA FLOR DE LUISITA' supported by a picture exhibiting two young girls sitting at a table with an old man conversing and drinking, the picture being entwined in the limb of a tree covered with flowers or blossoms, upon which birds are perched."

15,796.—MEDICINAL PREPARATION TO BE USED EITHER AS A POTION OR A LOTION.—*George F. Hutchison & Co.*, Hamilton, Ohio. Application filed May 5, 1888. Used since January 1, 1888.

"The words 'OMNI CURANT.'"

15,797.—TOILET POWDER.—*George Lorenz*, Toledo, Ohio. Application filed July 14, 1888. Used since September 1, 1887.

"The word 'LUXURY.'"

15,798.—SHUCKED RAW AND HERMETICALLY-SEALED OYSTERS.—*J. Ludington & Co.*, Baltimore, Md. Application filed July 13, 1888. Used since 1850.

"The words 'SEA SIDE.'"

15,799.—EXTRACTS OF MEATS.—*Julius Maggi & Co.*, Kempthal, Switzerland. Application filed April 28, 1888. Used since January 1, 1887.

"A design in the nature of a four-pointed star, having in its center a square or rectangular field, within which a Greek cross is placed."

15,800.—FLOUR.—*Donald McCulloch Gedge*, San Francisco, Cal. Application filed May 4, 1888. Used since February 1, 1888.

"The representation of a crown and coat of arms upon a flag or banner arranged or displayed upon a shield and having a lozenge-shaped figure above the shield."

15,801.—CONDENSED MILK.—*New York Condensed Milk Company*, New York, N. Y. Application filed July 9, 1888. Used since June 28, 1888.

"The word 'CHAMPION.'"

15,802.—PERFUMES AND ODORIFEROUS AND FLAVORING EXTRACTS.—*Nonantum Worsted Company*, Newton and Boston, Mass. Application filed June 6, 1888. Used since January, 1888.

"The words 'LADY GREY.'"

15,803.—PERFUMES AND ODORIFEROUS AND FLAVORING EXTRACTS.—*Nonantum Worsted Company*, Newton and Boston, Mass. Application filed June 6, 1888. Used since January, 1888.

"The words 'LONG BRANCH.'"

15,804.—WOOLENS, JEANS, AND LIKE GOODS.—*The Old Kentucky Woolen Mills Company*, Louisville, Ky. Application filed June 20, 1888. Used since 1875.

"The words 'OLD KENTUCKY.'"

15,805.—STEEL PENS.—*Ormiston & Glass*, Edinburgh, Scotland. Application filed July 12, 1888. Used since December 1, 1887.

"A representation of the terrestial globe and a pen-holder and pen used as a lever under the globe."

15,806.—PEARL BUTTONS.—*Ostheimer Brothers*, Philadelphia, Pa. Application filed June 26, 1888. Used since February, 1888.

"The representation of a star with the letters 'G N O B S.'"

15,807.—HYDRAULIC CEMENT.—*Joseph Robinson & Co.*, Knothill, near Carlisle, county of Cumberland, England. Application filed July 21, 1887. Used since 1828.

"The word 'ROBINSON'S.'"

LABELS.

5,680.—Title: "CARTER'S FANCY," (FOR FLOUR.)—*J. C. Carter*, Atlanta, Ga. Application filed July 25, 1888.

5,681.—Title: "ELECTRO CHEMICAL," (FOR INK.)—*Thaddeus Davids Company*, New York, N. Y. Application filed June 2, 1888. (Trade-Mark Registered.)

5,682.—Title: "MALONE PASTE."—*Whittelsey & Company*, Malone, N. Y. Application filed July 25, 1888.

PATENTS

GRANTED AUG. 21, 1888.

388,008. ELECTRIC SIGNALING. CLEMENT ADER, Paris, France. Filed Jan. 26, 1888. Serial No. 261,979. (No model.) Patented in England Dec. 20, 1887, No. 17,202.

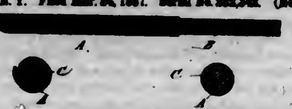
Claim.—1. The combination, with an electric signaling circuit, of a telephonic receiver in said circuit, a local battery in circuit with said receiver, and a rheotome arranged to interrupt the current from said local battery with a rapidity corresponding to the vibrations of an audible note, whereby a sound is produced in said receiver which remains uniform as long as no current arrives over the line and is varied audibly upon the passage of a line-current.

2. The combination, with an electric signaling circuit divided at the receiving-station into two branches, of a telephonic receiver in one of said branches, a local battery in circuit with said receiver and supplying a current thereto, and a rheotome arranged to interrupt the current from said battery with a rapidity corresponding to the vibrations of an audible note.

3. The combination, with an electric signaling circuit divided into two branches, of a telephonic receiver in one of said branches, a rheotome adapted to direct the current into said branches alternately with a frequency corresponding to the rapidity of vibration of an audible note, and a local battery in circuit with said branches and supplying a uniform current thereto, whereby the current from said battery is interrupted by said rheotome and produces a continuous sound in said receiver, which sound is varied audibly upon the passage of a line-current.

4. The combination, with an electric signaling circuit, of two telephonic receivers connected therewith, a local battery in circuit with one of said receivers and supplying a current thereto in one direction relatively to the line, a local battery in circuit with the other of said receivers and supplying a current thereto in the contrary direction, and two rheotomes constructed to vibrate at different velocities and arranged to interrupt the local currents traversing said receivers, respectively, whereby two different sounds are produced in said receivers, which remain uniform as long as no current arrives over the line and are varied inversely to one another upon the passage of a line-current, the sound in the one being increased and the other diminished by a positive current, and the sound in the other increased by a negative current.

5. The combination, with an electric signaling circuit, of a telephonic receiver connected therewith, a local battery in circuit with said receiver and supplying a uniform current thereto, two rheotomes constructed to vibrate at different velocities, corresponding to audible notes of different pitch, and arranged to interrupt the current traversing said receiver, and electrical circuit-connections between said local battery, receiver, and rheotomes and the line, so arranged that the polarities of the currents interrupted by the rheotomes are relatively reversed, whereby a positive current arriving over the line will cause a note of one pitch to be heard in said receiver and a negative current will cause a note of the other pitch to be heard.



6. The combination, with an electric signaling circuit divided into two branches, of a telephonic receiver in one of said branches, a local battery in circuit with said branches and regulated to supply a current thereto of equal intensity with the currents normally arriving over the line, and a rheotome arranged to interrupt the current from said battery with a rapidity corresponding to the vibrations of an audible note.

7. The combination, with an electric signaling circuit divided into two branches, of two telephonic receivers, one in each of said branches, a local battery in circuit with said branches and regulated to supply a current thereto of equal intensity with the currents normally arriving over the line, and a rheotome arranged to interrupt the current from said battery with a rapidity corresponding to the vibrations of an audible note, whereby a continuous sound is produced in both receivers so long as no current arrives over the line, and is extinguished in one receiver upon the passage of a positive current and in the other upon the passage of a negative current.

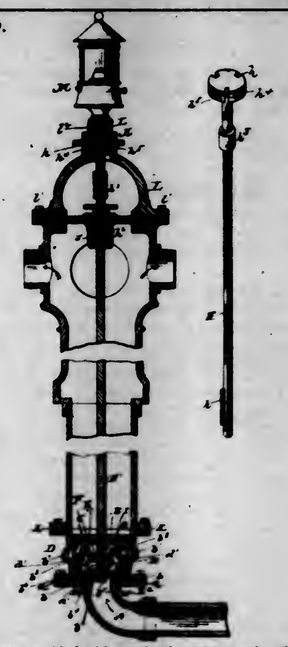
8. The combination, with an electric signaling circuit divided into two branches, of two telephonic receivers, one in each branch, two local batteries intercalated in said branches with their poles reversed relatively to the line, and a rheotome arranged to interrupt the currents from said batteries with a rapidity corresponding to the vibrations of an audible note.

9. The combination, with an electric signaling circuit divided into two branches, two telephonic receivers, one in each branch, a rheotome adapted to direct the current into said branches alternately with a frequency corresponding to the rapidity of vibration of an audible note, and two local batteries intercalated in said branches with their poles reversed relatively to the line.

388,009. COMBINED NEEDLE AND CORD. ELMER A. BAILEY, New York, N. Y. Filed Mar. 24, 1887. Serial No. 232,342. (No model.)

Claim.—A combined needle and cord composed of a piece of sheet metal wrapped around the end of the cord and compressed to form a practically solid mass, and pointed at the end opposite the one in which the cord is held, substantially as herein shown and described.

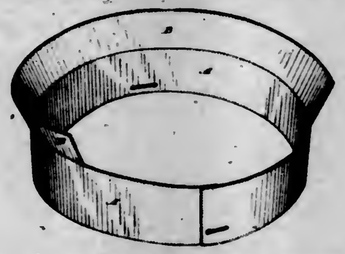
388,010. HYDRANT. PETER W. BAILEY, Seneca Falls, N. Y. Filed Mar. 10, 1888. Serial No. 266,894. (No model.)



Claim.—1. In a hydrant, the combination of the casing, having suitable waste-apertures and inlet-elbow, with the cap L, having the splines *l*, the vertical rod H, having the threaded and slotted head h^4, the nut K, working upon said head, the collar G, secured to the lower end of the rod H, the toggle-joint connecting said collar with the valves b^3 of the bucket B, and the bucket B, having the valves b^3 and b^4, whereby said valves are operated, substantially as described.

2. In a hydrant, the combination of the casing, having a suitable inlet-elbow, with the raised valve-seat *a'*, the cap L, having the splines *l*, the vertical rod H, having the threaded and slotted head h^4, the nut K, working upon said head, the bucket B, screwed upon the raised valve-seat *a'* of casing D, the bar I across the top of the bucket B, the collar G, secured to the lower end of the rod H, the toggle-joint secured to said collar, and the valve b^3 of the bucket B, whereby the internal mechanism may be withdrawn without digging up the hydrant, substantially as described.

3. In a hydrant, the casing D, having waste-apertures and inlet-elbow, with raised valve-seat *a'*, upon which is screwed the bucket B, in combination with the bucket B, having suitable waste and inlet valves, the inlet-valve b^3, having the groove b^5, whereby the same is held in position, substantially as described.

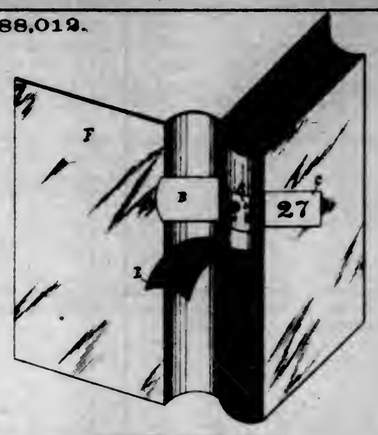


4. In a hydrant, the combination of the casing D, with cap L, having splines *l*, with a neck extending above said splines, to which is secured the lamp M, the vertical rod H, having the threaded and slotted head h^4, the nut K, working upon the head h^4 of the rod H, the collar G, secured to the lower end of the rod H, the toggle-joint connecting said collar with the valves b^3, the bucket B, having the valves b^3 and b^4, whereby said valves are operated without detaching the lamp or lighting device.

388,010.

5. A hydrant provided with a suitable casing, having the raised valve-seat *a'*, in combination with the bucket B, screwed upon said valve-seat, the cap L, having the splines *l*, with a neck extending above said splines, to which is secured a signal device, the vertical rod H, having the threaded and slotted head h^4 and the spline *h*, the nut K, working upon said head, the bar I across the top of the bucket B, the collar G, secured to the lower end of the rod H, the toggle-joint secured to said collar, and the valve b^3 of the bucket B, substantially as described, and for the purpose set forth.

388,011. APPAREL-COLLAR. GATES H. BARNARD, New York, N. Y. Filed May 15, 1888. Serial No. 273,914. (No model.)



Claim.—A bandless three or four ply collar of substantially uniform width, having secured to its upper edge a shorter supplemental flaring collar, as set forth.

388,012. IDENTIFYING-LABEL FOR BOOKS. JAMES M. BUNN, Brooklyn, N. Y. Filed Jan. 28, 1888. Serial No. 261,680. (No model.)

Claim.—1. In the manufacture of books, the method of affixing a suitable identifying-mark, which consists in suitably affixing upon or to the inner part of the case, lining, or back of the book a label, A, bearing said identification-mark, and having a protecting-flap, B, and covering the same by securely and permanently applying thereto the outer part of the book, and suitably affixing upon or to the outer part of the book the label C, bearing a duplicate of said identifying-mark, substantially as and for the purposes set forth.

2. The label A, bearing an identifying-mark and having the protecting-flap B, in combination with the detachable label C, bearing a duplicate of said identifying-mark, substantially as and for the purposes set forth.

388,012.

388,013. CHECK-ROWER. LORENZO D. RAMSEY, Peoria, Ill. Filed July 19, 1888. Serial No. 280,263. (No model.)

Claim.—1. In a check-rower, the combination, with the pinion having horizontal axis, of the rack-bars having the rack portions thereof located above and below the pinion, but their hook-engaging ends located side by side and in the same horizontal plane, and the hooked rods R, which engage with and move said bars, substantially as described.

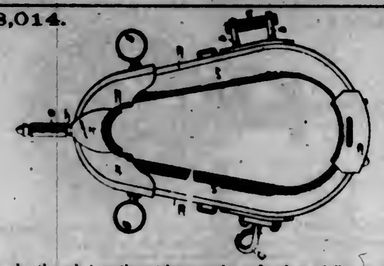
2. In a check-rower, the combination, with the rack-bars and the intermeshing pinion, of the radially-slotted disk connected to said pinion, the pin adjustably held in said slot, and the pitman joining said pin directly to the planter feed-slide, substantially as described.

3. In a check-rower, the combination of the rack-bars and the rack-bar support consisting of the plate adapted to be secured to one of the frame-beams formed with the shelves E', upon which rest the rack-bars, and the encircling strap portion having the detachable part E^2, substantially as described.

4. In a check-rower, the combination of the rack-bars, the pinion mounted on a shaft, F', turned by the racks, the support E for the rack-bars, having an upturned plate in which one end of the shaft is supported, the shelves E', upon which the bars slide and are supported, and the divided separable strap E^2 E^3, between which the other end of the shaft has a bearing, substantially as described.

5. In a check-rower, the combination, with the reciprocating bars having the angular paths therein, of the rod R, having the hook R', provided with the lateral projections R^2, as and for the purpose set forth.

6. In a check-rower, the combination, with the hooked rod, of the reciprocating bars having the paths A' and the holes A^2 therein, the contiguous walls A^3 of which are depressed, one with a rounded surface and the other with the shoulder A^4, for the purpose described.



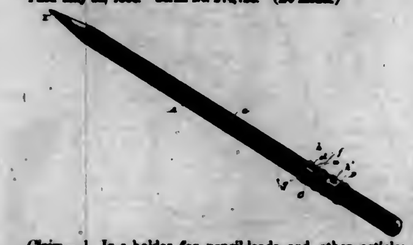
7. The combination, with the check-rower head having the sheave M, of a dolling-finger connected to the head and adapted when forcibly moved to force the check-row wire out from the groove of said sheave, for the purpose specified.

8. The combination, with the check-rower head having the sheave M, of the dolling-finger N, pivoted concentric with said sheave and projecting up by the periphery of the sheave and provided with the handle N'.

388,014. HORSE-COLLAR. CARL BLOM, Merrill, Wis. Filed Jan. 10, 1888. Serial No. 260,304. (No model.)

Claim.—1. The collar having the hinge-sockets at its upper end, in combination with the check-hook having an eye at its lower end and let into the lug-eyes or hinge-barrel, the shield having apertures and a threaded nut in one of them, and a pintle-rod having a buckle at one

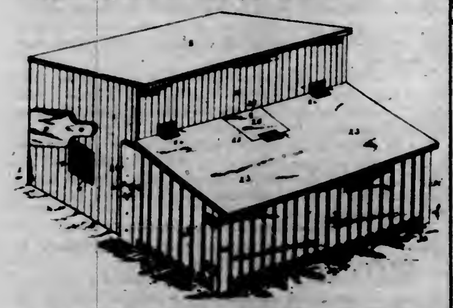
388,014.



end and a threaded portion at its opposite end, substantially as specified.

2. The combination, with a collar composed of two hinged sections, of a pintle for the said hinge having a loop at one end and a hinged tongue to form a buckle, whereby the said pintle may serve a twofold function, substantially as specified.

3. The combination with a collar having a hinge at its upper ends to unite the sections, of a check-hook having its lower end adapted to enter the barrel of the hinge, and a pintle-rod for the said hinge also passing through and securing the said hook therein, substantially as specified.

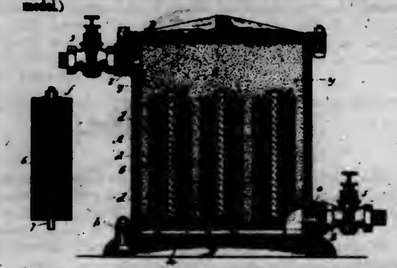


388,015. HOLDER FOR PENCIL-LEADS, &c. GLARE W. BOHAN, New York, N. Y., assignor to the Eagle Pencil Company, same place. Filed May 28, 1888. Serial No. 274,726. (No model.)

Claim.—1. In a holder for pencil-leads and other articles, the combination of a tubular longitudinally-slotted sheath, a stem for reception of the lead or other article, movable longitudinally in the sheath and provided with a guide-fin which projects through the slot in the sheath and is formed on said projecting part with an inclined cam or wedge face, and a sliding clamping-sleeve mounted on the exterior of the sheath, engaging said fin, and provided with a bearing face or shoulder to coact with the cam or incline on the fin, substantially as and for the purposes hereinbefore set forth.

2. The combination of the tubular longitudinally-slotted sheath, the stem B, provided with fin *d*, formed as described, the clamping-sleeve C, and the sleeve D, under the arrangement and for joint operation as hereinbefore set forth.

388,016. CHICKEN-COOP. JAMES H. BREWER, Annapolis, Ind. Filed Mar. 13, 1888. Serial No. 267,072. (No model.)



Claim.—1. A chicken-coop consisting of the main body 1, having the doorway 9 and ventilating-roof, the fooding-compartment composed of the detachable lattice-work comprising the end and side sections hinged together, and the inclined roof 23, hinged to the front wall of the main body and arranged over the fooding-compartment, substantially as described.

2. A chicken-coop consisting of the main body 1, having the doorway 9, the fooding-compartment composed of detachable lattice-work comprising the end and side sections hinged together, and the inclined roof 23, hinged to the front wall of the main body over the fooding-compartment, and having the scuttle-hole 26 and door 27 arranged directly over the doorway in the main body, substantially as described.

3. A chicken-coop consisting of an inclined roofed structure and a fooding-compartment inclosed by a detachable lattice-work comprising palings having the adjacent edges of their lower ends gained or cut out to provide passages for the exit and entrance of small chickens, substantially as described.

388,017. FILTER. FREDERIC W. BROWNLOW, Manchester, County of Lancaster, England. Filed Mar. 31, 1887. Serial No. 233,003. (No model.)

Claim.—1. As a new article of manufacture, a filtering medium consisting of a cylinder of solid homogeneous compressed carbon, provided with a central longitudinal tubular opening extending entirely through the same, and having a perforated tube of non-corrosive metal fitted tightly in said tubular opening, its ends projecting therefrom, one of said ends being closed, a suitable packing placed over the end of the tubular opening from which the closed end projects and around said end, and a nut fitted to the projecting end and screwed down against the packing, the opposite end of said tube being open and arranged to make connection with a filter, substantially as specified.

2. A filtering medium consisting in the combination of a compressed homogeneous carbon cylinder composed of two or more sections, each section having a central longitudinal tubular opening, and a perforated non-corrosive metal tube passed through said tubular openings and uniting the said sections together, said tube fitting tightly in said opening and having its ends projecting from the cylinder, one of said ends being closed and fitted with a nut and the other end being open and arranged to be connected with a filter, substantially as specified.

3. The combination of the filter-case A, provided with a suitable entrance-port, a filtering medium placed in said case and connected with the bottom thereof, said filtering medium consisting of a homogeneous compressed-carbon cylinder provided with a central longitudinal tubular opening, and a perforated non-corrosive metallic tube connected at one end with the bottom of the case and passed through the cylinder of compressed carbon, its upper end being closed and fitted with a nut by which the cylinder and tube are fastened together, substantially as specified.

4. A multiplex filter consisting of the combination of the filter-case A, provided with a suitable entrance-port, filtering media placed in said case, said media consisting of separate cylinders of homogeneous compressed carbon having central longitudinal tubular openings and perforated non-corrosive metallic tubes, each of which has one end passed through the bottom of the case, and each of said tubes being passed through a carbon cylinder, its end projecting therefrom being closed and fitted with a nut, by which the cylinder is connected with the tube, substantially as specified.

5. The combination, in a filter, of a case, A, provided with a suitable entrance-port, a filtering medium consisting of one or more cylinders of homogeneous compressed carbon, a perforated tube of non-corrosive metal having one end passed through the bottom of the case, said tube being also passed through a suitable tubular opening in the cylinder, and one of its ends projected out of the cylinder and closed and fitted with a nut, and a body of granulated carbon placed in the case and around the filtering medium, substantially as specified.

388,018. CURTAIN-FASTENER. WILLIAM H. BOSSELMAN, Columbia, Texas. Filed Nov. 26, 1887. Serial No. 256,126. (No model.)

Claim.—1. The herein-described carriage-curtain fastening, comprising a hook or pin upon which the curtain is hung, and a return-bend spring the inner portion of which is secured to the frame of the carriage, and the outer portion of which is bent downward nearly to the pin and binds the selvage of the curtain, when inserted thereunder, closely against the frame, substantially in the manner and for the purpose described.

2. A carriage-curtain fastening comprising a return-bend spring.

388,018.

D, and a pin, C, the spring D being arranged to embrace and bind the selvage of the curtain against the carriage-frame after the same is hung upon the pin, substantially as and for the purpose described.

388,019. LAMP-BURNER FLAME-EXTINGUISHER. Lowell J. Bullard, New York, N. Y. Filed Dec. 3, 1887. Serial No. 256,942. (No model.)

Claim.—1. In a flame-extinguishing device for lamps or burners, the flaps A A and the bifurcated lever C, provided with connecting-rods D D and with a detent angular boss or lug, E, and pivoted at the base to bear against an opposing angular spring, L, in combination with the spring L and a dome or bearer, and operative substantially as described.

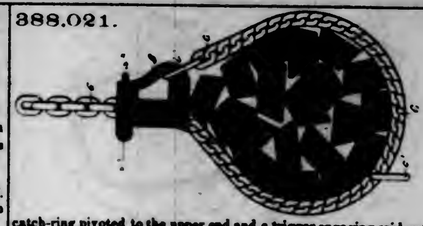
2. In a flame-extinguishing device for lamps or burners, the flaps A A, terminally and pivotally connected together and attached to the perforated base at the narrow sides of the wick-tube at its junction with the gallery, in combination with the bifurcated lever C, provided with connecting-rods D D and with a detent angular boss or lug, E, and pivoted at the base and bearing against an opposing angular spring, L, and with such spring L and a dome or burner, and constructed substantially as described.

388,020. CLASP. Lowell J. Bullard, New York, N. Y. Filed Jan. 7, 1888. Serial No. 260,107. (No model.)

Claim.—1. An inwardly-opening clasp provided with introverted prongs upon its fixed jaw and corresponding apertures in its movable jaw adapted to engage such prongs, such movable jaw being actuated by a spring to engage the prongs and apertures, substantially as described.

2. A double clasp consisting of a cuff-end spring-clasp, a sleeve-end spring-clasp, and a connecting-shank common to both clasps, the sleeve-end clasp being inwardly opening and provided with prongs upon its fixed jaw and with corresponding apertures in its movable jaw for engagement with such prongs upon an interposed fabric, substantially as described.

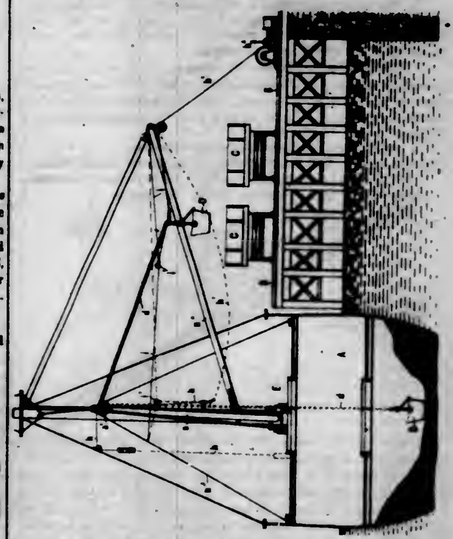
388,021. TRIP-SLING. James Byrne, Baltimore, Md. Filed Oct. 26, 1887. Serial No. 253,220. (No model.)



Claim.—1. A trip-sling for a hoisting apparatus, constructed in the form of a hollow cylinder, substantially as described, in combination with a catch suitably hinged or pivoted to the cylinder, and a trigger also pivoted to said cylinder, said catch and trigger operating together, substantially as described.

2. A trip-sling for a hoisting apparatus, constructed in the form of a hollow cylinder, in combination with a catch suitably hinged or pivoted to the cylinder, and a trigger also pivoted to the cylinder, substantially as shown, and a hoisting-rope arranged to pass freely through the cylinder, substantially as described.

3. A trip-sling for a hoisting apparatus, constructed in the form of a hollow cylinder, in combination with a catch suitably hinged or pivoted to the upper end of the cylinder, a trigger hinged or pivoted to the lower end of the cylinder and engaging with the catch, substantially as shown, and a hoisting-chain arranged to pass freely through the cylinder and provided with a stop-link, substantially as described.



4. A trip-sling for a hoisting apparatus, consisting of a sleeve made of a single piece of metal, substantially as shown, bent into the form of a tube, and having its upper ends secured together and its lower ends constructed to form supports for a pivot, in combination with a

388,021.

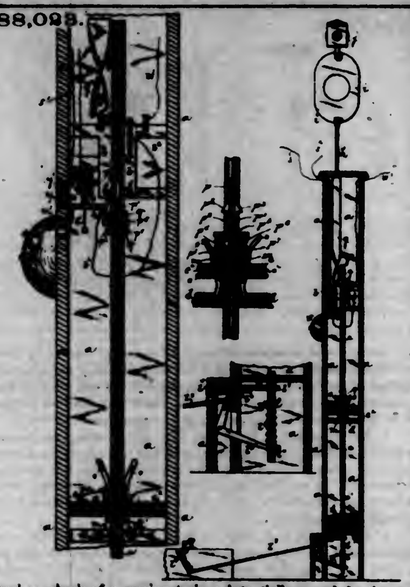
catch-ring pivoted to the upper end and a trigger engaging said catch-ring pivoted to the lower end, substantially as described.

388,022. CLUTCH FOR HOISTING-CHAINS. James Byrne, Baltimore, Md. Filed Feb. 18, 1888. Serial No. 264,442. (No model.)

Claim.—1. In a hoisting apparatus, a hoisting-chain-clutching device consisting of a ring, of metal or other suitable material, having a lever, as *f'*, pivoted to the ring, so as to rock vertically, in combination with a suspending-rope for the device attached to the short arm of the lever, and which rope also operates to release the lever, substantially as described.

2. In a hoisting apparatus, a clutching device for the hoist-chain, consisting of a ring, of metal or other suitable material, having one side open to slip over the hoist-chain, and projecting ends to support a pivot, in combination with a lever pivoted to the ends, a traveling suspending-rope attached at its lower end to the short arm of the lever, and the hoist-chain *d*, arranged and operating together, substantially as described.

3. In a hoisting apparatus, the combination of a clutching device for the hoist-chain suspended by a rope, as *h*, the carriage rope or cable *i*, to which the rope *h* is loosely suspended, so as to slide thereon, and the hoist-chain *d*, for the purpose set forth.



4. In a hoisting apparatus, a clutching device for the hoist-chain, in combination with the rope *h*, by which it is suspended, the crom-rope *i*, upon which the rope *h* is arranged to slide, the hoist-chain *d*, and means attached to the clutching device for hauling the load to the dump, substantially as set forth.

388,023. RAILWAY-SIGNAL. Thomas P. Corey, Danville, Ky. Filed Mar. 9, 1887. Serial No. 230,209. (No model.)

Claim.—1. In a signal apparatus, the combination of a signal-rod carrying the signals with an operating-rod engaging therewith and means for starting said rod into activity through virtue of a blow automatically delivered against the sustaining support of said rod, substantially as described.

2. In a signal apparatus, the combination of an operating-rod with lazy-tongs attached at one end to said operating-rod and at the other end to a lifting device which is operated by the expansion of a spring that has been compressed by force communicated from the

388,023.

wheel or wheels of a passing train, substantially as and for the purpose set forth.

3. In a signal mechanism, the combination of the operating-rod, expanding-levers attached to the lower end of said rod, another rod attached to the lower end of said expanding-levers, a forked arm embracing said rod and having a yielding connection therewith, and a tripping-lever connected to said arm, substantially as and for the purpose set forth.

4. In a signal apparatus, the combination of an operating-rod having one or more teeth or ratchets in its sides with a lever or levers for engaging said rod and supporting the same and means for withdrawing the levers from support of the rod by a blow automatically delivered against them, substantially as and for the purpose set forth.

5. In a signal apparatus, the combination of an operating-rod having a notch or notches therein, and arms pivoted to the signal-box for engaging said notch, with a loose collar or ring embracing said rod, substantially as and for the purpose set forth.

6. In a signal apparatus, the combination of an operating-rod, and a collar embracing said rod, having socket or sockets p' therein, with levers p' and p^2, attached to said rod for engaging said sockets, substantially as and for the purpose set forth.

7. In a signal apparatus, the combination of an operating-rod having one or more notches therein, arms engaging said notches, a loose collar surrounding said rod, and means for raising said collar and for maintaining it in its raised position, substantially as and for the purpose set forth.

8. In a signal apparatus, the combination of an operating-rod, a loose collar on said rod having one or more teeth or notches on its periphery, a lever for engaging said collar, and means for operating said lever, substantially as and for the purpose set forth.

9. In a signal apparatus, the combination of a signal-rod carrying the signal, an operating-rod, and electrical mechanism for releasing a weight, so that it may drop from its support and start said operating-rod into activity, substantially as described.

10. In a signal apparatus, the combination of the button *b'*, key *w*, a lever, *r*, and a wire connecting said lever and button with an electro-magnet, and electrical connection between said magnet and the arm *r*, and a circuit-breaker between said parts, substantially as described.

11. In a signal apparatus, the combination of an operating-rod having an enlarged head thereon with the key within the course of said head and adapted to be closed thereby and operate a circuit, substantially as described.

12. In a signal apparatus, the combination of an operating-rod having a block or enlarged head thereon, a key connected with the line-wire with which said head or block comes in contact, a pivoted lever having a bell-hammer on one end, an electro-magnet for operating said lever, and circuit-connections and a circuit-breaker between said key and magnet, substantially as and for the purpose set forth.

13. In a signal apparatus, the combination of a signal-rod carrying the signals and means for operating said rod with electrical mechanism operated by the train for releasing a weight, so that it may drop and thus start said operating means into activity, substantially as and for the purpose set forth.

14. In a signal apparatus, the combination of a button having a connection with the signal-box, an arm connected with the line-wire, and an arm carrying an insulating-disk with means for operating said parts by the train, substantially as and for the purpose set forth.

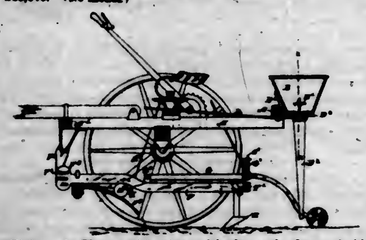
15. In a signal apparatus, the combination of the lever 1, having the pedal 3 attached to one end, a lever, 7, having an electrical connection with the line-wire, and means for connecting said lever 1 and arm 7 with a button, 10, having an electrical connection with the signal-box, substantially as and for the purpose set forth.

16. In a signal apparatus, the combination, with a lever, 2, having a pedal, 4, attached to one end, of an arm carrying an insulating-disk moved by said lever, and a button, 10, having a connection with the signal-box, substantially as described.

388,024. VENTILATING-COVER. James Davis, Mitchell, Dak. Filed July 6, 1887. Serial No. 243,866. (No model.)

Claim.—A ventilating-cover for milk-pans, consisting of the convex top 2, having ventilating-apertures and provided on its under side with the stops 6, having depending lugs 10, the horizontal portion of said stops being adapted to rest upon the top edge of a pan to provide an air-space between the pan and cover, and the depending lugs being adapted to prevent lateral motion to said cover by entering the pan and resting against its inner side, substantially as described.

388,025. HAY-RACK. William R. Deakin, Jamestown, Mo. Filed Apr. 24, 1888. Serial No. 271,760. (No model.)

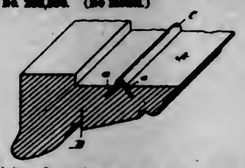


Claim.—1. A folding hay and grain frame for wagons, consisting of longitudinal sills and side pieces and transverse sills pivoted thereto and made in two sections hinged together, substantially as described.

2. In a folding hay and grain frame, the combination of the longitudinal sills, transverse sills pivoted thereto and projecting outside of the longitudinal sills, and the side bows pivoted to the cross-sills, substantially as described.

3. In a folding hay and grain frame, the combination of the longitudinal sills, the cross-sills made in sections hinged together, and the diagonal brace-rods connecting the longitudinal sill with the cross-sills, substantially as described.

4. In a folding hay and grain frame, the combination of the longitudinal sills, the hinged cross-sills, and the standards pivoted to the longitudinal sills to fold thereon, substantially as described.



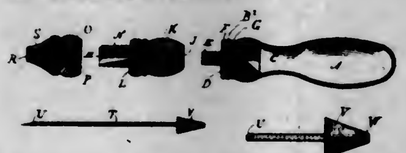
388,026. COMBINED SEEDING AND CULTIVATING MACHINE. William Dennison, Rockford, Ill. Filed Nov. 16, 1886. Serial No. 219,079. (No model.)

Claim.—1. The combination, with the main frame A A', of the seed-hopper E, secured thereto, the adjustable seed-spouts D^2, depending from said seed-hopper, the bars G, the curved pieces G^2, the horizontal rod H', and section-rollers H^2, substantially as described, and for the purpose specified.

2. The combination, with the bar J, of the rock-shaft J^2, provided with the transverse groove J^3 and marking-tooth J^4, the arm K, weight K', and handle K^2, substantially as set forth.

388,027. PICTURE-FRAME. Ebenezer Peterson, Cincinnati, Ohio, assignor of one-half to Albert Metz, same place. Filed Oct. 17, 1887. Serial No. 252,554. (No model.)

Claim.—A picture-frame having one or more cuts or grooves, *a*, in the rabbeted portion thereof, in combination with an elastic strip of material, as C; the two edges of said strip being inserted into said grooves, substantially as set forth.

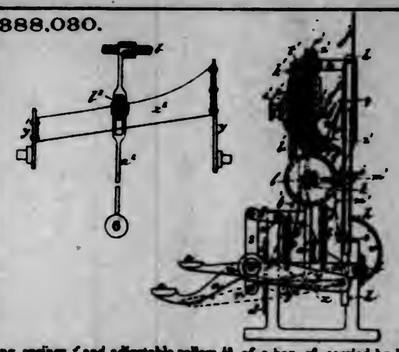


388,028. CENTRIFUGAL REEL. William R. Dunlap, Cincinnati, Ohio. Filed Dec. 24, 1887. Serial No. 258,922. (No model.)

Claim.—1. The combination, in a flour-bolt, of the inner and outer cylinders, the adjustable beaters mounted upon and around the inner cylinder, the inner cylinder-shaft bored and slotted, as shown, the diagonally-grooved hub D *d*, sleeved upon the said shaft, the links G, connecting said hub and beaters, with the rod C, having transverse pin projecting through the slot in the shaft and into the groove in the hub, and a lever to actuate said rod for the purpose of revolving the hub and changing the position of the beaters, substantially as shown and described.

2. The combination, substantially as specified, of the cylinder A, the beaters F, mounted upon and around said cylinder, the beater-shafts having arms *f*, the diagonally-grooved hub D, the links G, connecting the hubs and arms *f*, the bored and slotted shaft E, the rod C, having pins *c*, the forked lever E, for actuating said rod, and segment E', to retain the lever in position.

388,029. SYRINGE. J. Asbury Dunn, Chicago, Ill. Filed Oct. 22, 1887. Serial No. 253,154. (No model.)



Claim.—In a medicinal syringe, the combination of the body of a syringe with a compressible packing-piece, a needle which passes through said packing-piece, and a compression-piece which is connected with the body of the syringe and partially inclosing the packing, the parts so constructed and related that the needle is secured to the syringe solely by the pressure of the compressible packing, substantially as described.

388,030. CASH REGISTER AND INDICATOR. Leo Berlam, St. Louis, Mo. Filed Oct. 5, 1887. Serial No. 251,602. (No model.)

Claim.—1. The combination, with a series of pivoted key-levers, *a*, having springs *f*, of a bar, *x*, carried by pivoted levers *y y'*, extending in the same direction as said key-levers, having spring *z*, connecting-rod *c'*, toothed rack *b'*, engaging with toothed wheel *d'*, having pawl *i'*, engaging with ratchet-wheel *h'*, fixed to spindle *f'*, index-hand *p'*, and primal disk *b'*, marked with divisions on its face, substantially as and for the purpose described.

2. The combination, with a series of pivoted key-levers a^2, hav-

388,030.

ing springs *f* and adjustable rollers b^2, of a bar, z^2, carried by levers *y y'*, having springs *z*, connecting-rod *c'*, toothed rack *b'*, engaging with toothed wheel *d'*, having pawl *i'*, engaging with ratchet-wheel *h'*, fixed to spindle *f'*, index-hand *p'*, and primal disk *b'*, marked with divisions on its face, substantially as and for the purpose described.

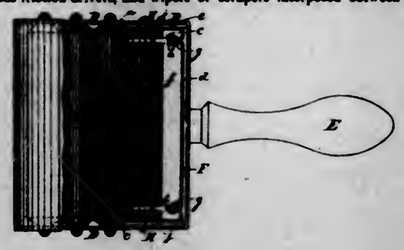
3. The combination, with a key-lever and a vertical rod adapted to display an indicating-tablet, of a compound sheave composed of two pulleys of different diameters secured to move together and have connections with the key-lever and with the vertical rod, whereby a varied range of movement of the key-lever and vertical rod is obtained, substantially as described.

4. The combination, with two or more pivoted key-levers *a* and vertical rods A, carrying indicating-tablets *j*, and having projecting pins or studs *q*, of compound sheaves or pulleys *l m*, spindle *k*, cords or chains *l' m'*, and hinged wing *n*, substantially as described.

5. The combination, with two or more vertical rods, A, carrying indicating-tablets *j*, and having projecting pins or studs *q*, and with means for raising the rods vertically, of a hinged wing, *n*, adapted to engage with said pins when the rods are raised, and formed with a bottom web or flange, *p*, substantially as described.

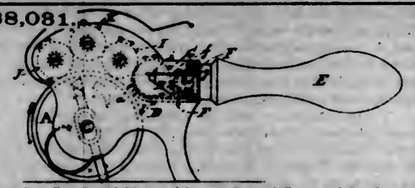
6. In a cash register and indicator, the combination, with a series of key-levers, of a graduating compound bar adapted to be actuated by and extending in the same direction as said key-levers, and having a pivot or hinge the axis of which extends in the direction of the width of the bar, substantially as described.

7. In a cash register and indicator, the combination, with a plurality of key-levers, of a graduating compound bar adapted to be actuated by and extending in the same direction as said key-levers, and having a pivot or hinge the axis of which extends in the direction of the width of the bar, a rotatable wheel connected with the registering mechanism, and direct connections between said wheel and graduating-bar to rotate the former, substantially as described.



8. In a cash register and indicator, the combination, with a plurality of key-levers, each provided with a contacting device or roller adapted to be adjusted to and from the fulcrum of the lever, of a pivoted bar adapted to be contacted by said contacting devices to be actuated thereby, substantially as described.

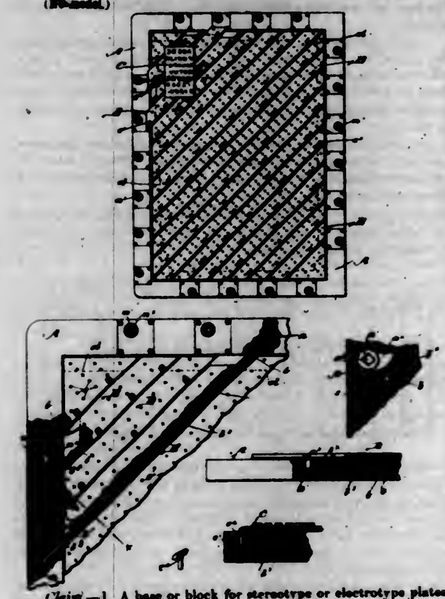
9. The combination, with a plurality of key-levers, of a pivoted compound bar adapted to be contacted by the levers and extending in the same direction as said levers, substantially as described.



388,031. HAND-PRINTING ROLLER-MACHINE. John H. Burnham, St. Louis, Mo. Filed Oct. 25, 1887. Serial No. 253,262. (No model.)

Claim.—1. In a hand-printing roller-machine, the combination, with a fountain, of a fountain-roll having at its ends friction-drivers, and wipers or scrapers interposed between the fountain-roll and the said friction-drivers, substantially as and for the purposes set forth.

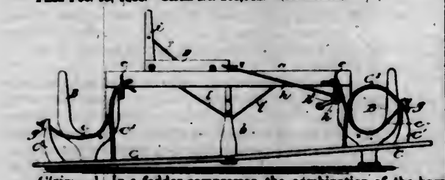
2. In a hand-printing roller-machine, the combination, with the inking-roller, of a fountain or reservoir, a fountain-roll having at its ends friction-drivers, and wipers or scrapers interposed between the



388,031.

fountain-roll and said friction-drivers, substantially as and for the purposes specified.

3. In a hand-printing roller-machine, the combination, with the fountain, the inking-roller, the fountain-roll of less length than said inking-roller, and the friction-drivers on the ends of the fountain-roll outside of the fountain and in contact with said inking-roller for preventing the ink from spreading beyond the end of the said inking-roller, of the adjustable plate having tongues interposed between the friction-drivers and the friction-roll, substantially as and for the purposes specified.

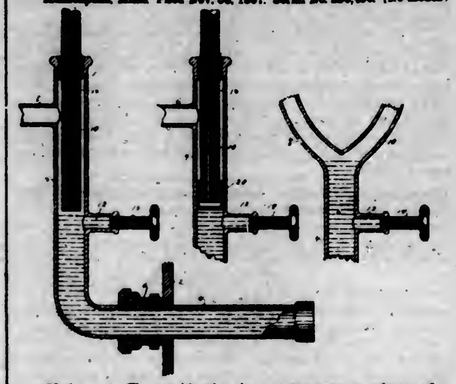


388,032. BLOCK FOR LOCKING STEREOTYPE-PLATES FOR PRINTING. Herman Fleming, Jr., Chicago, Ill., assignor of one-half to Daniel W. Ryan, same place. Filed Nov. 11, 1887. Serial No. 254,603. (No model.)

Claim.—1. A base or block for stereotype or electrotype plates, having its upper surface composed of a series of separate sections made relatively movable and provided with pin-holes arranged in check or cross rows, substantially as and for the purpose specified.

2. A base or block for stereotype or electrotype plates, composed of a series of separate relatively-movable sections provided with pin-holes, a frame for supporting such sections, and means, substantially as described, for locking the sections respectively in their various positions, substantially as and for the purpose specified.

388,033. FODDER-BINDER. Jeremiah Frame, Centown, Ohio. Filed Feb. 13, 1888. Serial No. 263,912. (No model.)



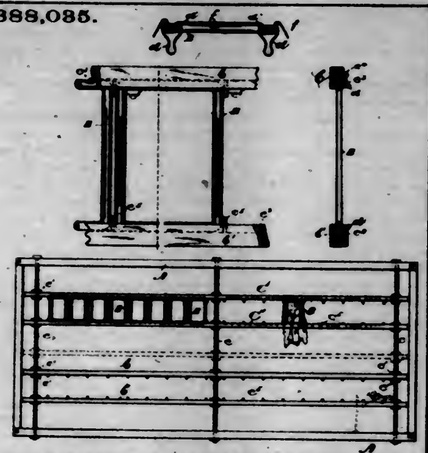
Claim.—1. In a fodder-compressor, the combination of the bars *a*, the inverted yokes B, secured to the bars *a* at their ends to support the said bars, the yokes forming a holder for the fodder, the vertical bar *b* dependent from the frame, the treadle-bars C, pivoted at their inner ends to the bar *b*, having the upright posts C' rigidly secured to them at their outer ends, and the compressor-ropes C^2, one end made fast to the treadle-bars, the other end adapted to be passed over the fodder in the yokes and removably attached to the upright posts C', substantially as herein set forth.

2. In a fodder-compressor, the combination of the horizontal bars *a*, the inverted yokes B, secured to the bars *a* at their ends to support the said bars, the vertical dependent bar *b*, dependent from the frame, the treadle-bars C, and the compressor-ropes C^2, one end made fast to the treadle-bars and the other end adapted to be passed over the fodder in the yokes and removably attached to the upright posts C', the upright posts C', having open slots in the free ends for holding the outer ends of the hand-cords *c*, also having the notch *g* on the outer side near the top end, to which the free ends of the compressor-ropes C^2 are removably attached, substantially as herein set forth.

3. In a fodder-compressor, the combination of the bars *a*, the inverted yokes B, secured to the bars *a* at their ends to support the said bars, the yokes forming a holder for the fodder, the vertical bar *b*, dependent from the frame, the treadle-bars C, pivoted at their inner ends to the bar *b*, having the upright posts C' rigidly secured to them at their outer ends, the compressor-ropes C^2, one end made fast to the treadle-bars, and the other adapted to be passed over the fodder in the yokes, and removably attached to the upright posts C', the carrying-frame D, comprising standards *i*, horizontal bars *j*, braces *j'*, and cross-pieces *k*, the said cross-pieces resting on the horizontal bars *a* of the binder-frame, a windlass secured to the yokes, and a cord connecting the windlass and the carrying-frame, substantially as herein set forth.

388,034. TEMPERATURE-REGULATOR. Henry J. Gerhardt, Minneapolis, Minn. Filed Nov. 30, 1887. Serial No. 256,460. (No model.)

Claim.—1. The combination, in a temperature-regulator, of a chamber, a body of expansible liquid contained therein, a regulating-piston, 14, for increasing or decreasing at will the capacity of said chamber, and thereby predetermining the degree of temperature at which the valve will open or close, a valve resting directly upon said liquid and adapted to be moved by the liquid as it expands or contracts in volume, and a valve-port adapted to be opened or closed by said valve.

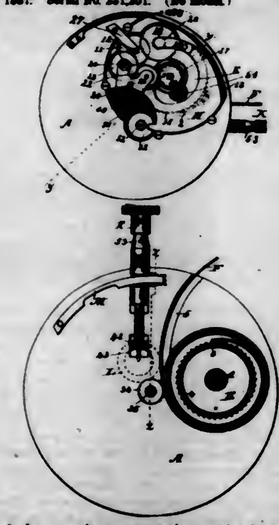


2. The combination, in a temperature-regulator, of the tube 4, the body of liquid contained therein, the regulating-piston 14, connected with said tube and adapted to increase or decrease the interior capacity of said tube 4, and thereby to raise or lower the surface line of the liquid in said tube, the pipe 8, connected with said tube 4, and the pipe 10, extending into said tube and adapted to be closed and opened by the rising and falling of said liquid, substantially as described.

388,035. HOLDING-FRAME FOR EMBROIDERING-MACHINES. Friedrich Graef, Newark, N. J., assignor to Herman Bornemann, same place. Filed June 16, 1888. Serial No. 276,902. (No model.)

Claim.—1. A fabric-stretching frame provided with sides oval in cross-sections, in combination with binding-clamps having yielding jaws applied to the thin edges of said oval sides and turned at right angles thereto, so that said clamps bind the ends of the oval sides of said frame, for the purposes set forth.

2. The combination, in a vibrating or tambour frame, of pairs of grooved and recessed holding-strips adjustably arranged in said frame, with threaded rods secured to said frame on which said holding-strips move, and holding-nuts arranged on said rods and engaging with the said holding-strips, substantially as and for the purposes set forth.



388,035.

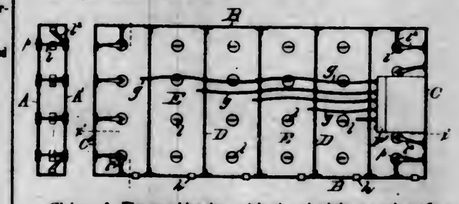
3. The combination, in a vibrating or tambour frame, of pairs of holding-strips constructed and arranged to hold a series of removable fabric-stretching frames, said stretching-frames projecting or fitting one into the other, and binding-clamps, whereby the corners of the fabric to be embroidered are held upon and stretched across said frames, substantially as and for the purposes set forth.

4. The combination, with a vibrating or tambour frame of an embroidering-machine, of pairs of adjustable holding bars or strips extending longitudinally in said frame, and constructed and arranged to hold a series of fabric-stretching frames removable therein and to be moved toward and from each other, adjusting devices, whereby said pairs of bars are moved toward and from each other and are held rigidly in position when thus adjusted, and a series of fabric-stretching frames removably arranged between said holding-bars, for the purposes set forth.

388,036. WATCH. HERMUND HAMMARLUND, Chicago, Ill. Filed Mar. 17, 1887. Serial No. 231,261. (No model.)

Claim.—1. In a watch-movement, the combination of the barrel having its periphery provided with ratchet-teeth, and the mainspring coiled in said barrel, with a flexible spring-strip having its inner end provided with a hook adapted to normally bear against said ratchet-teeth and its outer end provided with a pull-button, whereby said strip is adapted to be drawn out from the watch and uncoiled to turn the barrel and wind up the mainspring, substantially as described.

2. In a watch-movement, the combination of the dial-plate A, having a channel cut therein, the barrel having its periphery provided with ratchet-teeth, and the mainspring coiled in said barrel, with a flexible spring-strip having its inner end provided with a hook adapted to normally engage with said ratchet-teeth and adapted to be drawn out and uncoiled to wind up the mainspring and to be returned with its hook sliding over said ratchet-teeth to resume its normal coiled condition within the watch, substantially as set forth.



3. The combination, with the mainspring, the barrel, and the winding indicator-hand, of the rocker H, carrying the two sets or trains of gearing, one being the uptrain, driven from the barrel, and the other the downtrain, driven from the arbor of the mainspring, a gear carried by the spindle of the winding indicator-hand and in position to be alternately engaged by one and the other of said two trains of gearing, a spring, 28, tending to throw the rocker into position to bring the uptrain into engagement with the gear-wheel on the winding indicator-hand, and the winding-spring for turning the barrel, so as to wind up the mainspring, and in so doing relieve the rocker from the tension of the mainspring and permit the spring 28 to shift the rocker, which latter when subject to the tension of the mainspring is shifted in an opposite direction by the same, substantially as described.

4. The combination, with the pivoted regulator-arm for regulating the hair-spring, of the rotary disk provided with a spirally-formed groove wherein the regulator-arm engages, said spirally-grooved rotary disk being provided with a hub, 26, which is received in an opening through the back cap when the latter is closed, substantially as described.

5. The combination, with the pivoted regulator-arm for regulating the hair-spring, of the rotary disk provided with a spiral groove, wherein the regulator-arm engages, said spirally-grooved rotary disk being provided with a hub, 26, having on its outer end a scale which is visible through the back cap when the latter is closed, substantially as described.

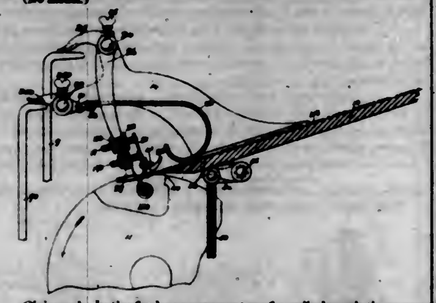
6. The combination, with the center pinion by which the center hand-carrying arbor is turned, of the center hand-carrying arbor, 50, split longitudinally for a portion of its length, substantially as and for the purpose described.

388,037. AIR-MATTRESS. JOHN B. HAMER, Elizabeth, N. J., assignor of one-half to Otis A. Glazebrook, same place. Filed July 23, 1887. Serial No. 245,033. (No model.)

Claim.—1. The combination, with the air-tight covering of an air-mattress, of air-tight partitions dividing the interior of the mattress into separate air-tight compartments, an air-pump provided with an inlet-opening and an internal air-chamber, and independent tubes connecting the air-chamber of said pump with the separate air-tight compartments of the mattress, respectively, substantially as and for the purpose set forth.

2. The combination, with an air-tight mattress, of a pump-chamber inclosed wholly within the air-tight covering of the same, having an outlet and outlet-valve opening therein, and a movable lid, also inclosed wholly within such air-tight covering, the chamber being provided with an inlet-valve and opening extending through the covering of the mattress, and the lid being adapted to operate like a bellows to draw the air into the pump-chamber through such inlet-valve, and to discharge it within the mattress through such outlet-valve, as and for the purpose set forth.

3. The combination, with the air-tight covering of an air-mattress, of air-tight partitions dividing the interior of the mattress into separate air-tight compartments, a pump-chamber and movable lid inclosed wholly within such air-tight covering, the chamber having an inlet-valve admitting air thereto, and a series of outlet-valves connected within the mattress to the separate compartments, as and for the purpose set forth.



4. The combination, with the covering of an air-tight mattress and partitions forming air-tight compartments therein, of the stay D', consisting in a strip of woven fabric folded and cemented into T shape longitudinally, the central double portion being secured to the edges of the partitions, and the extended edges being secured to the covering of the mattress upon the opposite sides of the partition, substantially as herein set forth.

5. The combination, with the covering of the mattress, of stays *l*, passed through slits in the same and having feet *l'* folded upon the outside of the covering and connected thereto, and the washers *p*, secured to the covering over the feet and around the stay, inside of the covering, substantially as herein shown and described.

6. The combination, with an air-mattress, of the lock-sections *o* and *i*, provided, respectively, with the spring-bolts *d'* and the sockets *f'*, the whole arranged and operated substantially as herein set forth.

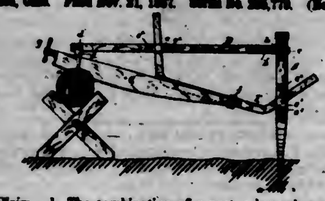
7. The combination, with an air-mattress, of the lock-sections *o* and *i*, provided, respectively, with the spring-bolts *d'*, having studs *b*, and with the sockets *f'*, and the wedge *w*, adapted to separate the bolts by pressure between their studs *b*, as and for the purpose set forth.

388,038. FEED-GUIDE FOR PRINTING-MACHINES. JOHN T. HAWKES, Taunton, Mass. Filed May 23, 1887. Serial No. 239,268. (No model.)

Claim.—1. In the feed-gage apparatus of a cylinder printing-press or other machine in which the cylinder receiving the sheet has a continuously rotating or oscillating motion, one or more oscillating arms, as 26, mounted upon a rock-shaft, as 24, journaled in suitable brackets or supports, as 14, not connected with the impression-cylinder, and carrying under guides, as 29, and adjustable front guides, as 21, all combined and adapted to be simultaneously withdrawn in the direction in which the sheet is to move at the proper time for its passage, whereby the edge of the sheet is properly gaged, located, and supported from contact with the moving impression-cylinder until clamped thereon by the cylinder-grippers in a smooth and unscrrugated condition, substantially as set forth.

2. In the feed-gage apparatus of a cylinder printing-press or other machine in which the cylinder receiving the sheet has a continuously rotating or oscillating motion, one or more oscillating arms, as 26, carrying under guides, as 29, adjustable front guides, as 21, and over guides, as 22, all mounted on a shaft, as 24, journaled in brackets attached to a feed-board, and combined and adapted to be operated, as described, substantially as and for the purpose set forth.

3. In the feed-gage apparatus of a cylinder printing-press or other machine requiring sheets of paper fed to it, in combination with a lifting feed-board, as 10, one or more oscillating arms, as 26, carrying under guides, as 29, and adjustable front guides, as 21, all combined and adapted to be operated as described, substantially as and for the purpose set forth.



4. In the feed-gage apparatus of a cylinder printing-press or other machine requiring sheets of paper fed to it, in combination with a lifting feed-board, as 10, one or more oscillating arms, as 26, carrying under guides, as 29, adjustable front guides, as 21, and over guides, as 22, all combined and adapted to be operated as described, substantially as and for the purpose set forth.

5. In the feed-gage apparatus of a cylinder printing-press or other machine requiring sheets of paper fed to it, in combination with an impression-cylinder having a bevel upon its gripper-edge, as 110, upon which the grippers may close without any portion of them extending beyond the circumferential line of said cylinder, and a lifting feed-board, as 10, one or more oscillating arms, as 26, carrying under guides, as 29, and adjustable front guides, as 21, all combined and adapted to be operated as described, substantially as and for the purpose set forth.

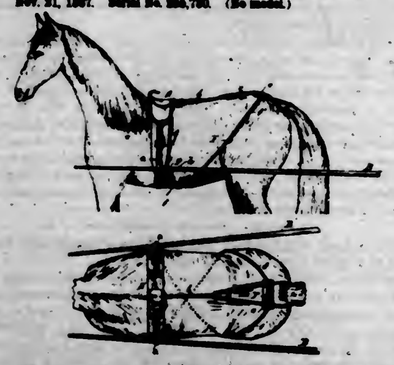
6. In the feed-gage apparatus of a cylinder printing-press or other machine requiring sheets of paper fed to it, in combination with an impression-cylinder having a bevel upon its gripper-edge, as 110, upon which its grippers may close without any portion of them extending beyond the circumferential line of said cylinder, and a lifting feed-board, as 10, one or more oscillating arms, as 26, carrying under guides, as 29, adjustable front guides, as 21, and over guides, as 22, all combined and adapted to be operated as described, substantially as and for the purposes set forth.

7. In the feed-gage apparatus of a cylinder printing-press or other machine requiring sheets of paper fed to it, one or more oscillating arms, as 26, carrying under guides, as 29, and adjustable front guides, as 21, all carried on a feed-board and adapted to be simultaneously withdrawn in the direction the sheet is to move at the proper time for the passage of the sheet, in combination with one or more drop-fingers, as 32, whereby the edge of the sheet is properly gaged, located, and supported from contact with the impression-cylinder and held by said drop-fingers during the last closing of the cylinder-grippers, until required to be clamped upon the impression-cylinder, thereby preserving the sheet in a smooth and unscrrugated condition, substantially as set forth.

388,039. SAWING APPARATUS. JAMES S. HEDDENBURG, Olmsted, Ohio. Filed Nov. 21, 1887. Serial No. 255,770. (No model.)

Claim.—1. The combination of a post, a brace-bar substantially horizontal, an angle-bar engaging with each, and a saw having sliding bearing on said angle-bar, substantially as set forth.

2. The combination of a post, a horizontal brace-bar engaging with the material to be cut, an angle-bar movably secured to said post and bar, and a saw having sliding bearing on said angle-bar, substantially as set forth.



3. The combination of a post secured vertically in the earth, a brace-bar secured to said post and engaging with the material to be cut, an angle-bar having a straight central portion and an angular end portion, said angle-bar engaging with said post and brace, and a saw having sliding bearing on said angle-bar, substantially as set forth.

4. The combination of post A, provided with sleeve *d'*, horizontal brace-bar B, having its one extremity secured to said post and its opposite extremity engaging with the material to be cut, said bar provided with a sleeve, an angle-bar fitting in said sleeve, and a saw having sliding bearing on said angle-bar, substantially as set forth.

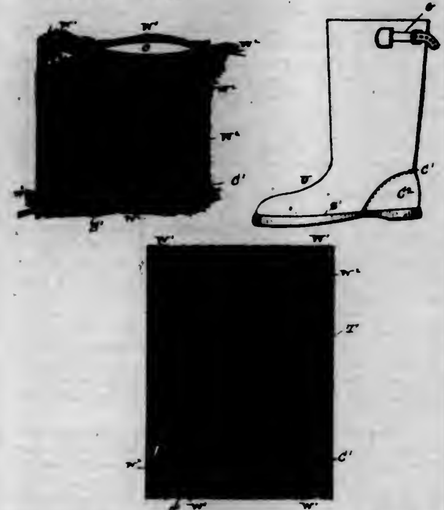
5. The combination of post A, provided with a sharp lower extremity and having sleeve *d'*, horizontal brace-bar B, having its one extremity secured to said post and its opposite extremity provided with dog *d*, said bar also provided with sleeve *e*, angle-bar F, provided with loosely-fitting sleeve *f*, said angle-bar having its extremities fitting in sleeves *e d'*, and saw G, pivoted at one extremity to said sleeve *f*, substantially as set forth.

6. The combination of post A, provided with a sharpened lower extremity and provided near its upper end with mortise *a'*, brace-bar B, having extremity *b* fitting in said mortise and provided near said extremity with mortise *b'*, bolt *c*, passing through said post and extremity into said mortise, said bar B having secured to its opposite extremity the double-pointed dog *d*, said bar and brace having, respectively, sleeves *e d'*, angle-bar F, having a right-line central portion and angular end portions, the latter fitting, respectively, in said sleeves, sleeve *f*, having loose sliding bearing on the right-line central portion of said angle-bar, and saw G, pivoted to said sleeve *f*, substantially as set forth.

388,040. HARNESS. JAMES S. HEDDENBURG, Olmsted, Ohio. Filed Nov. 21, 1887. Serial No. 255,780. (No model.)

Claim.—1. In a harness, the combination, with a crupper and pad secured thereto, of a holdback loosely passing between the two,

extending down on either side of the horse, crossing under the same, and adapted to be attached to the thills, substantially as set forth.



2. The combination of crupper *c*, pad *c*, an opening formed intermediate of the two, and holdback F, fitted loosely in said opening and adapted to encircle the horse and be attached to the thills, substantially as set forth.

388,041. BOTTOM BAR FOR WINDOW-SHADES. Mason A. Hoosier, Sugar Grove, Ill. Filed Dec. 22, 1887. Serial No. 258,662. (No model.)

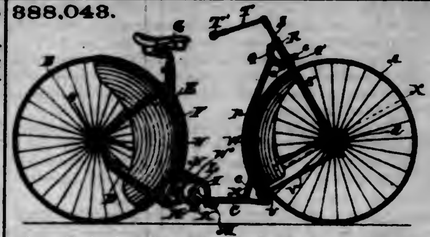
Claim.—In combination, the small rod *c*, angular in cross-section, the metallic bar having the much larger and spacious angular chamber *b*, to receive loosely and retain such rod, and the curtain end loosely lapped thereon, and the hollow slitted tube *c*, slipped over such bar, all as shown and described.

388,042. WOVEN FELTED BOOT. Jurgen C. Hillman, Hagaman's Mills, N. Y., assignor of two-thirds to Isaac L. W. Reynolds, same place, and Charles B. Knox, Johnstown, N. Y. Filed Nov. 30, 1887. Serial No. 256,516. (No model.)

Claim.—1. The method for producing a fabric-boot body, consisting in weaving the same in continuity, and then securing and cutting off the warp and woof threads where projecting beyond the sides and the sole part thereof, as and for the purposes specified.

2. The herein-described method for producing a fabric-boot body, consisting in weaving the same in continuity, then securing and cutting off the warp and woof threads, and then felting or felting the same, as and for the purposes specified.

3. The method for producing a fabric boot, consisting of weaving the same in continuity, then cutting off and securing the woof and warp threads and felting or felting the body, and then attaching an exterior sole to the bottom part, as and for the purposes specified.



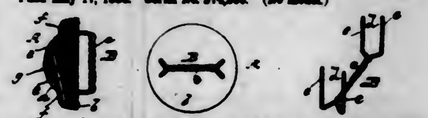
4. A fabric boot produced from woven material, with its top, upper, counter, and sole parts made in a single piece, having the warp-threads where projecting beyond the body secured and cut off, and its warp-threads where subtending the bottom opening secured and cut off with the material felted or felted, and provided with a supplemental sole, S^2, and re-enforce counter C^2, substantially in the manner as and for the purposes set forth.

388,043. VELOCIPEDE. Herbert R. Howe, Neenah, Wis. Filed Apr. 2, 1888. Serial No. 269,302. (No model.)

Claim.—1. In a velocipede, a cross-bar, U, centrally pivoted to the frame, with two connecting-rods, V V, and tiller S, the connecting-rods V V being each pivoted at one end to the cross-bar U and at the other end to the axle or a fork of the tiller, the points at which the rods V V are pivoted to the cross-bar U being the same distance from each other as the points at which these rods are pivoted to the axle or the forks of the tiller, substantially as described.

2. In a velocipede, an upright, P, having an arm, Q, pivoted to

388,048.

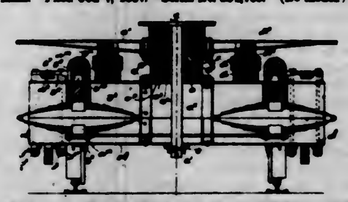


a sleeve, R, the sleeve R, and the tiller S, with the arm Q' of the upright P, having a slot, *b*, substantially as and for the purpose set forth.

3. The combination of the tiller S, sleeve R, upright P, pivoted to the sleeve R, and arm Q', provided with slot *b*, with connecting-rods V V and cross-bar U, pivoted on the frame, all arranged and connected substantially as described.

4. In a velocipede, a sprocket-wheel, I, supported in a bracket, H, and the bracket H, secured adjustably to the horizontal part C of the frame by means of a bolt, K, adapted to be inserted in any set of the many apertures in said bracket H, whereby said sprocket-wheel I may be adjusted horizontally and vertically, substantially as described.

388,044. HARNESS-ROSETTE. Orrin P. Howe, Streator, Ill. Filed May 17, 1887. Serial No. 274,302. (No model.)



Claim.—The within-described staple for harness-rosettes, consisting of two pieces of wire twisted together, forming a thickened horizontal portion, the extended single ends bent at right angles to the main portion and adapted to be secured to the rosettes, substantially as and for the purpose set forth.

388,045. BARREL-HEATER. Evan D. Hughes, Wheeling, W. Va. Filed Apr. 20, 1887. Serial No. 236,004. (No model.)

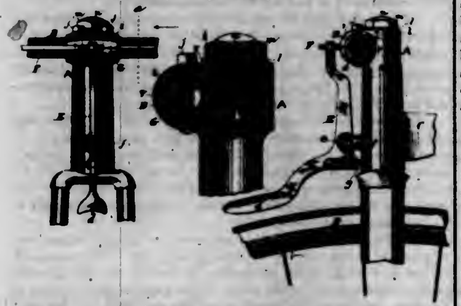
Claim.—The herein-described barrel-heater, comprising the furnace having the fire-box at one end, an opening in its top wall over the fire-box, a drum having a removable cover arranged above the opening in the furnace, and a partition or bridge-wall extending from the rear end of the fire-box through the opening in the furnace, whereby the heat passes directly from the fire-box into the drum and out of the chimney, causing the drum to be heated to an even temperature at all times, as and for the purpose described.

388,046. PASSENGER-CAR TRUCK. Lucius K. Jewett, Boston, Mass. Filed Oct. 7, 1887. Serial No. 251,703. (No model.)

Claim.—1. In a car-truck, a transom, arch-bars, a bolster, and elliptical springs to support the said bolster, and links to sustain the said springs, combined with a saddle-bar to be embraced by and support the said links away from and within the arch-bars and with a support for the said saddle-bar, substantially as described.

2. In a car-truck, a transom, a^2, arch-bars and links, a bolster, a^{10}, and elliptical springs to support the said bolster, combined with a saddle-bar comprising the bars b^2 b^3, and with a support for the bar b^2 within the arch-bar, the bar b^2 being supported by the arch-bar substantially as described.

3. In a car-truck, a center plate comprising two parts, each provided with one or more annular grooves, combined with balls c^4, fitted loosely into the said grooves in contact with each other and adapted to sustain the center load of the car, the said balls being free to move in said grooves, substantially as described.



4. In a car-truck, the upper curved plate, d^2, provided with a groove in its lower face, the lower curved plate comprising the spring-supported part d', having a groove in its upper face, and the part d, combined with balls d^3, fitted into said grooves and adapted to receive part of the load, substantially as and for the purpose specified.

5. The combination, with a car-truck having a transom, a^2, of a bar, *e*, extended across and under said transom, and braces e^2, to rigidly fasten the car-truck to the car-body, substantially as described.

6. The combination, with a car-truck having a transom, a^2, of a bar, *e*, extended across and under said transom, and braces e^2, to rigidly fasten the car-truck to the car-body, and bolts e^3, and trusses e^{12}, substantially as described.

7. In a car-truck, the pedestals a^3, combined with the pedestal tie-bar composed of the channel-bars *f f'*, the channel-bar *f* being fitted into the channel-bar *f'*, as and for the purpose specified.

388,047. VELOCIPEDE. Ivar Johnson and Claus Hansen, Worcester, Mass.; said Hansen assignor to said Johnson. Filed Oct. 31, 1887. Serial No. 253,513. (No model.)

Claim.—1. In a velocipede, the head A, having the bearing G, made, substantially as described, to receive the handle-bar, said bearing in turn having adjustable threaded openings to receive the fastening-bolts *j*, the usual center bolt, *n*, and the lock-nut *m*, preferably having a washer, *l*, under the same, in combination with the detachable cap *i*, also having suitable openings to receive the aforesaid fastening-bolts *j* and adapted to fit over the handle-bar and bearing G, also having a horizontal flange, *k*, extending back therefrom over the head, said flange being provided with a vertical slot or opening to receive the center bolt, the handle-bar having transverse openings through the same corresponding to those in the bearing and cap for the same purpose, and the fastening-bolts *j*, said bolts *j* serving the double purpose of holding the forward part of cap *i*, as well as the handle-bar, from rotary and longitudinal movement, substantially as set forth.

2. In a velocipede, the head A, having the bearing G, made, substantially as described, to receive the handle-bar, and the slots or openings *p*, to receive the projections *o* on the cap *i*, said bearing also having suitable openings to receive the fastening-bolts *j*, the center bolt, *n*, and lock-nut *m*, preferably having a washer, *l*, under the same, in combination with the detachable cap *i*, adapted to fit over the bearing G and handle-bar, and having a horizontal flange, *k*, extending back therefrom over the head, also having the projections *o* upon the under side thereof, and suitable openings to receive bolts *j*, said flange *k* also having a vertical slot or opening to receive the center bolt, the handle-bar having transverse openings through the same corresponding to those in the bearing and cap for the same purpose, and the fastening-bolts *j*, substantially as and for the purpose set forth.

3. The velocipede-brake E, having a horizontal opening or socket in the back side thereof below its pivot, in combination with the spring *g*, fitted therein, and the head A, substantially as and for the purpose set forth.

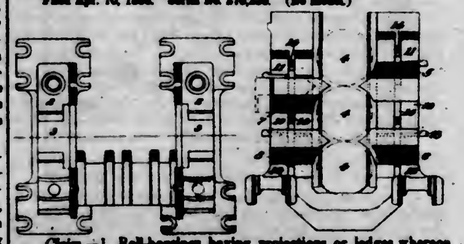
388,048. VELOCIPEDE. Ivar Johnson and Andrew Fyrberg, Worcester, Mass.; said Fyrberg assignor to said Johnson. Filed Dec. 29, 1887. Serial No. 259,391. (No model.)

Claim.—1. In a velocipede, the combination of the rotatable

388,048.

foot-treadle frame thereof and the central pivot bolt or shaft upon which it turns with a suitable spring, *h*, fitted over said shaft, attached at one end to the shaft and at its other end to the frame, and the plate or washer *m*, interposed between said treadle-frame and the crank-arm, and having the shoulders *l l'*, or their equivalents, adapted to strike against the foot-guard h^3, substantially as and for the purpose set forth.

2. The combination of the crank-arm A, treadle-bolt *j*, fastened to said arm and having a peripheral groove at its inner end, foot-treadle C, made with the hollow sleeve *k* and having the laterally-projecting flange k^2 at the inner end thereof, spring *h*, disposed within the aforesaid peripheral groove and having its ends connected, respectively, with said foot-treadle and bolt *j*, and plate *m*, having the shoulders *l l'* so arranged that the flange k^2 will come in contact therewith when the foot-treadle is rotated, substantially as and for the purpose set forth.



3. The combination of the crank-arm A, treadle-bolt *j*, fastened to said arm, provided with the key m^2 near the arm, and having the peripheral groove *i* at its inner end, foot-treadle C, made with the hollow sleeve *k* and having the lateral projecting flange k^2 at its inner end, spring *h*, disposed within the aforesaid peripheral groove around bolt *j* and having its ends connected, respectively, with the foot-treadle and said bolt, and plate *m*, arranged between the crank-arm and treadle, having the circular flange m^4 fitting over the end of the treadle-sleeve, also having the shoulders *l l'*, and so arranged that the flange k^2 will come in contact therewith when the treadle is rotated, substantially as and for the purposes set forth.

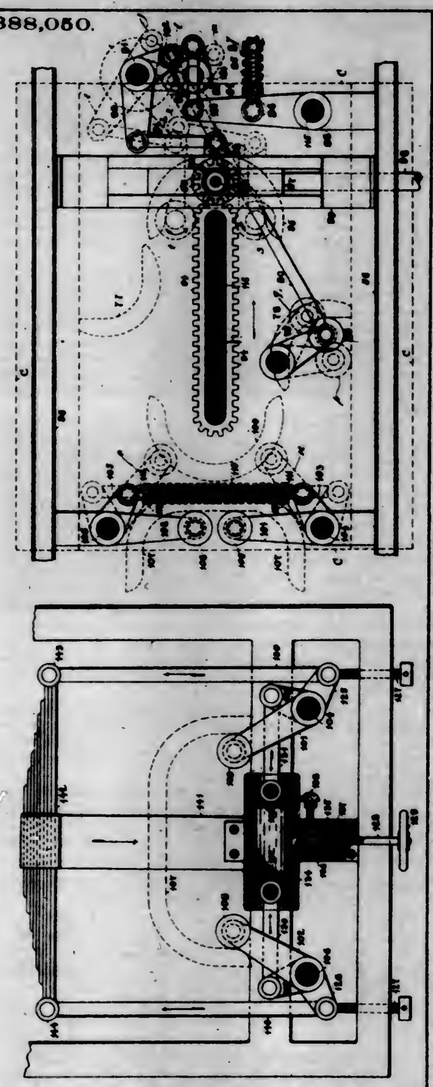
4. The combination of the crank-arm A, treadle-bolt *j*, provided with the key m^2, and foot-treadle C, made with the central sleeve, *k*, and having the lateral projection k^2 at its inner end, with the plate *m*, having the central opening, *m'*, radial slot m^3, and lateral flange m^4, and interposed between the crank-arm and treadle, substantially as and for the purposes set forth.

5. In a velocipede, a dust-guard interposed between the crank-arm and foot-treadle, consisting of a plate, *m*, formed upon or fastened to the treadle-bolt, and having a laterally-projecting rim or flange, m^4, extending over the inner end of the treadle-sleeve, substantially as set forth.

6. The combination of the treadle C, bolt *j*, having the longitudinal slot *q* in its outer end, the usual lock-nut, *o*, and the bearing *p*, or its equivalent, having the longitudinal projection or pin *s*, with the washer *n*, having the internal flange, *r*, and peripheral notches *t*, or their equivalents, substantially as and for the purpose set forth.

388,049. ROLL-HOUSING. William R. Joyce, Braddock, Pa. Filed Apr. 10, 1888. Serial No. 270,220. (No model.)

Claim.—1. Roll-housings having projections or ledges whereon the rest-bar is supported, and on which it is movable to or from the rolls, substantially as and for the purpose set forth.



2. Roll-housings having projections or ledges whereon the rest-bar is supported, and on which it is movable to or from the rolls, and upright keys, whereby the rest-bar is secured to the housings, substantially as and for the purpose set forth.

3. Roll-housings having projections or ledges whereon the rest-bar is supported, and on which it is movable to or from the rolls, and wedges insertible between the rest-bars and projections on the housing, substantially as and for the purpose set forth.

388,050. OPERATING MECHANISM FOR TYPE-BEDS OF CYLINDER PRINTING-MACHINES. Conrad Kahler and Leonard R. Rosecrans, Chicago, Ill., assignors to themselves and John J. Kahler, same place. Filed Sept. 22, 1887. Serial No. 250,496. (No model.)

Claim.—1. In a flat-bed press, a bed-driving mechanism consist-

388,050.

ing of a rack centrally located and attached directly to the bed or form-carriage, a sliding frame carrying a single driving-gear meshing with said rack, rock-shaft 81, lever 90, and rod 91, connecting said shaft and sliding frame, and means for automatically operating the frame, substantially as set forth.

2. In a flat-bed press, a cushioning device consisting of springs, fixed air-cylinders, and an automatic governor, substantially as described.

3. The reciprocating bed C, provided on its under side with a rack, 94, and having at the end of the rack a curved shoe, and a shoe on one side of the rack, in combination with a pinion, 93, sliding frame 97, and an operating mechanism for moving the frame to start the pinion on its travel around the end of the rack, substantially as described.

4. The bed C, provided with the rack 94 on its under side, and having a shoe at the end of the rack and a shoe at the side thereof, pinion 93, roller 96, and sliding frame 97, in combination with the arm 79, roller 89, rock-shaft 115, and connecting-rod 80, for operating the mechanism to move the sliding frame and start the roller around the end of the rack without straining the parts, substantially as specified.

5. The bed C, provided with a rack, 94, on its under side, and having a shoe at the end and side of the rack, pinion 93, roller 96, and sliding frame 97, in combination with the arm 79, roller 89, rock-shaft 115, connecting-rod 80, arm 102, rock-shaft 81, arm 90, and connecting-rod 91, attached to the sliding frame for operating the sliding frame at the start of the pinion around the end of the rack, substantially as specified.

6. The shoe 78, secured to the under side of the bed C, in combination with the arms 79, roller 89, rock-shaft 115, and connecting-rod 80, for operating a mechanism to move a sliding frame carrying the driving-pinion for the bed-rack, substantially as specified.

7. The sliding frame 97, carrying the driving-pinion for a rack of a printing-press bed, in combination with the rod 91, arm 90, rock-shaft 81, arm 102, and a connection between the arm 102, and operating devices moved from the travel of the bed for shifting the sliding frame, substantially as and for the purposes specified.

8. The shoe 78, arms 79, roller 89, rock-shaft 115, and connecting-rod 80, in combination with the arm 102, lever 90, and rod 91, for starting a sliding frame carrying a driving-pinion, substantially as described.

9. The lever 84, compression-spring 85, and sliding rod 86, in combination with the arm 82 and connecting-rod 83, for locking a sliding frame carrying a driving-pinion for a printing-press bed-rack, substantially as and for the purpose specified.

10. The lever 84, compression-spring 85, and sliding rod 86, in combination with the arm 82, connecting-rod 83, rock-shaft 184, and gears 181 and 183, for operating the arm 82, with the movement of a sliding frame carrying the driving-pinion of a printing-press bed-rack, substantially as and for the purpose specified.

11. The rock-shaft 81, arm 90, and rod 91, connected with a sliding frame carrying a rack-driving pinion of a printing-press bed, in combination with the gears 181 183, rock-shaft 184, arm 82, connecting-rod 83, lever 84, compression-spring 85, and sliding rod 86, for moving the sliding frame and locking it in position, substantially as and for the purposes set forth.

12. The shoe 78, arms 79, roller 89, rock-shaft 115, connecting-rod 80, arm 102, rock-shaft 81, lever 90, and connecting-rod 91, in combination with the gears 181 183, rock-shaft 184, arm 82, connecting-rod 83, lever 84, compression-spring 85, and sliding rod 86, for moving a sliding frame to start a driving-pinion and for locking the frame and pinion at the limit of their movements, substantially as and for the purposes specified.

13. The combination, with a reciprocating bed or form-carriage, C, provided with a rack, 94, on its under side, of a driving-pinion, 93, carried by a sliding frame, 97, devices for starting the sliding frame at the commencement of the travel of the pinion around the end of the rack, and the arm 82, connecting-rod 83, rock-shaft 184, and gear-wheels 181 and 183, for locking the sliding frame at the limit of its movement in either direction endwise, substantially as and for the purpose specified.

14. The shoe 107 and arms 101 and 102, each having a roller at its outer end, in combination with the rock-shafts 104 and 106, and arms 108 and 105, for operating the cushioning device at the limit of the end movement of a bed or form-carriage, substantially as specified.

15. The cushioning device for a bed or form-carriage of a printing-press, consisting of an air-cylinder, 134, compression-pistons 132 and 133, secondary cylinder 135, and cut-off piston 136, operated by the movement of the bed or form-carriage for cushioning purposes with variable speed, substantially as specified.

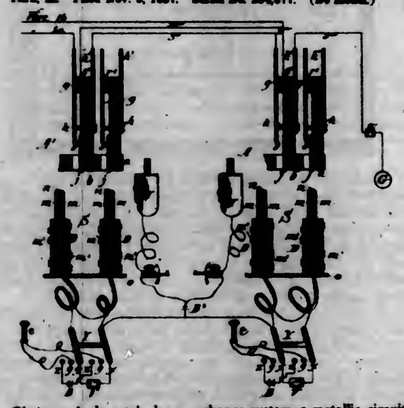
16. The air-cylinder 134, pistons 132 and 133, and secondary cylinder 135, in combination with the cut-off piston 136, compression-spring 137, adjusting-stem 138, and devices for operating the compression-piston from the movement of a bed or form-carriage for a printing-press, substantially as and for the purposes specified.

17. The shoe 107, arms 101 and 102, each having a roller at its outer end, rock-shafts 104 and 106, and arms 108 and 105, in combination with the connecting-rods 130 and 131, compression-pistons 132 and 133, air-cylinder 134, secondary cylinder 135, and cut-off piston 136, for cushioning the bed or form-carriage of a printing-press at the end of its movement under variable rates of speed, substantially as specified.

18. The arms 101 and 102, each carrying a roller at its outer end, rock-shafts 104 and 106, and arms 125 and 126, in combination with the adjusting-screws 127, for regulating the position of the arms 101 and 102, substantially as and for the purpose specified.

19. The arms 101 and 102, each having a roller at its outer end, rock-shafts 104 and 106, and arms 125 and 126, in combination with the connecting-rods 139 and 140 and spring 142, substantially as and for the purpose specified.

20. The shoe 107, arms 101 and 102, each carrying a roller at its outer end, rock-shafts 104 and 106, and arms 125 and 126, in combination with the connecting-rods 139 and 140 and spring 142, substantially as and for the purpose specified.

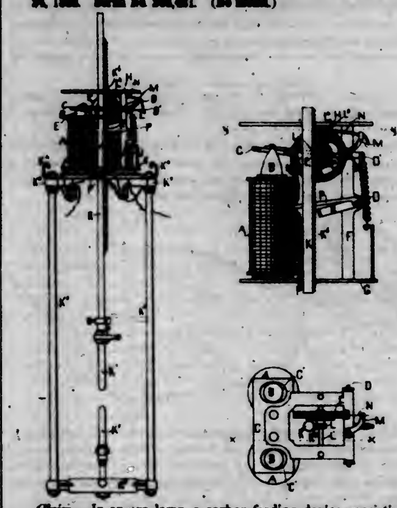


21. The shoe 107, arms 101 and 102, each carrying a roller at its outer end, rock-shafts 104 and 106, arms 125 and 126, connecting-rods 139 and 140, and spring 142, in combination with the arms 108 and 105, connecting-rods 130 and 131, compression-pistons 132 and 133, air-cylinder 134, secondary cylinder 135, and pressure-pistons 136, for cushioning a bed or form-carriage at the end of its movement, substantially as specified.

388,051. NUT-LOCK. William Kaul, Rush, Ohio. Filed May 1, 1888. Serial No. 272,494. (Model.)

Claim.—A nut-locking plate for rail-joints, having slotted elastic end arms, in combination with a chair on each rail, provided with the button F on the inside of the bank G, as and for the purpose specified.

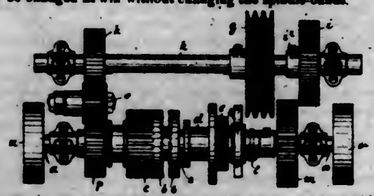
388,052. MULTIPLE SWITCH-BOARD. Milo G. Kellogg, Hyde Park, Ill. Filed Nov. 9, 1887. Serial No. 254,677. (No model.)



Claim.—1. In a telephone exchange system, a metallic circuit-line, a switch for said line containing two contact-pieces to which the two sides or branches of the line are respectively connected, and a loop-plug, with the two conductors of its double conducting-cord connected to its two contact-pieces, respectively, said plug being adapted to be inserted into said switch, and when inserted to connect its two contact-pieces with the two contact-pieces of the switch, in combination with a test-receiving instrument connected on one side to one of the conductors of said double cord and on the other side to a switch-testing device adapted to be brought into connection with a contact-piece of the line, and a battery in the circuit between the switch-testing device and the contact-piece of the plug connected therewith, substantially as set forth.

2. In a telephone-exchange system, metallic circuit-lines, multiple switch-boards for said lines, switches for said lines, one switch on each board, each switch containing two contact-pieces, to which the two sides or branches of the line are respectively connected, and pairs of loop-plugs at each board, each plug being adapted to be inserted into any switch, and when inserted to connect its two contact-pieces with the two contact-pieces of the switch, respectively, the two contact-pieces of one plug being connected with the contact-pieces of its mate, respectively, by two conductors with flexible cords, in combination with test-receiving instruments, one at each board, each instrument being connected on one side to one of the conductors connecting each pair of cords and on its other side to a switch-testing device adapted at the will of the operator to connect it with any line for testing, and a battery in the test-circuit thus established, substantially as set forth.

3. In a telephone-exchange system, metallic circuit-lines, multiple switch-boards for said lines, switches for said lines, one on each board for each line, each switch containing three contact-pieces, two of which are normally in contact, and the third piece being insulated from the others, (except by the line connections,) one branch of each line passing successively through the pairs of contact-pieces of its switches, which are normally connected, and from the last contact-piece to the ground, the other branch of the line being connected to said third contact-pieces of its switches on the different boards, in combination with loop-plugs, with two flexible conductors connected to the two branches of another line, said plugs being each adapted to be inserted into the switches at the boards where they are located, and when one is inserted into a switch to disconnect the pair of contact-pieces of the switch, which are normally in contact, and connect the two contact-pieces of the plug with the two contact-pieces of the switch, which are then connected with the two branches of the line-test-receiving instruments, one at each board, each instrument being connected on one side to one of the flexible conductors of each plug and on its other side to a switch-testing device adapted at the will of the operator to be brought into connection with any of said third contact-pieces of the switches at her board, and a battery in the test-circuit thus established, substantially as set forth.



388,053. ARC LAMP. Virgil C. Kellis, Chicago, Ill. Filed Mar. 24, 1888. Serial No. 268,681. (No model.)

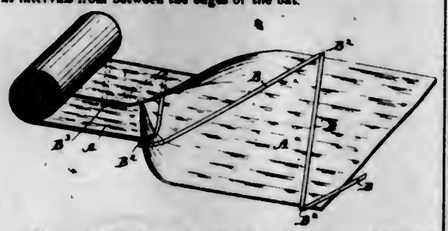
Claim.—In an arc lamp, a carbon-feeding device consisting of a rack upon the carbon rod, a pinion meshing therewith, a shaft carrying such pinion, a ratchet-wheel on the shaft, a friction-pulley loose on such shaft, but secured thereto by a dog which engages the ratchet-wheel, said shaft with pinion-pulley and ratchet-wheel journaled upon a lever-armature which is pivoted at one side of the carbon rod and at one end suspended over the electro-magnet core and at the other influenced by a counter-spring, a friction-chain about each pulley, fixedly held at one end and at the other secured to a pivoted arm which is downwardly drawn by a spiral spring, and a stop which engages such arm when the armature has descended a certain distance, the engagement of said arm loosening the chain on said pulley, and thus permitting the carbon rod to descend until the current passing through the carbons weakens the current through the electro-magnet and permits the armature to rise until the chain again grasps the pulley.

388,054. SPINNING-MULE. William H. Kendall, Bradford, and Walter H. Hemmy, Haverhill, Mass. Filed Apr. 12, 1887. Serial No. 234,794. (No model.)

Brief.—The object of the invention is to provide improved means whereby the direction of rotation of the spindles of a spinning-mule may be changed at will without changing the spindle-bands.

Claim.—1. The shaft *a*, provided with the gear *m*, in combination with the shaft *h*, provided with the adjustable gear *i* and gear *k*, the intermediate gear, *o*, gear *p*, the sleeve *s*, and pin *t*, substantially as shown and described.

2. The sleeve *s*, provided with gear *p*, in combination with the shaft *c*, provided with gear *m*, the pin *t*, the shaft *h*, provided with adjustable gear *i*, band-pulley *g*, and gear *k*, and the intermediate gear, *o*, substantially as and for the purposes set forth.



388,055. CURTAIN RING OR HANGER. J. William Lesley, Everett, Mass. Filed Apr. 11, 1888. Serial No. 270,314. (No model.)

Claim.—In a curtain ring or hanger, the ring having a roller-receiving recess, combined with a yoke fitted into the roller-receiving recess, the arms of the said yoke having journal-receiving sockets or openings and laterally-extended journal-bearings, as described, and the roller journaled in the yoke, substantially as and for the purposes set forth.

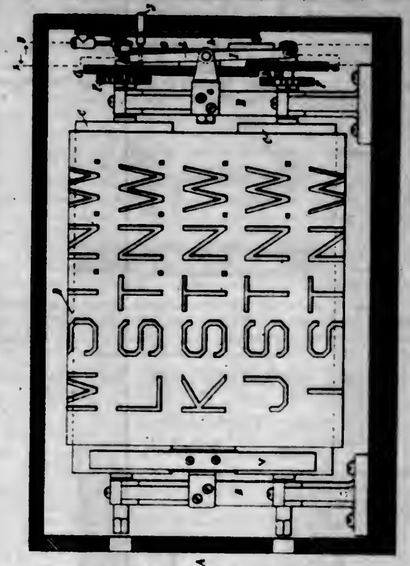
388,056. COTTON OR OTHER BATTING. Willard I. Lewis, Walpole, Mass. Filed Dec. 19, 1887. Serial No. 258,262. (No specimens.)

Brief.—For the purpose of readily finding the edges of the roll of batting and of avoiding tearing the same in opening out the roll, a strip of paper is applied, as shown and described, the paper projecting at intervals from between the edges of the bat.

Claim.—A roll of batting composed of a sheet of fibers folded upon itself parallel with its length, and having a strip of paper applied thereto in a zigzag manner and projecting beyond one edge of the sheet on one side of the latter as folded, substantially as shown and described.

388,057. PLATE-HOLDER. William H. Lewis, Brooklyn, assignor to the E. & H. T. Anthony & Company, New York, N. Y. Filed Jan. 28, 1888. Serial No. 262,294. (No model.)

Claim.—1. An improved plate-holder having an outer frame, within which are placed recessed bars on opposite sides of the frame, with which engage plate-holding bars movable toward and from each other, the said bars being provided with pivoted and laterally-swinging latches, which engage with the recesses in the said bars within the frame, the bars having plate-confining ledges on their edges, substantially as set forth.



2. The combination, in a plate-holder, of a frame, *a*, notched bars *b*, movable plate-holding bars *c*, and pivoted laterally-swinging latches *c*, adapted to engage with the notches in the bars *b*, substantially as set forth.

3. An improved plate-holder having an outer frame, within which are supported plate-holding bars movable toward and from each other, one of said bars being provided with spring-latches attached to it, and which engage with notches on the frame, whereby the bars are pressed toward each other by spring action, substantially as set forth.

4. An improved plate-holder having an outer frame, within which are supported plate-holding bars movable toward and from each other, and provided with plate-retaining ledges on their edges, one of said bars being provided with spring-latches attached to it, and which engage with notches on the frame, whereby the bars are pressed toward each other and the plate held by spring action, substantially as set forth.

5. In a plate-holder, the combination of movable plate-holding bars constructed and arranged to be clamped at predetermined places to the sides of the frame of the plate-holder, and springs movable with the bars, and which engage at differing places, depending on the position of the bars with the sides of the frame, and whereby the bars are pressed toward each other by spring action and the plate so held, substantially as set forth.

388,058. STATION-INDICATOR. Marcus L. Mann, Brooklyn, N. Y. Filed Jan. 3, 1888. Serial No. 259,804. (No model.)

Claim.—1. In a station-indicator, the combination, with an apron and apron-rollers, of the fixed spur-wheels F and loose cog-wheels G, both mounted on the shafts of said rollers, each of said loose wheels having a spur to engage the proper spur-wheel, the shifting-lever I, engaging the loose cog-wheels, the slide-rod J, engaging the shifting-lever, the driving-shaft H, gearing with both loose wheels, and a means for imparting an intermittent motion to the driving-wheel, the whole adapted to operate substantially as herein described.

2. In a station-indicator, the combination, with an apron and apron-rollers, of the driving-wheel H, arranged to impart motion to said rollers, the two ratchet-wheels K, having reversed teeth, the pawl-arm O, carrying pawls for engaging said ratchet-wheels, respectively, the case L, inclosing the ratchet-wheels and having openings to receive said pawls, and a means for imparting a vibrating motion to said arm, the whole adapted to operate substantially as herein described.

3. In a station-indicator, the combination, with an apron and apron-rollers, of the driving-wheel H, the ratchet-wheels K, having reversed teeth, the pawl-arm O, and pawls for engaging the ratchet-wheels, respectively, the whole inclosing case L, the reversing-lever P, having a fork, Q, to engage the pawl-arm, and the stops R, for regulating the position of the reversing-lever, the whole adapted to operate substantially as herein described.

388,059. STEAM-ENGINE. Richard H. Mather, Windsor, Conn. Filed Apr. 26, 1887. Serial No. 236,002. (No model.)

Claim.—1. A steam-cylinder, in combination with a double steam-piston consisting of two single hollow pistons and an intermediate slotted connection, which are formed of a single piece of metal and have a continuous bearing-surface within said cylinder from end to end of said pistons, substantially as and for the purpose specified.

2. A double steam-piston consisting of two single pistons and an intermediate cylindrical connection, all formed of a single piece and being of uniform diameter, but cut away in the middle of said connection and provided with a slotted cross-head, in combination with a steam-cylinder within which said piston has a continuous bearing-surface from end to end of said piston, substantially as and for the purpose specified.

3. In a steam-engine, a steam-cylinder having a continuous interior bearing-surface from end to end, and having central openings into the crank-shaft chamber, in combination with a double steam-piston consisting of two hollow steam-tight single pistons and an intermediate slotted connection which has an external bearing-surface against the interior of said cylinder continuously with said single pistons, substantially as and for the purpose specified.

4. In a steam-engine, a crank-shaft, a crank, a crank-shaft chamber through which the exhaust-steam is conducted, two steam-cylinders having a common axis and opening into said chamber, and a double

388,059.

steam-piston reciprocating in said cylinders and provided with a slotted cross-head, in combination with a crank-pin box consisting of two cylindrically-concave blocks which are set upon opposite sides of the crank-pin at a distance from each other, whereby a portion of the bearing-surface of said crank-pin is exposed to lubrication between said blocks, substantially as and for the purpose specified.

5. In a steam-engine, a double steam-piston consisting of two single pistons and an intermediate cylindrical connection, all formed of a single piece of metal and having a uniform diameter, but cut away in the middle of said connection and provided with a central slotted cross-head, in combination with a crank-pin box consisting of two separate blocks having cylindrically-concave bearing-surfaces and provided with a removable lip, substantially as and for the purpose specified.

6. In a steam-engine, a steam-piston which is formed of a single piece of metal and contains a slotted cross-head, in combination with a crank-pin box which is formed of two cylindrically-concave blocks and is provided with a removable lip, substantially as and for the purpose specified.

7. In a steam-engine, a double steam-piston consisting of two single pistons and an intermediate cylindrical connection, all formed of a single piece and being of uniform diameter, but cut away in the middle of said connection and provided with a central slotted cross-head, in combination with a crank-pin box which is provided with a removable lip, substantially as and for the purpose specified.

8. A steam-piston cylinder which is formed of a single piece of metal and contains a slotted cross-head, in combination with a crank-pin box which is provided with a removable lip, substantially as and for the purpose specified.

9. A double steam-piston consisting of two single pistons and an intermediate cylindrical connection, all formed of a single piece and being of uniform diameter, but cut away in the middle of said connection and provided with a central slotted cross-head, in combination with a steam-cylinder, within which said piston has a continuous bearing-surface from end to end of said piston, in combination with a crank-pin box which is adapted to reciprocate in said cross-head, substantially as and for the purpose specified.

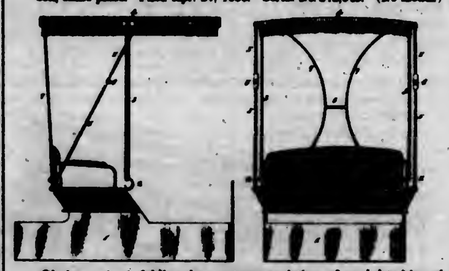
10. In a steam-engine, a crank, a crank-shaft, a crank-shaft chamber which extends from one to the other of the main bearings and is provided with inlet and outlet ports, a steam-cylinder having central openings into said chamber and having a continuous bearing-surface from end to end of said cylinder, and a double steam-piston consisting of two single pistons and an intermediate slotted cross-head, which are formed of a single piece of metal and have a continuous bearing-surface within said cylinder from end to end of said piston, said cross-head being a part of the only channel of communication between said ports, in combination with a crank-pin box consisting of two cylindrically-concave blocks which are set in said cross-head upon opposite sides of the crank-pin at a distance from each other, whereby a portion of the crank-pin is exposed in said channel between adjacent edges of said blocks, substantially as and for the purpose specified.

11. In a steam-engine, an exhaust-chamber which extends from one to the other of the main bearings of the crank-shaft and consists of two compartments, one of which has an inlet-port and the other of which has an outlet-port, in combination with a steam-piston having a central cross-head provided with a slot which is the only channel of intercommunication between said compartments, substantially as and for the purpose specified.

12. In a steam-engine, a crank and crank-shaft, a crank-shaft chamber having an outlet-port, two steam-cylinders having a common axis and opening into said chamber, and a steam-piston reciprocating in said cylinders and said chamber and having a central transverse aperture for the accommodation of a sliding crank-pin box, in combination with a valve-casing which opens into said chamber and two hollow valve-pistons which reciprocate in said casing, all being so disposed that the exhaust is conducted through said valve-pistons and casing and through said crank-shaft chamber and steam-piston aperture, substantially as and for the purpose specified.

13. In a steam-engine, an exhaust-chamber consisting of two compartments whose only channel of intercommunication is a slotted cross-head of the steam-piston, substantially as and for the purpose specified.

388,060. STOOL. William J. Melvin, Boston, Mass. Filed May 10, 1888. Serial No. 273,633. (No model.)



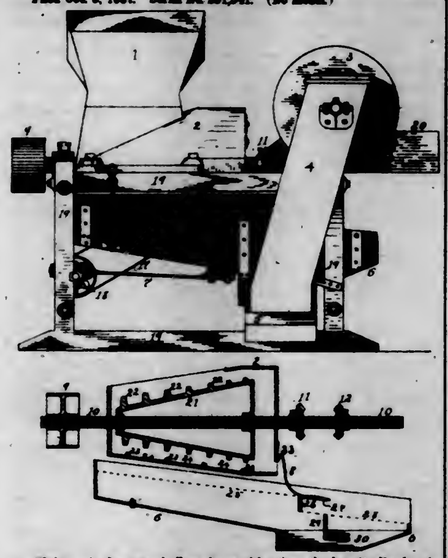
Claim.—1. In a stool, the combination, with a base and an upright, of a bracket pivotally secured to the said upright to turn in a substantially horizontal plane, a seat, and a seat-supporting frame, *b*, pivotally supported by said bracket and capable of being turned in a substantially vertical plane, whereby the said seat may be brought from an elevated position to one near the floor, substantially as described.

2. In a stool, the combination, with a base and an upright, of a bracket pivotally secured to the said upright to turn in a substantially horizontal plane, a seat, and a seat-supporting frame, *b*, pivotally supported by said bracket and capable of being turned in a substantially vertical plane, whereby the said seat may be brought from an elevated position to one near the floor, and a locking device to lock the seat-supporting frame in elevated position, substantially as described.

3. In a stool, the combination, with a base adapted to be secured to the floor, of a bracket pivotally secured thereto and provided with ears, a seat-supporting frame extended through said ears, adjustable collars on said frame, a flange on one of said collars to engage said bracket, and a seat on said supporting-frame, substantially as described.

4. In a stool, the combination, with a base adapted to be secured to the floor, of a bracket pivotally secured thereto and provided with ears, a seat-supporting frame extended through said ears, adjustable collars on said frame, a flange on one of said collars to engage said bracket, and a seat adjustable on said supporting-frame, substantially as described.

388,061. FOLDING BUGGY-TOP. William G. Miller, Boonville, Mo., assignor of one-half to Wilbur T. Johnson and William Morris Johnson, same place. Filed Apr. 27, 1888. Serial No. 272,049. (No model.)



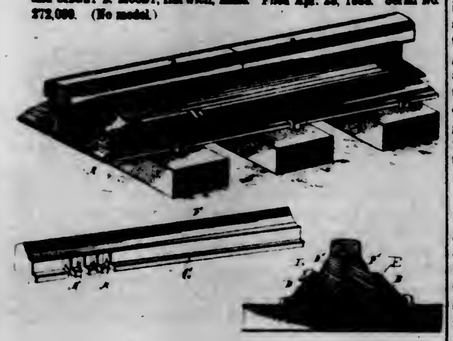
Claim.—1. A folding buggy-top consisting of uprights hinged substantially at the middle of the top and to the body of the buggy at the front part of the seat, jointed braces hinged to the top in front of said uprights and to the buggy back of said uprights, and one or more rods hinged to the back of the top and to the back of the buggy-seat.

2. A folding buggy-top consisting of uprights hinged substantially at the middle of the top and to the body of the buggy at the front part of the seat, jointed braces hinged to the top in front of said uprights

and to the baggy back of said uprights, and a lateral bracing pivoted to said top and baggy.

3. The combination, as hereinbefore set forth, of the baggy-top 4, the standards 3, hinged near the middle thereof and pivoted at or near the front part of the seat, the jointed braces 5, hinged to the top in front of said standards and to the baggy back of said standards, and the lateral braces 7, hinged to the back of the baggy-top and to the back of the seat.

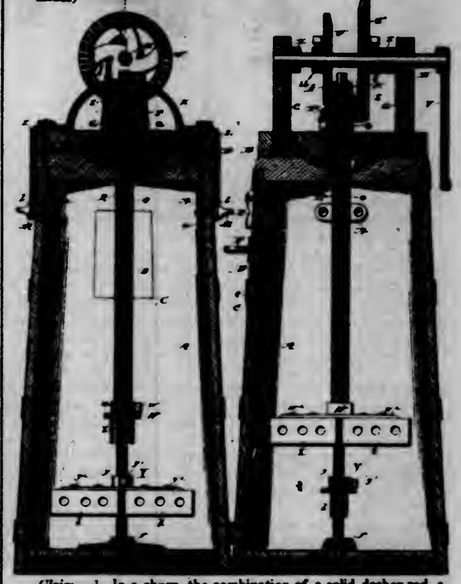
388,062. CORN-SHELLER. ALEXIS B. MONTGOMERY, Decatur, Ill. Filed Oct. 5, 1887. Serial No. 251,541. (No model.)



Claim.—1. In corn-sheller, in combination, the longitudinal main shaft carrying the shelling-cone, the transverse intermediate shaft geared with the main shaft, the transverse fan-shaft, and the transverse screen-reciprocating shaft, power-transmitters connecting the fan and screen shafts with the intermediate shaft, as and for the purpose set forth.

2. In corn-sheller, in combination, the longitudinal shaft carrying the shelling-cone and having the shifting bevel-wheels, the transverse intermediate shaft having a gear-pinion adapted to mesh with either of the shifting-wheels, the transverse fan-shaft and the transverse screen-reciprocating shaft, power-transmitting bands connecting the fan and screen shafts with the intermediate shaft, as and for the purpose set forth.

3. In a screen for corn-shellers, in combination, screen-sheet 25, terminating on transverse offset 26, screen-sheet 28, extending from the bottom of the offset in a line approximately parallel with a continuation of sheet 25, rods 27, projected over sheet 28 in line with sheet 25, and flexible flap 8, affixed to the sheller-casing and resting in part on the rods, as and for the purpose set forth.



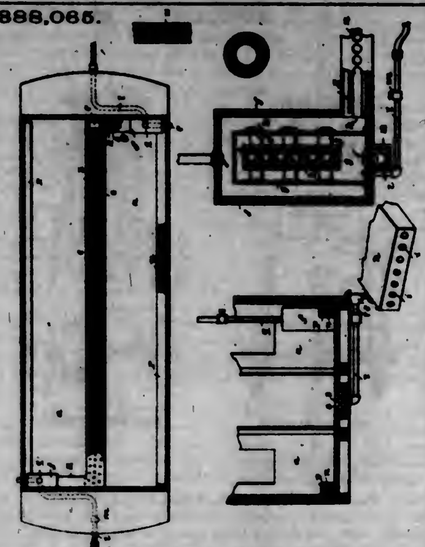
388,063. RAILWAY-RAIL JOINT OR CHAIR. JAMES M. MOODY and SIDNEY B. MOODY, Harwich, Mass. Filed Apr. 28, 1888. Serial No. 272,099. (No model.)

Claim.—1. The combination, with a railway-rail, of the chair provided with tapered side flanges, B B, having inclined grooves H H in their inner sides, the single wedge F, arranged between the rail and each side flange and provided with a series of inclined grooves, K, in their outer sides adapted to register successively with the grooves H, the upper ends of the said grooves being flush at their inner sides with the outer edges of the wedges, whereby the grooves K are invisible except when registering with the grooves H and the keys engaging the registering grooves H and K, substantially as and for the purpose specified.

2. The combination, with the railway-rail, of the chair provided with a depression or groove, C, and the apertures I I, the vertical side flanges, B B, having grooves H therein, the wedges arranged between the rail and the side flanges and having grooves in their outer sides adapted to register with the grooves H, and the railway-spikes arranged in the aligned grooves and apertures I, and engaging notches in the base or flanges of the rail, all substantially as and for the purpose specified.

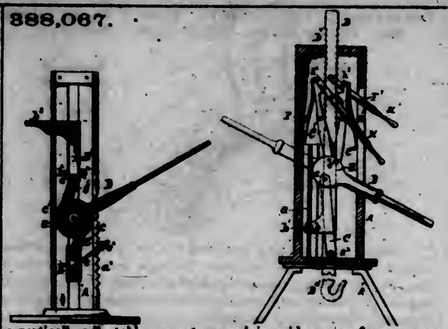
388,064. CHURN. WILLIAM H. MOORE and CALVIN H. MOORE, Adairsville, Tenn. Filed Jan. 3, 1888. Serial No. 259,616. (No model.)

Claim.—1. In a churn, the combination of a solid dasher-rod, a hollow dasher-rod surrounding the solid rod, the shaft and gearing, substantially as described, whereby said rods are rotated in opposite directions, a transverse dasher attached to and adjustable upon the hollow rod from its lower end to the inner surface of the top of the churn, and a similar dasher attached to the solid rod and adjustable thereon from the lower end of said rod to the lower end of the hollow rod, substantially as specified.



2. In a churn, the combination, with the driving-shaft mounted in the standards G, the crank-handle V, and the bevel gear-wheels T and U on said shaft, of the hollow rod O, having suitable bearings in the churn-top, the bevel gear-wheel P thereon, meshing with the bevel gear-wheel T, the transverse dasher attached to said hollow rod and adjustable thereon from the lower end of said rod to the inner side of the top of the churn, the solid rod R, stepped at the bottom of the churn, running up within the hollow rod, having near its top the bevel gear-wheel S, meshing with the bevel gear-wheel U, and the transverse dasher attached to the solid rod and adjustable thereon up to the lower end of the hollow rod, substantially as specified.

388,065. RAILWAY-CAR HEATER. THOMAS H. MOORE, Pittsburg, Pa. Filed Mar. 8, 1888. Serial No. 266,626. (No model.)



Claim.—1. In a car-heater such as described, the combination consisting of the heaters *f*, having an air chamber and pipe, *g*, for conducting a supply of air thereto, the steam-chest *g*, having centrally located therein a porous non-metallic slab, *h*, the trough *b*, arranged in the center of the car *a*, the pipes *c*, arranged in the said trough *b*, the small chambers *c* at each end of the same, the perforated distributing-pipes *n*, communicating with the heaters *f*, and a pipe, *o*, connecting the steam-chest *g* of the heater with the small chamber *c*, substantially as set forth and described.

2. In a car-heater, the combination of the heaters *f*, arranged at opposite ends of a car and each having a steam-chest arranged centrally therein to leave an intermediate air-space between said steam-chest and the exterior shell of the heater, the side troughs, *p*, having the perforated pipes *n* housed therein, one of said pipes communicating with the air-space of the heater at one end of the car and the other pipe with the air-space of the other heater at the opposite end of said car, and the central trough, *b*, having pipes communicating with the steam-chests of both heaters, substantially as described, for the purpose set forth.

388,065.

388,067.

388,066. SHELF. SAMUEL J. HERBERT, Hunterdon, N. J. Filed Feb. 24, 1888. Serial No. 265,169. (No model.)

Claim.—1. The combination, with the shelf and its supporting end pieces, of movable plates supplied to both ends of the shelf and having their inclined faces toward the front and rear edges of the shelves, substantially as set forth.

2. The combination, with the shelf and its supporting end pieces, of movable locking-plates seated in the recesses and between the sides of the shelf and projecting from the ends of the shelf into the supporting end pieces, substantially as set forth.

3. The combination, with the shelf having recesses *a* in its ends, of slotted guard-plates attached to the ends of the shelf and movable locking-plates seated in the recesses and projecting through the guard-plates, substantially as set forth.

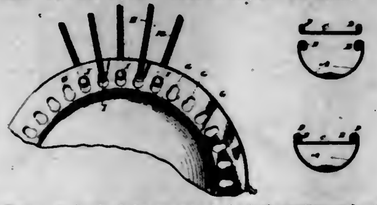
388,067. LATCHING-JACK. B. FRANKLIN BROWN, Detroit, Mich., assignor of two-thirds to Edward Brennan and Murtaugh P. Brennan, both of same place. Filed Sept. 23, 1887. Serial No. 250,253. (No model.)

Claim.—1. In combination, a case or frame, a vertically-sliding bar in said case or frame, a lever-head mounted in said case or frame, a vertically-adjustable support secured in said case or frame, means for locking the adjustable support in different adjustments, and a link, and a bar-operating connection, each connected eccentrically at one end to the lever-head, their opposite ends being in engagement with the sliding bar and the support, respectively, substantially as set forth.

2. In combination, a case or frame, a vertically-sliding bar mounted in the case or frame, a vertically-adjustable support, a spring-stop, *c*, adapted to lock the support in different adjustments, a lever-head mounted in the case or frame between the sliding bar and the adjustable support, and connections which are connected at one end to the lever-head, and their opposite ends being in engagement with the sliding bar and the adjustable support, respectively, substantially as set forth.

3. In combination, a case or frame, a vertically-sliding bar mounted in said case or frame, and provided with ratchet-teeth or notches, a lever-head mounted in the case or frame, a link eccentrically connected at one end with the lever-head and connected at its opposite end with a suitable support, a pawl eccentrically connected at one end with the lever-head and resting in engagement with the ratchet-teeth or notches at its opposite end, a retaining-pawl in engagement with the sliding bar, springs for holding the pawls in engagement with the sliding bar, and levers for throwing the pawls out of engagement with the sliding bar, substantially as set forth.

4. In combination, a case or frame, a vertically-sliding bar mounted in the case or frame, and provided with ratchet-teeth or notches at its edges, a lever-head mounted in the case or frame, a link-support for the lever-head, the said link-support being connected with the lever-head eccentrically, two pawls eccentrically connected with the lever-head and in engagement with the opposite edges of the sliding bar, the one to act as a retaining-pawl and the other as an operating-pawl, springs for holding the pawls in engagement with the ratchet-toothed bar, and levers for throwing the pawls out of engagement with the ratchet-toothed bar at pleasure, substantially as set forth.



5. In combination, a case or frame, a vertically-movable ratchet-toothed bar mounted in the frame, a lever-head mounted in the frame and embracing the opposite ends of the ratchet-toothed bar, a link-support for the lever-head, a pair of pawls connected eccentrically with the lever-head, springs to hold the pawls in engagement with the ratchet-toothed bar, levers for throwing the pawls out of engagement with the ratchet-toothed bar at pleasure, and a guide connected with the ratchet-toothed bar and extending into a guide-groove to steady the said ratchet-toothed bar, substantially as set forth.

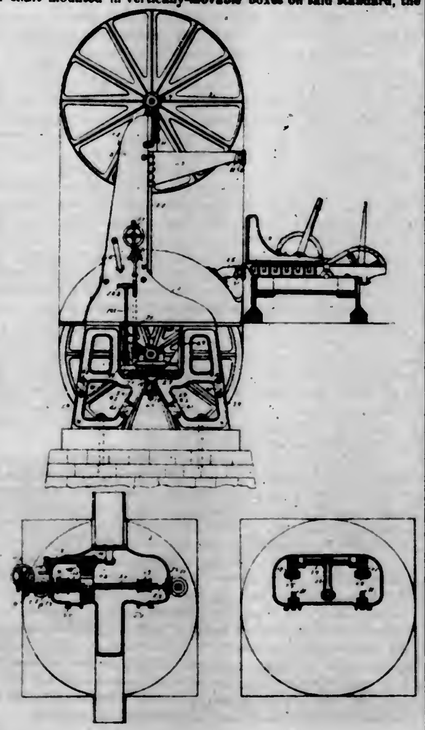
6. In combination, a case or frame, a vertically-notched bar mounted in the frame, a lever-head mounted in the frame, a link-support for the lever-head, a pawl eccentrically connected with the lever-head and in engagement with the notched sliding bar, and a lever pivoted to the case or frame and provided with a projection adapted to engage the pawl and throw it out of engagement with the notched bar, substantially as set forth.

7. In combination, a case or frame, a vertically-sliding bar mounted therein and provided with ratchet teeth or notches, a lever-head, a link connected eccentrically at one end with the lever-head and connected at the other end with a suitable support, and a pawl eccentrically connected at one end with the lever-head and resting in engagement with said ratchet or notches at its opposite end, substantially as described.

8. In combination, a casing or frame, a vertically-sliding bar mounted therein and provided with ratchet teeth or notches, a lever-head mounted in said casing or frame substantially in line with the vertical axis of said sliding bar, a link connected eccentrically at one end with the lever-head and connected at its opposite end with a suitable support, and a pawl eccentrically connected at one end with the lever-head and resting in engagement with said ratchet-teeth or notches at its opposite end, whereby the points of connection of said link and pawl with said lever-head may be brought substantially in line with the vertical axis of the sliding bar, substantially as set forth.

388,068. VEHICLE-WHEEL. ALBERT H. OVERMAN, Chicopee, Mass. Filed Dec. 19, 1884. Serial No. 150,727. (No model.)

Claim.—1. A wheel-rim composed of a body portion and a tread located between the same and below the edges thereof, each edge of the said body portion and each edge of the tread being bent at an angle to adapt their adjacent edges to be interlocked for supporting the tread, substantially as set forth.



2. A hollow wheel-rim composed of a body portion the edges whereof are bent inward to form hooks opening upward, and a tread located within such body portion and below the edges thereof, and having its edges bent to form hooks opening downward, which are embraced by those of the body portion, substantially as set forth.

3. In a vehicle-wheel, the combination, with an axle, of two slotted hub-flanges rigidly secured thereto, wire spokes having headed hooks at their inner ends and hooked in alternation into the opposite faces of each of the flanges through the slots thereof, and means for adjustably attaching the outer ends of the spokes to the wheel-rim, each spoke being entirely independent in its attachment to its flange from every other spoke, substantially as set forth.

388,069. BAND-SAW MILL. WILLIAM F. PARMS, Minneapolis, Minn. Filed Mar. 2, 1886. Serial No. 203,943. (No model.)
